James I. OF ENGLAND (1603-25) AND **VI. OF SCOTLAND** (1567-1625) was the only son of Mary, Queen of Scots, and Henry, Lord Darnley. He was born in Edinburgh Castle on the 19th June 1566, at which time unpleasant relations between Mary and her husband were beginning to develop themselves. Then followed the murder of Darnley in February 1567, the marriage of Mary to Bothwell in May, the rising of the nobles at Carberry Hill in June, and the subsequent imprisonment of Mary and enforced resignation of her crown. In consequence of this rapid course of events James was proclaimed king of Scotland, 29th July 1567. The nation at this time was rent by factions, and, as was customary in Scotland under 'bairn kings,' each faction sought to have possession of the person of the monarch. James was placed in Stirling Castle in the keeping of the Earl of Mar, and here he received his education under the famous scholar George Buchanan. Within eleven years Moray, Lennox, Mar, and Morton had successively held the regency of the kingdom, and when, in 1578, the Regent Morton was driven from power James himself nominally assumed the direction of affairs. But the government of his advisers was unpopular, and Morton once more succeeded in re-establishing himself in the regency. About this time James began to exhibit that partiality towards favourites which was so characteristic a feature of his life; and an accomplished, but truculent and unprincipled soldier, Captain James Stewart, whom he created Earl of Arran, was the favourite with whose help and that of the Duke of Lennox (another favourite) the king was enabled finally to break the power of Morton. After Morton's execution (1581) James ruled the kingdom through his two favourites, not without much discontent and grumbling on the part both of the kirk and the nobility. Hence, on 12th August 1582, occurred the well-known Raid of Ruthven (q.v.), when the king was forcibly seized by a party of his nobles, and under their direction was obliged to sanction the imprisonment of Arran and the banishment of Lennox. In 1583 a counter-plot

effected the king's freedom, when he immediately restored Arran to power. The confederate lords were obliged to flee to England, whence, in 1585, through the connivance of Queen Elizabeth, they returned, and with an army of 10,000 men forced James to capitulate in Stirling Castle. Arran once more was banished, and never again restored to power.

In 1586 Queen Mary, then a prisoner in England, was condemned by the English court to be executed. James's conduct at this time, taken in connection with his previous attitude towards his mother, and his subsequent friendly alliance with Elizabeth, has been severely censured by Mary's partisans, and in truth does not admit of much defence. In the winter of 1589 he went to Denmark, where he married the Princess Anne (1574-1619), daughter of Frederick II., king of that country. During these and subsequent years James was frequently in conflict with the Presbyterians on the one hand, and with the Roman Catholics on the other. Like Elizabeth, he hated Puritanism, and was not disinclined towards some modified form of Romanism. The spirit of Presbyterianism he regarded as too democratic, and was therefore disposed to introduce Episcopacy into Scotland, and did ultimately (in 1600) succeed in establishing bishops. In consequence of this tendency the king had frequent theological discussions with the Presbyterian ministers; which discussions, however, were not altogether unwelcome to him, as he had a strong taste for polemics. From 1591 to 1594 the Roman Catholic lords in the north were in a state of semi-insurrection; but James finally marched against them, and the disturbances were suppressed. In 1600 occurred that strange episode, the Gowrie Conspiracy (q.v.).

During the whole of Elizabeth's long reign the disturbing element in English politics had been the question of the succession to the throne; this was finally settled when, on the death of that queen in 1603, James VI. of Scotland ascended the English throne. He was at first well received by his subjects in England, but subsequently became unpopular by reason of his continued partiality towards favourites. He also degraded the prerogative of the crown by the sale of titles of dignity: the title of baronet, which he originated, could be bought for £1000, a barony for £5000, and an earldom for £20,000. His chief favourite at this time was Robert Kerr, or Carre, a Scotchman of the Border family of Kerr of Ferniehirst, on whom he showered honours and emoluments, finally creating him Earl of Somerset. When Carre fell out of favour he was succeeded by the notorious Buckingham. The king really governed through these minions, and the name and prestige of England, so formidable under Elizabeth, sank into insignificance. In 1617 James revisited Scotland, signalling his reappearance among his Scottish subjects by several angry disputes with the clergy, in which the king did not always come off victorious. His eldest son, Henry, Prince of Wales, having to the great grief of the nation, died in 1612, the succession devolved upon his second son Charles (afterwards Charles I.), between whom and a Spanish princess the king was long anxious to effect a marriage, but after years of negotiation the project was not successful. Buckingham, who was entrusted too much with the conduct of the affair, acted rashly and unwisely, with the consequence that war broke out between the two countries.

James died on 27th March 1625. His character has been painted in various colours by different historians. Sully epigrammatically described him as 'the wisest fool in Christendom'; and Macaulay, in one of his antithetical sentences, exaggerates this aspect of James's character by stating that 'he was indeed made up of two men—a witty, well-read scholar, who wrote, disputed, and languaged,

and a nervous, drivelling idiot who acted.' By more recent historians, however, such as Von Ranke and Mr S. R. Gardiner, his character has been treated more broadly and mildly; but perhaps the best popular estimate of the man, his manners, and his peculiarities, is the representation of him which is given by Scott in *The Fortunes of Nigel*.

The literary tastes which James had acquired under the tuition of Buchanan appeared in after life in various works which he issued, but none of which ever became popular. These are *Essays of a Prentice in the Divine Art of Poetrie* (1584); *Poetical Exercises at Yvancut Hours* (1591); *Deomologie* (1597); *Basiliæan Diron* (q.v.), in which he embodied his somewhat extreme views as to the divine right of kings; and the *Counterblast to Tobacco* (1616).

Besides the historians already named, as well as Burton, Tytler, Calderwood, &c., the following may be read: Goodman's *Court of James I.*, edited by J. S. Brewer (2 vols. 1839); *The Secret History of the Court of King James I.*, edited by Sir W. Scott (2 vols. 1811), containing Osborne's *Memoirs*, Weldon's valuable *Court of King James*, &c.

James II. of England and VII. of Scotland (1685-88) was the second surviving son of Charles I., and was born 14th October 1633. A short time before his father's execution he escaped to Holland, and shortly after went to France. He served for some time in the French army under Turenne, and when he was obliged to leave the French territory on the conclusion of peace between the English Commonwealth and Louis XIV. he entered the military service of Spain. At the Restoration (1660) James was recognised as Duke of York, and was made Lord High Admiral of England. In November 1659 he had married Anne Hyde, daughter of the Chancellor, afterwards Earl of Clarendon. He had some skill in maritime affairs, and in 1665 he commanded an English squadron which gained a signal victory over a Dutch fleet under Admiral Opdam. In 1671 he again encountered, off the coast of Suffolk, the Dutch led by the celebrated De Ruyter, and the conflict, which was obstinately contested, terminated at nightfall in a drawn battle. On the death of Anne Hyde in 1671 James made a public avowal of his conversion to the Roman Catholic faith. In 1673 the English parliament passed the Test Act, requiring all civil and military officers to subscribe a declaration against transubstantiation, and to receive the sacrament according to the rites of the Church of England. James was consequently obliged to resign the office of Lord High Admiral. Shortly after he married Mary, daughter of the Duke of Modena. The national ferment occasioned by the supposed Popish Plot became so formidable that he was under the necessity of retiring to the Continent, and during his absence an attempt was made to exclude him from the throne. He returned at the close of 1679, but King Charles found it necessary to require him to remove again from the court, and he was sent down to Scotland to take the management of its affairs. The cruelties which he inflicted on the Covenanters have left an indelible stain upon his memory. Meanwhile the Exclusion Bill was again introduced, and was twice passed by the Commons, but in the first instance it was rejected by the Lords, and on the second occasion it was lost by the dissolution of the parliament. James then returned to England, and in direct violation of the law took his seat in the council, and resumed the direction of naval affairs.

At the death of Charles in 1685 James ascended the throne, and on taking his seat at the head of the council board he declared his resolution to maintain the established government both in church and state, and to respect the liberties of the people. But immediately after his accession he proceeded to levy, on his own warrant, without

waiting for the meeting of parliament, the customs and excise duties which they had granted to Charles only for life. He sent a mission to Rome, heard mass ostentatiously in public with regal splendour, became, like his brother, the pensioned slave of the French king, and made the interests of his kingdom subservient to the arbitrary and ambitious designs of that monarch. In Scotland, at his instance, the persecution of the Covenanters was renewed with increased severity and cruelty, and a law was passed enacting that attendance at a conventicle, either as a preacher or a hearer, should be punished with death and confiscation of goods. After the futile rebellion of James's nephew, Monmouth (q.v.), came the 'Bloody Assize,' presided over by the infamous Jeffreys, in which 320 persons were hanged; the judicial murder of Alice Lisle and Elizabeth Gaunt produced an especially strong impression on the public mind. The suspension of the Test Act by the king's own authority, his prosecution of the seven bishops on a charge of seditious libel, his conferring ecclesiastical benefices on Roman Catholics, his violation of the rights of the universities of Oxford and Cambridge, his plan for packing parliament, and numerous other arbitrary and despotic acts showed his fixed determination to destroy the constitution and to overthrow the church. The indignation of the people was at length roused against him, and it became evident that his expulsion from the throne was necessary for the welfare and safety of the nation. The interposition of William, Prince of Orange, James's son-in-law, was formally solicited by seven influential politicians, and was readily granted. He landed at Torbay on the 4th of November 1688 at the head of a powerful army, and began his march towards London. He was everywhere hailed as a deliverer, while James was deserted not only by his ministers and troops, but even by his daughter the Princess Anne. The unfortunate king, on the first appearance of danger, had sent his wife and infant son to France, and he soon after made his escape from the country and joined them at St Germain's. He was hospitably received by Louis XIV., who settled a pension on him. In the following year, aided by a small body of French troops, he proceeded to Ireland and made an intellectual attempt to regain his throne. He was defeated at the battle of the Boyne, and returned to St Germain's, where he resided until his death, 6th September 1701, in the sixty-eighth year of his age. He left two daughters—Mary, married to the Prince of Orange, and Anne, afterwards queen—and one son by his second wife, James Francis Edward, usually designated the Chevalier de St George (see JACOBITES). He had also several illegitimate children—one of whom, Marshal Berwick, was a renowned military commander.

See the histories of England by Macaulay, Ranke, Lingard; Burnet's *History of his Own Time*; Macpherson's *History of Great Britain* (1775) and *Original Papers* (1775); the *Lives* by C. J. Fox and Clarke (1816); Wellwood's *Memoirs*, and Luttrell's *Relation of State Affairs*; Wilson's *James II. and the Duke of Berwick* (1876); Campana de Cavelli, *Les Derniers Stuarts à St Germain* (Paris, 1871); Bloxam's *Magnolia Gallery and James II.* (1886); works cited at CHARLES II.; and articles SEVEN BISHOPS, &c.

James, GEORGE PAYNE RAINSFORD, romance writer, was born in London in 1801. The son of a well-known physician, he was educated at Putney and in France, and by seventeen had written some eastern tales, which found favour with Washington Irving. Thereafter he ceased to write, dictating instead to an amanuensis his 'thickening fancies.' In all he published seventy-seven works, in 198 volumes—historical romances mostly, but also biographies, poems, &c. The best were

among the earliest—*Richelieu* (1829) and *Henry Musterton* (1832). He was British consul at Richmond, Virginia, from 1852 till 1858, and then at Venice till his death there on 9th May 1860. 'G. P. R. James' may be classed as a hybrid—a productive hybrid between Dumas and Mrs Ann Radcliffe. Leigh Hunt writes kindly of him, and Sir Archibald Alison could 'revert with pleasure to his varied compositions,' which even yet may be safely recommended to the 'young person.' But his two horse-men will be remembered best, if not indeed solely, by Thackeray's parody *Barbazure*.

James, SIR HENRY, director of the Geological Survey of Ireland and of the Ordnance Survey of the United Kingdom, was born near St Agnes in Cornwall in 1803. He passed in 1825 from the Royal Military Academy, Woolwich, into the Royal Engineers. In 1844 he was appointed director of the Geological Survey of Ireland; in 1846 head of the Admiralty works at Portsmouth; in 1852 director of the Ordnance Survey of the United Kingdom; and in 1857 chief of the Statistical and Topographical Department of the War Office. He was knighted in 1860, and made major-general in 1868. He died at Southampton on 15th June 1877. From his pen came several works on geology, surveying, &c., including *Ordnance Trigonometrical Survey of Ireland* (1858) and *Account of the Principal Triangulation of the United Kingdom* (1864). By means of zinc-photography, a process which he invented in 1859, he produced fac-similes of *Domesday Book* (32 vols.) and of national MSS. of England (to Anne's reign), of Scotland, and of Ireland.

James, HENRY, LORD (of Hereford), Q.C., born at Hereford in 1828, went to school at Cheltenham College, and was called to the bar of the Middle Temple in 1852. In 1850, and again in 1851, he had attained legal distinction as lecturer's prizeman at the Inner Temple. He became a Queen's Counsel in 1869, a bencher of his Inn in 1870; and in March 1869 entered the House of Commons for Taunton. He continued to represent Taunton in the Liberal interest until 1885, when he was returned for Bury, in Lancashire. He made a considerable mark in the debates on the Judicature Bill in 1872, and in the succeeding year was appointed by Mr Gladstone Solicitor-general. In 1873 he became Attorney-general, and was knighted; and in 1880, on the return of Mr Gladstone to power, he again became Attorney-general. He ably conducted the *Corrupt Practices Bill* through the House of Commons in 1883. Sir Henry James was offered the Lord Chancellorship on the formation of Mr Gladstone's third administration in 1886, but he declined to take office in consequence of his inability to support the Premier's Irish Home-rule policy; and in 1886 he was re-elected for Bury unopposed, as a Liberal Unionist. He defended the *Times* before the Parnell Commission, and strongly opposed the second Home Rule Bill. Created Lord James of Hereford in 1895, he became Chancellor of the Duchy of Lancaster.

James, HENRY, an eminent American novelist, was born in New York, 16th April 1843. He was until his father's death known to the reading public as Henry James, junior, the father (1811-82) being a well-known and original theological writer and lecturer, the exponent in turn of Saude-manianism and the system of Swedenborg. The boy was cosmopolitan from his cradle, and was educated under his father's eye in New York, Geneva, Paris, and Boulogne. In 1862 he entered the Harvard law-school, but his destiny was to be solely a man of letters, and, after the usual preliminaries of magazine-writing and shorter stories, he took his place among contemporary novelists

with *Roderick Hulsan* in 1875. Already in 1869 he had migrated to Europe, there to reside by turns in England and in Italy. He is only less eminent as a critic, and his perfect mastery of modern French literature, added to his natural subtlety of perception, has given a quite extraordinary value to his delightful, clever, yet ineffective studies collected in *French Poets and Novelists* (1878) and *Partial Portraits* (1888). The value of the latter in particular is marred by its inconclusive conclusions, and by too indiscriminate admiration of his friends. His *Hawthorne* (1879), in 'English Men of Letters,' is a clever study, but yet one scarce adequate to its theme. Besides these he has published several volumes of pen-sketches of things in the Old World, written for American magazines, as *Portraits of Places* (1884) and *A Little Tour in France* (1884). His more important novels of greater or less length are *The American* (1878); *The Europeans* (1878); *Daisy Miller* (1878); *A Bundle of Letters* (1879); *Washington Square* (1880); *The Portrait of a Lady* (1881); *The Bostonians* (1886); *Princess Casamassima* (1886); *The Tragic Muse* (1890); *What Maisie Know* (1897); and *The Awkward Age* (1899). Some of his cleverest work is to be found in such volumes of shorter stories as *Stories Revised* (1885), *The Revenger* (1888), *The Aspen Papers* (1888), and *A London Life* (1889).

In fiction James may be said to lead the English section of the analytical school represented in France by Bouquet, Guy de Maupassant, and other too clever young writers. His stories deal mainly with the uneventful lives of Americans living or travelling in Europe, and their main interest lies in the subtle contrasts presented in the contact of a comparatively new with an ancient civilisation. James has paid a price for his citizenship of the older world, and some of his studies have been far from pleasing to his countrymen. His chief want as a novelist is a lack of vigour and of wholesome breadth in his views of life. He shrinks from a strong situation, even when it is required by dramatic necessity, and his constant foible is verbosity, which he escapes only in his shorter stories. His style is ever neat and graceful—a medium admirable for gentle satire on human weakness, unfit for the expression of the tragic and deeper side of nature. A spirit of tranquil pessimism breathes through all his work, but the burden of the world weighs but lightly on his heart.

James, JOHN ANGLI, an eminent Congregationalist minister, was born at Blandford Forum, Dorsetshire, June 6, 1785, apprenticed to a linen-draper, afterwards studied for a short time at a dissenting college at Gosport, and was placed on the 'preaching list' at seventeen. He was highly popular, and when only twenty was settled as pastor of the 'church meeting in Carl's Lane,' Birmingham, where he remained till his death, October 1, 1859. He published a multitude of sermons, tracts, addresses, and small religious volumes (the best known being the *Unquiet Inquirer*), which had a vast circulation (collected, 17 vols., 1860-62). See his *Life* by Dale (1861).

Jameson, ANNA, authoress and art critic, was the daughter of an Irish miniature painter named Browell Murphy, and was born at Dublin in 1794. Her girlhood was passed in the north of England, and then for a dozen years she had been a governess, when in 1823 she married Mr Robert Jameson, a barrister, who in 1829 was appointed a puisne judge in Dominica. In consequence of her husband's harsh treatment, Mrs Jameson refused to accompany him; and save during a brief visit to Canada in 1836-38, she ceased to live with him. Mrs Jameson published in 1831 her first important work, entitled *Memoirs of Female*

Sovereigns, and this was succeeded in the following year by her subtle and fascinating *Characteristics of Shakespeare's Women*. Among other topics upon which she wrote at this time were female labour, penitentiaries, and hospital nursing. She further published, in 1833, *Beauties of the Court of Charles II.*, in 1837 *Sketches of Germany*, in 1838 *Rembles in Canada*, and in 1846 *Memoirs and Essays*. But it is as an art critic that she is best remembered, for her *Handbook to Public Galleries in and near London* (1832); *Lives of Early Italian Painters* (1845); *Poetry of Sacred and Legendary Art* (1848); *Legends of the Monastic Orders* (1850); *Legends of the Madonna* (1852); and a *Commonplace Book of Thoughts, Memories, and Fancies* (1854). Her work on our Lord and John the Baptist as represented in art was completed by Lady Eastlake. She died at Ealing, March 19, 1860. See the *Memoirs* by her niece (1878), and the new edition of her works (6 vols., 1890).

Jameson, LEANDER STARR, leader of the raid into the Transvaal, was born at Edinburgh 8th February 1853, studied medicine there and at London, and having gone to the Cape, settled in medical practice at Kimberley in 1878. Through Mr Rhodes he took part in pioneer work, was made administrator for the South Africa Company at Fort Salisbury, and conciliated enormous influence and popularity. During the troubles at Johannesburg between the Uitlander reform party and the Boer government, Jameson, who by order of Mr Rhodes, then Cape Premier, had concentrated the military forces of Rhodesia at Mafeking on the Transvaal frontier, started with 500 troopers to support the Reformers (29th December 1895) just when they had been intimidated by President Kruger; and after riding foodless for twenty-four hours the party encountered on 1st January 1896 an overwhelming Boer force strongly posted at Krugersdorp, to the west of Johannesburg. Surprised and disappointed that no support came to them from Johannesburg, they fought gallantly till their ammunition was exhausted and till Boer reinforcements brought up artillery. Then Jameson and 450 men surrendered, and were imprisoned at Pretoria, but handed over ere long to the British authorities for trial. Jameson, who arrived in England two months after the raid, was in August condemned to fifteen months' imprisonment, without hard labour, Sir John Willoughby, military chief of the expedition (an officer holding Her Majesty's commission), to ten months, and 'Dr Jim's' other officers to minor terms of imprisonment—all as first-class misdemeanants. The private troopers were not punished. This disastrous raid provoked the German Emperor's congratulatory letter to Kruger, which caused such fierce resentment in Britain and nearly led to war with Germany.

Jameson, ROBERT (1772-1854), geologist, born at Leith, and educated at Edinburgh University and under Werner at Freiberg (1800-2), was elected in 1804 to the chair of Natural History in the university of Edinburgh. At first a Wernerian, he adopted Hutton's views; and he published half a dozen works on mineralogy and geognosy (1804-37).

Jamesone, GEORGE, portrait painter, was born in Aberdeen, probably in 1588, a son of Andrew Jamesone, a master mason and burgess of guild of the city. A baseless tradition affirmed that he studied painting in Antwerp under Rubens along with Van Dyck. Really he was in 1612 apprenticed for eight years to 'John Anderson, painter' (see *Academy*, 14th April 1894). The dates inscribed upon his works prove that in 1620 he practised his art

at Aberdeen, and afterwards mainly in Edinburgh, of which he became a burghess in 1633. He was soon in excellent repute as a portrait-painter, and likenesses by his hand of many of his most eminent contemporaries still exist. One of his chief patrons was Sir Colin Campbell of Glenorchy, for whom he executed an extensive series of portraits, both from the life and from earlier pictures, which are now preserved at Taymouth Castle and Langton House, Duns. Many works attributed to Jamesone—in not a few cases falsely attributed to him—are preserved in the mansions of Scotland. His authentic works are painted with considerable delicacy, but are marred by very pronounced mannerisms, and their painter has little claim to his customary title of 'the Scottish Van Dyck.' He died at Edinburgh in 1644. See J. Bulloch's *George Jamesone* (1885).

James River is formed by the union of the Jackson and Cowpasture streams in the west of Virginia, and has its entire course in that state. It flows in a generally east-south-east direction, passing Lynchburgh and Richmond; and, widening into an estuary for the last 60 miles of its course, it falls into the Atlantic at the southern extremity of Chesapeake Bay. It is 450 miles in length, and is navigable for large steamers to City Point, at the mouth of the Appomattox. It was at Jamestown, now a ruined village on the north bank of this river, that the first English settlement in America was formed (1607). The James River and Kanawha Canal, which extends from Richmond to the White Sulphur Springs, follows the windings of the river for a considerable distance.

James's Bay, the southerly arm of Hudson Bay, about 250 miles long from north to south, and 175 miles wide. It is greatly beset with islands, and its navigation is dangerous.

James's Powder is the modern representative of an old nostrum of Dr Robert James (1703-76) of London. The preparation in the pharmacopœia which is supposed to have similar virtues in febrile affections consists of oxide of antimony and phosphate of lime. It is but little used now.

Jamestown, a village of New York, on Chautauqua Lake, 70 miles S. by W. of Buffalo by rail. It has manufactures of woollens and alpaccas, pianos, furniture, &c. Pop. (1880) 9357; (1890) 16,038.—**JAMESTOWN**, in North Dakota, has a pop. of 2236. See also **JAMES RIVER**.

James Town, the chief place and only seaport of St Helena (q.v.).

Jami, the last classical poet of Persia, 1419-92. See **PERSLA** (*Literature*).

Jamieson, JOHN, D.D., a meritorious Scotch scholar, was born in Glasgow, March 3, 1739, studied for the ministry, and in 1781 was ordained pastor of the Secession (Anti-burgher) congregation at Forfar. In 1797 he was translated to Edinburgh, where he died July 12, 1838. Jamieson's reputation rests on his *Etymological Dictionary of the Scottish Language* (1808-9; supplement 1825; best edition by David Donaldson, 4 vols. 1879-87). It is a work of great industry, and of very considerable value as a collection of Scotch words, phrases, customs, &c.; but it possesses little critical or philological merit, according to the present standard. His preliminary dissertation on the 'Origin of the Scots Language' is an elaborate but unsuccessful attempt to prove that the Scottish language is really the Pictish language, and that the Picts were not Celts, but Scandinavian Goths. Jamieson also wrote on the Cublees, on the affinities of the Greek and Latin languages to the Gothic, on the royal palaces of Scotland, &c.; and he published editions of Barbour's *Brave*, Blind

Harty's *Sir William Wallace*, and Slezar's *Theatrum Scoticum*.

Jammu (*Jummoa*), a town of Cashmere, on an affluent of the Chenab. Pop. 8000.

Jammuotri, hot springs near the source of the Jumna, in northern India, in 30° 59' N. lat. and 78° 35' E. long., 10,849 feet above the sea. Their temperature is 194.7 F., nearly that of boiling water at their elevation. They are overhung by three connected mountains known as the Jammuotri Peaks (20,100 to 21,150 feet).

Janesville, a city of Wisconsin, lies mostly between bluffs in the narrow bottom-land of Rock River, which is crossed here by six bridges, 91 miles NW. of Chicago, at the junction of four railways. The river is crossed by dams, and its water-power is utilised in the numerous manufactories. There are a number of flour, cotton, and woollen mills, two foundries, and thirty-four factories of various kinds. Pop. (1890) 11,836.

Janet, PAUL, an eminent French philosopher, born at Paris, 30th April 1823. He was educated at the Normal School, and was in turn teacher in the gymnasium at Bourges, and professor of Philosophy in the faculty at Strasburg and of Logic in the Lycœum Louis-le-Grand. In 1864 he was elected to the Academy of Moral and Political Sciences, and then he lectured in the Sorbonne at Paris. He died 4th October 1899.

His books are *La Famille* (1855), *Histoire de la Philosophie morale et politique* (1858), *Le Philosophie du Bonheur* (1862), *Le Matérialisme contemporain en Allemagne* (1864), *Le Courant et la Pensée* (1866), *Les Problèmes du XIX^e Siècle* (1872), *Philosophie de la Révolution Française* (1875), *Les Causes nées* (1876; Eng. trans 1878), *La Philosophie Française contemporaine* (1879), and *Les Origines du Socialisme contemporain* (1883).

Janin, JULES GABRIEL, French critic and novelist, was born at St Etienne, December 24, 1804, and had his education there and at Paris. He took early to journalism, writing for the *Figaro*, the *Quotidien*, and the *Journal des Débats*, and his dramatic criticisms in the last-named journal made him a reputation by their wit and vivacity. Janin wrote with fatal fluency, and his numberless articles, prefaces, books of travel, and miscellaneous pieces of task-work pleased his readers and filled his pockets, but did nothing for a future fame. But the 'prince of critics' wrote gaily for the present, lacking the instinct of perpetuity. Yet twice he came near to writing things which the world will not willingly let die. His strange and at least half-serious story *L'Âge mort et la Femme quillatinte* (1829) was followed by *Barnave* (1831), an interesting book, half-historical novel, half polemic against the Orleans family. Janin succeeded to Sainte-Benoît's chair in the French Academy in 1870, and died 19th June 1874. His *Œuvres Choieses*, in twelve volumes, appeared in 1875-78, and his *Correspondance* was published in 1877.

Janina (pronounced *Yanina*), or JOANNINA, capital of a vilayet in Turkish Albania, stands in a striking situation on a lake (12 miles long by 3 broad) of the same name, 50 miles inland from the shore opposite the island of Corfu. Its buildings include more than twenty ecclesiastical edifices, and the ruined castle of Ali Pasha (q.v.), whose headquarters were at Janina. Gold lace is extensively manufactured, as well as morocco leather, silk goods, and coloured linen. The population, which numbered 40,000 under Ali Pasha, is now about 20,000, of whom some 15,000 are Greeks; Greek is the language spoken. The town has been under Turkish rule since 1430.

Janizaries (Turkish, meaning 'new soldiers'), the first regular standing army of the Turks,

formed by Sultan Orkhan, about 1330, of Christian prisoners compelled to embrace Mohammedanism, and of the children of Christians forcibly trained as Mussulmans. It was more perfectly organised by Orkhan's son, Amrath I., after 1362, especial privileges being conferred on those who belonged to it. This soon induced many Turks to join its ranks. There were two classes of Janizaries, one regularly organised, dwelling in barracks in Constantinople and other towns, whose numbers sometimes amounted to 100,000, and the other composing an irregular militia, scattered throughout the empire, and amounting to 300,000 or 400,000. At the head of the whole force was an *aga*, who was held in most reverential respect, and whose power extended to life and death. In time of peace the Janizaries acted as a police force. In war they served on foot, and were noted for the wild impetuosity of their attack. The sultan's bodyguard was formed of them. But success and special privileges produced their usual effects: the history of the Janizaries abounds in conspiracies, assassinations of sultans, viziers, agas, &c., and atrocities of every kind, and in the end they became more dangerous to the sultans than any foreign enemies. More than one sultan attempted, but unsuccessfully, to reform or dissolve them. At last Sultan Mahmoud II., in 1826, having organised a new force after the pattern of the European armies, displayed the flag of the Prophet, and after some sanguinary fighting drove back the Janizaries into their barracks, which he burned, 8000 perishing in the flames. Not fewer than 15,000 were executed, and more than 20,000 banished. By a proclamation of June 17, 1826, the Janizary force was finally dissolved; its place was taken by the Nizam, the modern regulars organised on a European plan.

Jan Mayen Land, a volcanic island in the Arctic Ocean, named after the Dutch navigator by whom it was discovered in 1611. It lies between Iceland and Spitzbergen, and is 35 miles long. Its highest point is the extinct volcano of Beerenberg, 8350 feet (Mohn, 1887), the sides of which are covered with immense glaciers and frozen waterfalls. In 1882-83 it was made the station of the Austrian polar expedition. Important seal and whale fishings are carried on east and north of Jan Mayen every summer. For an account of the island, see Lord Dufferin's *Letters from High Latitudes* (2d ed. 1857), and *Nature* for August 1883.

Jansen, CORNELIUS, from whom the sect of Jansenism derives its name, was born in 1585, at Aequoi, near Leerdam, in Holland. He made his studies at Utrecht, Louvain, and Paris, and from early youth was familiar with some of the disciples of Bajus (q.v.), and with the Abbé de St. Cyran. For some time he filled a chair at Bayonne; and in 1617 he was called to Louvain, where in 1630 he was appointed professor of Theology. In 1636 he was made Bishop of Ypres, and in this city he died of the plague, May 6, 1638, just as he had completed his great work of more than twenty years' preparation, the *Augustinus*, seu *Doctrina S. Aug. de Hum. Natura Sanitate, Egritudine, Medicina, adversus Pelagianos et Massilienses* (4 vols.), which proved the occasion of a great theological controversy. The main object of this work was to prove, by an elaborate analysis of St. Augustine's works, that the teaching of this Father against the Pelagians and semi-Pelagians on Grace, Free-will, and Predestination was directly opposed to the teaching of the modern, and especially of the Jesuit schools, which latter teaching he held to be identical with that of the semi-Pelagians. Jansen repudiated the ordinary Catholic dogma of the freedom of the will, understood to mean the power to choose at the time good or evil (*libertas contrarie*

dictaminis), asserting merely the existence of freedom from external constraint (*libertas a coactione*), not inward necessity. He also refused to admit merely sufficient grace, maintaining that interior grace is irresistible, and that Christ died for all. In the preface Jansen submitted the work to the judgment of the holy see; and on its publication, under the care of Frommond, in 1640, being received with loud clamour, especially by the Jesuits, the *Augustinus* was prohibited by a decree of the Inquisition in 1641; in the following year it was condemned in general terms, as renewing the errors of Bajus, by Urban VIII. in the bull *In Eminentiss.* This bull encountered much opposition in Flanders; and in France the *Augustinus* found many partisans, animated both by doctrinal predilection and antipathy to the alleged laxity of moral teaching in the schools of the Jesuits, with whom the opposition to the *Augustinus* was identified. Most eminent among these were the celebrated scholars and divines who formed the community of Port Royal (q.v.), Arnault, Nicole, Pascal, and others. Nevertheless, the syndic of the Sorbonne extracted from the *Augustinus* seven propositions (subsequently reduced to five) which were definitively condemned as heretical by Innocent X. in 1653. The friends of the *Augustinus*, while they admitted that in point of right the five propositions were justly condemned as heretical, yet denied that in point of fact these propositions were to be found in the *Augustinus*, at least in the sense imputed to them by the bull. Arnault in a celebrated *Lettre* admitted the church's infallibility on the former question, and the duty of entire submission, but held that the latter was a question of historical fact on which the church might err, and that it was sufficient if the faithful received her decision on it with 'respectful silence.' Meantime the controversy had produced one work that holds its immortality as securely as any book in the range of literature, the *Lettres Provinciales* of Pascal. Arnault's distinction between right and fact was at length condemned by the Sorbonne, and himself and sixty other doctors expelled, and in October 1656 a further condemnation of the *Augustinus*, 'in the sense of the author,' was issued by Alexander VII., rigidly enforced in France, and generally accepted; and early in 1669 peace was partially restored by Clement IX.—at least all overt opposition was repressed by the iron rule of Louis XIV.

The more rigid Jansenists, however, and at their head Antoine Arnault, emigrated from France, and formed a kind of community in the Low Countries. The controversy was revived with new acrimony by the dispute on the so-called 'case of conscience,' whether a dying ecclesiastic could lawfully be absolved who was not convinced that the five propositions as condemned by the church were contained in the *Augustinus*; and still more angrily in the person of the celebrated Quesnel, whose *Moral Reflections on the New Testament* was denounced to the pope, Clement XI., as a text-book of undisguised Jansenism. This pope had already in 1705 decided the case of conscience by the bull 'Vineam Domini,' when in 1713 he condemned by the bull 'Unigenitus' as many as 101 propositions extracted from the *Moral Reflections*. After the death of Louis XIV., the regent, the Duke of Orleans, was urged to refer the whole controversy to a national council, and the leaders of the Jansenist party appealed to a general council. The party thus formed, which numbered in 1717 four bishops and many inferior ecclesiastics, were called, from this circumstance, the Appellants. The firmness of the pope, and a change in the policy of the regent, brought them into disfavour. An edict was published, June 4, 1720, receiving the bull; and even the parliament of Paris submitted to register

it, although with a reservation in favour of the liberties of the Gallican Church. The Appellants for the most part submitted, the recusants being visited with severe penalties; and on the coming of age of the new king, Louis XV., the unconditional acceptance of the bull was at length formally accomplished. From this time forward the Appellants were rigorously repressed, and a large number emigrated to the Netherlands, where they formed a community, with Utrecht as a centre. The party still remaining in France persisted in their inveterate opposition to the bull, but the real significance of Jansenism may almost be said to have died with Quesnel in 1719, and, indeed, the movement inaugurated by such intellects as Arnault and Pascal ended in France before the middle of the century in fanaticism and superstition. The miracles in the St Médard cemetery, and the physical convulsions that became common, brought Jansenism in France to a discredited conclusion (see CONVULSIONARIES).

In one locality alone, Utrecht, and its dependent churches, can the sect be said to have had a regular and permanent organisation. The vicar-apostolic, Peter Kodde, having been suspended for Jansenist sympathies by Clement XI. in 1702, the chapter of Utrecht refused to acknowledge the new vicar named in his place, and angrily joined themselves to the Appellant party in France, many of whom had found a refuge in Utrecht. At length, in 1723, they elected an archbishop, Cornelius Steenhoven, for whom the form of episcopal consecration was obtained from the French bishop Varlet (titular of Babylon), who had been suspended for Jansenist opinions. A later Jansenist Archbishop of Utrecht, Meindarts, established Haarlem and Deventer as his suffragan sees; and in 1763 a synod was held, which sent its acts to Rome, in recognition of the primacy of that see. Since that time the formal succession has been maintained, each bishop, on being appointed, notifying his election to the pope, and craving confirmation. The popes, however, have uniformly rejected all advances, except on the condition of the acceptance of the bull *Unigenitus*; and the definition as of Catholic faith of the dogma of the Immaculate Conception of the Blessed Virgin Mary (1854) and the Papal Infallibility (1870) have been the occasion of fresh protests. The Jansenists of the Utrecht Church still number about 6000 souls, and are divided over twenty-five parishes in the dioceses of Utrecht and Haarlem. Their clergy are about thirty in number, with a seminary at Amersfoort. Loos, the Jansenist Archbishop of Utrecht, consecrated Dr Reinkens bishop for the German Old Catholics, Pius IX. restored the Dutch hierarchy in 1851, so that there is now an orthodox Archbishop of Utrecht. The Dutch Jansenists are in doctrine and discipline strictly orthodox Roman Catholics, being known by their countrymen as *Oude Roomsche* ('Old Roman').

See vol. ii. of Hergenrother's *Allgemeine Kirchengeschichte* (1877-78); Fuzet, *Les Jansénistes* (1877); Neale, *Jansenist Church of Holland* (1858); Reuchlin, *Gesch. von Port-Royal* (1839-44); Sainte-Beuve, *Port-Royal* (1860); a German work by Nippold (1872); Séché, *Les derniers Jansénistes* (1891); *French Jansenists*, by Mrs Tollenmache (1893).

Janssen, CORNELIS, born in London in 1593, died at Amsterdam about 1661, lived and worked in England from about 1618 to 1643, and acquired a reputation as a fine painter of portraits and historical subjects.

Jaussens, ABRAHAM, a Dutch painter, who called himself Jaussens van Nuyssen, was born in Antwerp about 1575, and entered the guild of St Luke in 1601. He died at Antwerp in 1632. His most famous pictures are the 'Entombment of Christ' and the 'Adoration of the Magi.' From

his vigorous drawing and admirable colouring he ranks next to Rubens among the historical painters of the period.—Another artist of this name was VICTOR HONORIUS JANSSENS (born at Brussels 1664, died there 1739), who painted chiefly in Rome and at Brussels.

Janthina. See IANTHINA.

Jannarius, ST. or SAN GENNAIO, a martyr of the Christian faith under Diocletian, was a native of Benevento, or at least became bishop of that see in the later part of the 3d century. According to the Neapolitan tradition, he was taken prisoner at Nola; and the place of his martyrdom, in 305, was Pozzuoli, where many Christians suffered the same fate. His body is preserved at Naples, in the crypt of the cathedral, and in a chapel of the same church are also preserved the head of the martyr, and two phials (*ampullæ*) supposed to contain his blood. On three festivals each year—the chief of which is the day of the martyrdom, September 19, the others the first Sunday evening in May and the 16th December—as well as on occasions of public danger or calamity, as earthquakes or eruptions, the head and the phials of the blood are carried in solemn procession to the high-altar of the cathedral, or of the church of St Clare, where, after prayer of longer or shorter duration, the blood, on the phials being brought into contact with the head, is believed to liquefy, and in this condition is presented for the veneration of the people, or for the conviction of the doubter. It occasionally happens that a considerable time elapses before the liquefaction takes place, and sometimes it altogether fails. The latter is regarded as an omen of the worst import; and on those occasions when the miracle is delayed beyond the ordinary time the alarm and excitement of the congregation rise to the highest pitch. Those who are curious as to the literature of the controversy regarding this celebrated legend will find many documents in the sixth volume of the *Hollandist Acta Sanctorum* for September. For a good account of the modern ceremony, see E. N. Rolfe and H. Ingley's *Naples in 1888*.

January, the first month of the year. It was, among the Romans, held sacred to Janus (q.v.), from whom it derived its name, and was added to the calendar along with February by Numa. It was not till the 18th century that January was universally adopted by European nations as the first month of the year, although the Romans considered it as such as far back as 251 B.C.

Janus, an ancient Italian god. The distinctive mark of Roman religion and Roman gods as opposed to Greek gods is that the former are abstract, whilst Greek thought was marked by its anthropomorphism. In the belief of the Roman everything and every action had its corresponding spirit—even such processes as plunging, harrowing, &c. Janus, tried by this test, approves himself as peculiarly Italian. He is 'the spirit of opening,' and there is nothing in the mythology of any other Aryan nation to correspond to him. His name is derived from the same root as the Latin word *janua*, 'a gate' or 'opening.' As the spirit of opening he was invoked at the beginning of all undertakings (at the beginning of human life as *Conscious*). For the same reason he was the god of the beginning of day, *Matutinus Pater*, and of the beginning of the (agricultural) year, the first month of which, January (though originally the eleventh of the calendar year), was dedicated to him. Hence, too, may be explained the fact that he took precedence of all other gods, even of Jupiter, and that he is called in the Salaric Hymn *Deorum Deus* (Macrobi, *Sat.* i. 9), and even

Summarius. In the next place, as the spirit of openings, Janus was the god under whose care were all *januae*, or gates, in Rome; above all, he it was under whose protection was the arch-way out of which the army marched to war and by which it returned. This arch-way, which in later times was replaced by a temple of Janus, naturally had its gates open in time of war and closed in time of peace. The tutelary god of the gate that opened both ways was, by a natural transference of thought, himself represented by an image having a double head that looked both ways (see AS). His connection with the year was sometimes indicated by the fact that three fingers of the right hand were bent so as to indicate the numeral CC (200), while the fingers of the left hand were spread so as to denote the numerals L (50) + V (5), or in later times L + V - V + V—that is, in all, the 355 days of the older, and the 365 days of the reformed Julian year. As the god of gates he naturally carries keys. As an auspicious god he is crowned with laurel. The interpretation of Janus as originally a god of light fails to explain his functions, is at variance with the spirit of Roman religion, and is based on a false etymology: Janus cannot be the masculine of Diana, because the *i* is long (and therefore cannot be consonantal); and, moreover, the real masculine of Diana is preserved in an inscription (C. I. L. 5, 783), *Jovi Dianæ*. Janus is not derived from a root meaning 'to shine,' but from one meaning 'to go.'

Japan. a corruption of Marco Polo's *Zipangu*, itself a corruption of the Chinese pronunciation of the native name *Nihon*. *Nihon*, or *Nippon*, means 'Land of the Rising Sun.' *Dai*, 'Great,' is sometimes prefixed. Japan Proper comprehends four large islands—viz. Honshū (the Japanese mainland), Shikoku, Kyūshū, and Yezo—and extends from 26° 59' to 45° 30' N. lat. Formerly the southern portion of Saghalien belonged to Japan, but this was ceded to Russia in 1875, certain of the Kurile island group being granted in return. The empire of Japan—the area of which has been estimated at 155,000 sq. m., or 34,000 miles larger than the United Kingdom—includes, in addition to the above, nearly 4000 small islands, among which are the Liu Kiu ('Loo Choo') and Kurile groups, and is situated between 24° 6' 50' 56' N. lat., and 122° 45'–156° 32' E. long. It is bounded on the N. by the Sea of Okhotsk, on the E. by the North Pacific Ocean, on the S. by the eastern Sea of China, and on the W. by the Sea of Japan. On the 1st January 1891 the population of Japan was 40,453,461, an increase of nearly 2 millions in 5 years; in 1894 it was 41,390,000. The population is distributed as follows: Honshū, 31,722,674; Shikoku, 2,907,280; Kyūshū, 6,379,262; Yezo, 379,097. Formosa and the Pescadores, ceded by China in 1895, are now Japanese.

Physical Features.—The islands of Japan appear to be the highest portions of a huge chain of mountains which rises from a deep ocean bed: they are the advanced frontier of the Asiatic continent. This chain, though dotted with volcanoes, is not therefore itself of volcanic origin. Earthquakes occur very frequently in Japan, although the western slope, facing the Asiatic continent, is exempt. Japan is one of the most mountainous countries in the world. Its plains and valleys, with their foliage surpassing in richness that of any other extra-tropical region, its arealian hillslopes and forest-clad heights, its alpine peaks towering in weird grandeur above ravines noisy with waterfalls, its lines of foam-fringed headlands, with a thousand other charms, give it a claim to be considered one of the fairest portions of the earth. The sublime cone of the sacred Fuji-san (Fujiyama, Aino, 'Fire-goddess Mountain'), an extinct or rather

dormant volcano, rises from the sea to a height of 12,365 feet. Ontakō-san and Yari-ga-take (each 10,000 feet), Tatē-yama (9500), Yatsuga-dake (9000), Haku-san (8590), Asama-yama (active volcano, 8260), with many other scarcely lower peaks, rise in Honshū. The eruption on July 15, 1888, of Bandaisan (6037 feet), near Lake Inawashiro, was due to imprisoned steam: 1600 feet was blown off the top of the hill, and 27 sq. m. of country covered with debris. The three other large islands also abound in mountains, though of less elevation. Yezo has no fewer than eight active volcanoes. Throughout the empire there are many solfataras, and sulphurous springs well up from hundreds of volcanic valleys. The plains, most of the valleys, and many of the lower hills are highly cultivated. Lakes are not very numerous, the only two of any size being Biwa, near Kyoto, and Inawashiro, midway between Tōkyō and Sendai; but there are countless rivers, most of which, however, are too impetuous to admit of navigation. The harbours are spacious and deep, but not numerous, considering the great length of the coast-line.

Climate.—The different parts of Japan vary widely in climatic conditions. Leaving out the northern and southern extremes, at Tōkyō (Yedo) we find the annual average temperature to be 57·7° F., while in winter the mercury occasionally falls to 16·2, and in summer it may rise to 96; at Nagasaki the lowest winter temperature is 23·2°; at Hakodate the annual extremes are 2 and 84°. The normal hot weather begins only about the beginning of July, and terminates usually in the middle of September. The late autumn is the driest and most agreeable season. The ocean current known as the Kuro-shiwo ('Black Stream') considerably modifies the climate of the south-east coast: thus, while snow seldom lies more than 5 inches deep at Tōkyō, in the upper valleys of Kaga, near the west coast, less than 1° farther north, 18 and 20 feet are common. The east coast of Yezo is visited by a cold current from the Kuriles, which renders the climate foggy in summer and retards cultivation. The rainfall, which varies much in different years, is on an average 145 inches. No month passes without rain: but it is most plentiful in summer, especially at the beginning and the close of the hot seasons, when inundations frequently occur. North and west winds prevail in winter, and south and east in summer. The violent circular storms called typhoons are liable to occur during summer, but are more destructive in the autumn. August and October are the pleasantest months for travelling. Thunder-storms are neither common nor violent, and autumn fogs are equally rare. The climate, though somewhat relaxing to Europeans and having a tendency to produce anaemia and troubles of the head, is fairly salubrious, highly so in the mountains.

Vegetable Productions.—In Hodgson's *Japan* will be found a systematic catalogue of Japanese flora by Sir Joseph Hooker. Chestnut, oak (both deciduous and evergreen), pine, beech, elm, cherry, dwarf-oak, elder, sycamore, maple, cypress, and many other trees of familiar name abound. The grandest forests of pine and oaks of great size grow in Yezo; but the *Rhus vernicifera* or lacquer-tree, the *Laurus camphora* or camphor-tree, the *Broussonetia papyrifera* or paper-mulberry (the bark and young twigs of which are manufactured by the Japanese into paper) and the *Rhus saccharina* or vegetable wax tree of Japan, are among the remarkable and characteristic trees of the country. Bamboos, palms, including sagopalm, and 150 species of evergreen trees likewise flourish. Thus the vegetation of the tropics is strangely intermingled with that of the temperate

or frigid zone; the tree-fern, bamboo, banana, and palm grow side by side with the pine, the oak, and the beech, and conifers in great variety. The camellia, the Paulownia, and the chrysanthemum are conspicuous amongst the indigenous plants. The azalea blooms in May, and a red variety is found in the mountains as late as the beginning of July. The splendid *Lilium auratum* covers the hillsides in July; and these are also bright during the same month with the pink berries of the *Coccoloba japonica*, the same plant from which comes the arrow poison of the New Zealanders. Nymphæas and parnassia fill the lakes and morasses. The tobacco-plant, the tea-shrub, different varieties of the potato, rice, wheat, barley, buckwheat, and maize are all cultivated. The flora of Japan bears a remarkable resemblance to the flora of that part of the North American continent lying between the Lower Mississippi and the Atlantic.

Zoology.—Wild animals are not numerous in Japan. No true wolf exists, the Japanese *yumainu* (wild

few merits, and in most provinces is a miserable animal. The province of Shimosa, east of the capital, is now largely devoted to horse-breeding, stallions having been brought from San Francisco for the purpose of improving the breed. Draught oxen are common on the main island, but milk-cows are of quite recent introduction. Donkeys are seldom or never seen. Pork is rapidly becoming a favourite food, and horseflesh is prepared at some of the restaurants of the capital. Goats are practically unknown, and the sheep does not thrive. The domestic dog is a wolf-like, ill-conditioned animal, while the domestic cat is remarkable in having a mere stump of a tail; foreign varieties of these animals are being rapidly introduced. There are numerous water-birds—cranes, storks, herons, coots, moorhens, snipe, wild geese, ducks; and cormorants trained to fish, the

dog) being a poor imitation of the fierce European animal. The black bear peculiar to the country is found in the mountains north of Tokyo, and is dreaded in Yezo. Wild boar's flesh is often seen for sale in the capital, as also monkey's flesh, an animal remarkable in Japan for its bright crimson face. Wild deer, protected by law in one or two places, are freely hunted elsewhere. A factory for tinning venison was established in Yezo, at Bibi. A clumsy species of antelope inhabits the mountains. The fox, a small-sized breed, plays an important part in the folklore, as the embodiment of craft and as a kind of magician. A variety of the stoat, known as the *tachi*, wages war on rats and on poultry. A badger resembling the American species is trained for fortune-telling. There are two species of squirrel, also two flying squirrels, various kinds of rat—powerful pests—but no true house mice. The hare is a small species resembling a rabbit. There is a single species of otter, and there are several varieties of the seal and the whale. Of the various varieties of snake only one, the small *ayumushi*, is poisonous. Of domestic animals there are few. The native horse, introduced according to tradition in the 3d century, is really a mere pony, and has

practice dating back at least 1100 years. Land-birds are less numerous, the voracious and powerful crow, sometimes mistaken for a raven, reigning supreme, and acting as a general scavenger. There are two magnificent species of pheasant, pigeons, quail, hazel grouse, and ptarmigan. The goshawk was much used for hawking in feudal times. Various owls abound. Song-birds are not specially numerous, the bullfinch and two varieties of *uguisu* ('Japan nightingale') being best known. Swallows, swifts, sparrows, goat-suckers, and woodpeckers all abound, and there is a fine species of Japanese jay. Of all Japanese birds the *Icteria princeps*, a fly-catcher, is the most beautiful. Bird-catching is commonly practised, decoy-birds being cruelly blinded for the purpose; and the European market is now largely supplied with skins from Japan. One lark is found, besides twelve buntings, eleven thrushes, three robins, a wren, a tit, and various other small birds. There are many varieties of the ordinary fowl, these birds being kept in nearly every house, almost solely for their eggs. The larger breeds known as *Shamo* and *Kukin* are, as their names imply, of foreign origin, the ordinary breed resembling a pheasant in size and shape. The fresh water fish of Japan are

mostly of European genera. The rivers of *Yezo* swarm with salmon, which, when salted, supply the southern market. Carp are kept in garden ponds, and goldfish are reared extensively. Of salt-water fish the red-fleshed *muyuro* and the *tai* are eaten raw under the name of *sashimi*. Oysters abound, Akkeshi in *Yezo* being noted for its beds; the lobster, an emblem of longevity, is highly prized for the table. Insect life is specially abundant; butterflies, moths, dragon-flies, and beetles exist in a astonishing variety. And yet Japan is comparatively free from insect pests. Mosquitoes and gnats are troublesome; wasps are rare; honey-bees are scarce, and the native honey is an insipid substance.

Agriculture is the chief occupation of the Japanese, and they are very careful farmers, thoroughly understanding cropping and the rotation of crops. The soil is not naturally very fertile, being mostly volcanic or derived from igneous rocks, but it is made productive by careful manuring, especially with night-soil from the villages and towns. Rice is the staple production, while barley, wheat, millet, buckwheat, maize, and many varieties of bean and pea are also everywhere produced. The rice harvest commences in September; wheat is sown in drills in November and December, and is reaped in May and June. Of vegetables the staple is the large white radish or *daitkon*. Of Japanese fruits the persimmon and orange are alone worthy to be classed as really good fruits. The plums, peaches, and cherries are very poor, the trees being reared for their blossoms. The culture of tea, introduced from China in 770, is universal in the middle and south; the whole production amounts to about 22,000,000 lb. annually. Sericulture is on the increase, and cotton and hemp are also widely grown. Of sugar a total of over 90,000,000 lb. was produced in 1895; much tobacco is also raised—an inferior kind, remarkable for its mildness and dryness. There are two agricultural colleges, with foreign professors on their staffs, one in Tokyo, the other at Sapporo in *Yezo*.

Mineralogy.—The mineral resources of Japan are considerable, and the government during the sixteen years preceding 1884 spent largely upon mining. Since then it has allowed private enterprise to step in. Gold, silver, copper, iron, lead, antimony, tin, sulphur, coal, basalt, felspar, greenstones, granites (red and gray), rock-crystal, agate, carnelian, amber, scoria and pumice-stone, talc, alum, &c. are found in greater or less quantities. Gold is principally worked in the island of Sado; silver on the main island. Coal-beds extend from Nagasaki to *Yezo*, the principal mines being Takashima, Miike, and Karatsu in Kyūshū, and Poronai, near Sapporo, in *Yezo*. Petroleum is found in small quantities near Niigata and in *Yezo*. The supply of sulphur is almost inexhaustible, and of wonderful purity. Good building-stone is scarce.

History.—The reputed founder of the present dynasty was Jimmu Tenno, who ascended the throne in 660 B.C. The legendary epoch continues for more than 1000 years, and all Japanese history before 500 A.D. is to be classed as legendary. In 201 A.D. the Empress Jingō is said to have invaded and conquered Corea, and this expedition was followed by the introduction of Corean civilisation, the sacred Chinese books *Rougo* and *Sanjimon* arriving from Corea in 285. In 552 Buddhism was introduced from Corea, and became, forty years later, the established religion. In 624 a Buddhist hierarchy was established by government. Shortly before this direct relations had been entered upon with China, and Chinese civilisation was thereafter rapidly assimilated. The system of periods com-

menced in 646, and from this time onward the national history is clearly traced. During the five centuries which ensue the people made immense strides in civilisation. A complete system of officialdom was organised, under the rule of the Fujiwara family, whose members filled all the chief posts under government, and gave a succession of consorts to the imperial house.

The decadence of this family and the growing weakness of the government favoured the rise of the hitherto subordinate military class, which, in the person of Yoritomo, created *Shōgun* or Generalissimo in 1192, seized the reins of power. The usurpation of supreme authority by this officer, long known to Europe by the Chinese name of *Tycoon*, led to the erroneous but natural belief that, down to 1868, there were two emperors in Japan—one, a Mikado or 'spiritual emperor' who reigned but did not govern, and the Shōgun, who really governed though he paid homage to the Mikado. The next four centuries until 1603 were a period of bloodshed, marked by all the untold miseries of civil strife. The military fiefs organised by Yoritomo raised up a feudal baronage, who succeeded in making themselves virtually independent of the central power. Even the Buddhist monasteries in many cases became military centres. At one time (1333-92) two puppet dynasties held sway, the north and the south, to one or other of which the feudal barons rallied. The Shōgunate, made powerful by Yoritomo, itself fell into abeyance, but the military genius and astute policy of Hideyoshi, who died in 1598, prepared the way for its revival in 1603 by Tokugawa Iyeyasu, the illustrious general and statesman who gave a lasting peace to Japan. In 1592 Hideyoshi had directed an expedition against Corea, inflicting a blow on the prosperity of that country from which it has not since recovered. Iyeyasu, victorious over a combination of southern barons at Sekigahara near Lake Biwa in 1600, fixed his seat of government at Yedo, the 'port' situated at the head of the Gulf of Yedo, and near the embouchure of the rivers which drain the largest plain in Japan. Backed principally by the northern clans, he was able to consolidate his power and to found a permanent succession, his descendants reigning at Yedo till 1868. From being a collection of small scattered villages this place soon became one of the most populous cities in the world. His system was perfected by Iyemitsu, the third Shōgun of the Tokugawa dynasty.

It was his policy 'to preserve unchanged the condition of the native intelligence,' and 'to prevent the introduction of new ideas;' and to effect this he not only banished foreigners, interdicted all intercourse with them, and extirpated Christianity, but introduced that 'most rigid and cunningly-devised system of espionage' which was in full activity at the time of the Earl of Elgin's mission, as amusingly described by Laurence Oliphant. 'This espionage,' says a recent Japanese writer, 'held every one in the community in dread and suspicion; not only the most powerful daimyo felt its insidious influence, but the meanest retainer was subject to its sway; and the ignoble quality of deception, developing rapidly to a large extent, became at this time a national characteristic. The daimyos, who at first enjoyed an honourable position as guests at the court of Yedo, were reduced to vassalage, and their families retained as hostages for the rendition of a biennial ceremonial of homage to the Shōgun. Restrictions surrounded personages of this rank until, without special permission, they were not allowed to meet each other alone.' The Portuguese, who first landed in Japan in the year 1543, carried on a lucrative trade; but by and by the ruling powers took alarm, ordered away

all foreigners, and interdicted Christianity (1624), believing that foreigners impoverished the country, while their religion struck at the root of the political and religious systems of Japan. The converts to Catholicism were found to have pledged their allegiance to a foreign power, while their conduct is said to have been offensive towards the Shintō and Buddhist temples; so that in time they came to be regarded as a dangerous and anti-national class whose extirpation was essential to the well-being of the nation and to the success of the political system being organised or perfected by Iyemitsu. The Portuguese continued to frequent Japan till 1638, when they and their religion were finally expelled. From this date the Japanese government maintained the most rigid policy of isolation. No foreign vessels might touch at Japanese ports under any pretence. Japanese sailors wrecked on any foreign shore were with difficulty permitted to return home; while the Dutch, locked up in their factory at Deshima, were allowed to hold no communication with the mainland; and the people lived 'like frogs in a well,' as the Japanese proverb has it, till 1853, when they were rudely awakened from their dream of peace and security by Commodore Perry steaming into the harbour of Uraga with a squadron of United States war-vessels. He extorted a treaty from the frightened Shōgun, 31st March 1854, and Japan, after a withdrawal of 216 years, entered once more the family of nations. Other countries slowly followed the example of the United States until sixteen in all had obtained the same privileges.

Five ports, Kanagawa (Yokohama), Kōbe (Hyōgo), Nagasaki, Niigata, and Hakodate, were opened to foreign commerce, 'settlements' or foreign quarters in these being set apart for the residence of foreigners under the jurisdiction of their own consuls. A limit of travel, extending to a radius of twenty-five miles round these ports, was granted. Foreign settlements were also established in Yedo (Tokyo) and Osaka, these settlements being within the prescribed twenty-five miles' limit of Yokohama and Kōbe. Obstructions being placed in the way of foreign merchants settling at Kanagawa, the question was quickly solved by their crossing the narrow bay, now filled up, and erecting their 'hongs' at Yokohama, a few miles farther from the capital. With the opening of these ports commenced the extra-territoriality system under which Japan has shown herself so restive.

The fall of feudalism was merely accelerated by the arrival of foreigners. For long not a few of the most powerful clans, chiefly Satsuma and Chōshū, had been dissatisfied with the Shōgun's position, and these gladly availed themselves of the pretext now furnished for opposing him. All possible means were taken to involve him in complications with the ambassadors at his court; and to this motive rather than to any hatred of foreigners are to be ascribed the numerous assassinations which darkened the period immediately prior to 1868. Every weakening of his power was a step gained towards his overthrow and the longed-for unification of the empire in the hands of the Mikado (emperor). At length the Shōgun resigned; but it was only after a sharp civil war in the winter of 1867-68 that the power of his adherents was completely crushed. At the outset of the struggle the imperial party were decidedly retrogressive in their political ideas; but before its close various circumstances convinced them that without intercourse with foreign nations the greatness which they desired for their country could not be achieved; and when they got into power they astonished the world by the thorough-

ness with which they broke loose from the old traditions and entered on a course of enlightened reformation. Recognising Yedo as really the centre of the nation's life, they resolved to make it the capital; but the name Yedo being distasteful through its associations with the Shōgunate, they renamed the city Tokyō or Tokkei—i.e. 'eastern capital.' Here the emperor established his court, abandoning for ever that life of seclusion which had surrounded his ancestors with a halo of semi-divinity, but deprived them of all real power. The venerable city of Kyōto, which had remained the capital since 794, was at the same time renamed Saikyō or Saikēi—i.e. 'western capital.' The daimyos, very few of whom were more than mere weaklings under the direction of strong-willed retainers, resigned their fiefs, and were pensioned by the government. Since 1868 the leading men of Satsuma and Chōshū, forming what is called the Sat-chō combination, have held the important portfolios of state. The new period, commencing with the Emperor Mutsuhito's accession, has been named *Meiji*, 'enlightened peace.'

Japan has during the Meiji period striven to make her influence felt as a powerful factor in Asiatic politics. Her expedition to Formosa in 1874 to punish piracy, her annexation in 1879 of the Loo Choo Islands, notwithstanding China's remonstrances and threats, her spirited policy in Corea in 1873 and again in 1882, her conscription law of 1883 and subsequent army reorganisation, her development of a strong navy, her coast-defence scheme of 1887, subscribed to liberally by wealthy private individuals, prove her assertive spirit. A rebellion in 1877 of the fiercer Satsuma men under General Saigō was promptly crushed.

In 1887 the negotiations for a revision of the treaties were broken off, owing to an outbreak of popular dissatisfaction with the guarantees demanded by the seventeen foreign powers acting in concert. This breakdown was followed by a distinct conservative reaction in the nation, in no way seriously affecting the steady progress of western institutions, but marking a more cautious attitude and a more critical spirit. In the spring of 1889 the combination of treaty powers was broken through by the action first of the United States and then of Germany and Russia, who formed treaties on their own account, abolishing extra-territoriality and sanctioning mixed residence under certain mild restrictions. These treaties were to come into force in 1890. Mexico, not a treaty power, had also arranged an independent treaty in November 1888. Other powers prepared to follow. But a strong opposition having sprung up, the Kuroda cabinet found itself unable to carry out the scheme, and treaty revision was once more shelved. This is the close of the first epoch in the modern history of Japan, following on the heels of the promulgation of a popular constitution, February 11, 1889.

The position in which Japan has been placed during the past few decades is so exceptional that outsiders find great difficulty in forming a correct judgment of her political situation. Instability is supposed where it is really absent, the fact being that no nation's history has been more consistent than Japan's. The sudden change of front in 1868 was deliberate and final, one end having been kept in view all through the independence and glory of Dai Nippon. So hurried an assimilation as was made necessary by her complete previous isolation was naturally accompanied by numerous minor imprudences and extravagances, the result of ignorance. But the thoroughly patriotic spirit of the nation has triumphed, and her administration is now in a highly satisfactory condition.

The assassination in 1877 of Ōkubo, chief of the party whose reforms gave rise to the Satsuma rebellion, was followed twelve years later by the assassination of Viscount Mori, a cabinet minister. This last was not, like the former, a political event, but merely an unfortunate isolated incident, the work of a religious fanatic, a Shintoist. Political assassination is not, however, dead, and is a peculiar danger in Japan, where its perpetrators seem wholly regardless of their own lives.

During the past few years, especially since the reconstruction of the cabinet and the administration in 1886, the court has emerged entirely from its seclusion. The emperor and empress have visited all the chief institutions, and are present at public spectacles. The crown-prince, Haru, was the first in the long dynasty to be educated at a public school. A new nobility was created in 1884, drawn partly from the old feudal baronage and partly from the new men of 1868. It consists of five orders, princes or dukes (11), marquises (28), counts (85), viscounts (355), and barons (102), who send representatives to the newly-created Upper Chamber. The nation is itself divided into three classes, *Kwazoku* ('nobility'), *Shizoku* ('gentry'), and *Heimin* ('commonalty'). Officials are of four classes, *shimin*, *chokumin*, *sonin*, and *hannin*. Officials constitute the flower of the nation; class jealousy is absent, careers being open to the poorest. The main events of the triumphant war with China in 1894-95, the acquisition of Formosa, as also the Chinese campaign of 1900, have been noted at CHINA, Vol. III. p. 194. Japan was visited by a terrible earthquake in 1892; and in June 1896 an earthquake wave cost 10,000 lives.

Inhabitants.—With the exception of the wilds of Yezo, peopled by 12,000 Ainos, the Japanese islands are inhabited by a single race speaking various dialects of the same tongue. Probably, but this is merely a conjecture, the Japanese are a mixed race, the issue of the intermarriage of victorious Tartar settlers, who entered Japan from the Korean peninsula, with Malays in the south and people of the Aino race in the main island. We read in Japanese annals of constant war with savages, and in comparatively recent times the Aino race occupied the northern extremity of Honshū. There are two distinct types of Japanese face, that which is found in art designs being the aristocratic and rarer type. It is distinguished by an oval head and face, rounded frontal bones, a high forehead, a nose curved and well shaped but not prominent, narrow and lightly oblique eyes with an overlapping of the eyelid. In the man the face is almost hairless, with the exception of a narrow and short moustache. The complexion is pallid or slightly olive, and the expression demure. The commoner and vulgar type, almost universal in the northern districts, is pudding-faced, full-eyed, flat-nosed, and good-humoured in expression. The stature of the race is small, and the trunk is proportionately long as compared with the legs, which are short. The use of heavy wooden clogs (*gata*), together with the carrying, when still young themselves, of their infant brothers and sisters, gives the women excessively thick ankles and flat feet. The hands are usually prettily shaped, both in the man and the woman; but the habit of keeping these, especially in winter, inside the

kimono ('coat'), while the wide sleeves are allowed to hang loose, makes them clumsy to the touch. The hair is coal-black and strong in texture, and the beard has sometimes a ruddy tinge. The race is physically an inferior one, the men having an ill-developed form and harsh features, whilst the women lose any pretensions to good looks after the first bloom of youth is over. The plainness of the latter is increased by the habit at marriage, or after passing the marriageable age, of blackening the teeth and shaving the eyebrows, customs happily on the wane. The girls, with their rosy cheeks, fascinating manners, and exquisitely tasteful dress, are, however, particularly attractive, and the children are bright and comely, being allowed full liberty to enjoy themselves—indeed Japan is the paradise of children.

The Japanese have many excellent qualities: they are kindly, courteous, law-abiding, cleanly in their habits, frugal, and possessed with a high sense of personal honour which makes sordidness unknown. This is associated, moreover, with an ardent patriotic spirit, quite removed from factionness. Nowhere are good manners and artistic culture so widespread, reaching even to the lowest. On the other hand, the people are deficient in moral earnestness and courage, which leads to corruption in social life and institutions. It is only when matters have become intolerable that discipline is enforced by the use of Draconian measures. An utter lack of chivalry towards women is an unpleasant feature of the national life. Civic courage has also to be developed.

The town costume of the Japanese gentleman consists of a loose silk robe extending from the neck to the ankles, but gathered in at the waist, round which is fastened a girdle of brocaded silk. Over this is worn a loose, wide-sleeved jacket, decorated with the wearer's armorial device. White cotton socks, cleft at the great toes, and wooden pattens complete the attire. European costume has been prescribed by government as the official dress, and the empress and her suite have recently adopted foreign costume, being followed to a certain

A Street Scene in SOWA.

extent by the fashionable ladies of the capital. Hats are not generally worn, except by those who follow European fashions or in the heat of summer. The women wear a loose robe, overlapping in front, and fastened with a broad heavy girdle of silk (*obi*), often of great value. In winter a succession of these robes are worn, one over the other. The

formerly universal chignon coiffure of the women, stiff with pomatum, which was done up by the hairdresser once or twice a week, is rapidly yielding to the simpler Grecian knot. The poorer classes wear nothing more than a loose cotton gown, tied at the waist, and a loin-cloth, frequently working only in the loin-cloth. Women of the lower class think nothing of exposing the person to the waist. The women powder profusely, a white skin being highly appreciated, and dye the lips a deep red; jewellery is not worn. The old-fashioned coiffure of the men, still frequently seen among the lower classes, especially among fishermen, is peculiar. The head is shaven on the top, leaving a broad rectangular bald space, and the hair of the unshaven portion, formed into a compact mass like a candle-end, is then turned forward upon the crown. The children's heads are shaven grotesquely; priests and many old women shave the head completely. Long hair is frequently worn by dis-contented politicians and philosophers, while widows wear short hair. Both Japanese men and women are fond of smoking tobacco; the bowl of the pipe they use is less in size than half a tumbler, and requires constant refilling.

Although the Japanese are a singularly united people, yet the nation divides itself into two portions, the governing and the governed. The former, representatives of the military class and numbering some 4000 families, are high-spirited and masterful; the rest of the nation are submissive and timid. Many of the seemingly contradictory opinions given forth regarding the Japanese can be reconciled by a recognition of this fact.

Mode of Living, &c.—Japanese houses are slight constructions of wood; in place of windows and shutters they have an inner set of paper screens, and an outer set of wooden shutters, both sliding in grooves. In the northern districts at least two sides of the house are closed in with walls of mud plastered on wicker-work. The floors are covered with thick soft straw mats, measuring 6 by 3 feet, and the accommodation of the houses is reckoned by the number of these mats. On them the inmates sit, eat, and sleep, the bed-clothes—heavily-padded quilts,—being kept during the day in adjoining closets. The surface of these mats is scrupulously clean, for boots and clogs are removed before entering. In winter heat is obtained from charcoal boxes, either movable or set into the floor, and most of the cooking is done over charcoal braziers. Rice is the staple food of the people, but in the poorer mountainous regions millet often takes its place. Fish, seaweed, and beans in all forms are served with the rice, especially in the soups, which likewise contain bean-curd, eggs, and vegetables. Chestnuts and hazelnuts are also largely eaten, and the walnut is made into a sweetmeat. *Shōyu* (soy), a sauce made of beans and wheat, is the universal condiment. Generally speaking, the food is unsatisfying and unwholesome to foreigners. Fowls are now pretty widely used for the table, and pork and beef, as well as bread, are increasingly eaten. The meat shops are frequented at night, as taverns are in England.

Japanese towns are subject to conflagrations to such a degree that in crowded city districts houses are supposed to last on an average only three years. The people store their valuables in square towers of bamboo wattle-work and mud, which are left standing when the fire has swept past. Incendiarism followed by robbery is a common crime, formerly punished savagely. The institution of a gendarmerie in 1881, and the more stable nature of the edifices recently erected in the capital, have greatly lessened these fires.

The Japanese are a dyspeptic people, more dying from diseases of the digestion than from any other cause. Skin diseases, well treated at the various *solfataras*, are common; bone diseases are also rife. Lung diseases are not so deadly as in Great Britain, and child-birth is attended with little or no danger. A very dangerous disease peculiar to the country and yielding to no specific remedy is *lakke*, a form of elephantiasis or *beri-beri*. Smallpox was formerly a scourge, but compulsory vaccination has remedied this. Cholera appeared in force in the year 1879, and again violently in 1886. The houses are built low on the ground, the drains are open, wells are close to closets and rubbish-heaps. However, there are now both an active sanitary society in Tokyo and a foreign professor of sanitary engineering in the university, and water-works with the latest improvements had been provided for Yokohama by 1890, when the capital and Nagasaki had also water-work schemes under consideration. Infant mortality is small. Suicide is common, especially among men, three out of four male suicides hanging themselves, one out of every two female suicides drowning herself. The figures for 1890-94 showed an annual average of 4606 men and 3000 women.

Manners and Customs.—Many of the customs once characteristic of Japan have, since the abolition of feudalism, become obsolete. Among these is *seppuku* or *hara-kiri* (see HARI-KARI), for long a legalised mode of suicide. The wearing of swords by civilians in public was forbidden by law in 1876. The social position of women is more favourable than in most non-Christian countries, but still leaves much to be desired. However, the attitude assumed by the empress and the imperial princesses is rapidly bringing about a social equality of the sexes. Formerly concubines were recognised by law, and a certain number of imperial mistresses are attached to the court, whose children are open to the succession—the present emperor and crown-prince being the sons of mistresses. A man can, however, have only one legal wife, and the keeping of concubines in the same house with a wife is more and more discountenanced by social opinion. Divorces are easily obtained by husbands, and the nuptial tie is little respected among the lower classes; but women of the well-to-do classes are modest and virtuous. Marriages are arranged through an intermediary, and both sexes marry at an early age. As the continuance of families is a point of great importance, adoption is largely resorted to in order to prevent families dying out. Prostitution is prevalent. It was formerly no uncommon thing for a dutiful daughter to sell herself for a term of years to the proprietor of a house of ill-fame in order to retrieve her father's fallen fortunes. When she returned no stigma attached to her; rather was she honoured for her filial devotion. Licensed houses of ill-fame have always been confined to certain districts, outside the city limits, and are carefully inspected. Hot baths are a great institution in Japan. Formerly it was a general custom for persons of both sexes to bathe together; and this primitive custom still prevails in rural districts, although forbidden in the cities and always unknown in Tokyo. Great respect is paid to the dead, and posthumous names are conferred after death, some of the most celebrated names in Japanese history being posthumous titles. Heavy sums are lavished on funerals.

Until lately the only vehicles in Japan were two kinds of palanquin—viz. the *lago* and the *norimono*; but in all the more level districts these have now been superseded by the *jurikisha* ('man-power-carriage'), a sort of two-wheeled perambulator drawn by a man who runs between the shafts. In many of the more mountainous regions the roads are impracticable even for the *jurikisha*.

The Japanese are essentially a pleasure-loving people, and spend comparatively large sums upon amusements. The theatre, though formerly despised by the *sumurai* class, who refused to enter its doors, forms one of the chief national resorts. The female parts are taken by men, but theatres exist where only women act. A single performance lasts from morning till sunset, and a whole household will hire a box and spend the entire day at the theatre. Many of the arrangements are primitive, especially the orchestra, whose music is thin, harsh, and monotonous. This is generally true of Japanese music, which is in a primitive stage; the principal instruments are the stringed *sumisen*, *koto*, and *kokyū*, and the wind-instruments called *shakuhachi* and *shō*, the latter mostly used at funerals. Professional musicians are in great request and are well paid, especially the young women known as *geisha*, whose dances are wonderfully graceful. Flower-shows are very popular, and flower-gardens are crowded at the proper seasons—the plum and peach blossom season being in February and March, the cherry-blossom season and the peony season in April, the wistaria season in May, the iris season in June, the lotus season in August, the chrysanthemum season in October and November. The time of greatest festivity is the New Year, now held contemporaneously with our own, when pine-trees are planted before the doors, the houses are gay with decoration, and presents are lavishly made. The favourite game at this season is *oyobane*, a kind of battledore and shuttlecock. January is the kite season; the smaller kites are of various fantastic shapes, while the larger and more powerful ones are usually rectangular. Wrestling, juggling, and archery are favourite sports, and among indoor games *go* (checkers) and *shōgi* (chess).

Language and Literature.—The Japanese language belongs structurally, like Corean and Manchurian, to the Altaic family, and like other Altaic languages, delights in long involved sentences, the introductory details being heaped up to an extraordinary length, so that when the final verb is reached many of these are apt to be already forgotten. The verbs, which are burdened with untranslatable honorific endings, come at the close of the clause. Grammatical gender is unrecognised; case is indicated by separable particles; there are no articles; prepositions follow the words they govern. The language, though difficult to master, is easily pronounced and musical. The introduction of Chinese civilisation in the 6th century was followed by a wholesale absorption of Chinese words and characters, but the language remained grammatically unchanged, as obscure and involved in its idioms and constructions as before. Chinese ideographs are said to have been reduced to a phonetic syllabary by the Buddhist priest Kobōdaishi in 810. In process of time this system, the *Hiragana*, was rendered more complex by the addition of variants, and this led, apparently, to the introduction of another and simpler alphabet, entirely without variants, known as the *Katakana* character. The revolution of 1868 caused the language to become more Chinese in vocabulary than ever, from the necessity of coining a host of new scientific terms, although many European words were also transferred *simpliciter*. A movement, powerfully supported, has been on foot for several years to introduce the Roman alphabet, a reform which would save much tedious labour, as Japanese youths have to spend years in familiarising themselves with the difficult Chinese ideographs. The literature of Japan is meagre and vapid when compared with European literature. Poetry came to be a mere matter of the manipulation of words, a feminine accomplishment, associated with fine calligraphy, although the classical poetry has left some

charming remains. Both the classical prose and poetry owe much to women writers. A cloud rested on literature during the troublous feudal times, lasting from the 12th to the 17th century. The revival of the Shinto religion by Mabuchi, Motoori (1730-1801), and other scholars was accompanied by a great improvement in style; but this Neo-classical Japanese has been servilely imitated, and is fast becoming fossilised. At present the language, though capable of expressing almost every shade of thought required in a complete modern civilisation, labours under these difficulties: (1) there are countless homonyms—e.g. fifty-four characters pronounced *kō*, often requiring pictorial explanation in speaking; (2) the colloquial and written styles differ wholly, and thus literature fails to receive fresh impulses, and is not the heritage of the whole nation. The greatest of Japanese novelists is Bakin (1767-1848), but his works are terribly spun out. The light prose, which made its appearance in the 17th century, is well represented by Yayu and Ikku. From the *Kojiki*, or 'Records of Ancient Matters,' downwards Japanese literature is full of indecencies. Much of the place nomenclature of Japan has been traced by Mr Chamberlain to an Aino source. Double names abound, a native and a Chinese form, especially for the provinces, that with the *shū* termination, as in *Shūshū*, being the Chinese form. Most family names were originally place names.

Religions of Japan.—There are two prevailing religions in Japan—*Shintō* or *Kami no Michi* ('The way of the gods'), the indigenous faith; and Buddhism, introduced from China in 552. (1) *Shintōism.*—The characteristics of Shintoism in its pure form are 'the absence of an ethical and doctrinal code, of idol-worship, of priestcraft, and of any teachings concerning a future state, and the deification of heroes, emperors, and great men, together with the worship of certain forces and objects in nature.' The principal divinity is the sun-goddess Amaterasu, from whom the Mikado is held to be descended. After the restoration the government attempted to free Shintoism from the Buddhist innovations which had contaminated it, and to revive it in its pure form as the national religion. Shintō temples are singularly destitute of ecclesiastical paraphernalia. A metal mirror generally stands on the altar, but even this is a Buddhist innovation. The spirit of the enshrined deity is supposed to be in a case, which is exposed to view only on the day of the deity's annual festival. The worship consists merely in washing the face in a font, striking a bell, throwing a few cash into the money-box, and praying silently for a few seconds; nevertheless, long pilgrimages to famous shrines and to the summits of sacred mountains are often taken to accomplish this. Shintoism is rather an engine of government than a religion; it keeps its hold on the masses chiefly through its being interwoven with reverence for ancestors and patriotic ideas. (2) *Buddhism.*—Of Buddhists there are no fewer than thirty-five sects. The monks have assumed the functions of priests, and Japanese Buddhist worship presents striking resemblances to that of the Roman Catholic Church. Notwithstanding the increased patronage recently bestowed upon Shintoism by the government, Buddhism is still the dominant religion among the people. The most popular, as well as the wealthiest and most enlightened, of the Buddhist denominations is the *Amato* or *Shinshū* sect, which recognises one God in Amida Buddha (only, however, an abstract principle personified), discourages asceticism and clerical celibacy, and cultivates preaching, the favourite topic being the duty of self-reliance. It would be a mistake, however, to suppose that a

clear line can be drawn between adherents of Buddhism and Shintoism respectively; in the popular mind the two faiths are so blended that the temples of both are frequented without much discrimination. The better-educated classes are mostly agnostics, striving more or less to regulate their lives by the maxims of Confucius. The priests retain their hold on the people largely as being custodians of the graveyards and performers of funeral rites. Their moral influence is not weighty, many being bad boys for whom their fathers have found it impossible to find good wives. In the Meiji period none of the imperial family have entered the church; they affect in preference the army and navy. Some of the more active sects, notably the Monto sect at Kyōto, which has established a large college, are rising to the occasion and sending out preachers and propagandists to meet the active forces of modern Christian missions. Japan is a land of temples,

Torii of Temple, Suwa.

but many are now falling into decay, while others are turned into schoolhouses. Every grove has its shrine and *torii*, a structure in wood or stone, consisting of two upright pillars joined at the top by two transverse beams or slabs; metal torii are also not unknown. The Buddhist monasteries in the Japanese middle ages were undoubtedly wonderful centres of civilisation, and the priests for long commanded reverence by their self-denial.

Christian Missions.—Full toleration is extended to all forms of religious belief, in so far as they do not conflict with the peace and order of the community. Francis Xavier introduced Christianity in 1549, but his work was extinguished in blood, till scarcely a trace of it was left. When, however, the country was opened in 1854 it was found that 22,000 historical Roman Catholic Christians had survived persecution in the neighbourhood of Nagasaki. Christianity may be said to have finally died out in Tokyo in 1715. The Roman Catholic Church has now a bishop of north and one of south Japan, and schools and convents scattered over the country. The Greek Church has built an imposing cathedral in Tokyo, and carries on a flourishing work in the capital and the north-east of Japan. Of the Protestant missions the Presbyterians, five sects working together, and the American Congregationalists are the most flourishing. The American and Canadian Methodists, the Baptists, Episcopalians, and others are also actively at work. In 1893 the number of Protestant missionaries was 150 men, 100 mi-

married ladies, and 102 native ministers, and the membership at the 532 stations was over 20,000. There were 10,297 scholars at the mission schools, and at Sunday schools 21,597 pupils. There were 32,000 Roman Catholics, with 62 missionaries and 40 unmarried ladies; and 14,000 members of the Greek Church. Osaka is the centre of the work of the Church Missionary Society, but the bishop who presides over it and the Society for the Propagation of the Gospel resides in Tokyo. The Young Men's Christian Association of America has a resident secretary in Tokyo, and is represented by teachers in almost every province.

Education is general and compulsory. There is a complete system of local elementary, middle, and normal schools, and a central university in the capital, with five higher middle schools as feeders, one in Tokyo, the others at Sendai, Kyōto, Kanazawa in Kaga, and Kumamoto. There is also a higher normal school in the capital. The elementary school course extends over eight years (six to fourteen), four years being devoted to an ordinary and four to a higher course. There were, in 1888, 25,530 elementary schools, 52 middle schools, and 46 normal schools, besides 18 girls' high schools, 89 technical, 1741 special, and 67 kindergarten schools. The university, reorganised in 1886, when it absorbed the late Imperial College of Engineering and other institutions of a high grade, consists of five colleges—Law and Politics, Literature, Science, Engineering, and Medicine. It is attended by over 700 students, and is a powerful and well-equipped institution, costing the country £42,000 annually. On its staff are 8 German professors, 7 British, 1 American, and 1 French. Other institutions in the capital are the Music Academy, the Technological School, the Dendrological School, the Nobles' School, attended by the young crown-prince, the Peeresses' School, the Girls' Higher School, the Ladies' Institute, the English Law School, the Higher Commercial School, besides eight other commercial schools in the country. Education is perfectly free from class restrictions, even the Nobles' School being by no means exclusively aristocratic. Mission schools have been doing excellent work. The capital is full of private schools and colleges, the Seimon-Gakko, founded by H. E. Count Ōkuma; the Keiō-Gijūku, conducted by Mr Fukuzawa, one of the leaders of modern Japanese thought and editor of a popular daily paper; the Kyoritsu Gakko, &c.

The printing-press is very active. Daily newspapers abound and are sold astonishingly cheap. The press laws are stringent, and imprisonments under them frequent. During the war of 1895 the sanitary and surgical appliances and methods of the Japanese were scientifically perfect. Japanese physiologists and chemists (such as Kitasato) now rank with the foremost European and American scientists.

Army and Navy.—The Japanese army was organised after European methods in the years 1868-72 by a French military mission. A mild form of conscription (1 out of every 28 young men above twenty) came into force in 1883. The presence of German military advisers resulted in the departure in 1888 of the last of the French military mission. The soldiery carry the Murata rifle, an adaptation of the chassepot. In 1890 the army numbered, in service, 49,294, of whom 3685 were commissioned officers and 131 engineers; 1st reserve, 113,965 and 22 engineers; 2d reserve, 51,691. In 1895, after the war, the regular army was reported to number no less than 279,000 men. The navy, organised under a British naval mission, possessed in 1895, after the war, some 30 ships of all kinds, including those captured from the Chinese, and 3 modern

coast-defence gun-vessels, besides 5 obsolete steamers and sailing-vessels, some of which are used as training-ships. There were also 3 powerful ships of the latest design fitting out and in reserve, and 5 more under construction. Of torpedo boats there were 5, with 17 more under construction, also 4 stationary school ships, and 6 or 7 small fast craft for harbour defence. The three naval stations are Yokosuka, 15 miles south of Yokohama; Kure, on the Inland Sea; and Sasebo; the principal arsenal is at Yokosuka. The personnel consists of 850 commissioned officers and 12,000 sub-officers and men. The naval college was removed in 1888 from Tokyo to the island of Etajima, in the Inland Sea, close by Kure.

The Japanese police is a most efficient force, chiefly recruited from the old *samuraï*, and numbering over 27,000. A gendarmerie was established in 1881. The convict system is an excellent one, and convict establishments yield a profit to the government.

Railways.—The railway-system began with two lines, one from Tokyo to Yokohama, and the other from Hyogo to Osaka and Kyoto. In 1877 a great impetus was given to railway construction by the formation of private companies. The lines now in course of construction will, when completed, give the following trunk lines: (1) a central railway between the two capitals (finished); (2) a continuation through Hyogo to Shimonoseki; (3) a line from Tokyo to Aomori; (4) a west-coast railway by the Shinano Mountains to Niigata; (5) a line in Kyushu from the Strait of Shimonoseki to Kagoshima. Shikoku and Yezo have each one short railway. Numerous branch and loop lines are finished or under construction. The gauge is a narrow one; most of the engineers are English-trained. Total mileage open in 1896, 2500 miles.

In the *mechanical arts* the Japanese have attained to great excellence, especially in metallurgy, and in the manufacture of porcelain, lacquer ware, and silk fabrics; indeed, in some of these departments works of art are produced so exquisite in design and execution as to excel the best products of Europe. The Emperor Gotoku, eighty-third of his line, founded about 1200 a school of sword-making in Kyoto, which he himself practically superintended; Masamune (14th century) blades are the most famous. Gotô Yûjô (1435-1513) may be said to have created the art of chiselling in metals in Japan. Excellently-finished cutlery is still made in Osaka and Tokyo. The porcelain industry virtually dates from the 13th century, when Shunkei, the 'Father of Pottery,' flourished at Seto in Owari; hence the Japanese name *Setsunawo* for all kinds of earthenware. Shunkei studied for six years in China; but Japan also owes much to Korea, whence artisans arrived at various periods on the invitation of Japanese nobles. Among the most celebrated wares are the cracked Satsuma, which dates from about 1640, the Hizen, the Kaga, and the Owari. Much of the art-decoration of these is executed in Tokyo. The lacquer industry dates from prehistoric times; some of the finest specimens of lacquer ware extant date from the shôgunate of Yoshimasa (1436-80); towards the end of the 17th century lacquering perhaps reached its acme of perfection. The bronze and inlaid metal-work of Japan is highly esteemed. The best enamel (*shippô*), an art introduced from China two and a half centuries ago, is made in Kyoto. Silk-weaving is carried to high perfection, especially in the two districts of Kwanseï, round Kyoto, whose looms supply artistic silk and cotton goods, and Kwanto, round Maebashi, north of Tokyo, which supplies ordinary wearing materials. Factories with their modern improvements are, however, gradually taking the

place of the old-fashioned looms. Kyoto is also a centre for embroidered goods, often so exquisitely finished as to resemble paintings. The Japanese make neat carpenters and coopers. Their saw and plane, instead of being pushed, are drawn towards the manipulator; they are very skilful in the use of the adze, but their axe is a clumsy instrument.

Japanese *pictorial art* divides itself into several schools. The primitive school, of which the celebrated Sugawara Michizane and Kose Kanaoka are the leading names, took its rise in the 9th century. The first really native school, which is known as the Yamato Rin, and later on as the Tosa Rin, dates from 1000; it devoted itself principally to the painting of court-life scenes of ceremony, illustrations of the early native romances, careful drawings of horses and falcons, &c., landscape being subordinate. The drawing was careful and with a fine brush; gold and bright colours were lavishly used. The perspective was isometrical, and the liberty was frequently taken of ignoring the roofs of buildings when depicting the interiors. Kosen, the last famous painter of this school, died in 1866. The Chinese school, which may be traced back to 1400, reached its highest development in the great master Kano Motonobu or Ko-Hôgen (1476-1559), and held pre-eminence for three centuries. The works of this school are characterised by quiet and harmonious colouring, and a bold use of the pencil; the scenery depicted is conventional, often impossible, and nearly always in its origin Chinese. The advent of Hokusai (1760-1849) marked a new departure. Hokusai, a man of the people, struck out a new path, and is one of the most realistic of the world's painters. It is this popular school, held in comparatively slight respect in Japan itself, which has the chief attraction for foreign lovers of art.

Commerce and Industries.—The commercial and industrial progress of Japan has of late been most satisfactory. Until the year 1880 Japan had not accommodated her expenses to her income. A diminution of expenses then began, culminating, at the close of 1885, in a wholesale dismissal of unnecessary officials. The ministry of finance had already taken in hand the question of the paper currency, which fell steadily from 1879, until in 1883 it touched 80 per cent. discount. Contrary to all expectation, silver payments were resumed in 1884, a wonderful triumph of finance. Since then private companies have been encouraged to buy over government undertakings and develop new schemes. Foremost of such are the Nippon Ginko (Bank of Japan), a semi-government institution, the Nippon Yusen Mail Steamship Company, numerous railway companies, various tramway lines, &c. Japanese commercial morality and far-sightedness do not enjoy a high reputation. Wholesale transactions have been rendered impossible by want of good faith, and excellent undertakings have been nipped in the bud for the same reason. The chief ports are Yokohama and Kobe (or Hyogo), the outlet for the rich products of central Japan, now a formidable rival to Yokohama and eclipsing Nagasaki, which will always have a certain importance as long as the Takashima coal mine remains unexhausted. Niigata is a foreign port only in name; Hakodate, in Yezo, carries on a growing trade. The commercial and industrial development of Japan has of late been marvellous. In 1890-95 the exports increased in value from £11,300,000 to nearly £25,000,000; the imports from £16,000,000 to about £30,000,000. Japan is now seriously threatening the commercial and manufacturing supremacy of Britain and other European countries in many parts of the East, as in Singapore. In respect of volume of trade with Japan Britain comes first, then the United States,

then China, then France, and next India. From Great Britain come chiefly cotton and woollen goods, iron and machinery, and chemicals. The staple exports of Japan are tea (United States and Canada), silk (United States, Canada, France, Great Britain), rice (Australia, Great Britain, Germany), porcelain, coals, matches, umbrellas, clocks, mats, fans, gums, camphor, shellfish, hemp, lacquer-ware, copper, salt fish, cuttle-fish, fish-oil, fish manure, seaweed, mushrooms, &c. In 1895, of 2300 ships (1600 of them steamers) entering and clearing Japanese ports in the foreign trade, nearly 900 were Japanese (350 steamers). The development of the cotton manufacture is a significant feature in the Japanese industrial revolution; in 1896 there were over thirty prosperous cotton factories. The Japanese emigrate to Hawaii, Queensland, &c. In 1894 Britain rescinded the capitulations under which British subjects in Japan could only be tried by consular courts.

Government and Administration.—The government is a hereditary monarchy, the succession being now exclusively in the male line. The cabinet consists of ten ministers of state, presided over by a minister president, their departments being Foreign Affairs, Imperial Household, Interior, Finance, War, Navy, Justice, Education, Agriculture and Commerce, Communications (post and telegraph, &c.). There is also a privy-council, mostly composed of former ministers of state. The new constitution, laid out on German lines, is jealously careful of the supremacy of the throne. The imperial diet consists of two Houses, and its approval is necessary for the passing of every law, debates being held in public. The first general election took place in 1890; provincial assemblies were instituted in 1879. For administrative purposes Japan is divided into forty-three *ken* or prefectures and three *fu* or city governments (Tokyo, Kyoto, Osaka). The normal revenue of late years (apart from the war indemnity received from China, q.v.) has been about £14,000,000, and is usually much more than balances the expenditure. The debt in 1895 was £63,000,000. Penal and civil codes have been drafted on a European basis. Taxation mostly falls upon land; the land-tax is levied in the form of a percentage of the market value of the land. It has hitherto been impossible for Japan, owing to the restrictions imposed by the treaties, to increase the revenue from customs duties. The liquor and tobacco duties are heavy.

Coinage, Weights and Measures, &c.—The coinage is practically of silver, although gold coins are still issued. The mint for metal coinage at Osaka, organised and superintended until quite recently by British experts, turns out exquisitely finished coins. The silver dollar or *gen* has since 1880 circulated generally in the Far East on a par with the Mexican dollar; its present value is about 3s. There is a subsidiary silver coinage of 50, 20, and 10 *sen* pieces, besides a nickel 5 *sen* piece; also a copper coinage of 2 *sen*, 1 *sen*, 5 *rin*, 2 *rin*, and 1 *rin* pieces (10 *rin* = 1 *sen*; 100 *sen* = 1 *yen*). The paper mint in Tokyo turns out a redeemable paper currency.

For lineal measure, the artisan's and land *shaku* answers pretty closely to the English foot (= 3942119); the dry goods *shoku* is longer (1·212765). Long distances are measured by *ri*: 36 *cho* = 1 *ri* = 2·44034 English miles. Land is bought and sold by the *tsubo* (= 36 sq. feet). Weight is reckoned by *kin* (1 *kin* = 1·32507323 lb. avoird.) and by *kwannin* (16 *kwannin* = 100 *kin*).

On January 1, 1888, mean solar time for 135 long., or 9 hours E. of Greenwich, was adopted as standard time for all Japan. This meridian passes through Akashi, fully half a degree W. of Kyoto.

Authorities.—The works of Kaempfer (2 vols. Lond. 1727) and of Siebold (20 vols. Leyden, 1832-51) remain always classical. The best handy compendiums of information on Japan are the *Handbook for Japan*, in Murray's series, compiled by Satow and Hawes (1884), the *Ancient Japan* of Appert and Kimoshita (Tokyo, 1888), and *A Concise Dictionary of Japan: Roads, Towns, Laws, &c.*, by W. N. Whitney (Tokyo and Lond. 1890). As general treatises J. J. Rein's *Japan* (2 vols.; Eng. trans. 1884-88) and W. E. Griffith's *The Mikado's Empire* (New York, 1876) may be consulted, the first being scientific, the second popular. Anderson's *Pictorial Arts of Japan* (Lond. 1886) and Morse's *Japanese Homes* (Boston, U.S. 1886) are valuable special treatises. For the language and literature consult the grammars of Aston, Chamberlain, and Inulric, and the dictionaries of Hepburn, Satow, and Gabbins, and Chamberlain's *Classical Poetry of the Japanese* (1880). A mine of information is contained in the *Transactions of the Asiatic Society of Japan* (Lond. Trübner), the *Transactions of the German Asiatic Society*, the *Transactions of the Sismological Society of Japan*, and the *Chrysanthemum*, a monthly review now extinct. The Imperial University sends out memoirs; and there is a *Japan Weekly Mail* (Yokohama). See also works by Arnold (1891), Murray (1891), Hearn (1895), and Parsons (1896); and books on the Far East by Curzon (1894) and Norman (1895).

Japanning is the art of producing, by the aid of heat, a hard coating of coloured varnish upon metal, wood, or papier-maché. Articles so coated resemble the lacquer wares of Japan and China (see LACQUER). A japanned surface differs from an ordinary painted surface in being harder and more durable, and also in not being easily injured by hot water or by being placed near a fire. A good brown 'japan' is prepared by separately heating equal quantities of amber and asphaltum, and adding to each one-half the quantity by weight of boiled linseed-oil. Both compounds are then mixed together. Copal resin may be substituted for the amber, but it is not so durable. Tinned iron goods are most largely japanned, and for them brown and black colours are chiefly used. Both are obtained by the use of brown japan, the metal getting a preliminary coating of black paint when black is required. Only one coating of brown japan is given to cheap goods, but for better wares two or more coatings are applied. After each coating the articles are heated for ten or twelve hours in an oven at from 135 to 165 F., or even up to a much higher temperature. The japanned surface is then rubbed with fine ground pumice, next with rottenstone, and the final polish given to it by the palm of the hand. Gold or bronze bands or floral decoration, or both, are generally added. These are first painted on in japanner's gold size, and then the gold leaf is applied or the bronzed powder dusted on, after which the objects are again placed in the oven. After they are removed the gilt or bronzed portions get a protecting coat of white spirit varnish. When white or other light colours are used for japanning they are mixed with japanner's varnish. These require more careful heating in the oven than dark brown or black. Such articles as tea-trays, coal-boxes, cash-boxes, tin canisters, and the like are japanned in great numbers in Birmingham. Portable bathtubs are usually finished internally in white japan; and it may be remarked that this would last much longer than it often does if care were taken not to leave soapy water in the bathtubs after being used. The varnishing or japanning of the surface of papier-maché wares is a similar process to the above, but in the case of these shell or metal inlaying is often worked into the japan.

Japhet, according to the Hebrew record, the second son of Noah, whose descendants peopled first the north and west of Asia, after which they proceeded to occupy the 'isles of the Gentiles.' The term Japhetic or Japetic was at one time used

loosely for peoples of the European stock (nearly as Aryan and Indo-European now) as opposed to Semitic and Hamitic (Asiatic and African). See ETHNOLOGY, PHILOLOGY.

Japurá (*Yapura*), or CAQUETA, an important tributary of the Amazon, rises in southern Colombia, on the east side of the Andes, flows ESE., and enters the Amazon opposite Tefle by several arms. Its upper course is broken by many falls, but in the lower part it is navigable for river-steamer to nearly 70 W. long., or almost 500 miles.

Jargoon. See JACTUUM.

Jarl. See EARL.

Jarnac, a village in the French department of Charente, 23 miles by rail W. of Angoulême, where, on March 13, 1569, the Duke of Anjou, afterwards Henry III., and 26,000 Catholics defeated 15,000 Huguenots under Louis L., Prince of Condé (q.v.).

Jaroslav (pronounced *Yaroslaf*), capital of the Russian government of that name, stands at the junction of the Volga with its affluent the Kotorost, 173 miles by rail NE. of Moscow. The town has broad streets, a fine quay, 2 miles long, beside the Volga, nearly fifty churches, three monasteries, and a theological college; it is the seat of an archbishop. The law college (lyceum) has more than 300 students. The staple industry of the place is the manufacture of cotton stuffs; next comes the weaving of linen, wool, and silk. Jaroslav is an important river-port, and does an active trade in corn (one half), groceries, and textiles. Pop. 70,171. The town was founded in 1026, and was the capital of an independent principality until 1471, when it fell to Moscow.—The government of Jaroslav, with an area of 13,751 sq. m. and a pop. (1897) 1,073,593, spins and weaves cotton and flax, and manufactures spirits, tobacco, and chemicals.

Jarrah. See TIMBER, WESTERN AUSTRALIA.

Jarrow, a municipal borough and seaport of Durham, situated on the Tyne, 3 miles by rail SW. of South Shields and 7 miles E. of Newcastle. Its growth from a small colliery village to the thriving town has been due to the construction of its docks (since 1859), and to the establishment of Palmer & Co.'s iron-shipbuilding and marine engine works, blast-furnaces, iron foundries, gun-factory, &c., which together employ upwards of 7000 hands. Paper and chemicals are also manufactured, and coal is shipped in large quantities. At Jarrow in 682 Benedict Biscop founded the Benedictine monastery with which the name of Bede (q.v.) is inseparably associated. The chancel of the parish church, reconstructed in the 11th century, retains portions of Benedict's work; the nave was rebuilt in 1783 and again in 1866. Bede's chair is still preserved in the church. Jarrow was made a municipality in 1875. Pop. (1871) 18,115; (1891) 33,675. See Jewitt's *Jarrow Church* (1861).

Jasher, BOOK OF (*Jashar* in Revised Version; Heb. *Sepher ha-jashar*, 'the Book of the Upright'; translated by the LXX. *Biblion tou Euthous*, and by the Vulgate *Liber Instorum*; but the Peshito has *Sepher Hashar*, 'Book of Praises or Hymns'), is one of the lost books of the ancient Hebrews, which is quoted twice (Joshua, x, 13; 2 Samuel, i, 18). Regarding its character and contents there has been much speculation. Talmudic and later Jewish authorities identified it variously with Genesis (sometimes called 'the Book of the Upright'), Deuteronomy, Judges, &c., to all which notions there is the obvious and fatal objection that the two quotations from it which survive are not to be found in any of these books, and could not possibly be found in the first two, as they refer to incidents which occurred at a subsequent period

in the national history. The conjecture of the Syriac and Arabic translators has been adopted by Dr Lowth, Herder, and other scholars—viz. that the Book of Jasher was a collection of national ballads, recording the warlike deeds of the national heroes or singing the praises of otherwise celebrated men. Gesenius is inclined to adopt the same view, and suggests that it may have acquired its name, 'the Book of the Upright,' from having been written chiefly in praise of upright men. Donaldson, in an over-ingenious work, *Jashar* (1854), contended for its being a composition of the age of Solomon, and a work of Nathan and Gad. He conceived that it originated in the desire of the more religious of the community to possess a record of the national history which should chiefly set forth the righteousness of the true Hebrews, and he attempted to extract from the so-called canonical books of the Old Testament such passages as he believed to have originally formed part of it. The actual book could not have been earlier than the age of Solomon, especially if a fragment relating to the building of the temple in the Septuagint of 1 Kings, viii, be from that work. In the 12-14th centuries no less than three different works professing to be the lost Book of Jasher were produced; and in 1751 a preposterous forgery under this name (and ultimately traced to one Hive, a London printer) created some excitement. It claimed to have been translated from Hebrew by 'Alein of Britain,' and was reprinted in 1829.

Jashpur, a native state of Chutia Nagpur, in Bengal. Area, 1963 sq. m.; pop. 90,240. The country is a tableland, ranging from 2200 to 3500 feet in height, and has excellent soil.

Jasmin, JACQUES, a modern Gascon poet, was born at Agen, 6th March 1798. He has given in his *Sonnetts* (1830) a humorous account of the poverty and privations of his early life. He earned his living as a barber; but wrote poetry in his native Languedoc dialect. His first volume, entitled *Papillotes* ('Curl Papers'), appeared in 1835. He greatly enhanced his reputation by reciting his own poems in public. His poetry is full of beauty and power; the pathos of his serious and the wit of his comic pieces are of a high order. His poems were received with enthusiasm in France and even other parts of Europe. He was made a Chevalier of the Legion of Honour in 1846, and in 1852 his works were crowned by the French Academy and a prize awarded to him. He published four volumes of poems in all; the best pieces are *The Chacivari* (1825), a mock-heroic poem; *The Blind Girl of Castel-Cuille* (1835), trans. by Longfellow; *Françolette* (1840); *The Twin Brothers* (1841); *Martha the Simple* (1845); and *The Sun's Work* (1849). These poems raised Jasmin's native tongue to the dignity of a literary language, and initiated a literary and linguistic movement in the south of France which has gone on spreading and thriving since his death (at Agen, on 4th October 1864). See French Lives by Rabain (1867) and J. Andrien (1882), and vol. iii. of Sainte-Beuve's *Portraits Contemporains*, and the Life by Samuel Smiles (1892).

Jasmine, or JESSAMINE (*Jasminum*), a genus of plants of the natural order Jasminaceæ. The genus Jasmine has its calyx and corolla each 5 or 8 cleft, two stamens attached to and included within the tube of the corolla, and a two-lobed berry, one of the lobes generally abortive. The name Jasmine is from the Persian *yasmin*. The native country and the date of introduction of the Common Jasmine (*J. officinale*) are unknown, but according to Gerard it was in common use as a wall-shrub and for covering arbours as far back as 1597, and it is naturalised in many parts of Europe and Asia.

The perfume is obtained from the flowers by means of absorption in a fatty substance. An essential oil is also distilled from jasmine. The commercial oil of jasmine, however, is merely oil of ben or the like flavoured with jasmine. *J. grandiflorum*, a native of the East Indies, has flowers still more fragrant. Another Indian species is *J. Sambac*.

Jasminum nudiflorum.

—Several other species, some with erect and some with twining stems, are not uncommon in gardens and greenhouses. Some have white, and some have yellow flowers.—Cape Jasmine is a name for Gardenia (q.v.), and the Carolina Jasmine is Gelsemium (q.v.).

Jason. See ARGONAUTS.

Jasper (Gr. *iáspis*), a mineral generally regarded as one of the varieties of Quartz (q.v.), and distinguished by its opacity, owing to a mixture of clay or other substances with the silica of which it is chiefly composed. There are many kinds of jasper, some of them of one colour, as brown, red, yellow, green, white, blue, or black, and some variously striped, spotted, or clouded with different colours. Jasper is a very abundant mineral; it is found in veins and embedded masses in many rocks, sometimes appears as a rock of which whole hills are formed, and is very common in the shape of pebbles. It has been prized from the most ancient times for ornamental purposes, as it takes a high polish. The kind called *Porcellan jasper* is rather rare. It is often full of minute holes, or is cracked in all directions. It is regarded as a kind of natural porcelain, and is found in places where coal-seams have taken fire; it is thus simply a baked clay. Similar baked clays are not infrequently met with in the vicinity of intrusive igneous rocks.

Jassy, or **JASHI**, the capital of Moldavia, the northern division of Roumania, stands 5 miles W. of the Pruth, 205 miles by rail NW. of Odessa, and 289 NNE. of Bucharest. The town was almost destroyed by fire in 1827, after which it was rebuilt. The streets are broad, and are paved with asphalt, and the houses mostly one-storied and built of wood. There are more than forty Greek churches and close upon sixty Jewish synagogues. The most noticeable secular buildings are the palaces of the boyars or Roumanian nobles, both in the city and in its environs. The town has a university with about 40 teachers and 170 students. The industry is unimportant; but there is an active trade in corn, spirits, and wine, mostly with Galatz on the Danube. Pop. 70,000, of whom half are Jews, besides Armenians, Russians, Gypsies, &c. Jassy was the residence of the Moldavian princes from 1565. Here peace was concluded between Russia and Turkey in 1792. During Ypsilanti's insurrection the town was almost destroyed by the Turkish Janizaries (1822).

On a height close to the town is the residence of the former woiwodes or governors of Moldavia.

Jaszbereny, a town of Hungary, 39 miles E. of Budapest. Pop. 21,507, employed in agriculture, cloth manufacture, and wine-making.

Játaka (literally, 'relating to birth'), the name of a collection of legends, containing an account of the 550 previous births of Sákya Muni, or the Buddha. It forms a part of the *Suttapitaka*, or 'baskets of discourses,' of Pali literature, and an edition of the text, with commentary, was issued by Fausböll in 6 vols. (Lond. 1877-96). These are of great importance as the earliest collection of popular stories, many of which at an early date found their way by one channel or other to the West, and are still current as fables of Esop or as traditional and apparently indigenous folk-tales. The best English translation is that undertaken in 1895 by Professor Cowell.

Jativa, or **NATIVA**, SAN FELIPE DE, a town of Spain, 35 miles by rail SSW. of Valencia. As the *Scythia* of the Romans it was famous for its linen manufactures. It was a Moorish town until taken from them by Jayme I. in 1224. Here was born the painter Ribera (Lo Spagnoletto) in 1588. It was also the home of the notorious Borgia (Borja) family. Pop. 15,000.

Jats, the most numerous and valuable section of the agricultural population of the Punjab, number about 4½ millions. They are by many identified with the *Geta*; and some of the best authorities accept the theory that they are descended from Scythian invaders of India in pre-historic times. Some scholars believe them cognate with the Gypsies (q.v.).

Jauer, a town of Prussian Silesia, on the Neisse, 13 miles by rail S. of Liegnitz. It is famous for its sausages and its weekly corn-market, held regularly since 1404. Jauer was formerly the market for the linen-trade of Silesia and the capital of a principality; but the Thirty Years' War ruined it. It now manufactures sugar, leather, cloth, &c. Pop. (1885) 11,178.

Jauf. See ARABIA.

Jaundice, a yellow colour of the skin and conjunctiva of the eye, arising from the presence of the colouring matter of the bile in the blood and tissues, is a symptom of various disordered conditions of the system rather than a special disease. With this colouring of the skin and eyes the following symptoms are associated: the feces are of a grayish or dirty-white tint, in consequence of the absence of bile, and the urine is of the colour of saffron, or is even as dark as porter, in consequence of the presence of the colouring matter of the bile. There is sometimes, but not in the majority of cases, an extreme itching of the skin. It is a popular belief, as old as the time of Lucretius, that to a jaundiced eye everything appears yellow. This, however, is a very rare symptom.

The causes of jaundice naturally fall into two classes, those where there is mechanical obstruction of the bile-duct, and those where there is no obstruction. Mechanical obstruction may be produced by gall-stones (see CALCULUS) or thickened bile within the duct; by inflammatory swelling of its lining membrane or that of the duodenum, into which it discharges (*catarrhal* jaundice); by the pressure upon it of tumours of neighbouring parts, of the pregnant uterus, or of accumulations of feces in the bowels. Jaundice may result without obstruction of the ducts from congestion or cirrhosis of the liver, from severe mental emotions (anger, fright, &c.), and especially from the action of various poisons—e.g. phosphorus, arsenic, mercury, snake-poison—and of various acute diseases

—e.g. typhus fever, pyæmia, and above all yellow fever. In cases of obstructive jaundice, all authorities are agreed in referring the yellow staining of the skin and other tissues to absorption by the lymphatics and veins of the bile-pigment, which is secreted by the liver but not discharged into the intestine. The explanation of non-obstructive jaundice is, however, not so clear, and raises complicated physiological questions. According to one theory, the bile-pigments are formed in the blood and merely excreted by the liver; and on this view non-obstructive jaundice is caused by their defective elimination owing to diminished activity of the liver-cells. Others hold that the bile-pigments are not formed except by the action of the liver-cells; that in non-obstructive jaundice also secretion and re-absorption always take place; and that the bile-pigments continue in the circulation owing to some defect not fully understood in the processes occurring in the blood. The question must be regarded as an open one; but the latter theory seems at present most in favour.

Both prognosis and treatment of jaundice depend entirely upon the recognition of the cause to which it is due. In cases of gall-stones, catarrhal jaundice, pressure of the pregnant uterus or of fecal accumulations, and of congestion of the liver, the case usually terminates favourably; in cases of tumour and of cirrhosis of the liver the outlook is always grave; in poisoning and in acute diseases jaundice is often a very serious symptom; where it results from mental emotion it sometimes disappears quickly, but is often followed by severe nervous symptoms and death. See LIVER (DISEASES OF).

Jaunpur, the capital of a district in the North-west Provinces of India, is situated on the Gumti, here crossed by a bridge (1560-73) 712 feet in length. The former capital of a Mohammedan kingdom, Jaunpur has several splendid architectural monuments, including Ibrahim's baths (1420), mosques, and ruins of mosques and of the fort. Pop. (1881) 44,845.

Java (Djāvā), an island of the Dutch East Indies, the seat of the colonial government. It is situated between 5° 52' (St Nicholas Point) and 8° 50' (South Cape) S. lat., and 105° 13' and 114° 39' E. long. The island is washed on the N. by the Sea of Java, on the E. by the Strait of Bali, on the S. by the Indian Ocean, and on the W.

by Sunda Strait. It extends almost due west and east, declining about 15° to the south. The extreme length is about 600 miles, the breadth 40 to 125 miles, the superficial area about 49,000 sq. m. (excluding Madura, q.v.). The coast-line is not much developed; a few large bays, protected by islands, furnish safe anchorage for vessels. From end to end of the island (most probably corresponding to a volcanic line of fissure) there is a mountain-chain, named Gunning Kendang, and, especially in the western part of the island, several parallel shorter chains. To the north there are a few isolated mountains in the alluvial plain. Towards

the south the island falls in general steeply towards the sea. There are forty-three volcanoes, several of which are still active. The rivers are generally small, but become torrents when swollen by rain; only a few of them are navigable. The climate depends on the altitude; it is rather hot and unhealthy on the coast, but pleasant in the hills. The thermometer seldom indicates more than 95° F. In Batavia the average temperature is 78·5°, the extremes being 92·7° and 66·9°. The mountains rise to about 12,000 feet, and are clothed up to 9000 or 10,000 feet with luxuriant foliage; on the loftiest eminences the thermometer sometimes sinks to 32°. Generally, even in the hills, the days are hot, but moderated by land and sea breezes, which blow regularly across the island; the nights, especially in the highlands, are cool. The rainy season lasts from November to March.

The population of Java has rapidly increased; in 1850 it was 9,570,000, and in 1894, 24,643,000. At the beginning of 1888 (excluding Madura) it amounted to a total of 20,898,122. These figures included 20,614,222 natives, 228,340 Chinese, 11,665 Arabs, and 2736 other Orientals (natives of India, of Further India, &c.). The Europeans (half-castes included) amounted to 41,159. The natives belong to the Malay (q.v.) race. The Madurese, in the eastern part of the island, the Sundanese, living in the western part, and the Javanese proper differ in physique and in language. Most of them are Mohammedans, at least in name, for much of the belief of their ancestors survives in the Islam that is now practised. A few tribes, however, profess the old religion (viz. the Baduwis in Bantam and the 'Heathen' of the Tenger Mountains). The native Christians number about 12,000, and the Chinese Christians a few hundreds. How many half-castes are counted among the Europeans it is impossible to say. The inhabitants are more civilised than those of the other islands of the archipelago. One of the chief vices is opium-smoking, which is a source of income to government, and yields for Java alone about £1,000,000 a year for licenses and profit on the import. There are thirty-nine Dutch Protestant and twenty-one Roman Catholic clergymen for the whole of the Dutch East Indies, besides those who are working among the natives. Every form of religious belief is free, but proselytising is strictly prohibited.

The chief wealth of Java consists in its luxuriant vegetation, though the producing power seems to be now a little exhausted, at least to judge from the many diseases by which the plantations have been visited of late. The character of the vegetation varies with the soil and the elevation. The division (of Jungblum) into four botanical zones, up to 2000, 4500, 7500, and above 7500 feet altitude, has been commonly adopted. The fauna differs from that of the other islands of the archipelago. The animal kingdom is not very rich; tigers (which are a scourge to some parts of the island), rhinoceros, deer, and wild swine are the chief representatives of the quadrupeds; there are only a few birds that are conspicuous for their plumage, and hardly any that are distinguished by their song. Several species of serpents (some venomous) and crocodiles are found on the island. The geology of Java is still largely undetermined. For the greater part, the island belongs to the Tertiary formation, altered by many eruptions of more recent date. Some parts of Java seem to belong to the Pleistocene period; sedimentary formations of recent date are especially considerable along the north-west part of the island. Though in old times Java was called the 'land of gold,' little of that metal has been found of late; silver is scarce; and there are no other metals at all. Salt, the manufacture of which is a govern-

ment monopoly, is prepared from sea-water; and coal is worked in the Preanger, and marble in the Madium residency.

Formerly Java used to be considered as affording almost a perfect answer to the question, How can a colony best be governed? The material prosperity which resulted to the mother-country from this possession was owing, for the greater part, to the system of General Van den Bosch (introduced in 1830). Under that system the natives were compelled to cultivate part of the ground and plant staple articles on it, whilst the produce was delivered at a fixed price to the magazines of the government, and from them shipped to Europe and sold by the Netherlands Trading Company. Although this system brought large sums into the treasury of the Netherlands, a vigorous opposition against it existed almost from the beginning, since it pressed very hard on the natives. As time went on the opposition gained ground, and in name the system was given up and private planters admitted. But in point of fact, at least so far as the coffee-plantations were concerned, the system was still continued, because the income derived from this item could not be dispensed with. A commission was appointed in 1880 to consider in what way the system of coffee-planting might be altered. At that time the natives received fifteen florins (£1. 5s.) for one picul (133½ lb. avoird.), which they had to deliver at the magazines. Though private planters had been admitted before 1870, the 'Agrarian Law,' which then was promulgated, greatly facilitated the establishment of plantations by private individuals; but still the competition of the government prevented an unrestrained development. In some parts of the island (especially in the western part) where private persons are owners of the ground, or hire it from the native princes, private industry was in better circumstances; but of late diseases in the crops and a falling-off in prices have done much damage. Sugar, coffee, indigo, tea, and tobacco are planted for export. Rice is grown extensively for native consumption (and a little for export); but it is not sufficient, and other food-crops (maize, &c.) have to be cultivated. The teak-forests belong exclusively to the government, but they are managed by private persons, working under contract. The live-stock includes about two and a half million buffaloes, two million cattle, half a million horses.

Java may be considered the centre of the commerce and trade of a great part of the Dutch East Indies. In 1888, 2995 vessels entered and 3126 cleared from Java. Of the chief staple articles there were exported, in 1888, 13,529 cwt. of indigo, 576,957 cwt. of coffee, 7,381,040 cwt. of sugar, 239,657 cwt. of tobacco, 66,791 cwt. of tea, 198,073 cwt. of tin (all these by private persons or by companies), and 426,331 cwt. of coffee and 117,420 cwt. of tin by the government. The general exports and imports were valued in 1886 at £308,266 and £2,090,709 respectively on account of the government, and at £10,079,683 and £10,140,717 respectively on account of private persons. The countries which trade most extensively with Java are Holland, the Straits Settlements, and Great Britain. The leading articles of import are cotton and linen goods, wine and spirits, provisions, machinery, railway-plant, &c. Java has frequent intercourse with Europe, *via* Singapore or directly by Dutch steamers, and is connected by cable with Europe and with Australia. The telegraph system of the island is very extensive. There are good roads and railways, partly belonging to the government, partly to private companies; 566 miles of the former and 194 miles of the latter were open in 1889.

The island is (excluding Madura) divided into

twenty-one residencies: Bantam, Batavia, Kravang, Preanger Regencies, Cheribon, Tagal, Pekalongan, Samarang, Japara, Rembang, Surabaja, Pasuruan, Probolingo, Besaki (including Banyuwangi), Banyumas, Bagelen, Kadu, Jokjakarta, Surakarta, Madium, Kediri—two of which (Surakarta and Jokjakarta) are under native princes. Over each residency a Dutch resident exercises a general control. The residencies are divided into *afdeelingen*, under assistant-residents, to whom are subject the controllers (100). Subject to the supervision of these European officers the administration is carried on by native functionaries—regents at the head of the regencies (generally corresponding to the *afdeelingen*), to whom are subject the *wedono* or *denang*: the regents have substitutes called *putih*.

The languages are Javanese, a Malayan tongue, divided into an aristocratic dialect and a popular dialect, Sundanese, and Madurese. Besides there is another language used in old inscriptions and manuscripts, called *Kawi* (better, Old Javanese). The Javanese alphabet is derived from the Devanagari. Many antiquities were left by the early Hindu conquerors, especially in middle and eastern Java (Boro Budor (q.v.), Brambanan, Dieng). The literature of modern Java is rather insignificant. *Babad*s ('chronicles') and the *wayang* ('puppet-plays') stories should be mentioned.

The *history* of Java can only be given in outline. The earliest historical references date back to the beginning of the 5th century. In 412 A.D. Fa-Hien visited Hindu colonies in Java. About the year 800 the intercourse of the Hindus with the island appears to have become more important. Already by that time the Javanese had attained to a considerable degree of civilisation. To judge from the antiquities, there were three periods of Hindu ascendancy—a period of Buddhism, a period of Sivaism, and a period of compromise. Several powerful Hindu states were established, among which Madjapahit must be mentioned. At the beginning of the 15th century Mohammedanism reached the island and quickly got a firm footing. At the end of the 16th century European merchant-adventurers established themselves in Java; whilst the Dutch rule in the island began in 1610 (the first governor-general, Pieter Both). Then began a long, tough struggle with the natives, but with the lapse of time the Dutch gained ground. The most important native state then was Mataram. In 1705 the company obtained possession of the Preanger Regencies, and in 1745 its authority was extended over all the north-east coast of the island. In 1755 the empire of Mataram was divided into two states, Surakarta and Jokjakarta. In 1808 the kingdom of Bantam was incorporated with the Dutch possessions; but these in 1811 became part of the French empire. In the same year Java was occupied by the English, and remained in their hands up to 1817. A short time after the Dutch had resumed possession of Java an insurrection burst out in Jokjakarta in 1825 under Dipa Negara, and the struggle lasted until 1830, when the chief of the rebels submitted to the Dutch authorities. By that time the greater part of the states of the native provinces had been incorporated in the Dutch possessions, which then assumed the extension they have to-day.

See Sir Stamford Raffles's *History of Java* (Lond. 1817); De Jonge, *Nederlandsch Oost-Indië* (1862-88); Jungbluth, *Java* (1849-53); Worsfold, *A Visit to Java* (1893); P. J. Veth, *Java, Geographisch, Ethnologisch, Historisch* (3 vols. 1875-78). This last is the most important work on Java, though, in some respects, a little out of date. See also R. Schuing, *Nederlandsch Oost en West* (1889; a general description of the East Indian colonies, not always to be trusted); *De Loofer Handleiding tot de Kennis van het Staats- en Administratief-Recht van Nederl. Indië*

(3d ed. 1884); Worsfold's *Visit to Java* (1893); Eliza Scidmore's *Java, the Garden of the East* (1898); and Douwes Dekker's romance, *Max Havelaar* (Eng. trans. 1868). The best maps are in *Atlas der Nordindische Besitzungen in Ost-Indie*, by Stenfoort and Ten Scherff.

Jaworow, a town of Austrian Galicia, 30 miles WNW. of Lemberg, was the favourite residence of John Sobieski, king of Poland. Pop. 9159.

Jaxartes, now called SHÛN, or SYR-DARIA (both *syr* and *daria* mean 'river'), a river of western Asia, which rises at an altitude of 12,000 feet, 30 miles S. of Lake Issik-kul, in the Tian-Shan Mountains. It is at first called the Juak-tash, then the Taragai, and under the name of the Naryn it descends, through a wild narrow gorge, to the level of 6800 feet at Fort Narynsk, flowing all the while steadily west with deflections to the south-west. After passing through a series of dried-up lakes and being joined by several mountain-streams, it receives, just below Namangan, the name of Syr-Daria. A little west of Khojend it breaks through another gorge; then turns suddenly to the north-west, and, retaining that direction for 850 miles, finds its way into the Sea of Aral by a delta with three mouths. The river is navigable over this distance only (850 miles). Its total length is 1500 miles; area of its drainage basin, 320,000 sq. m. Two streams, the Tehu (600 miles long) and the Sary-su (570 miles), which formerly joined the Syr-Daria from the right, are now lost in the sands east of Perovsk before reaching it. Five centuries ago the Syr-Daria used to send off a south-western branch at Perovsk, which flowed into the Sea of Aral on its south-east side, not far from the mouth of the Amu-Daria. This branch is now likewise lost in the sand. The Syr-Daria is the Nile of Turkestan. The people fertilise their valleys by its water, carried off in irrigation channels.

Jay (*Garrulus*), a genus of short-winged, short-billed birds of the Crow family (Corvidæ), represented in the palaearctic region by about 12 species. The jays inhabit woodlands, and the adults are generally found alone or in pairs. They are almost omnivorous, feeding chiefly on berries, seeds, nuts, and fruits, but eating also worms, insects, larvae, birds' eggs, and even young mice and the nestlings of singing-birds. The well-known blue and black markings on the wing-coverts are characteristic of the whole genus, of which the Common Jay (*G. glandarius*), the only British species, may be taken

Common Jay (*Garrulus glandarius*).

as a type. This bird is comparatively common throughout England and Wales, and is found in the south and east of Ireland, and in Scotland as far north as Inverness-shire. Its numbers, however, are everywhere gradually decreasing, owing to the constant war waged against it by game-keepers on account of its partiality for the eggs of game-birds.

It is also sought after for its beautiful blue feathers, which are used in the making of artificial flies. The common jay builds, in thick trees or high bushes, a cup-shaped, basket-like nest of sticks lined with grasses. The eggs, 5 or 6 in number, are of a greenish-gray colour, thickly speckled with light-brown, and sometimes marked with fine black lines. The adult bird measures about 14 inches. The prevailing colour is a light brown, but the tail-feathers and quills are black; the wing-coverts are black, barred with bright blue and white; the head bears an erectile crest of whitish feathers with black streaks. Though the genus *Garrulus* is strictly confined to the Old World, closely allied genera, *Cyanocitta*, the Blue Jays, and *Nanuthura*, the Long-tailed Jays, are found in North and South America. The Common Blue Jay (*C. cristata*) measures 11½ inches, and is of a grayish-purple colour. It is common throughout Canada and the southern and eastern States, and sometimes does valuable service in ridding a district of caterpillars. When taken young jays are easily tamed, and are very popular as pets: for, though their natural note is harsh and unpleasant, they possess considerable powers of imitation.

Jay, JOHN, an American statesman and jurist, and first chief-justice of the supreme court of the United States, was born in New York city, December 12, 1745. He graduated at King's (now Columbia) College in 1764, and was admitted to the bar in 1768. Elected to the first Continental congress in 1774, and re-elected in 1775, he prepared addresses to the people of Great Britain and Canada, and to his own countrymen; drafted the constitution of New York state in 1777, and was appointed chief-justice of the state; was returned to congress in 1778 and elected its president, and in the following year was sent as minister to Spain. In 1782 he was added by congress to the peace commissioners, and it was mainly by his efforts that the treaty was brought to a conclusion on terms so satisfactory to the United States. In 1784-89 he was secretary for foreign affairs; on the adoption of the national constitution in 1789 he wrote in its favour in the *Federalist* (see HAMILTON); and after the organisation of the Federal government, Washington having offered him his choice of the offices in his gift, he selected that of chief-justice of the supreme court. In 1794 he concluded with Lord Grenville the convention familiarly known as 'Jay's treaty,' which provided for the recovery by British subjects of pre-revolutionary debts and by Americans of losses incurred by illegal capture by British cruisers, and the determination of the eastern frontier of what is now the state of Maine; the British were to surrender the western posts held by them in 1786, and there was to be reciprocity of inland trade between the United States and British North America. The treaty, though favourable to the United States, was passionately denounced by the Democrats as a surrender of American rights and a betrayal of France; but it was ratified by Washington in August 1795. Jay was governor of New York from 1795 to 1801. Then, though offered his former post of chief justice, he retired from public life, and passed the remainder of his days at his estate of Bedford, in Westchester county, New York. There he died, May 17, 1829. There is a good *Life* (1833) by his son, William Jay (1789-1858), who was a notable leader in the anti-slavery movement, and whose writings in favour of arbitration in national disputes exerted a considerable influence. See also the *Life* by William Whitlock (New York, 1887), and by Pellou, in 'American Statesmen' series (1890).

Jay, WILLIAM, an English Congregational minister, was born May 6, 1769, at Tisbury, in

Wiltshire. He worked at his father's trade, that of a stonemason and mason, until his sixteenth year. He was then sent to Marlborough Academy, a Congregational training college for the ministry. His first charge was at Christian Malford, near Chippenham; then he officiated for a year in a chapel belonging to Lady Maxwell; and in 1791 was called as pastor of Argyle Chapel at Bath, which position he occupied for sixty-two years. He died December 27, 1853. Jay was an impressive and eloquent preacher; he began preaching when only sixteen. As a writer he produced several works which attained to a rapid and very extensive popularity. Among them are *Morning and Evening Exercises, Short Discourses, The Christian Contemplated, Life of Rev. Cornelius Winter, Memoirs of Rev. John Clark, Lectures on Female Scripture Characters*, and an *Autobiography* (1854). A collected edition of his works, in 12 vols., revised by himself, was published in 1842-48 (new ed. 1876).

Jayadeva, the *nom de plume*, meaning 'god of victory,' of a Hindu poet, who was born at Kenduli, in Birbhuma district, Bengal, in the 12th century. His great work is the *Gita Govinda*, a Sanskrit lyric drama, in which is celebrated the love of Krishna and his wife Radha. The Hindu commentators give the poem a mystical interpretation. As the 'Indian Song of Songs' it was translated in 1875 into English by Sir Edwin Arnold.

Jazyges, a Sarmatian tribe, whose original home was to the north of the Sea of Azov. In the 1st century of the Christian era they moved westwards, finally settling in the plains of Hungary between the Theiss and the Danube, though one band seems to have gone to the north side of the Carpathians, and to have been vanquished by Hermanric, the king of the Goths, in the early part of the 4th century. The southern division of the tribe maintained an almost incessant warfare against the Danubian provinces of Rome, in spite of numerous defeats, especially by Marcus Aurelius (172) and Carus (283). Their power was finally broken by the Huns and Goths. The Jazyges were bold, savage horsemen, whose only abodes were wagons and tents. See SARMATIANS.—Jazygia is a district in Hungary, ESE, of Pesth, whose inhabitants, Magyars, have no connection with the ancient Jazyges.

Jeanne d'Albrét (1528-72), the Calvinistic mother of Henry IV. of France (q.v.), through whom he succeeded to Navarre and Béarn.

Jeanne d'Arc. See JOAN OF ARC.

Jebb, SIR RICHARD CLAVERHOUSE, a great Greek scholar, was born at Dundee, August 27, 1841. The grand-nephew of Bishop Jebb, and on the maternal side the great-grandson of Bishop Horsley, he inherited the traditions of the scholar, and passed with marked distinction through St Columba's College, Dublin, the Charterhouse, and Trinity College, Cambridge, graduating as senior classic in 1862. Soon after he was elected Fellow of his college, and he took a prominent part in organising the system of Inter-Collegiate Classical Lectures, and served as secretary to the newly-founded Cambridge Philological Society. In 1869 he became public orator of the university, in 1872 classical examiner in the university of London, and tutor of his own college, in 1875 professor of Greek in the university of Glasgow, and in 1889 regius professor of Greek at Cambridge. He has received honorary degrees from Edinburgh, Harvard, Cambridge, and Bologna, and was awarded a Greek decoration in 1878. In 1891 he was elected M.P. (Unionist) for Cambridge University. He has actively supported the teaching of modern Greek, and he helped to establish the British School of Archaeology at Athens. Professor Jebb's books are *The Characters of Theophrastus*

(1870); *The Attic Orators: Antiphon to Isocor* (2 vols. 1876-80); *A Primer of Greek Literature* (1877); *Modern Greece* (1880); *Translations into Greek and Latin Verse* (1873); *Bentley* (1882) in the series of 'English Men of Letters'; admirable school editions of the *Electra* and *Igor* of Sophocles; an *Introduction to Homer* (1887); *Lectures on Greek Poetry* (1893); and *Humanism in Education* (1899). But perhaps his most important work is his monumental edition of the plays of Sophocles, with text, commentary, and prose translation, of which the Cambridge Press issued *Edipus Tyrannus* in 1883, *Edipus Coloneus* in 1885, *Antigone* in 1888, *Trachiniae* in 1892, and *Electra* in 1894. As a scholar Jebb is equally brilliant and accurate; he shows exceptional sanity and sense of proportion, and possesses the gift of writing admirable English. In 1900 he was knighted.

Jedburgh, the county town of Roxburghshire, is beautifully situated on Jed Water, 56 miles by a branch-line (by road 49) SE. of Edinburgh. Of its magnificent Augustinian abbey, founded by David I. in 1118-47, and finally spoiled by the English in 1544-45, the ruined church only remains. This, Norman to Second Pointed in style, is 235 feet long, and has a central tower 86 feet high. In 1823 a jail (now disused) was built on the site of the royal castle (razed 1409), where a skeleton appeared to Alexander III. at his marriage-feast (1285). Other memories has Jedburgh—of Mary Stuart and Prince Charles Edward, of Thomson, Burns, Scott, and Wordsworth, of Mary Somerville and Sir David Brewster. A border town, it nurtured a warlike race, whose slogan, 'Jeddart's here!' was seldom long silent. Their chief weapon was the 'Jeddart axe,' a stout steel-headed pole, 4 feet long; and 'Jeddart justice' is still a byword for hanging first and trying afterwards. Ferniehirst Castle (rebuilt 1598; restored 1889) was the seat of the Kerrs. Jedburgh has been a royal burgh from time immemorial, and till 1885, with Haddington, &c., returned an M.P. Woollen goods have been manufactured here since 1728. Pop. (1841) 3277; (1881) 3402. See Watson's *Jedburgh Abbey* (2d ed. 1891).

Jeddah. See JIDDAH.

Jefferies, JOHN RICHARD, generally known as RICHARD JEFFERIES, English writer on rural subjects, was born at the farmhouse of Coate, 2½ miles from Swindon, in Wiltshire, on 6th November 1848. He started life as a journalist on the staff of the *North Wilts Herald* about 1866, and for twelve years was busy with this kind of work and with writing crime novels. His name first became known by a long letter to the *Times*, in November 1872, on the labourers of Wiltshire. This procured him an opening to the magazines as a writer on agricultural and rural topics. In 1877 he abandoned country journalism, and moved nearer to London, hoping to make a living by his pen. In the following year he won his first real success with *The Gamekeeper at Home*; its subtitle, 'Sketches of Natural History and Rural Life,' indicates the kind of work by which his future fame was won. Other books written in the same vein, or on similar subjects, are *Wild Life in a Southern County* (1879), *The Amateur Poacher* (1880), *Round about a Great Estate* (1881), *Nature near London* (1883), *Life of the Fields* (1884), *Red Deer* (1884), and *The Open Air* (1885). The book entitled *The Story of My Heart* (1883) is a strange autobiography of inner life. Besides these he wrote some later novels of indifferent merit; *After London*, or *Wild England* (1885) is a curious romance of the future. Within his own province, although it was not a wide one, Jefferies was an admirable writer. He possessed a wonderful insight into the habits and ways of animals and

birds and creeping things, and a great love of them. No English writer has shown a more minute and accurate acquaintance with the life of the hedge-rows and woodlands and fields of southern England. He had also a reverent feeling for nature, not only of her outward phases and aspects, but also of what may be termed her inner life. Nor were human beings excluded from the range of his observation and sympathy: he has left admirable sketches of country-folk—farmers, gamekeepers, labourers, village-loafers, &c. He died at Goring in Sussex on 14th August 1887, after a painful illness of six years' duration. See Sir Walter Besant's *Eulogy* (1888) and the *Life* by H. S. Salt (1893).

Jefferson, JOSEPH, comedian, was born in Philadelphia on 20th February 1829. He came of a theatrical stock, his great-grandfather having been a member of Garrick's company at Drury Lane, while his father and grandfather were well-known American actors. With such an ancestry it is not wonderful that young Jefferson was on the stage from his very infancy, appearing as Cora's child in *Pizarro* when only three years of age, and dancing as a miniature 'Jim Crow' when only four. For many years he went through the hard training of a strolling actor, and then played in New York, where in 1847 he made a hit as Doctor Pangloss, and in 1858 created the part of Asa Trenchard in *Our American Cousin*, Sothorn playing Lord Dundreary. In 1865 he visited London, and at the Adelphi Theatre played for the first time his world-famous part of Rip Van Winkle (4th September 1865). With this character his name is identified, and although he has shown himself an admirable comedian in many characters, to the English-speaking world he is always Rip Van Winkle. Nor is this wonderful, for the character is one of the most perfect works of art—beautiful in conception, subtle and delicate in execution. And the art is all the actor's; the dramatist has done nothing. Rip is a lazy, good-for-nothing vagabond, but Jefferson makes him 'the Arcadian vagabond of the world of dreams.' See his *Autobiography* (New York, 1890).

Jefferson, THOMAS, third president of the United States, was born at Shadwell, Albemarle county, Virginia, 13th April 1743. His father, Peter Jefferson (d. 1757), of Welsh descent, was a planter and surveyor, and a member of the House of Burgesses; his mother was a granddaughter of William Randolph (1650-1711). Thomas Jefferson was the third child and eldest son of a family of ten children. He entered William and Mary College at the age of seventeen, three years after the death of his father, and remained there two years. In 1767 he was admitted to the bar, and practised with success. In 1769 he was a delegate to the House of Burgesses, and here his first important effort was in support of a motion for the easier emancipation of slaves. The passing of the Boston Port Bill, to take effect on 1st June 1774, decided Virginia to make common cause with Massachusetts, and Jefferson favoured the resolution passed in the Assembly of Virginia to set apart the first day of June as a day of fasting and prayer. The governor, Lord Dunmore, offended by this action, dissolved the Assembly, and the members met in the Raleigh Tavern, Williamsburgh, and resolved to advise the people of Virginia to send deputies to a convention to consider the affairs of the colony and elect delegates to a general colonial congress. Jefferson was chosen a member of the convention, and, unable to attend, he sent a communication which was published under the title of 'A Summary View of the Rights of British North America.'

It was not adopted as written by Jefferson, still he was threatened by Lord Dunmore with prosecution for high-treason; and his name was included in a bill of attainder moved in parliament, but not pressed to a vote. Jefferson was a member of the second congress, which met at Philadelphia in 1775, and took his seat on 25th June, a few days after the battle of Bunker Hill. Here his unwavering devotion to his country's cause, his close acquaintance with English law, and his manner, characterised by John Adams as 'prompt, frank, explicit, and decisive,' secured him the respect of the House. He was re-elected to the third congress (1776); and on 7th June Richard Henry Lee, of Virginia, as instructed by his constituents, moved that independence should be declared. Congress fixed 1st July for the consideration of Mr Lee's motion, and meanwhile appointed a committee of five to prepare a suitable declaration on which to act; Jefferson was chairman, and the others were Franklin, John Adams, Roger Sherman, and Robert R. Livingston. By request of his colleagues, Jefferson wrote the draft of the declaration which was submitted to the House on 28th June. Lee's resolution was passed July 2, and the formal declaration, essentially as submitted, was adopted July 4, 1776.

Jefferson now resigned his seat, and, although appointed a commissioner to France with Franklin and Silas Deane, he declined the office in order to serve the people of Virginia in forming a state constitution. Among the reforms largely due to him were laws converting estates tail into fee-simple, abolishing the principle of primogeniture, and establishing the freedom of religious opinion. He succeeded Patrick Henry as governor of Virginia in 1779-81; and during the invasion of the state by Arnold and Cornwallis he was equal to the emergency. In 1783 he was elected to congress, then sitting at Annapolis, Maryland, where he secured the adoption of the decimal system of coinage. He was sent in the summer of 1784 to act with Franklin and Adams as plenipotentiary in negotiating treaties of commerce with foreign nations; but in this mission they were not very successful, the only treaties effected being with Prussia and Morocco. The next year Jefferson succeeded Franklin as minister to France, just before the opening events of the Revolution. He remained during the stormy meetings of the National Assembly and the destruction of the Bastille, performing with much tact the delicate duties of ambassador, but evidently in sympathy with the revolutionary movement. In 1789 Washington appointed him secretary of state, but he did not enter on the duties of the office till March 1790. From the origin of the two political parties, Federal and Republican, Jefferson was the recognised head of the latter, while the other members of the cabinet and the president were Federalists. On 1st January 1794 Jefferson withdrew from public life to his estate at Monticello to devote his leisure to agricultural pursuits and his favourite literary and scientific studies.

From this retirement he was called to the vice-presidency of the United States in 1797; and in 1801 he was chosen president by the House of Representatives on the thirty-sixth ballot. The popular vote re-elected him by a large majority for the next presidential term. During the eight years of his administration party spirit ran high. Among the chief events of his first term were the war with Tripoli, the admission of Ohio, and the Louisiana purchase; of his second term, the firing on the *Chesapeake* by the *Leopard*, the Embargo, the trial of Aaron Burr for treason, and the prohibition of the slave trade. For these and nearly all other acts and events of his administrations Jefferson was as warmly praised by some as blamed

by others. In 1809, after nearly forty years of public service, he bade adieu to political life and strife. Henceforth his time was devoted to the cultivation of his estate, to boundless hospitality, to the interests of education, and especially to the establishment and superintendence of the University of Virginia. He died at Monticello, July 1, 1826, a few hours before the death of John Adams. Among his papers was found this inscription for his tomb: 'Here lies buried Thomas Jefferson, author of the Declaration of American Independence, of the Statute of Virginia for Religious Freedom, and Father of the University of Virginia.' In person he was over six feet in height, with blue eyes, fair complexion, broad forehead, and, in early life, red hair. He was a good classical scholar, and proficient in the science of his day, a ready writer and fluent talker, but not an eloquent orator.

We have his *Writings, Correspondence*, &c. (9 vols. ed. by H. A. Washington, New York, 1853-54), his *Notes on Virginia* (Paris, 1781), and his *Manual of Parliamentary Practice*. See Lives by Tucker (1837), Parton (1874), and Morse (1883); also Henry Adams, *History of the United States during the First and Second Administration of Thomas Jefferson* (4 vols. New York, 1891). His authorship of the Declaration of Independence has recently been disputed.

Jefferson City, since 1826 the capital of Missouri, is situated on the south bank of the Missouri River, 125 miles by rail W. of St. Louis. It has a state-house, governor's residence, U.S. court-house, state armory and penitentiary (1500 convicts), and the Lincoln Institute, a state-supported college for coloured students. Pop. 6742.

Jeffersonville, a city of Indiana, on the Ohio River, opposite Louisville, Kentucky, with which it is connected by an iron railway bridge nearly a mile long. The falls of the river at this point are utilised in the various manufactories, which include railway workshops, foundries, machine-shops, flour-mills, &c. There are also boat-yards, and hydraulic cement is manufactured in the vicinity. One of the state-prisons is here. Pop. (1890) 10,666.

Jeffrey, FRANCIS, LORD, a Scottish judge, politician, and literary critic, was the son of a deputy-clerk in the Court of Session, and was born at Edinburgh, 23d October 1773. After preliminary education at the High School there, with Scott and Brougham as schoolfellows, he spent two sessions at the university of Glasgow, and one at Oxford. In 1794 he was called to the Scottish bar, but, having adopted Whig politics at a time when Whig opinions were not favourable to professional advancement, he made little progress for many years; indeed for long his income did not exceed £100 per annum. He was early famed for the keenness and alacrity of his intellect and for his literary tastes. In after years, when his practice increased, he was, although not an orator, remarkably successful in jury trials. In the trials for sedition between 1817 and 1822 he acquired his greatest reputation at the bar. In 1820 and again in 1823 he was elected Lord Rector of the university of Glasgow on account of the great literary distinction he had then attained as editor of the *Edinburgh Review*. In 1829 he was elected Dean of the Faculty of Advocates; in 1830 he entered parliament as member for Perth, and on the formation of Earl Grey's ministry was nominated Lord Advocate for Scotland. After the passing of the Reform Bill, with which he had much to do, especially in the measures relating to Scotland, he was returned for the city of Edinburgh, which he continued to represent until 1834, when, tired of politics, he accepted from Lord Melbourne the dignity of a lord of the Court of Session. As a judge he was noted for his carefulness and ability. From 1815 he lived at Craigerook, where he died, 26th January 1850.

It is neither as lawyer, judge, nor politician that Jeffrey has secured his chief title to fame. It is as a literary critic and as leader in a new departure in literary enterprise. It was he who, along with Sydney Smith, Francis Horner, and a few others, established the *Edinburgh Review* (q.v.). The first proposer of the scheme is supposed to have been Sydney Smith, who was the nominal editor of the first three numbers, in 1802. After that, however, Jeffrey was appointed editor at a fixed salary of £50 per number, down to 1809, and then of £200 per number down to 1829, when he resigned. His own contributions were very numerous, especially at first, and were among the most brilliant and attractive of the papers. He himself appraised as his most valuable work a *Treatise on Beauty*, which nobody now reads. His style was easy and fluent, but diffuse and at times careless. He was exceedingly well informed on a great variety of topics, but not profound. He had a fine imagination, a satirical turn, and a quickness of perception which instantly detected errors in manner or offences against taste. He had the critical faculty without being a critic in the highest sense, for he devoted himself more to analysis of method than of matter and thought. His defect as a critic was strikingly illustrated by his mistaken estimate of the Lake poets. There was always much of the partisan about him, and a robustness, not to say brutality, in his treatment of opponents, which brought him many enemies. His contributions to the *Review* numbered about 200, and a selection from them was published in 4 vols. in 1844. See the Life by his friend Lord Cockburn (1852), as also Macvey Napier's *Correspondence* (1877) and Carlyle's *Reminiscences* (1881).

Jeffreys, GEORGE, BARON, the infamous judge, was born at Aeton in Denbighshire in 1648, educated at Shrewsbury, St Paul's, and Westminster schools, and called to the bar in 1668. He rose rapidly into practice at the Old Bailey bar, and became in 1671 common serjeant of the City of London. Hitherto he had affected to belong to the Puritan party, but he now began to intrigue for court favour, was made solicitor to the Duke of York, was knighted in 1677, and became Recorder of London in the following year. He was actively concerned in many of the Popish Plot prosecutions, was made chief-justice of Chester and king's serjeant in 1680, baronet in 1681, and chief-justice of the King's Bench in 1683. His first exploit was the judicial murder of Algernon Sidney, but in every state-trial he proved himself a willing tool to the crown, thus earning the special favour of James, who raised him to the peerage soon after his accession. Among his earliest trials were those of Titus Oates and Richard Baxter, and in both he showed his customary brutality and vindictiveness. In the summer of 1685 he was sent to the west to try those involved in Monmouth's rising, and earned the Lord Chancellorship by a series of judicial murders which has left his name a byword for cruelty. Three hundred and twenty were hanged as rebels during the 'Bloody Assize,' as Jeffreys made his way through Dorset and Somerset, while eight hundred and forty-one were transported, and a still larger number imprisoned and whipped with merciless severity. A drunken and brutal bully, he heaped the foulest reproaches upon his unhappy victims, and gloated with fiendish malignity over their prospective sufferings. It was his boast that he had hanged more traitors than all his predecessors since the Conquest. He held the Great Seal from September 1685 until the downfall of James, and supported all the king's despotic measures as president of the newly revived Court of High Commission, and in the trial of the seven bishops. Yet he had rational views on witchcraft, and was too

honest to turn Catholic like many better men. On the flight of his master he tried to follow his example, but was caught disguised as a sailor at Wapping, and sent to the Tower to save him from being torn in pieces by the mob. Here he died four months after, his frame already worn out by hard drinking, April 18, 1689.

See the *Life* by Woolrych (1827) and the apologetic or eulogistic one by H. B. Irving (1898).

Jehan. See AURUNGZEBE, AGRA.

Jehlam. See JHELUM.

Jehovah. the distinctive name for God in the Old Testament, in the Authorised Version is sometimes merely transliterated from the Massoretic Hebrew text, as above, but more frequently it is translated as 'LORD' (with capital letters). The word consists of the consonants JHWH or JHWH, with the vowels of a quite separate word, Adonai ('Lord'), an indistinct E being substituted for the short A. What its original vowels were is only matter of inference, for owing to a peculiar interpretation of such texts as Ex. xx. 7. Lev. xxiv. 11, the name came to be regarded as ineffable; the scribes in reading substituted 'Lord,' and the LXX. translation has *Kyrios*. The evidence of the Greek Church fathers, who give the forms *Jaho* and *Jao* as traditional, as well as the shortened Hebrew forms of the word, *Jah* (Ps. lxxviii. 4, &c.) and *Jahu* (in proper names, such as Jimejahn or Jeremiah), indicate that most probably it was originally spoken *Jahuch* (pron. *Yahuch*). Etymologically, it is a third person singular, imperfect, probably of the verb *hawah* (or *hajah*), signifying 'to be'; as regards the 'voice,' scholars are not agreed, some supposing it to be causative, and translating 'he will cause to be' or 'he will cause to come to pass,' while others with more probability view it as a simple indicative. The text usually relied on for the explanation of the name is Ex. iii. 14, with its kindred passages. The older interpreters explain the verb (here used in the first person) in a highly metaphysical and abstract sense; the 'I am' is He who really is, the absolutely existent, the eternal. The tendency of modern exegesis is to read a more concrete and historical meaning into the expression, translating it 'I will be what I will be,' and taking it as referring to the divine sovereignty, autonomy, self-determination, freedom, but especially to the freedom of the divine grace. This view is confirmed by such a passage as Hos. i. 9: 'Ye are not my people and I am not I WILL BE for you.' Jehovah is 'He who will be'—all in all to his people; but 'eye hath not seen,' 'ear hath not heard,' 'it hath not entered into the heart of man, nor can language express the ways in which his divine grace is to show itself to them; it must be left to unfold itself in the as yet undreamed-of actualities of their lives. The language of Ex. vi. 3 (which belongs to the priestly or latest portion of the Pentateuch) has been taken as proving that the name Jehovah was of relatively late origin among the Hebrews; but, if this interpretation is correct, the representation is hardly reconcilable with what is said in Gen. iv. 26 (an older portion of the Pentateuch), or with the very early existence of proper names containing this divine name (Ex. vi. 20). The word is doubtless very old, and in all probability its earliest connotation, if known, would be found to represent a very primitive phase of religious thought (perhaps it may be 'he who causes to fall' [the rain or lightning]; see Hebrew of Job, xxxvii. 6). At one time or another in the history of Israel and of the Christian church, it has conveyed with various fullness and depth all shades of the metaphysical and religious meanings hinted at above. Certain portions of the Pentateuch, especially of

Genesis, are distinguished by the almost unvarying use of this name of God, as also are certain sections of the Psalter—a peculiarity which has an important bearing on questions of Old Testament criticism (see BIBLE). For references to the recent literature of the subject, see the lexicon of Gesenius (ed. 1890), or Driver's essay in *Studia Biblica* (1885).

Jeisk, or **Elsk,** a town in the Russian province of Kuban (Caucasus), on a small bay, at the east end of the Sea of Azov, 65 miles SW. of Azov. Founded in 1848, it has grown rapidly, exports corn, flax, and wool, and has cloth manufactures and tanneries. Pop. 27,915.

Jejeebhoy, SIR JAMSETJEE (Jamshelji Jijibhai), a Parsee merchant-prince and philanthropist, was born of poor parents at Bombay, 15th July 1783. At an early period he showed a great aptitude for mercantile pursuits, and was taken into partnership by his father-in-law, a Bombay merchant, in 1800. When peace was restored in Europe after the fall of Napoleon the Indian trade with Europe increased enormously, and in this increase these Parsee merchants participated. By 1820 Jejeebhoy had amassed an immense fortune, and now began to exhibit liberality on a magnificent scale. He contributed very generously to various educational and philanthropic institutions in Bombay, as a hospital, a poor asylum, the Parsee Benevolent Institution, and a school of art; built the Mahim Causeway; and paid most of the expenses connected with the construction of the water-works at Poona. Altogether, between 1822 and 1838 he spent upwards of a quarter of a million pounds sterling in undertakings of a purely benevolent character. Parsee and Christian, Hindu and Mussulman, were alike the objects of his beneficence. The Queen knighted him in 1842; and in 1857 he was made a baronet. He died 14th April 1859.

Jejunum, the middle part of the small intestine. See DIGESTION.

Jelalabad, a town of Afghanistan, stands near the Kabul River, about half-way between the Indian frontier fortress of Peshawar and the city of Kabul. Formerly a strong fortress itself, it is now a dirty village of about 3000 inhabitants. It is interesting from its heroic defence by Sir R. Sale in 1841-42; in the war against Afghanistan (q.v.) of 1878 it was held by the British until 1880.

Jelal-ud-din, a Sufi Persian poet (1200-73). See PERSIA (*Literature*).

Jelatou, or **ELATMA,** a town in the north of the Russian province of Tambov, 170 miles ESE. of Moscow. Pop. 7560.

Jeletz, or **ELETZ,** a town of Russia, 120 miles by rail ESE. of Orel. It exports large quantities of wheat and flour, and has a great trade in cattle. Its industries include leather, soap, candles, iron goods, lace, and linen. Pop. (1890) 36,250.

Jelf, RICHARD WILLIAM, theologian, was born 25th January 1798, the second son of Sir James Jelf. He was educated at Christ Church, Oxford, took a second class in 1820, and became Fellow of Oriel, and later, tutor. In 1826 he was appointed preceptor to Prince George of Cumberland, afterwards king of Hanover, in 1839 Canon of Christ Church, and in 1844 Principal of King's College, London. He died September 19, 1871. His most important work is his Bampton Lectures for 1844, *The Motus of Grace*. Dr Jelf was a pillar of orthodoxy, and his name will be best remembered for the part he took in the proceedings which led to Maurice being deprived of his professorship at King's College for unsound views on the question of eternal punishment expressed in his *Theological*

Essays. His Thirty-nine Articles Explained was edited by J. R. King in 1873.

Jelf, William Edward, Greek grammarian, was son of Sir James Jelf, of Oaklands, Gloucestershire, and was born at Gloucester in 1811. He was educated at Eton and Christ Church, Oxford, took a first-class in 1833, and was successively tutor and censor of his college, public examiner and proctor of the university. He was one of the preachers at the Chapel Royal, Whitehall, 1846-48, and gave the Bampton Lectures in 1857 on *Christian Faith*. In 1861 he published a letter to Dr Temple on the "Supremacy of Scripture" in answer to his famous essay on "The Education of the World." Dr Jelf died October 18, 1875. He is best remembered as the author of a *Greek Grammar*, based on that of Kuhner (1842-45; 4th ed. 1866), still the most complete in English. His *Ecumenism into the Doctrine of Confession* appeared in 1875; his *Ritualism, Romanism, and the English Reformation* in 1876; a Commentary to the 1st Epistle of John in 1877.

Jellachich, Joseph, Baron, Austrian general and Ban of Croatia, was born at Peterwardein on 16th October 1801. His father attained some celebrity in the Turkish wars and in those of the French Revolution; the son also adopted the profession of arms. Having won the entire confidence of the Croats, he was in 1848 appointed Ban of Croatia; by this appointment Austria secured the support of the Slavonian Croats against the Magyars of Hungary. Jellachich took an active part in the suppression of the Hungarian rising. He died at Agram, 20th May 1859. Not only a soldier and administrator but a poet, he published a collection of his poems at Vienna in 1851.

Jellalabad. See JELALABAD.

Jelly. For jellies made with fruit, see PRESERVED PROVISIONS. The food value of calves-foot jelly and similar jellies depends on their gelatine. See GELATINE, FOOD, DIET.

Jelly-fish (*Medusa*), bell-shaped or disc-like marine Hydrozoa, for the most part active swimmers. One set, known as Acraspeda or Acalephæ, are usually large, with a climax in a giant specimen of *Cyanea*, which had a bell $7\frac{1}{2}$ feet across, and tentacles 120 feet long. Beset with myriads of stinging cells, these "hubbbers" often make bathers more than uncomfortable. They are frequently left stranded in great numbers on the beach by the retiring tide. The common Aurelia is a well-known representative, while the exceptional Lucernarians are noteworthy in leading a more or less sedentary life attached to seaweeds and other objects. Anatomically different from the above, and included among the Craspedote Hydrozoa (q.v.), are the Trachymedusæ, of which *Geryonia* is a good type. Finally, a great number of Medusoid forms, usually small in size, very closely resemble the Trachymedusæ, but differ both from them and from the Acraspeda in being the liberated sexual "persons" of Hydroïd or Zoophyte colonies. See CELENTERATA; GENERATIONS (ALTERNATION OF); and for exact classification, HYDROZOA.

Jemappes, a village in the Belgian province of Hainault, 3 miles by rail SW. of Mons. Here the French republicans under Dumouriez, on 6th November 1792, defeated the Austrians, which victory placed Belgium in the power of the French. The village stands on one of the richest coalfields of Belgium, and manufactures stoneware, glass, and chemicals. Pop. (1885) 11,322.

Jena, a town of Saxe-Weimar, at the Leutra's influx to the Saale, 14 miles by rail SE. of Weimar,

and 31 NNE. of Saalfeld. It lies 518 feet above sea-level, engirt by steep chalk hills, of which the Hansberg (1069 feet) is crowned by the old Fuchsturm, and the Forstberg by a tower in memory of the Jena students who fell in the Franco-German war. It is still a quaint old-world place, with its ducal *schloss*, the "Black Bear" inn where Luther halted on his flight from the Wartburg, and a church whose steeple is 311 feet high. Goethe here wrote his *Hermann and Dorothea*, Schiller his *Wallenstein*; and the houses of these and of other illustrious residents were marked with tablets in 1858, on occasion of the tercentenary of the university, when, too, was erected a bronze statue of its founder, the Elector John Frederick of Saxony. He founded it in 1547-58 to take the place of Wittenberg as a seat of learning and evangelical doctrine; and it soon attained a high reputation, though not its zenith till the days of Goethe's patron, Duke Karl August (1787-1806). To that period belong the names of Fichte, Schelling, Hegel, Schiller, the Schlegels, Voss, Fries, Krause, and Oken; to our own, of Hase and Haackel. Jena now has 88 professors and lecturers, over 450 students, and a library of 200,000 volumes. In 1883 a memorial was erected of the Burschenschaft (q.v.). Pop. (1875) 9920; (1885) 12,017.

The battle of Jena is often applied as a collective name to two separate engagements fought on the same day, 14th October 1806—one at Auerstädt (q.v.), 14 miles to the north, between 30,000 French under Davout and 48,000 Prussians under the Duke of Brunswick; the other, on the heights round Jena, between 70,000 Prussians under the Prince of Hohenlohe and 90,000 French under Napoleon in person. In both the Prussians were totally defeated; and their defeat entailed that utter prostration of the Fatherland which was typified two years later by the hare-hunt held on the battlefield of Jena by the French and Russian emperors. See works by Orloff (3d ed. 1876), Ritter (1885), and, for the battle, Goltz (1883).

Jenghiz Khan. See GENGHIS.

Jenissei. See YENISEI.

Jenkins, Robert, an English merchant captain, trading from Jamaica, who alleged that in 1731 his sloop had been boarded by a Spanish *guarda costa*, and that, though no proof of smuggling had been found, he had been tortured, and his ear torn off. The said ear—some said he had lost it in the pillory—he produced in 1738 in the House of Commons; and a member asking him what were his feelings in the hour of peril, he answered, "I recommended my soul to God, and my cause to my country." Walpole next year was forced by the popular clamour to consent to war against Spain.

Jenner, Edward, the discoverer of vaccination, was born at Berkeley, in Gloucestershire, on the 17th of May 1749, and was the third son of the Rev. Stephen Jenner, vicar of the parish, and rector of Rockhampton. His schooling over, he was apprenticed to Mr Ludlow, an eminent surgeon at Sodbury, near Bristol; and in his twenty-first year went to London to prosecute his professional studies under the celebrated John Hunter (q.v.), in whose family he resided for two years. The influence of the master exerted a lasting effect on the pupil, who became an expert anatomist, a sound pathologist, a careful experimenter, and a good naturalist. In 1773 Jenner settled in his native place, where he soon acquired a large practice. In 1788 his well-known memoir, *On the Natural History of the Cuckoo*, appeared in the Transactions of the Royal Society. In 1792, the fatigues of general practice having become irksome to him, he resolved to confine himself to medicine,

and with that view he obtained the degree of M.D. from St Andrews.

The discovery of the prophylactic power of vaccination, by which the name of Jenner has become immortalised, was the result of a prolonged series of observations and experiments. He was pursuing his professional education in the house of his master at Sodbury, when a young country-woman came to seek advice. The subject of smallpox being mentioned in her presence, she observed: 'I cannot take that disease, for I have had cow-pox.' This was before the year 1770. It was not till 1775 that, after his return to Gloucestershire, he had an opportunity of examining into the truth of the traditions respecting cow-pox; and in the month of May 1780, while riding with his friend Edward Gardner, on the road between Gloucester and Bristol, he went over the natural history of cow-pox; stated his opinion as to the origin of this affection from the heel of the horse [when suffering from the grease]; specified the different sorts of disease which attacked the milkers when they handled infected cows; dwelt upon that variety which afforded protection against small-pox; and with deep and anxious emotion mentioned his hope of being able to propagate that variety from one human being to another, till he had disseminated the practice all over the globe, to the total extinction of smallpox. Many investigations delayed the actual discovery for no less than sixteen years, when at length the crowning experiment on James Phipps was made on the 14th of May 1796, and Jenner's task was virtually accomplished. This experiment was followed by many of the same kind; and in 1798 he published his first memoir, entitled *An Inquiry into the Causes and Effects of the Variola Vaccinæ*. Although the evidence accumulated by Jenner seemed conclusive, yet the practice met with violent opposition until a year had passed, when upwards of seventy of the principal physicians and surgeons in London signed a declaration of their entire confidence in it. His discovery was soon promulgated throughout the civilised world. Honours were conferred upon him by foreign courts, and he was elected an honorary member of nearly all the learned societies of Europe, though not of the College of Physicians, which required him to pass an examination in classics. Parliament voted him in 1802 a grant of £10,000, and in 1807 a second grant of £20,000; and in the year 1858 a public statue in his honour was erected in London. His latter days were passed chiefly at Berkeley and Cheltenham, and were occupied in the dissemination and elucidation of his great discovery. He died of apoplexy at Berkeley, 26th January 1823. See his *Life and Correspondence*, by Dr J. Baron (2 vols. 1827-38; 2d ed. 1850); also the article VACCINATION.

Jenner, Sir William, physician, was born at Chatham in 1815, and educated at University College, London, where he himself was professor from 1848 till 1879. He was appointed physician in ordinary to the Queen in 1862, and to the Prince of Wales in 1863; was made a baronet (1868), K.C.B. (1872), G.C.B. (1893), F.R.S., president of the College of Physicians, &c. It was he who established the difference between typhus and typhoid fevers (1851). See his *Lectures on Fevers and Diphtheria* (1893). He died 11th Dec. 1898.

Jennings, Sarah. See MARLBOROUGH.

Jenolan Caves, a series of vast limestone caverns, situated on the west side of the Blue Mountains, in New South Wales, 160 miles W. of Sydney. They were discovered in 1841, and were set apart in 1866 as public property by the colonial government. In grandeur, magnitude, and rich variety they rival the Mammoth Caves of

Kentucky. See S. Cook's *Jenolan Caves* (Lond. 1889).

Jensen, Adole, a German composer, was born in 1837 at Königsberg; from 1856 to 1868 was a musician successively at Posen, Copenthagen, and Berlin, and, his health giving way, next lived at Dresden, Gratz, and Baden Baden, where he died, 23d January 1879. He is best known by his songs and compositions for the piano.

Jenyns, Soame, was born in London in 1704; studied at St John's College, Cambridge; sat in parliament for Cambridgeshire, Dunwich, and Cambridge town; was a commissioner to the Board of Trade, and died in December 1787. As he was rich he easily acquired a literary reputation, but he lacked capacity for the high metaphysical problems that he attacked, and his books are long since securely forgotten. Indeed his name only survives from the accident that Dr Johnson criticised in the *Literary Magazine* his *Free Inquiry into the Nature and Origin of Evil* (1756). He condemned the book as shallow and inadequate, and this judgment Jenyns never forgave him. Indeed the argument was not worth his powder and shot, but Johnson in his criticism excelled himself. Jenyns, now grown orthodox, published in 1776 a no less shallow book, *View of the Internal Evidence of the Christian Religion*, for the divine origin of which he strangely argued from its utter variance with human reason.

Jephthah, one of the judges of Israel, was a base-born son of Gilead, and at his father's death was driven out from any share in his father's inheritance by the legitimate sons. He was a leader of free-booters on the border-land of Ammon until recalled by the Gileadite elders to heal them in their attempt to throw off the yoke of Ammon. He collected his warriors from all parts of Gilead and Manasseh, and before the battle made his unhappy vow to offer up for a burnt-offering the first thing that came forth from the doors of his house on his return. The Ammonites were defeated with great slaughter, and twenty of their cities taken, but as the triumphant conqueror drew near his house at Mizpeh there came forth to meet him a procession of maidens with dances and timbrels, and first among them his daughter and only child. The high-spirited maiden asked only for two months in which to bewail her hapless fate with her companions among her native mountains, and then returned to her father, and 'he did unto her his vow.' Jephthah had next to subdue the tribe of Ephraim, envious of his glory, and this he did effectually, cutting off thousands of the fugitives at the fords of Jordan, where they were identified as Ephraimites by their inability to pronounce the word *Shibboleth*. Jephthah judged Israel for six years, and died. Many theologians have found it difficult to believe that one of the heroes of faith of Hebrews, chap. xi., should have offered a human sacrifice, and have taken refuge in Joseph Kimchi's suggestion that the conditions of the vow were satisfied by a sentence of perpetual virginity; but this is to take a dishonest liberty with the plain meaning of the passage. The story of Jephthah's daughter is closely paralleled by that of Iphigenia in Greek mythology, and both are grouped together by Tennyson in his splendid poem, *The Dream of Fair Women*.

Jerablûs. See CAEGHLMUSH, HITTITES.

Jerash. See GERASA.

Jerba, a small island of Africa, off the south-east coast of Tunis, to which country it belongs. It is situated in the Gulf of Gabes, being separated from the mainland by a narrow channel. Area, 425 sq. m.; pop. 40,000, seven eighths Berbers, the rest

Jews. The soil is very fertile, and is laid out in gardens, which produce olives, dates, &c. Fine woollen textiles are made. Jerba is a centre for the Tunisian sponge-fishing. It has been held to be the home of the ancient Lotophagi; ruins of the former capital, Meninx, still exist. See EXIGAKAYSER, *Description Historique de l'Île Djérba* (1885).

Jerboa (*Dipus*), a genus of rodent quadrupeds, belonging to a distinct family, Dipodidae, remarkable for the great length of the hind-legs and kangaroo-like power of jumping. The fore-legs are very small, hence the ancient Greek name *dipous* ('two-footed'). The tail is long, cylindrical, covered with short hair, and tufted at the end.

Jerboa (*Dipus aegyptus*).

The jerboas are inhabitants of sandy deserts and wide grassy plains in Asia and the east of Europe and Africa. An allied form, *Mariusus*, occurs in North America. They are burrowing animals, nocturnal, very destructive to grain and other crops, laying up hoards for their winter use. They take prodigious leaps when alarmed; the fore-feet are then not used at all, but by means of the hind-feet and the tail they leap, although they are small animals, several yards. Their flesh is said to resemble that of the rabbit.—Closely allied to the jerboas are the Gerbils (*Gerbillus*), small quadrupeds, also distinguished by great length of hind-legs and power of leaping, inhabitants of the warm and sandy portions of the Old World.

Jordan, WILLIAM, an active journalist, born at Kelso in 1782. He removed to London in 1804, reported for the short-lived *Larva* and the *Pilot* evening newspaper, next joined the staff of the *Morning Post*, and subsequently reported during three sessions for the *British Press*, contributing at the same time to the *Satirist*, or *Monthly Meteor*, the copyright of which he purchased. It was he who seized Bellingham after he had murdered Spencer Percival in the lobby of the House of Commons on 11th May 1812. In 1813 Jordan became editor of the *Sun*, but sold his share in 1817 to found the *Literary Gazette*, which he edited for thirty-three years. He lent his support to establish the Royal Society of Literature and the Melodists' Club, and in 1830 commenced the *Foreign Literary Gazette*, which died, however, in its thirteenth number. In 1852 Jordan was granted a pension of £100, while a testimonial was presented to him subscribed to by many of the first men of the day. He published his *Autobiography* in 4 volumes in 1852-53, and in 1866 *Men I have known*. He died in 1869.

Jeremiah (Heb. *Jirmijahû*, or *Jirmejâh*), the prophet, son of Hilkiah, the priest, was a native of

Anathoth (now Anata), in the territory of Benjamin, about 2½ miles NNW. of Jerusalem. In Anathoth while still young (i. 6) he received the prophetic call, described in the opening of his book, in the thirteenth year of Josiah (627-26 B.C.), and his prophetic activity, principally carried on in Jerusalem, continued for at least forty years thereafter. His teaching in its political, ethical, and religious aspects can be understood only after a careful study of the complicated circumstances of his time, which, of course, can only be broadly indicated here. It was after he had been for five years a prophet—in the eighteenth year of Josiah—that the important occurrences connected with the finding of the book of the law (2 Kings, xxii., xxiii.) took place: and, although Jeremiah is not mentioned in the history as having had any part in these, he was fully in sympathy with the reformation movement which they inaugurated, and most of his distinctive prophetic teaching had reference to it (see, for example, especially xi. 1-8; xvii. 19-27). In the thirty-first year of Josiah, when Jeremiah had been for eighteen years a prophet, occurred the death of that king on the battlefield of Megiddo, and Jehoahaz or Shallum, his immediate successor, was, after a brief reign of three months, deposed by Pharaoh-Necho, the conqueror, in favour of Jehoiakim, the subservient vassal of the Egyptian king. Jehoiakim had not been long on the throne before Jeremiah began to foretell the doom of Judah and Jerusalem, which he saw to be inevitably approaching, in the series of characteristic discourses preserved in chaps. vii.-ix. and xxvi., warning the Jewish leaders of the folly of the security with which they vainly trusted in the presence of the temple of the Lord among them, and bidding them look to the ruins of Shiloh. It was at the close of one of these discourses that he was seized by the priests and the prophets and all the people and brought before the authorities on the capital charge of having 'prophesied against the city,' and it was chiefly to the intervention of his fast friend Ahiakan, the son of Shaphan, that he owed his acquittal and release. The battle of Carchemish, in the fourth year of Jehoiakim, when the defeat and retreat of Pharaoh-Necho laid the whole of Syria and Palestine open to the approach of the Chaldeans, naturally had a profound effect upon the foreign policy of Judah; the same year marked also a new departure in the prophesying of Jeremiah, in so far as he began henceforward to declare Nebuchadnezzar's divinely-appointed mission to be to lay upon Judah a period of desolation which was to last for 'seventy' years. It was in this year that he received the divine command to commit to writing the various oracles he had up to that time delivered, and this he did with the assistance of Baruch, his disciple and friend. The incidents of the public reading of this record, and of a subsequent partial reading in the presence of the king, which led to its being committed to the flames, are among the most graphic in the whole book (xxxvi.).

Jehoiakim after a reign of eleven years was succeeded by his son Jeconiah, whose brief and obscurely-recorded reign of three months terminated in the deportation of himself and a number of his subjects to Babylon, the incident alluded to in the parable of the two baskets of figs (xxiv.). To these exiles the prophet shortly afterwards addressed the letter contained in chap. xxix., with hopeful assurances, but warning them that the captivity would certainly last for seventy years. To King Zedekiah, who had succeeded, and his advisers, Jeremiah held equally decided language, declaring the futility of all their politic devices against the Chaldean power; the watchword of his policy was 'Serve the king of Babylon

and live,' and this, in the teeth of angry and bitter opposition, he never failed to maintain, as, for example, in his public controversy in the temple court with the rival prophet Hananiah, whose theme was 'Ye shall not serve the king of Babylon' (xxxviii.). At length, in consequence of Zedekiah's treacherous and impolitic alliance with Egypt, Nebuchadnezzar, in Zedekiah's ninth year, invaded Judæa. For a time he was compelled by the appearance of an Egyptian army to raise the siege of Jerusalem, a temporary relief which led the nobles to use their influence with the king to revoke the emancipation of the slaves which shortly before had been proclaimed. This revocation, against which Jeremiah strongly protested, was the theme of his last public address (xxxiv.). Persuaded that the catastrophe he had so long foretold was only postponed, he was in the act of leaving Jerusalem in order to spend the rest of his days in retirement at Anathoth, when, on the suspicion that he was deserting to the Chaldeans, he was arrested and thrown into prison. Still adhering to his gloomy prophecy, he was consigned to the deepest dungeon, where but for the interference of Ebedmelech he would doubtless soon have perished. He was not restored to liberty until an eighteen months' siege had ended in the capture of the city, when he received from Nebuzardan permission to fix his residence where he chose. It was towards the end of the siege that he gave practical proof of his faith in the ultimate return of his countrymen to their own land by exercising his right of redemption over the ancestral lands of his family in Anathoth. Jeremiah now attached himself to Gedaliah, the governor whom the Babylonians had set over the Jews whom they had left, with his headquarters in Mizpeh; after the murder of Gedaliah he accompanied his compatriots to Tahpanes, the border city of Egypt, where, according to tradition, he died a martyr's death.

Viewed in the light of the preceding brief sketch of Jeremiah's life, it will be seen that the book of his prophecies as we now possess it does not follow any chronological order. It consists of the following four parts: (1) chaps. i.-xxxix., consisting of prophecies relating to Judah, mostly with some historical data attached, and all belonging to the period prior to the fall of Jerusalem; (2) chaps. xl.-xlv., narrative of events subsequent to the fall, along with certain prophecies belonging to that period, and also including an oracle relating to Baruch, spoken in the fourth year of Jehoiakim; (3) xlvii.-li., oracles relating to foreign nations—Egypt, Philistia, Moab, Ammon, Edom, Damascus, Kedar, and the kingdoms of Hazer, Elam, Babylon—of various dates; according to most critics, l. li. are not by Jeremiah, but by a prophet who wrote in Babylonia towards the close of the captivity; (4) chap. lii., a historical appendix closely parallel to 2 Kings, xxv.

Important critical questions are suggested by the fact that the LXX. version of Jeremiah differs considerably in its arrangement from that now seen in the Massoretic text, and that it is considerably shorter—by about one-eighth of the whole—mainly through the omission of words, clauses, and single verses. The relative value of the Greek and Hebrew recensions has not yet been conclusively determined; neither seems to deserve unqualified preference.

The distinctive advance of Jeremiah's teaching on that of his predecessors is due to his clear recognition of the fact that the divine purpose could not be realised under the forms of the Hebrew state, that the continuity and victory of the true faith could not be dependent on the continuity of the nation. Israel must be wholly dispersed, and can

only be gathered again by a divine call addressed to individuals, and bringing them one by one into a new covenant with their God, written on their hearts (xxxi.). Here for the first time in history the ultimate problem of faith is based on the relation of God to the individual soul; and it is to Jeremiah's idea of the new covenant that the New Testament teaching directly attaches itself.

The most important expositions of Jeremiah are those of Ewald (*Prophets*, vol. iii. Eng. trans. 1857), Graf (1862), Hitzig (1841), and, in English, Cheyne (*Pulpit Commentary*, 1883-85). See also Cheyne's *Jeremiah: his Life and Times* (1888), and Ball's *The Prophecies of Jeremiah* (1890); and Workman's *Text of Jeremiah* (1889) is useful, though not to be implicitly trusted.

Jerez de la Frontera. See XERES.

Jerfalcon. See FALCON.

Jericho, once one of the most flourishing cities of Palestine, two hours' journey westward from the Jordan, and six hours north-east from Jerusalem, in a well-watered and fruitful district, yielding dates, raisins, balsam, and honey, and having rose-gardens. The capture of Jericho by the Israelites on their first entry into Canaan, its destruction, Joshua's curse on the rebuilders, and the rebuilding of it in the reign of Ahab are recorded in Josh. vi.; 1 Kings, xvi. 34. It appears to have been afterwards the seat of a school of prophets (2 Kings, ii. 4, &c.). It suffered during the Babylonian exile (Ezra, ii. 34). The groves of Jericho were given by Antony to Cleopatra, and passed to Herod the Great, who resided in Jericho, beautified it, and died there. It was destroyed in the reign of Vespasian, and again rebuilt under Hadrian. In the time of the crusades it was repeatedly captured, and at last completely destroyed. The place is now a shapeless ruin, with a miserable village, Ribā or Arīhā, and excavations into the green mounds have only disclosed sun-dried bricks, of which it has been thought the walls of the city may have been built.

Jerked-beef, beef preserved by drying in the sun. It is properly called *charqui*, and, like its name, is originally of Chilian origin.

Jeroboam, the first king of the divided kingdom of Israel. He belonged to the tribe of Ephraim, and for his capacity was raised by Solomon to be superintendent of the labours and taxes exacted from his tribe at the construction of the fortifications underneath the citadel of Zion. The growing disaffection of his tribesmen and the alienation from Solomon of the prophetic order fostered his own ambition; but he was soon obliged to flee to Egypt for safety. After Solomon's death he returned to head the revolt of the northern tribes against Rehoboam, and established his chief strongholds in Shechem on the west and Penneh on the east. In order to destroy the religions as well as the political unity of the ancient kingdom he now established shrines at Dan and Bethel to wean away his people from the sacred yearly pilgrimages to Jerusalem, and, further, set up in these images borrowed from the animal-worship of the Egyptians. Thus his name has descended in proverbial infamy as 'Jeroboam, the son of Nebat, who made Israel to sin,' and Roman Catholic writers found in him a convenient parallel to Henry VIII. at the time of the Reformation. Jeroboam suffered a defeat from Abijah, son of Rehoboam, and died soon after in the twenty-second year of his reign.—Jeroboam II. was the son of Joash, of the dynasty of Jehu. He thrust back the Syrian invaders, reconquered Ammon and Moab, but earned the denunciations of the prophets Amos and Hosea by failing to reform religion at home.

Jerome, SE (EUSEBIUS HERONYMUS SOPHRO- NIS), was born at Stridon, a town whose site is

now unknown, on the confines of Dalmatia and Pannonia, at some period between 331 and 345—probably nearer to the latter year. His parents were both Christians. His early education was superintended by his father, after which he studied Greek and Latin rhetoric and philosophy under Elinus Donatus at Rome, where he was also admitted to the rite of baptism. After a residence in Gaul, he seems to have revisited Rome; but in the year 370 he had settled in Aquileia with his friend Rufinus. For some unknown reason he suddenly went hence to the East; and after a dangerous illness at Antioch, which appears to have still further added to the religious fervour of his disposition, he retired, in 374, to the desert of Chalcis, where he spent four years in penitential exercises and in study, especially of the Hebrew language. In 379 he was ordained a priest at Antioch, after which he spent three years in Constantinople in close intimacy with Gregory of Nazianzus; and in 382 he came on a mission connected with the Meletian schism at Antioch to Rome, where he became secretary to the pope Damasus, and where, although already engaged in his great work of the revision of the Latin version of the Bible, he attained to great popularity and influence by his sanctity, learning, and eloquence. Many pious persons placed themselves under his spiritual direction, the most remarkable of whom were the lady Paula and her daughter Eustochium. These ladies followed him to the Holy Land, whither he returned in 385. He permanently fixed his residence at Bethlehem in 386, the lady Paula having founded four convents, three for nuns, and one for monks, the latter of which was governed by Jerome himself. It was in this retreat that Jerome pursued or completed the great literary labours of his life; and it was from these solitudes, all peaceful as they might seem, that he sent forth the fiery and vehement invectives which marked not only his controversy with the heretics Jovinian, Vigilantius, and the Pelagians, but even with his ancient ally, Rufinus, and, although in a minor degree, with St. Augustine. His conflict with the Pelagians rendering even his life insecure at Bethlehem, he was compelled to go into concealment for above two years; and soon after his return to Bethlehem in 418 he was seized with a lingering illness, which terminated in his death, September 30, 420. His original works, consisting of letters, treatises, polemical and ascetical commentaries on Holy Scripture, and his version and revision of former versions of the Bible, were first published by Erasmus, 9 vols. folio (Basel, 1516), and have been several times reprinted. The best editions are that of the Benedictines (5 vols. folio, Paris, 1693-1706) and, still more, that of Vallarsi (11 vols. Verona, 1734-42). St. Jerome is universally regarded as the most learned and eloquent of the Latin Fathers. His commentaries on the Bible are especially valuable for the learning which they display; but his opinions are often exaggerated and fanciful, and through his controversial writings there runs a strain of violent invective, which contrasts unfavourably with the tone of his contemporary, St. Augustine. See the article VULGATE; also the works by Zoëcker (Gotha, 1865), Amedée Thierry (Paris, 1867), Goelzer (Paris, 1886), E. L. Curtis (S. P. C. K. 1878), and Mis Martin (1888); and the translations by Fremantle (1893).

Jerome Bonaparte (1781-1860), king of Westphalia. See BONAPARTE.

Jerome of Prague, the friend and disciple of Huss, was born at Prague between 1360 and 1370. The statement that his family name was Faulfisch is incorrect. After attending the university of his native town, he studied for some

time in Oxford, where he became a convert to Wyclif's doctrines. When he reached home he zealously taught the new doctrine he had learned in England. He further studied at Paris, Heidelberg, and Cologne, and acquired a reputation for learning and energy. Ladislaus II., king of Poland, employed him to help to reorganise the university of Cracow in 1410; and Sigismund, king of Hungary, invited him to preach before him at Budapest. Jerome entered with his whole soul into the contest carried on by Huss (q.v.) against the abuses of the hierarchy and the profligacy of the clergy. But his impatient zeal led him to overstep the bounds of prudence, and even to abuse the authority he possessed. When Huss was arrested at Constance Jerome voluntarily hastened to his side to defend him, although he was not provided with a safe-conduct. Arrived at Constance, he was met by sinister rumours as to the fate in store for Huss and himself. He hastily withdrew from the city, and applied for a safe-conduct. It was refused; thereupon Jerome set out to return to Prague, but was arrested at Hirschau in Bavaria in April 1415, and conveyed to Constance. After four months' imprisonment he recanted his opinions; but eight months later still (in May 1416) he boldly withdrew his recantation, and in the same heroic spirit went to the stake, 30th May 1416. See works in German by Helfert (1853) and Becker (1858), with others cited at HUSS and WYCLIF.

Jerrold, DOUGLAS WILLIAM, author, dramatist, and wit, was born in London, January 3, 1803. He was the youngest son of Samuel Jerrold, actor and manager, by his second wife. His infant years were passed at Wilsby, near Cranbrook in Kent. In 1807 his father became lessee of the theatre at Sheerness. Here, with Gesner's *Death of Abel* and *Roderick Random*, Douglas Jerrold as a child of six or seven began to manifest a voracious appetite for books. About the end of 1809 he was sent to school at Sheerness; in December 1813 he joined the navy as a midshipman. On the close of the war his ship was paid off; and the first day of January 1816 saw the arrival of the Jerrold family in London, where, from Broad Court, Bow Street, Douglas Jerrold started life anew as a printer's apprentice. In 1819 he was a compositor on the *Sunday Monitor*, when the following incident probably decided his bent towards literature: he had been to see *Der Freischutz*, and, having written a criticism on it, dropped it into his employer's letter-box, and the next morning was handed his own copy to set up, with an editorial note to the anonymous correspondent requesting further contributions. Jerrold's capacity for study was enormous, and his perseverance indefatigable; night and morning he worked at Latin, French, and Italian, besides getting through a vast amount of reading. He became dramatic critic, as well as compositor, on the *Monitor*. In 1821 he married Miss Mary Swann. Before this date he had already made a start as a dramatist; four of his pieces had been produced, the first of which, *More Frightened than Hurt* (written when Jerrold was about fifteen), came out in 1821. In 1825 Jerrold was engaged, at a weekly salary, to write dramas, farces, &c., as required, for the Coburg Theatre. In 1829 he was engaged at five pounds a week to write in a similar manner for the Surrey Theatre, where in that year *Black-eyed Susan* was acted for the first time. From this date up to 1854, when *The Heart of Gold* came out at the Princess's Theatre, numerous plays were produced, each one of which was characterised by the author's unique style and brilliant and sparkling dialogue. Jerrold's contributions to periodical literature began soon after he commenced life in London, with occasional verses and sketches in the various magazines of

the day; as his position became more assured he contributed to the *Monthly*, the *New Monthly*, *The Ballot* (which he sub-edited), *Punch in London* (a short-lived prototype of *the Punch*), the *Athenian*, *Blackwood's*, and other periodicals. *Punch* was started in 1841, and Jerrold was a constant and important contributor from its second number up to the time of his death. He successively edited the *Illuminated Magazine* (1843-44), *Douglas Jerrold's Shilling Magazine* (1845-48), and *Douglas Jerrold's Weekly Newspaper* (1846-48). In these periodicals, along with *Punch*, appeared much of his best work. In politics—and his was no mean political force—Jerrold was Liberal, and in 1852 he accepted the editorship of *Lloyd's Weekly Newspaper* of which it has been said that he 'found it in the street, and annexed it to literature.' As a wit, for what has been well termed 'flashing insight,' Jerrold stands alone. He died at Kilburn on June 8, 1857. A collected edition of Jerrold's works, in eight volumes, was published during his lifetime; it contains his principal writings, *St Giles and St James*, *The Man made of Money*, *The Story of a Feather*, *Cakes and Ale*, *Punch's Letters to his Son*, *Punch's Complete Letter-writer*, *Chronicles of Cloacynook*, *Mrs Caullie's Curtain Lectures*, &c., and fewer than half of Jerrold's dramatic works. A selection from Jerrold's political writings in *Lloyd's* was published in 1868 under the title of *Other Times*. *The Life and Remains of Douglas Jerrold*, by his son, W. Blanchard Jerrold, was published in 1859.

WILLIAM BLANCHARD JERROLD, eldest son of the above, born in 1826, was named after Laman Blanchard (q.v.), who was his godfather, and whose daughter he married (1849). Educated as an artist, Jerrold early abandoned art for literature, his chief work as artist being the part he took in the production of Howe's *Illustrated Book of British Soaps*. He served his apprenticeship to literature on his father's newspaper, and for a short time was reporter on the *Daily News*. On his father's death Blanchard Jerrold became editor of *Lloyd's*, which office he continued to the time of his death, March 10, 1884. He was appointed (1852) Crystal Palace Commissioner to Sweden, and on his return published his interesting *Bray-broker with the Sirenes* (1854). He was founder and president of the British section of the International Literary Association. A facile and voluminous writer, he published *Children of Lætitia; Cant, per Cent.; a Story written on a Bill Stamp; Life of George Cruikshank; Life of Napoleon III.; Life of Doré; and London—a Pilgrimage, &c.* Of his dramatic writings the best known is *Cant us a Cucumber* (1851), one of the most successful farces ever written.

Jerrymander. See GERRY.

Jersey, the chief of the Channel Islands (q.v.), 14 miles from the Norman coast, 133 from Southampton, 95 from Weymouth. Measuring 11 miles by 5½, it is 45 sq. m. in area, of which nearly two-thirds is cultivated. Pop. (1806) 22,855; (1851) 57,020; (1881) 52,455; (1891) 54,518, one-half rural, the rest in the capital, St Helier, and suburbs. The land rises to the north, sloping to the south and west. On all sides are large open bays; Boulay on the north is capable of becoming a fine harbour, which is at present much wanted, that of St Helier being dry at low-water. The highest point, Mount Mado, is 473 feet high; its mass is a porphyroid granite which extends south as far as St Peter's. Smaller masses of the same are found in the south-east. The north-east part is conglomerate, and the rest of the island is chiefly divided between siliceous and schistose rock; the lower levels are covered with clay and blown sand. The rocks on the coasts, being mixed with veins of

greenstone and shale, have been eroded by the sea, which has left a number of caverns and pinnacles of fantastic form. About the south-east are numerous reefs of primitive rock which render the approach dangerous. Between Jersey and the French shore the Ereehos, Bouffetins, and Minquiers indicate a former connection with the mainland, and thus confirm the traditions which tell of a separation in comparatively recent times. It is also noticeable that moles and toads are found in Jersey, as also in Alderney, while there are none in Guernsey. Agriculture is pursued on small farms held on feudal tenures resembling copyhold. The chief present staple is the potato, the early produce of which comes into the London market a fortnight before that of the west of England, and thus commands a high temporary price. Consequently other cultivation has been much neglected, and the land greatly stimulated by artificial manures. The potato export exceeds 60,000 tons yearly, of a value of £264,000. The rearing of cattle is also lucrative; it is estimated that there are fifty-eight head of cattle to every 100 acres—nearly three times the ratio of the United Kingdom. The purity of the breed is maintained by careful official registration, and the stock fetches high prices from breeders in England and America. The number of cattle exported averages nearly 1600 head annually (see CATTLE, Vol. III, p. 22). The imports consist largely of potatoes and butcher-meat, from France and England, as the island produces little food for its own consumption. There is a large and well-kept market in St Helier, and a number of good shops. There are twelve parishes in all, of which the rectors and constables are *ex-officio* members of the 'states,' the rest of the assembly being elected deputies, with the addition of the twelve jurats, or judges of the royal court, whose chief is the bailiff, a trained lawyer. The language of deliberation and judicial business is French, though the people among themselves either use English or a form of the ancient Norman. The parish churches are old, but have lost many traces of their primitive architecture in frequent restorations. The royal court is a large but ill-lighted building containing some pictures, the best of which is a full length portrait of Marshal Conway, by Gainsborough. The character of the people is orderly and frugal, the deposits in the savings-bank exceeding £300,000. There is little pauperism and hardly any serious crime.

See Ansted and Latham's *Channel Islands* (Lond. 1862); also articles in the *Fortnightly Review* by the Right Hon. G. Shaw-Lefevre and Rev. Barham Zincke, and one by the present writer in the *English Historical Review* for 1887.

Jersey City, after Newark the second city of New Jersey, and capital of Hudson county, is on the west bank of the Hudson River, opposite New York, of which it is, though in another state, an extension, and with which and Brooklyn it is connected by steam ferries; a tunnel was being made in 1874-95; and a bridge was sanctioned in 1894. It stands on a peninsula bounded on the west by the Hackensack River and Newark Bay; on the south-east it extends along New York Bay. Jersey City is a busy but not a beautiful city. It is the terminus of six great and as many local railways, and is connected with Easton, Pennsylvania, by canal; and at its wharves many ocean-steamers receive and discharge their freight. It is thus the entrepôt of a large trade, especially in iron, coal, and agricultural produce. Its own manufactures are on a large scale, and include sugar, flour, iron and steel, zinc, boilers and machinery, locomotives, oils and chemicals, oakum, lumber, silk, watches and jewellery, lead pencils, tobacco, pottery, soap, beer, &c. The city has large abattoirs and stock

yards, and grain elevators notable both for their size and efficiency. The site of Jersey City was formerly called Paulus Hoeck (Hook); the town received its present name and became a municipality in 1838. Pop. (1860) 29,226; (1870) 82,546; (1890) 163,003.

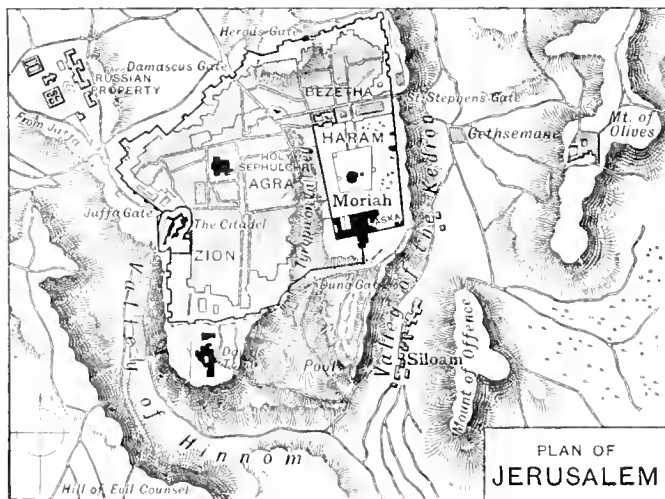

Jerusalem. *Its Site.*—Jerusalem—31° 46' 50" N. lat. and 35° 13' 25" E. long.; height, 2364 to 2582 feet above the sea-level—stands on the spurs of two hills surrounded and divided by two valleys, once deep, now partly or wholly filled up with rubbish. The exact form of the hills has recently been ascertained by taking, whenever practicable, a series of rock levels, of which 250 have been (1890) correctly laid down over the whole area of the city. More are being added from day to day, and the contours have been settled by Major Conder, the surveyor of western Palestine, with a general accuracy which can only be questioned at a few points. The dividing valley had two shallow branches within the city, a fact of considerable importance in considering the course of the second wall. The Eastern Hill was originally a rounded top crowned with the 'threshing-floor of Araunah,' and the rock and cave, probably a sacred site from time immemorial. It sloped steeply to the west and gradually to the east; its southern extremity was a tongue of land between the central valley, the Tyropoeon, and the eastern valley of the Kedron.

shalaim, mentions other forms—*Urishallum*, *Urishalum*, and *Shallam*, as formerly used in the days of the Jews. It is first mentioned in Joshua, x. 1—'Adoni-zedek, king of Jerusalem.' Afterwards, in the same book, it is spoken of as Jebus, or Jebusi, 'which is Jerusalem.' It has therefore been inferred that the name of Jerusalem was given to the city by David. But the name was found in 1890 on the cuneiform tablets from Tel-el-Amarna; it there appears as *Urusalem*, the 'City of Peace.' It was therefore known under that name at least 500 years before the conquest by David. The northern boundary of Judah is drawn south of the Jebusite; therefore it is reckoned among the cities of Benjamin. In some passages, however (e.g. Psalm, lxxviii. 68), it is held to belong to Judah. The conquest of the city by the Israelites proved at first incomplete; before the time of the Judges it was again 'the city of the stranger.' Finally conquered by David, the Lower City was united to the Fortress of the Upper Hill and the whole surrounded by a wall.

Its History.—The history of Jerusalem covers a period of about 3500 years. Of these, 500 at least are prehistoric, though glimpses of this long period may hereafter be arrived at from the treasures of the cuneiform inscriptions. Of the 3000 years which remain, less than 500 show us Jerusalem independent, the capital of a free country, and the centre of a national religion.

For 600 years longer the city was in the hands of the Israelites, it is true, but never wholly independent, always a prey to internal factions, and alternately the possession of Egypt or some other powerful neighbour. Loss of independence, banishment from the city, persecution and exile, have only made the Jew look with more passionate eyes of longing upon the city which, when it was his own, he could not hold without idolatry, contempt of his own laws, and internal dissensions. Only 500 years of independent tenure! That period removed by more than 2000 years; yet the passionate love of the Jew for Jerusalem is no whit diminished.

Here are the landmarks of its history. Its name is found on an inscription 500 years at least before David (see also Gen. xiv. 18); it was besieged almost

The Western Hill, higher than the other by more than a hundred feet, presented similar characteristics of a steep valley on either side and a tongue of land running southwards. Either hill was therefore a strong natural fortress, a hill fortress, such as are found in great numbers in England—e.g. the ancient stronghold called Castle Neroche, in Somersetshire, seems to be exactly the kind of fortress which David stormed. The weakness of the place for purposes of defence lay in its insufficient supply of water. One spring, that now called the 'Virgin Fount,' lies just without the old city wall of Ophel. The rock-cut passage, which runs from this spring to the Pool of Siloam below, enters within the course of the old Ophel wall. There is also a well called Hammam es-Shafa in the very centre of the city, close to the Bab al-Kattanin ('Gate of the Cotton Merchants') in the Haram area.

Jerusalem is known to the Moslems as *Beit el-Mukaddas* or *Beit el-Mukdis*, the 'Holy House,' or *El-Kuds*, 'The Holy.' Yaqut, the great Moslem geographer, who knew the Jewish name *Yeru-*

immediately after the death of Joshua, *circa* 1400 B.C.; it was again taken by David about 1046 B.C.; it was surrendered by Jehoiachin 597 B.C.; it was taken from Zedekiah 586 B.C., and wholly destroyed. Fifty years later (536 B.C.) the edict of Cyrus enabled the people to return; the temple was rebuilt; for a hundred years parties of the Jews straggled back. Ezra arrived 457 B.C., Nehemiah 445 B.C. For 500 years after this Jerusalem knew not a single generation of peace. Internal factions tore it to pieces; the city was the possession in turn of Persian, Macedonian, Syrian, Egyptian, and Roman. It was never wholly independent; there was never any real independence for Jerusalem after its destruction by Nebuzaradan. It is a great pity that those who study the history of Jerusalem generally pass over the period from Nehemiah to Herod as of little interest. It is, on the other hand, a time of the greatest interest, and full of instruction for those who study the development of the fiery Judaean race. We hear no more about Baal-worship and the groves of Asherah; the

pagan cult was growing obsolete; the gods of Hellas had invaded Syria; those of Phœnicia were forgotten. Under Antiochus the temple was consecrated to Zeus Olympios; pigs were sacrificed on the altars; the Jewish rites and ceremonies—the observance of the Sabbath, the sacrifices enjoined by the law, the rite of circumcision—were forbidden. Had it not been for one family—the most illustrious rebels on record—the religion of the Jews would have been abandoned and their nationality lost. How both were saved belongs to the history of this period (see MACCABEES).

It is not, however, a time on which the historian dwells with pleasure. The character of the people, always fiery and full of zeal, turned to fanaticism; their respect for the law, forced upon them by persecution and disaster, turned to a worship of the letter; they divided into sects which hated each other more bitterly than they hated the Gentile. The picture of Jerusalem and its people during the fifty years which preceded the destruction of the city by Titus is nowhere surpassed in all the dark annals of religious zeal. The city was besieged, taken, and totally destroyed by Titus, 70 A.D.

During the long history of Jerusalem—the City of Peace—it sustained seventeen sieges; twice it was utterly destroyed and razed to the ground. There is no city in the world whose soil has been more repeatedly drenched with the blood of its people—the thousands who have perished by the sword within these gray walls from the time when the 'children of Judah smote it with the edge of the sword and set it on fire' to the day when Godfrey de Bouillon and his knights rode in a stream of blood reaching to their saddle girths to recover the Holy Sepulchre.

The history of the city to the destruction by Titus is the history as contained in the Bible; that which follows is a second volume divided into four chapters. The first chapter contains the early centuries of Christianity, for the most part a peaceful time when the land was covered with monasteries, churches, and hermitages; when the voice of psalm and prayer never ceased day or night. The city contained the great group of churches of which the most splendid was Constantine's Basilica of the Anastasis, built not *over* the sepulchre, but to the east of it, the sepulchre itself being ornamented with columns and open to the sky. Pilgrimages began at first to the site of the Ascension, afterwards, as other sites were miraculously recovered, to that of every scene in the gospel history. The Persians came 614 A.D., sacked the city, and destroyed all the churches. Then the Moslems appeared, and the gates were thrown open without a blow.

The second chapter contains the Moslem rule (637-1099). Then the Mosque el-Aksa was built, Justinian's great church of St. Mary furnishing the principal edifice; the Dome of the Rock was built; and, by order of the mad calif Hakem Bi Asur Allah, the church of the Holy Sepulchre was again destroyed.

The third chapter is that of the Latin kingdom (1099-1244). The constitution of this kingdom, as contained in the *Assises de Jerusalem*, is the most valuable document extant on the principles of feudalism. The kingdom, after continuous war for eighty-seven years, lost Jerusalem, nor did the crusaders ever succeed in retaking it. It was, however, ceded by treaty to Frederick II., who in 1229 crowned himself in the church with his own hands, being then under papal excommunication.

The last chapter is that of Jerusalem again under the Moslems (since 1244). It was in 1517 that the Turkish sultan Selim took Jerusalem. The seven hundred years covered by this chapter have been for the most part years of peace. The

chronicles of later years are barren and devoid of incident.

Its Monuments.—The principal buildings and monuments for which the explorer of the modern city has to look are the first, second, and third walls of the great temple itself; the royal towers of Phasaelus, Hippicus, Psephinus and Mariamme; the Tyropœon Bridge; Baris or Antonia; Ophel; the Tombs of the Kings; and certain pools. It would be strange indeed if, after so many sieges and so many generations, much should survive of the city of Herod, to say nothing of the city of Solomon. There is, however, more than might have been expected, more in proportion than remains of ancient Rome of the former date; far more than remains of Tyre, Carthage, or Corinth. The town was so carefully examined by the ordnance survey of Sir Charles Wilson in 1865 that it seemed as if everything above ground must have been found. Yet we must not forget that Clermont Ganneau found above ground the inscribed stone of the temple, and that there may still be most important remains built up in walls. Excavations on a very extensive scale have also been conducted by Sir Charles Warren in 1867-70, Major Conder in 1871-76, Clermont Ganneau in 1874-75, the Russians, the French, and the Germans; so that since 1870 the whole of the previous literature in Jerusalem topography has become completely antiquated. In the 'Jerusalem' volume of the *Survey of Western Palestine* the authors, Warren and Conder, have enumerated most of the monuments that now exist above ground or have been discovered under ground. They are briefly as follows:

- (1) The rock scarps on the south of Zion, which were almost certainly those of the first wall, and therefore belong to the time of David.
- (2) The tomb, west of the rotunda of the Holy Sepulchre Church, known as that of Nicodemus. Its form is that of the oldest class of Jewish tombs. If the site was formerly within the second wall this must have been the Tombs of the Kings.
- (3) The great rock-cut passage from the Virgin's Fount to the Pool of Siloam. This can hardly be more recent than the 8th century B.C. The inscription discovered there in August 1880 is believed from the form of the letters and the character of the language to belong to that period.
- (4) The wall of Ophel, discovered by Sir C. Warren (1868-69).
- (5) The rock scarp of the Tower of Baris. This is most probably that scarp now existing at the N.W. angle of the Haram.
- (6) The rock-cut monuments in the Kedron valley. Many belong apparently to the Hasmonean period (2d c. B.C.).
- (7) The Haram area itself, the site of the temple, with its stupendous walls, its ancient gates, its wailing-place, and the buildings within it; the Mosque el-Aksa, the Dome of the Rock, the Dome of the Chain, the Golden Gate, its vast vaults, hitherto but little explored.
- (8) The Pool Amygdalon, now called Hezekiah's Pool. This is probably as old as Herod.
- (9) The Pool of Bethesda, recovered in 1888.
- (10) The Twin Pool, half of which was found by Wilson in 1866, and the other half by Warren in 1868.
- (11) The Tower of David, which is certainly on the site of one of the old royal towers, probably Phasaelus.
- (12) The Tyropœon Bridge, marked by the spring of the first arch. The remains of that arch and the opposite pier were discovered sixty feet under ground by Warren in 1868.
- (13) The wall erected by Hadrian to fortify his Elia Capitolina. This probably followed the line of the present city wall. He also probably made the great reservoir, Birket Israel.
- (14) The Basilica of the Anastasis, completed by Constantine in the year 335 A.D., certainly stood on the site of the present church of the Holy Sepulchre. It was entirely destroyed by Chosroes II in 614 A.D. There are, however, still existing certain remains and fragments which have been fitted by Conder into their places in Constantine's work. After the destruction of this building a more humble group of churches was erected on the site.
- (15) In the year 532 A.D. Justinian built the great Basilica of St. Mary's within the temple area. This church is probably the present Mosque el-Aksa. It is suggested by Conder that the later ornamentation of the Double Gate, the structure of the Golden Gate, and the roofing of the Haram eastern also belong to the time of Justinian.
- (16) The existing church of the Holy Sepulchre was commenced in 1103 A.D. and stood until 1808, when it was partly destroyed by fire. Some parts of it are, however, believed to be older than the crusaders' time.
- (17) The great Hospice of the Knights of St. John, south of the Holy Sepulchre, was erected during the Latin kingdom.

Recent excavations (1875-85) have laid bare a great part of these buildings.

- (18) Of crissading remains there are still many in the city. The Tower of David on the site of Phasaclius (?) is mainly the work of the Pisans, and a great deal of the city wall is of crissading times.

These are the principal monuments now existing. We may add the discovery in 1887 of a fragment of what was certainly part of the second wall, certain rock scarpings which are supposed to belong to the same wall, and a wall with a gate discovered in the building of the Protestant church, which has been conjectured to belong to this wall. But this is uncertain, as the course of the wall has never been clearly ascertained.

The Restoration of the City.—The restoration of the ancient city, whether under Herod or Solomon, has been the subject of keen controversy for many years. It is, of course, perfectly well known that to the ordinary pilgrim every spot in the city connected with the Sacred Narrative is exactly ascertained. He has no doubt. The first who ventured to dissent from the authority of tradition and the priests was one Korte, a German printer, who travelled in Palestine about the year 1728. There, however, a hundred years later, he was followed by Dr Robinson, who argued that the church of the Holy Sepulchre could not possibly cover the site of our Lord's tomb. In the year 1847 Mr James Fergusson, a well-known student of Indian architecture, produced an essay on the topography of Jerusalem, in which he advanced the proposition that the Dome of the Rock was not built by Melek at all, but by Constantine, that it covered the Holy Sepulchre, that the site had been transferred at some time or other—during some period of disturbance—that the temple was not built over the 'Rock,' but in the south-west corner of the Haram. These revolutionary views were adopted by a small party, and even advanced in Smith's *Dictionary of the Bible*. Since that time the opinion has also been advanced further that Mount Zion and the city of David were not the upper but the lower hill, and that the latter was situated on the northern slope of Ophel. These views, of course, necessitated a complete re-casting of the topography, with results that have been, with various modifications, before the world for forty years. As regards the general acceptance of these theories it is enough to say that Warren, the explorer of Jerusalem, and Conder, the surveyor of western Palestine; that Palmer and Le Strange among linguists; that De Vogué, George Williams, Willis, Clermont Ganneau, among antiquaries and scholars; with many other scholars, all alike refuse to accept them; and that not a single architect of eminence has followed Fergusson's views as to the date of the Dome of the Rock.

The sites adopted in this article are those advocated by Warren and Conder, who agree in the main points. The reasons will be briefly indicated.

(1) *The Site of the Temple.*—It was within the Haram area, which is defined by the ruins of its gigantic walls: Josephus says that the cloisters reached from 'valley to valley'; that the wall of Ophel joined the east cloister; that the temple was on the top of the hill; that the Tower of Antonia stood on a lofty rock north of the hill. Not one of these conditions can be satisfied by Fergusson's view, which places the temple in the south-west corner of the Haram and makes the east wall start northwards 600 feet from the south-west corner and on the level part of the ridge. This theory was put forward before any excavations had been attempted and when the nature of the ground was utterly unknown. The hill has now been contoured, and it seems certain that if Josephus was right the temple stood over the sacred rock, which, according to De Vogué, was just south, and

according to Warren, was just north, of the altar. The latter also makes it the foundation of the gate Nitzotz. Conder, on the other hand, identifies the rock, which is the highest point of the hill, with the foundation-stone of the Holy House. He therefore follows Josephus exactly. Not only this: he follows a tradition accepted universally by Jew, Christian, and Moslem. Now it is a maxim based on the experience of this officer, who has given far more time and attention to this subject than any other traveller or scholar, that when a tradition is accepted by all alike it is generally true. From every other consideration, indeed, Conder's views seem impregnable. If Solomon built his temple where Fergusson put it, he either built it half-way down the hill and on a steep slope, or he had to make enormous sub-structures to begin with: he chose for his site a hill with a slope of 1 in 5; he neglected the obvious advantages of the summit; and he departed from the universal custom of choosing the highest part of the hill for temple, fortress, or city. As regards the position of Antonia, that agrees perfectly with the rock scarpings now known to exist at the north-east of the Haram area and with Josephus. Further, if the temple had been built at the south-west corner there would have been a break in the continuity of the wall at a point 600 feet east of the south-west angle—that is, at the Double Gate. No such break occurs, and no trace of foundations remains where the east wall of the temple would have stood. The whole of the walls about the Haram have been examined at different points; they all belong to the same period, and were built by the same builder. But, it is argued, Josephus says that the temple enclosure was a stadium in length on each side. Fergusson began, therefore, by measuring out a space of 600 feet. Why Josephus should in one place be considered as accurate as a modern engineer and in all other places should be acknowledged as a loose and inaccurate writer is not apparent. Conder, however, and those who agree with him meet the difficulty by supposing (as the Mishnah also does) that the sacred enclosure, *estimated, not measured*, by Josephus, meant the sacred court within which no Gentile could enter. (See Warren and Conder's *Jerusalem*.)

(2) *The Site of the Holy Sepulchre.*—This site is even more important on topographical grounds than the exact position of the temple. For on it depends the course of the second wall. On other grounds it is important, because the whole question of tradition and its value depends upon it. If we can prove that the second wall runs without the church, then Christ could never have been buried here, and the whole mass of medieval traditions comes toppling to the ground, dragging with them a thousand superstitious and traditions attached to other places. Fergusson says that the Dome of the Rock is the actual church built by Constantine. Now this church was certainly destroyed by Hakém. Further, if our view of the temple be correct, the church could not have stood on this site. But against Fergusson's view every single writer, every pilgrim and traveller, and every architect is arrayed. There exists a long *catena* of evidence from the Bordeaux pilgrim of the 4th century to the present day, which, when it is arranged in chronological order, makes it impossible to doubt that the basilica erected by Constantine was on the site of the present church.

Was, however, the true site of the Holy Sepulchre known to the Christians of that time? The present writer agrees with those who believe that in the 4th century the site of the Holy Sepulchre was utterly lost and forgotten. There is not a hint anywhere to show that it was known or cared about. No tradition of it survived. When

pilgrims first began to visit the city they were shown the site of the Ascension; it was the living Lord they worshipped, not the dead Christ. As for the tomb itself, they never so much as inquired after it. When sites began to be manufactured this would doubtless be one of the first, and Eusebius with naïveté records the surprise of everybody when they dug up the ground covering what they called the site of the Lord's tomb, and actually did find a tomb there! The difficulty of a transference of sites—though sites are sometimes transferred—is enormously increased in this case, because there never ceased, during the time, when the transference was possible, a continuous stream, first, of Christian pilgrims, including clerics as well as ignorant people, and next, of Moslem pilgrims; and in order to gain evidence for their story, the Christians who changed the site would have to get the Moslems to join in the fraud. And how was the memory of the old site to be obliterated from the minds of the people?

There are many other questions connected with the topography of the city, such as the apparent confusion of Mount Zion, sometimes with the city of David, and sometimes with the temple; the description of the city given in the Book of Nehemiah; the date and purpose of the Golden Gate; the position of the gates of the city; the course of the first, second, and third walls; the royal towers; the Tombs of the Kings, with many others which must be left for a more detailed investigation. Meantime, to fix the site of the temple, Antonia, the first and second walls, and the Basilica of the Anastasis is to go far towards clearing up the whole of this difficult question connected with the recovery of Jerusalem.

Modern Jerusalem.—The present city contains about 48,000 inhabitants, of whom half are Jews, a quarter Moslems, and the rest Christians of various sects. There are three sects of Jews, the Sephardim, of Spanish origin; the Ashkenazim, of German or Polish origin, themselves divided into several sects; and the Karaites. The Christians consist of Greeks, Armenians, Georgians, Copts, Syrians, Abyssinians, Latins, and Protestants. Lying among not very fertile mountains, the city has but little commerce, and practically no manufactures; of late years it has grown a considerable way outside its walls, the dull, uniform, windowless one-storied houses stretching on every side. The climate has been compared to that of the south of France. Snow sometimes falls in January and February; rains begin in October and continue to fall at intervals till April, when a cloudless sky begins and lasts until October. There are now banks and hotels, and a railway from Jaffa was opened in August 1892.

The best books on Jerusalem are De Vogüé's *Temple de Jérusalem*; Warren and Conder's *Jerusalem* (Palestine Exploration Fund), with its great portfolio of plates (1884); Wilson's *Ordinance Survey of Jerusalem* (1868). The student should also consult the *Quarterly Statement of the Palestine Exploration Fund*, for which a very good index has been made. *Palestine under the Moslems* (1890), by Guy le Strange (Palestine Exploration Fund), is invaluable because it is the only book which gives the evidence of Arabic writers. Major Conder's *Tent Work in Palestine* (1878) also contains an excellent chapter on Jerusalem. And for architecture there is the work (1888) of Professor Hayter Lewis on the Dome of the Rock. See also Besant and Palmer, *Jerusalem, the City of David and Saladin* (1872; 4th ed. 1899); and the articles CALVARY, JEWS, MACCABEES, CRUSADES, GODFREY, BALDWIN, HOSPITALIERS, OMAR.

JERUSALEM BISHOPRIC.—In 1841, at the instance of Frederick William IV. of Prussia and by the mediation of Count Bunsen, an arrangement was made to institute a bishopric at Jerusalem in connection with the united Church of England and

Ireland, and under the joint protection of England and Prussia. The right of appointment was to lie alternately with each of the protecting governments. The agreement met with strenuous opposition on the part of the Tractarian section of the Church of England, as excluding sympathy with the Roman Catholic Church, and courting intercommunion with Protestant, non-episcopal Prussia; and Newman regarded it as 'the third blow, which finally shattered his faith in the Anglican Church.' The first bishop, Alexander, was a converted German Jew who had taken orders in the English Church. On his death (1845), Bishop Gobat, a German Swiss who had been in the service of the London Missionary Society, was appointed by Prussia. He died in 1879; and on the death of the third bishop, Barelay (named by England), in 1883, no successor was appointed. Prussia withdrew from the agreement in 1886; and since 1887 the bishopric is a missionary bishopric of the Church of England exclusively. See Hechler, *The Jerusalem Bishopric* (1883).

Jerusalem Artichoke. or TOPINAMBURO

(*Helianthus tuberosus*), a plant of the natural order Compositæ, and of the same genus with the common Sunflower (q.v.), is a native of Brazil. The word Jerusalem, in the English name, is a corruption of the Italian *girasole*, 'sunflower'; the name *artichoke* is merely from a supposed similarity of flavour in the eatable part—the tuber—to the Globe artichoke. The Jerusalem artichoke has straight, sparsely branching stems from 8 to 12 feet high, and many rough, ovate, acute stalked leaves; and in the end of autumn, though rarely in Scotland, produces yellow flowers resembling those of the common sunflower, but smaller.

The thick, fleshy, and knotted perennial root produces, pretty closely around it, oval or roundish tubers, sometimes thirty or fifty in number, which are reddish on the outside, and whitish within, in appearance very similar to potatoes. They have a sweetish, mucilaginous taste when boiled, and are much more watery and less nourishing than potatoes. They are, however, very palatable, when properly prepared with sauce, and make very good soup. The plant is also useful for fodder for cattle, yielded by its leaves and the more tender parts of the stems. The stems and leaves contain much nitre, and have been used for making potash. The fibre is used for making cordage and coarse cloth.

The Jerusalem artichoke is scarcely an agricultural crop in Britain, although it is to some extent in some parts of Europe. It was known in English gardens before the potato, to which it in some measure gave place. It is generally propagated by small tubers, or cuttings of tubers, like the potato; and its cultivation is in most respects similar, although the aspect of the plant is very different. In America it is sometimes called Canada potato or Virginia potato.

Jerusalem Artichoke
(*Helianthus tuberosus*).

Jerusalem Chamber. See WESTMINSTER.

Jervanx Abbey (pronounced *Jarris*), a ruined Cistercian abbey of Yorkshire, 13½ miles NW. of Ripon. It was built in 1156 by monks from the Yorkshire monastery of Byland, and was dismantled in 1539, its last and twenty-third abbot having been hanged two years before for his share in the Pilgrimage of Grace. Its scanty ruins were excavated in 1803 by the Earl of Ailesbury.

Jervis, SIR JOHN. See ST VINCENT (EARL).

Jesi, or **LESI** (anc. *Æsium* or *Æsis*), a walled town of Italy, 17 miles by rail SW. of Ancona, has a cathedral, a town-house with good pictures, manufactures of silk, paper, soap, &c., and a trade in wine, olive-oil, corn, and cheese. Here the Emperor Frederick II. was born. Pop. 12,118.

Jessamine. See JASMINE.

Jesse, EDWARD, a popular writer on natural history, was born at Hutton Cranswick, Yorkshire, 14th January 1780. He became clerk in a government office, and was successively secretary to Lord Dartmouth, commissioner of hackney-coaches, and deputy surveyor-general of the royal parks and palaces. He died at Brighton, 29th March 1868. His books include *Gleanings in Natural History* (1832-35), *An Angler's Rumbles* (1836), *Scenes and Tales of Country Life* (1844), *Anecdotes of Dogs* (1846), and *Lectures on Natural History* (1861); besides editions of Walton's *Complete Angler*, White's *Selborne*, and Ritchie's *Windsor Castle*. See Mrs Houston's *Sylvanus Redivivus* (Lond. 1890).

—**JOHN HENEAGE JESSE,** son of the foregoing, was born in 1815, and at an early age filled a place in the secretary's department of the Admiralty at Whitehall. He had already written poems and plays without success, when he found his work in a series of bright and interesting works in the field of domestic history, which have yet far more than their mere readableness to commend them to general readers, if not to serious students. These are *Memoirs of the Court of England during the Reign of the Stuarts* (1840), *Memoirs of the Court of London from the Revolution of 1688 to the Death of George II.* (1843), *George Selwyn and his Contemporaries* (1843-44), *Memoirs of the Pretenders and their Adherents* (1845), *Richard the Third and his Contemporaries* (1862), and *Memoirs of the Life and Reign of King George the Third* (1867), the last his best book. Other works are his *Literary and Historical Memorials of London* (1847); *London: its Celebrated Characters and Remarkable Places* (1871); and *Memoirs of Celebrated Etonians* (1875). He died 7th July 1874.

Jesse Window, a window that had the genealogical tree of Jesse, father of David, painted on its glass or sculptured on the mullions. Such were once common in churches.

Jessor, also called **KASBA,** a town of Bengal, capital of a district, 7½ miles by rail NE. of Calcutta. Pop. 8095. Since the opening of the Central Bengal Railway Jessor has developed into a trading-mart of some importance in local products.

Jest-books are of two kinds: collections of witty sayings and practical jokes which go under the names of certain men who were celebrated in their day as 'merry fellows,' and collections of fæticæ, gathered from many sources, ancient and modern. Of the first class *Tarleton's Jests* may be considered as a fair type among English books of fæticæ. Here all the jests and practical jokes are ascribed to that popular Elizabethan comedian, or rather buffoon; but probably not a single one of them is genuine or authentic. This book, in fact, is simply a catchpenny collection of jests taken out of older books, and fathered on Tarleton after his death in order to stimulate its sale and popularity.

A notable example is found in Tarleton's device to reach London without expense, at a time when he was in the country and with an empty purse: he contrived to have himself arrested as a 'seminary priest' and taken up to the metropolis, where he was at once recognised and set at liberty. This is a variant of the well-known story of Rabelais, with his three packets of harmless wood-ashes, labelled 'Poison for the King,' 'Poison for the Queen,' 'Poison for the Dauphin.' And it reappears in another jest-book of the same class, in the composition of which the learned man under whose name it goes had no more share than he had in that of the Talmud, namely, *The Witty and Entertaining Exploits of George Buchanan, commonly called the King's Fool*. Another old English book of this kind is the *Jests of Scogin*, which the enterprising printer foisted on the public—as was also done in the case of the *Tales of the Mad Men of Gotham* (see **GOTHAM**)—as having been compiled by 'A. B. of Phisicke Doctour,' meaning the facetious Andrew Borde. In this book Scogin, or Scogan, 'a scholler of Oxford,' is represented as playing all sorts of tricks, most of which are found in earlier collections, and all are traceable to French, Italian, and Asiatic sources. For example, with the help of his 'chamber-fellow,' he cheats a simple rustic out of half his flock of sheep by persuading him that they are really hogs—a trick which not only occurs in mediæval Latin collections and all the jest-books of Europe, but has its probable original in an old Indian work entitled *Hitopadesa* (a Sanskrit form of the Fables of P'lipay, or Bidpai), where, in like manner, three sharpers cheat a Brahman of a goat he is carrying to sacrifice, by making him believe it is a dog. Of other jest-books the *Pleasant Conceits of Old Hobson, the Merry Londoner*, is a good example, albeit, as usual, containing little that is not found elsewhere. Old Hobson is a confirmed practical joker, and many of his best conceits turn on merely verbal quibbles. Two more books of this class are the *Jests of George Feble*, the player, and *Archy Armstrong's Banquet of Jests*; and it is hardly necessary to say that their names are all that is theirs in the collections.

The oldest known English jest-book is *A Hundred Merry Tales* (about 1525), to which the lively Beatrice refers when she says to Benedick, in *Much Ado about Nothing* (Act II. scene I), 'Will you tell me who told you that I was disdainful, and that I had all my good wit out of the *Hundred Merry Tales*?' Next in order of date—and of interest also—is *Merry Tales, Witty Questions, and Quicke Answers, very Merry and Pleasant to be Redde* (about 1535). From these two the compilers of subsequent jest-books in the early years of the 17th century drew very freely, with one notable exception, *Taylor's Wit and Mirth* (i.e. John Taylor, the Water-poet), which, he tells us in the lengthy title-page, he 'chargeably collected out of Taverns, Ordinaries, Innes, Bowling-greenes and Alleys, Ale-houses, Tobacco shops, Highways and Water-passages,' and which is 'made up and fashioned into Clines, Bulls, Quirkos, Yerkes, Quips and Jerkes; apothegmatically bundled up at the request of John Garrett's Ghost' (1635). This is by far the most original of all our English jest-books—by which we mean that it contains very few of the tales found in the earlier collections. And if we seek for the reason of this, it is probably to be found in the superior advantages which Taylor possessed over mere literary hacks who were able only 'to make new books as apothecaries make new mixtures, by pouring out of one vessel into another'—in his profession of a Thames waterman, which must have brought him into contact with all sorts and conditions of men, from whom, more especially

sea-captains, he probably learned a goodly portion of the jests he tells so quaintly.

The earliest collections are largely derived from classical and monkish sources, and some of the tales are exceedingly coarse, even obscene. Many are at the expense of the monks and friars, whose greed and licentiousness are the subjects of unsparring ridicule. Not a few exhibit women in no very favourable light, whether maids or matrons, and these we may be sure are the invention of misogynist clergymen. Such tales show that women were held in almost as low estimation in Europe during the middle ages, and long after, as they seem ever to have been in Asiatic countries; and there can be little doubt that this was due mainly to the monks and friars, for whom our own Chaucer had seldom a good word to say. There is, however, considerable humour in some of these tales at the expense of women; and, after all, human nature is very much the same in every age and place: as, for example, in the story of the young woman who grieved for the death of her husband, and her father tried in vain to console her by saying that he had got her another husband, but she declared she would have him not; however, when they were all seated at dinner, she whispered to him, amidst her sobs, 'Father, where is this same young man that is to be my husband?' To which the story-teller adds the 'moral' that 'by this ye may see that it is no more wonder for a woman to weep than for a goose to go barefoot.'

The best known of English collections of facetiæ is *Joe Miller's Jest-Book, or the Wit's Vale Mecum*, which, even in its original form (1739), is a mere compilation of witti-i-isms, drawn by the versatile John Mottley mainly from 16th and 17th century jest-books, the best joke in it being the name of Joseph Miller (1684-1738) on the title-page; for, though a comedian by profession, it is said that he was never known to make a joke in his life. Those who are well acquainted with the humorous literature of other countries as well as that of our own must confess that if our jest-books, both ancient and modern, were stripped of all that is borrowed, the number of jokes that we can fairly claim would be exceedingly few indeed. But, for the matter of that, no other country is better. The late Mr Radston has justly remarked that 'an unfamiliar jest is rarely met with in the lower strata of fiction.' The best jokes have been for ages known alike to the Russian or Norwegian peasant, the vine-dresser of France or Spain, the Italian rustic, the Argyllshire crofter, the wandering Arab, the luxurious Persian, the peaceful Hindu, and the crafty Chinese. We pass over the species of mountebank jest which has of late years come into vogue in the corners of many American newspapers, as it is likely soon to perish of its own infirmities. Most of the early English jest-books mentioned in this article are now, in their original forms, of extreme rarity, although there must have been many and large editions of them. Mr W. C. Hazlitt—who has reprinted a considerable number of them in his *Shakespeare Jest Books* (3 vols. 1864), with valuable prefaces and notes—thinks that they were literally 'thumbed out of existence;' but this can hardly account for their exceeding rarity, and we are rather disposed to believe that vast numbers of copies were destroyed during the Puritanical times along with much more valuable books; and, when the reaction set in with the Restoration, they would be considered as old-fashioned, and the wits would begin afresh, though they did not disdain to make a very liberal use of the antiquated jest-books.

Besides the books already incidentally mentioned, most collections of folklore and of chap-books contain jests,

Again, many books of this class are roughly grouped as 'Facetiæ' in booksellers' lists, especially if more or less *grovianis* in character. Good English jest-books of the Cavalier period are the *Westminster Droollery, Choice Droollery*, and *Merry Droollery*, reprinted by Mr R. Roberts of Boston (3 vols.). See articles BIDPAL, CHAP-BOOKS, FOLKLORE, and GOTHAM.

Jesters. COURT, persons who were kept in the households of princes and lesser dignitaries to furnish amusement by their real or affected folly, and hence commonly called Court Fools. At what time they were introduced into European courts has not been precisely ascertained, but there is reason to suppose that they existed in England during the period of our Saxon history, and certainly in the reign of William the Conqueror, since an almost contemporary historian, Maitre Wace, has left a curious account of the preservation of William's life, when he was only Duke of Normandy, by his fool Godes. Other fools whose names have descended are the Hitard of Edmund Ironside, the Will Somers of Henry VIII., Archie Armstrong, who lost his office for jests which the petty-minded Laud could not endure; and in France Caillet and Triboulet in the time of Francis I., and Chicot in the reign of Henry III. Triboulet figures in Rabelais, and is the hero of Hugo's *Le roi s'amuse* and of Verdi's *Rigoletto*. The last private person to keep a fool in England was Lord Suffolk, whose jester, Dicky Pierce, was buried at Berkeley in 1728. In Douce's *Illustrations of Shakespeare* (1897) there is a dissertation on clowns and fools, with an account of their peculiar dress, the motley coat, the tight breeches with legs of different colours, the cowl bearing asses' ears and crested with a cockscomb, and the bauble, a short staff with a ridiculous head. Douce divides them into nine classes, and finds the parent of the Shakespearean stage clown in the 'vice' of the mysteries and moralities.

In the East the office of jester existed in the 8th century, and probably much earlier in India. The famous Calif Haroun al-Raschid had a jester named Bahalul, some of whose sayings and doings have been preserved by Arabian writers. He appears to have possessed vivacity, wit, and observation, which were, however, often concealed under a mask of simplicity, and he was permitted to take great liberties with the calif's courtiers. 'I wish,' said Haroun to him one day, 'I wish you would proemre me a list of all the fools in Bagdad.' 'That would be difficult, O Commander of the Faithful,' replied the jester; 'but if you desire to know the wise men, the catalogue may soon be completed.' This found its way—*mutatis mutandis*—into English jest-books in the 16th century. One day Bahalul was discovered seated on the calif's throne, for which Haroun awarded him a whipping; then said the jester, 'O Commander of the Faithful, I sat in this seat only half an hour and have been whipped for doing so; what do you deserve who sit in it every day?' The jester doubtless thought the slight scourging he received was amply compensated by the bag of gold pieces which Haroun ordered to be given to him for his witty remark.

From the practical jokes popularly ascribed to Ramakistnan, he may be styled the Scogin of Madras. A collection of his jests in the Tamil language was translated into English and Telugu by Narrain Sawmy, and published at Madras in 1839, and not a few of them are almost identical with tales ascribed to European court jesters, such as our English Scogin and the Italian Gonella. This almost unknown little book explains how he was endowed with so much wit that he became the greatest jester in the world, and by the exercise of this wit at the court of a rājā, was able to maintain himself and family. Like the European court

jesters, Rannakistnan's too ready wit frequently roused his royal master's wrath; but though sometimes condemned to death he always evaded it, and was again and again received with favour through his irresistible drollery. His jests, however, have none of the coarseness which is the chief characteristic of his western brethren; for example, in his counterpart to the well-known jest of Scogin, when the king commanded him never to show his face in the royal presence again, he saves propriety and carries out his jest by entering with a large pot over his head and down to his shoulders. See Dr Doran's *History of Court Fools* (1858).

Jesuits, or SOCIETY OF JESUS, a celebrated religious order of the Roman Catholic Church, which has filled a large space in the ecclesiastical and even the political history of the world. It was founded in 1534 by Ignatius Loyola (q.v.), in concert with five associates—Peter Le Fevre, a Savoyard; three Spaniards—James Lainez, Francis Xavier, and Nicholas Bobadilla; and a Portuguese named Rodriguez. The original object of association was limited to a pilgrimage to the Holy Land, and a mission for the conversion of infidels; but as all access to the Holy Land was precluded by the outbreak of a war with the Turks, the associates turned their thoughts to a more comprehensive organisation, specially designed to meet those more modern requirements which had arisen since the Reformation. With this view, Ignatius Loyola, with Lainez and Le Fevre, having meanwhile recruited several new associates, repaired to Rome in 1539, and submitted to the pope, Paul III., the rule of the proposed order, the great aim of which was expressed in their adopted motto: *Ad Maiorem Dei Gloriam* ('To the greater glory of God'); and the vow of which, in addition to the threefold obligations common to all Catholic religious orders, of chastity, poverty, and obedience, comprised a fourth, whereby the members bound themselves unreservedly to go as missionaries to any country which the pope might indicate to them. The new rule was approved by a bull of 1540; and in the following year the association was practically inaugurated at Rome, by the election of Ignatius Loyola as its first general.

The original constitution of the society has undergone few modifications. Although it is commonly represented as absolutely monarchical, yet the authority of the general is, in many respects, strictly limited. It is true that the general—who is elected by a congregation of professed members, composed of two elected fathers in each province together with the provincial—holds his office for life; and, although he is aided in his government by a council of five assistants, he is not obliged to follow their advice even when unanimous. These assistants are elected by the same congregation that elects the general, and remain in office during his life. Each assistant has a more immediate charge of a group of provinces and missions called an *Assistance*, formed mainly according to the principal European languages—Italian, German, French, Spanish, and English. But though the general is thus absolutely free in his decisions, he is strictly bound by the constitutions of the order; nor, although he may dispense in particular cases, is he competent of his own authority to annul or to alter any of the constitutions. Another check on merely arbitrary power and outlet for complaints may be mentioned. Every three years a Congregation of Procurators, as it is called, is summoned by the general. This is composed of a deputy chosen by vote in each province to go to Rome or elsewhere, and lay the condition and needs of the province personally before the general. When all the deputies are assembled, they have under the presidency of the general always to vote

on and decide one question—whether there is any need of convoking a general congregation. Although no instance of deposition has ever occurred, the general himself is liable to be deposed by the sentence of such a general congregation, in certain contingencies which are specifically pointed out by the constitutions.

The body over which this general presides consists of four classes: (1) Professed, who, having passed through all preparatory stages, which commonly extend over ten or twelve years, or even a longer period, have solemnly taken the vows described above, including that of obedience to the pope. It is from this class alone that the general and all the higher officials of the society are chosen. (2) Coadjutors, spiritual and temporal; the former—who have completed their studies, and have (seldom before their thirty-second year, or even later) been admitted to holy orders—being designed to assist the professed in preaching, teaching, and the direction of souls; the latter being lay-brothers, to whom the minor and menial offices of the society are assigned. (3) Scholastics, who, having passed through the novitiate, are engaged for a long series of years, either in pursuing their own studies, or in teaching in the various schools of the order. (4) Lastly, novices, who, after a short trial as 'postulants' for admission, are engaged for two years exclusively in spiritual exercises, prayer, meditation, ascetic reading, or ascetic practices, and generally in a course of disciplinary training. The administrative and executive government of the society, throughout the various provinces or missions into which it is divided, is entrusted, under the general, to provincials, who are named by the general, and hold office commonly for at least three years. In each separate province there are three kinds of communities—professed houses or residences, colleges, and novitiates. The head-superior in each is appointed by the general, who receives at stated intervals a detailed report of the character, conduct, and position of each member of the society. In all these gradations the subordination is complete, and the obligation of obedience is immediate and unreserved; and one of the most familiar accusations against the society is that this duty of blind and implicit obedience makes the superior the sole and final arbiter of conscience for all his subjects, the judge of good and evil, of virtue and of vice. Nevertheless, whatever may be said of the practical tendency of this relation, the Jesuits and their apologists plead that both in the rules of St Ignatius and in the so-called 'examen' of the candidate there is contained, in the duty of obedience to a superior, an explicit reservation for the subject, 'unless where the superior should command what is sinful.'

The system of training exhibits the most profound knowledge of the human heart, and the most correct appreciation of the religious instincts and impulses of mankind. The long exercises of the novitiate were designed by Ignatius to form the individual character in habits of personal holiness, and practices of personal piety. It was the business of the school and college to form the social character of the future teachers of men, and directors of the destinies of society. To learning carefully adapted to the actual condition and progress of knowledge they sought to add manners and habits calculated to inspire confidence, and to disarm prejudice and suspicion. Unlike the older orders, they made no parade of a special calling, whether by a peculiar habit, or by peculiar exterior indications of austerity or asceticism. They enjoyed, indeed, in these respects, some exemptions from the more austere practices of other orders. Their churches were but designed as supplementary

to those of the parish clergy (whose ordinary costume they adopted as their own conventional dress), without the canonical services, without much imposing or attractive ceremonial; being chiefly appropriated for religious instruction, and for the duties of the confessional. Their casuistry avoided all harsh and excessive rigour; and it cannot be doubted that some of their writers carried it to the opposite extreme. But above all, they addressed themselves to the great want of their time—education; and through the mastery which they soon obtained in this important field, as well as their eminence in every department of learning, divinity, philosophy, history, scholarship, antiquities, and letters, they attained to unbounded influence in every department of society.

The organisation of the society is settled, in every important particular, by the original rules and constitutions of St Ignatius. The opponents of the Jesuits, however, allege that, in addition to these public and avowed constitutions, there exists in the society, for the guidance of their hidden actions, and for the private direction of the thoroughly initiated members, a secret code, entitled *Monita Secreta* ('Secret Instructions'), which was meant to be reserved solely for the private guidance of the more advanced members, and which was not only not to be communicated to the general body, but was to be boldly repudiated by all should its existence at any time be suspected or discovered. This singular code, a masterpiece of craft and duplicity, was first printed at Cracow in 1612, and has been repeatedly reprinted by the enemies of the Jesuits; but it is indignantly disclaimed by the society. The accounts of the time and circumstances of its discovery are suspicious and contradictory. The book has been repeatedly condemned, both at Rome and by other authorities, as well as by the society, and its apocryphal character is now commonly admitted.

The history of the society is varied in the different countries, but in each may be divided into three stages—the rise, the suppression, and the restoration of the order. In Italy its early career was brilliant and unclouded. Before the death of the first general, St Ignatius, in 1556, the Italian Jesuits had swelled to 1000 in number, and the order was established in twelve provinces. Their first check in Italy occurred in Venice. In the contest of this republic with Paul V. (q.v.) the Jesuits, taking the side of Rome, accepted in 1606 the alternative, proposed by the senate, of leaving the Venetian territory; nor was it till 1656 that they were re-established in Venice, from which time they continued to enjoy undisturbed influence in Italy until the suppression of the order. The earliest settlements outside of Italy were in Portugal and Spain. In 1540 Rodriguez (a Portuguese nobleman) and Francis Xavier opened colleges in Portugal, at the invitation of the king. Francis Borgia, Duke of Gandia, in Spain, was equally well received in his native country, where the order flourished so rapidly, that, at the time of the suppression, the Spanish Jesuits numbered above 6000.

In France, although a house for novices was founded in Paris by St Ignatius in 1542, the university of Paris opposed their introduction as unnecessary, and irreconcilable with its privileges. They were distasteful to supporters of the Gallican liberties, and still more to the Huguenots. The jurists, the parliament, and the partisans of absolutism were alarmed by the free political opinions which had found expression in some of the Jesuit schools. On the other hand, the democratic party attributed to them a sinister use of their influence with courts. And thus their progress in France was slow, and their position at all times precarious. It was with much difficulty that the parliament of

Paris consented to register the royal decree which authorised their establishment. In more than one instance the university protested against their schools as invading its privileges. In the wars of the League they did not fail to make new enemies; and at length the assassination of Henry III. by Clement (although no evidence of any connection with the Jesuits appeared in his case), and the circumstance that Chatel, who attempted the life of Henry IV., had at one time been a pupil in their schools, led to their expulsion from France in 1594. They were reinstated, however, in 1603; but on the assassination of Henry IV. by Ravaillac the outcry against them was renewed. Although it seems quite certain that this clamour was utterly without foundation, yet the opinions held by one of their order, Mariana (q.v.), on the right of revolt, although condemned by the general, gave a colour to this and every similar imputation. A less deep but more permanent and formidable movement against them was gradually stirred up at a later period, by a combination of all the causes of unpopularity already described, to which new point was given by the well-known Jansenist controversy, and by the questions as to the imputed laxity of the moral teaching of the Jesuits, and their alleged corrupt and demoralising casuistry. What the ponderous and indignant prelections of the Sorbonne, and the learned folios of the Dominican and Augustinian schools had failed to accomplish, the wit and brilliancy of the celebrated *Lettres Provinciales* of Pascal (q.v.) effectually achieved. The laxity of some of the Jesuit casuists was mercilessly exposed by this brilliant adversary, who represented it as the authorised teaching of the order, and the crafty maxims and practices popularly ascribed to the society were placed before the world in a light at once exquisitely amusing and fatal to the reputation of the body. The attempts at rejoinder on the part of the Jesuits but served to fix the ridicule more firmly. Of the thousands who laughed at the happy humour, or sympathised with the vigorous railery of Pascal, few, indeed, could plod through the learned but heavy scholasticism of his adversaries. In vain the Jesuits insisted that the obnoxious casuists had been condemned by the society itself; in vain they showed where their opinions differed from those imputed to them. The wit of Pascal remained unanswered; and whatever were the logical merits of the controversy, no doubt could be entertained as to its popular issue. The pungent pleasantries, too, of the *Provincial Letters* were but a foretaste of the acrimony of the later Jansenistical controversies, in which the Jesuits stored up for themselves an accumulation of animosities in the most various quarters, the divines, the lawyers, the courtiers, which were destined to bear bitter fruit in the later history of the society in France. Nevertheless, after a long conflict, they enjoyed a temporary triumph in the last years of the Regency and the beginning of the reign of Louis XV.

In Germany the Jesuit institute was received with general and immediate favour. In the Catholic territories, Austria, Bavaria, and the Rhenish principalities, they not only founded colleges and other establishments of their own, but they were appointed at Ingolstadt and other universities to hold important professorships, and received in many dioceses the charge of the episcopal seminaries then newly established. Before the death of the first general, St Ignatius, the order could reckon in Germany 26 colleges and 10 professed houses. In Hungary and Transylvania much bitterness arose out of their introduction; the same may be said of Bohemia and Moravia; and through the whole course of the Thirty Years' War the Jesuits, though in many instances wrongfully,

were regarded by the belligerent Protestants as the soul and centre of the Catholic camp.

In the Netherlands they encountered some opposition at first; but in 1562 Lainez, the second general of the order, came to the Low Countries, and a college was opened at Louvain, which eventually became one of the greatest colleges of the order. In the Protestant kingdoms the Jesuits obtained entrance only as missionaries, and in some, as in England, Scotland, and Ireland, under circumstances of great difficulty and peril. From England they were excluded by the penal laws under pain of death; nevertheless, with a constancy and devotedness which it is impossible not to admire, they maintained through the worst times an unbroken succession of missionaries in many parts of England. They often resorted to the most singular disguises, and generally bore false names; and several of the old Roman Catholic mansions still show the 'Priest-hole,' which was contrived as a retreat for them in cases of sudden emergency. Into Ireland they effected an entrance almost at the first foundation, and, after many vicissitudes, towards the close of the reign of Charles II. they had more than one considerable college for the education of youth.

But a still more fertile field for the enterprise of the order was that of the missions to the heathen, in which they outstripped all the older orders in the church. In the Portuguese colonies of India the successes of Francis Xavier (q.v.) are well known. The results of their missions in China (under such men as Ricci, 1552-1610, and Schall, 1591-1669) and Japan were even more extraordinary, as also in Northern and Central America. Above all, their establishments in the southern continent, in Brazil, in Paraguay and Uruguay, upon the Pacific coast, in California, and the Philippine Islands were missions of civilisation as much as of religion.

Such was this association in the first stage of its history. At their first centenary jubilee the members already numbered 13,112, distributed over 32 provinces. At their suppression, a century later, they had increased to 22,589, and were possessed of 24 professed houses, 669 colleges, 176 seminaries, 61 novitiates, 335 residences, and 275 missionary stations in infidel countries or in the Protestant states of Europe.

The decline in the fortunes of the Jesuits was rapid and decisive in its consummation. The first blow which they sustained was in Portugal. An exchange of colonial territory having been effected between that kingdom and the crown of Spain, the so-called 'Reductions' of Paragnay (q.v.), in which the Jesuit missionaries possessed an authority all but sovereign, were transferred to Portugal. The native Indians having resisted this transfer, the Portuguese ascribed their disaffection to the Jesuit missionaries. The Portuguese minister, Pombal de Carvalho, to whom the Jesuits allege that their possessions in Portugal had long been an object of desire, instituted a commission of inquiry; and while it was still pending, an attempt on the life of the king, Joseph, which was laid to the charge of the Jesuits, furnished him with a fresh ground of impeachment; and, without awaiting any judicial proof of either accusation, he issued, in September 1759, a royal decree, by which the order was expelled from the kingdom. This example was followed in other kingdoms. In France, under the Duc de Choiseul, the immediate occasion of the disgrace of the Jesuits was a trial in the civil courts. Father Lavalette, as procurator of the order in Martinique, had consigned to a commercial house in Marseilles two valuable cargoes, which were seized by English cruisers, and, Lavalette being unable to meet the bills, the Marseilles merchants proceeded

successfully against the order. The Jesuits replied that Lavalette acted not only without the authority of the order, but against its positive constitutions, and appealed to the parliament of Paris against the sentence. The inquiry thus raised presented an opportunity of which the ancient enemies of the order in the parliament eagerly availed themselves. A report on the constitutions of the society, highly denunciatory, was speedily drawn up, and a demand was made for the suppression of the order, as being irreconcilable, in its constitution and practice, with the interests of the state and of society. A strong effort was made to arrest the proceeding; but a powerful court-faction, aided by the secret influence of the royal mistress, Madame de Pompadour, who was irritated by the refusal of her Jesuit confessor to grant her absolution unless on condition of her separating from the king, and supported in the press by the philosophic party, carried all voices, public and private, against the Jesuits. An attempt at compromise was proposed to the general, Father Ricci, by which the obnoxious constitutions might be abolished or modified; but his unbending reply, 'Sint ut snnt, aut non sint' ('Let them be as they are, or let them cease to exist'), cut short all negotiation; and a royal edict was published in 1764, by which the society was suppressed in the French territory. This example was followed by Spain, in 1767, with circumstances of great harshness and severity; and by the minor Bourbon courts of Naples, Parma, and Modena. The court of Rome had zealously but vainly interposed in their behalf, and from Clement XIII., especially, they received earnest support. But his successor, Clement XIV., inclining in this and all other questions of church and state to the side of peace, having in vain endeavoured to procure from the courts by which they were condemned a relaxation of their severity, and being pressed by the ambassadors of France and Spain, at length issued, July 21, 1773, the celebrated bull 'Dominus ac Redemptor Noster,' by which, without adopting the charges made against the society, or entering in any way into the question of their justice, acting solely on the motive of 'the peace of the church,' he suppressed the society in all the states of Christendom. The bull was put into execution without delay. In Spain and Portugal alone the members of the society were driven into exile. In other Catholic countries they were permitted to remain as individuals engaged in the ministry or in literary occupations; and in two kingdoms, Prussia under Frederick the Great, and Russia under Catharine, they were even permitted to retain a quasi-corporate existence as a society for education.

What was meant, however, to be the suppression of the society proved but a temporary suspension. The ex-members continued in large numbers, especially in the Papal States and Northern Italy; and soon after the first storm of the Revolution had blown over measures began to be taken for the restoration of the society. The first overt reorganisation of them, barely tolerated by the pope, was in 1799, by the Duke of Parma; in 1801 Pius VII. permitted the re-establishment of the society in Lithuania and White Russia, and with still more formality in Sicily in the year 1804. It was not, however, until after the French Restoration, and the return of Pius VII. from captivity, that the complete rehabilitation of the Jesuit order was effected, by the publication of the bull 'Solicitudo Omnium Ecclesiarum,' August 7, 1814; and in 1824 their ancient college, the Collegio Romano, was restored to them. Once thus re-established by Pius VII., the Jesuit order as a religious order has remained on in the Catholic Church. But in different kingdoms of Europe it has had various fortunes. In Modena, Sardinia, and Naples it was re-established

in 1815, as also in Spain. It was again suppressed in Spain from 1820 to 1825, from 1835 to 1844, from 1854 to 1858, and its members were banished once more in 1868. In Portugal they have never obtained a firm footing. Their position in France was one of sufferance rather than of positive authorisation; nevertheless, they were very numerous and influential, and their educational institutions held the highest rank. In 1880, however, the republic decreed the dissolution of the order, without giving it the alternative of seeking authorisation; and in July of that year the members were expelled from all their establishments save the educational, an additional month being allowed them for vacating the latter. In Belgium they reinstated themselves after the Revolution, and they now possess many great establishments, professed houses as well as colleges, which are largely attended both by Belgians and foreigners. In Holland also they possess several considerable houses, as well as in England, Ireland, the United States, and, within a recent period, Scotland. In Switzerland they opened in 1818 a college at Freiburg, which became a most flourishing establishment, and subsequently they extended themselves to Schwyz and Lucerne; but the war of the Sonderbund (one of the main causes of which arose out of the Jesuit question) ended in their expulsion from the Swiss territory. Of the German states Bavaria and Austria tolerated their re-establishment for educational purposes. In the Italian provinces of the former, as also in the Tyrol, they enjoyed a certain freedom until the revolution of 1848. In Russia they were placed under sharp restrictions in 1817; and in 1820, in consequence of their successful efforts at proselytism, they were banished by a final ukase from the Russian territory, whence they still remain excluded. The Italian revolution of 1848 seriously affected their position in that country. In that year Pius IX. found it expedient to permit the breaking up of the college and other houses in Rome. They returned, however, with the pope himself, and resumed possession of their ancient establishments. On the proclamation of the kingdom of Italy they withdrew from Sardinia, Naples, Sicily, and the annexed territories in general. In the recent legislation of the kingdom of Italy the Jesuits have been visited with a special measure of repression. While each of the other principal religious orders is permitted to retain its 'mother house' at Rome, in which the general of the order may reside, the Jesuits have been required to quit their principal convent of the Gesu. In Germany also they have been treated with exceptional severity, being held responsible as the main agents and advisers of the measures adopted in the Vatican Council, which were complained of by the government as infringing the rights of the state. By a law of 1873 the order was excluded from the empire, its establishments were abolished, and all foreign Jesuits were ordered to be expelled, and the German members of the society, as well as of kindred orders and congregations, to be 'interned.'

The twenty-four generals of the Society of Jesus have been the following (Italians, except where otherwise specified): Loyola (1541-56), Spaniard; Lainez (1558-65), Spaniard; Borzia (1565-72), Spaniard; Mercurian (1573-80), Belgian; Acquaviva (1581-1615); Vitelleschi (1615-45); Carafra (1616-49); Piccolomini (1649-51); Gottofredi (1652); Nickel (1652-64), German; Oliva (1661-81); Novelle (1682-86), Belgian; Gonzalez (1687-1705), Spaniard; Tamburini (1706-30); Retz (1730-50), Bohemian; Visconti (1751-55); Centurioni (1755-57); Ricci (1758-75); Brzozowski (1805-20), Pole; Fortis (1820-29); Roothaan (1829-53), Dutch; Beckx (1853-84), Belgian; Anderledy (1884), Swiss; Martin (1892), Spaniard.

The literature of the history of the Jesuits, whether hostile or friendly, is almost endless in extent and variety; reference may be made to Gioberti, *Il Gesuita Moderno* (1847), and Creteineau Joly, *Histoire de la Compagnie de Jesus* (1845); to the histories by Wolff (2d ed. 1803), Stemmetz, Huber, Guettee (1859), Theleman (1873), Griesinger (Eng. trans. 2d ed. 1885); Parkman's *Jesuits of North America in the 17th century* (20th ed. 1886); Ranke's *Römische Päpste* (6th ed. 1871); Foley's *Records of the English Province of the Society of Jesus*; T. G. Law, *Conflicts between Jesuits and Seculars under Elizabeth* (1890). See also CASUSTRY, LOYOLA, XAVIER.

Jesus, son of Sirach. See ECCLESIASTICUS.

Jesus Christ. It is obvious that any attempt to speak in a few pages of a life which was divine as well as human—of a life which stands at the very centre of the world's history as the fulfilment of all the past hopes of humanity, and as the highest ideal of all its future aims—can only be carried out by rigid limitation of the end in view. It will be impossible here to enter into any critical inquiries; or into profound theological discussions respecting the inter-relation of the two natures in one person; or into a review of philosophical theories respecting the work and person of Jesus; or into a defence of the *a priori* possibility or credibility of miracles; or into a minute examination of conflicting systems of chronology; or into a harmony of the variations in the historical narratives which have been magnified into irreconcilable discrepancies. On such questions we can barely touch, referring for further information to the articles on CHRISTIANITY, CHRISTOLOGY, CHRONOLOGY, GOSPELS, JOHN, and MIRACLES.

The sources of our knowledge of the life of Jesus are almost exclusively biblical. The references to Him in Jewish and heathen literature are distorted by hatred, prejudice, and ignorance; and the only additions to our knowledge which can be gleaned from the Christian literature of the early centuries are dubious in authenticity, and insignificant in amount. Though legend has connected the name of Philo with the apostle Peter, the learned Alexandrian lived too early to be reached by the growing force of Christianity, and makes no allusion to it. Some critics have imagined the existence of Christian interpolations in Philo's account of the Therapeutic. Josephus speaks briefly of John the Baptist, and of the martyrdom of James, the Lord's brother; but the authenticity of the famous passage about Christ is now given up in its present form, for it must in any case have been tampered with by some Christian scribe. The silence of Josephus can only have been due to perplexity or policy. From other Jewish references we learn nothing except the blinding fury of the malignity excited by the name of Christ. The blasphemous scandals and immoderies of the Talmud, which culminate in such deplorable medieval calumnies as the *Toldoth Jeschu*, are lamented by all respectable Jews, and indeed they refute themselves by their preposterous anachronisms and impossible absurdities. Generally the Talmudists veil their hatred under distant allusions to 'so and so,' 'Absalom,' 'the fool,' 'the hung;' and they conceal a malediction under the form in which they write the name of Jesus. Suetonius only alludes to Christ (if at all) under the blundering notion that he ('Christus') stirred up troubles in Rome in the days of Claudius. Tacitus historically records the crucifixion, but is otherwise as grossly ignorant of every fact about the Christians as he is about the Jews. The only notion of Christianity entertained by him, by Suetonius, and by Pliny is derived either from the monstrous falsehoods of pagan enemies or from a confusion of Christians

with the members of the vilest Jewish and Gnostic sects. Not one fact can be disinterred from the cynical perillage of Lucian in his tract on the death of Peregrinus, or from the anonymous Philopseudes. Celsus, indeed, professes to have studied the documents of Christianity, but his views had been tainted, partly by the hostile prejudices of philosophy, and partly by his reliance on the invention of scandal-mongering Jews. It is more disappointing that no fact about Jesus can be derived from the earliest Christian literature. There is scarcely a single grain of gold in the accumulated rubbish-heap of legends contained in the apocryphal gospels; not a single fact in the allusions of the Fathers on which we can rely, unless it be the statement that the stable of the Nativity was a cavern; not a single unrecorded saying of Christ (*ἰσχυροὺς λόγους*), unless it be 'Prove yourselves good money-changers;' or one or two others which—like 'He who is near me is near the fire'—are already implicitly contained in the records of the gospels.

We therefore turn to the New Testament, and here no *facts* of the life are preserved for us except those which are recorded in the gospels, and receive independent attestation from the references of St John, St Peter, and St Paul. St Paul preserves for us the one unrecorded precious maxim, 'It is more blessed to give than to receive,' but nothing more. The question therefore arises, 'May we rely on the four gospels as authentic and adequate?' That they are so might seem to be sufficiently proved by the existence and the ever-growing strength of Christianity and Christendom—the religion and the society which are based upon them. They have indeed been placed in the crucible and thrust into the hottest furnace of modern criticism, but only with this result that in these days scarcely a critic pretends to impugn the general historic truthfulness of the synoptic narratives, though many endeavour to eliminate the supernatural elements. The characteristics of the gospels themselves—their simplicity, their naive confessions, their inimitable stamp of honesty and veracity (the *simpliciter veri sigillum*), the impossibility that the Character which they set forth should have been invented by fishermen and tax-gatherers, the historic verification of which they are capable—are the pledge of their authenticity. And of the various theories which have been adopted to explain away their significance one after another has hopelessly broken down. Paulus attempted to account for the gospels on naturalistic grounds, so that miracles were merely mistakes of enthusiastic observation; but after the crushing exposure of this hypothesis by Strauss it has never been revived. Strauss, with imposing wealth of learning and ability, tried to apply to them the principles of Hegel, and to explain them as myths generated by the idea; but after a temporary success he was himself forced to complain that his views had been swept away by the orthodox reaction. Even Renan says of Strauss's *Leben Jesu*, 'Ce Christ *a priori*, ou le divine bien, n'est pas encore le Christ historique'—*Et. d'Hist. Rel.* pp. 157-58; and in point of fact Strauss was rebutted by the intense and unique originality of the gospel story, and by the fact that no miracle was attributed to John the Baptist even at the zenith of his mighty influence. Baur and his able successors helped to nullify the arguments of Strauss, and in their turn applied to the story of the origins of Christianity the strong solvent of criticism; but his followers had to make larger admissions than he himself, and his attempt to show that the gospels were 'tendency-writings' proved itself so little satisfactory, and was so completely counteracted by the writings of Neander and others, that at Tübingen itself there is a

Tübingen school no more (Ewald, *Gesch. Christus, Vorrede*, p. xxvii. 3d ed.). Lastly there arose the eclectic schools of Schleiermacher and Renan. The medial system (*Vermittelungs-Theologie*) of Schleiermacher produced a powerful effect, but the day for half-views has gone by. The success of Renan was due mainly to the charm of style, but he was not sufficiently serious to captivate many proselytes. His *Vie de Jésus* was vitiated in part by the writer's own vacillations about the fourth gospel and in part by the indignant scorn which was kindled by his hypothesis that He whom the world has recognised as *verax et verus et ipsa veritas* lent Himself to wilful deception in the raising of Lazarus. The unshaken belief of the vast majority of Christians, even of those who have most thoroughly examined the literature of scepticism, is sufficient to prove that modern apologetics have been adequate to sustain the far fiercer battle of the forces which were routed in the earlier centuries by Origen and Athanasius, and in the 18th by Butler, Lardner, and Paley.

The attack on the authenticity of the fourth gospel has been longer and more determined, but the evidence has been exhausted with careful accuracy and stated with perfect candour, and we may point to the papers of Bishop Lightfoot and the edition of the Gospel of St John by Bishop Westcott as containing arguments which seem finally decisive against the destructive critics. On this subject the author of *Supernatural Religion* was practically driven out of the field, and the certainty that Tatian in his Diatessaron used the fourth as well as the other gospels—which has now been proved by the discovery of an Armenian translation of Ephraem's commentary in the library of the Mechitarist Fathers at Venice in 1836—is a strong addition to the weight of external evidence. This commentary of Ephraem was translated into Latin by Ancher in 1841, and published by De Mösinger in 1876. Tatian was a hearer of Justin Martyr, and his undoubted acceptance of the fourth gospel gives certainty to the already strong probability that that gospel was accepted by Justin.

Before proceeding to set forth in its general idea the narrative of the gospels some preliminary considerations must be passed in review. It is essential to notice that the life of Christ, as related in the gospels, is partial and fragmentary. It has been calculated that in narrating the public ministry of Christ the synoptic gospels only deal with the events of fifteen months (450 days); but that so little consecutive is the narrative that not more than thirty-five days are distinctly touched upon, while there are *lacunæ*, in which the events of one, two, or even three months at a time are passed over in silence. Further, it has been observed that the records of two or three of these days—the day in the cornfield (Matt. xii. 1-xiii. 52), the day of the Sermon on the Mount (Matt. v. 1-viii. 17)—occupy large fractions of St Matthew's Gospel; the day of the cursing of the fig-tree occupies one-seventh of St Mark's; and the story of five days (Luke, xx. 1-xxiv.) occupies one-fourth of St Luke's, exclusive of the story of the infancy. If this computation be accepted, the result is that the Synoptists move in the sphere of one-thirteenth part of a ministry of which the extent is uncertain, but which is generally believed to have covered little more than three years (see Dr Martineau's *Seat of Authority in Religion*, p. 185). It is a legitimate inference from this that much of our Lord's public activity is unrecorded; but this is what St John himself distinctly tells us (John, xxi. 25). The gospels were written to establish a faith, not to detail a biography; to record the essence of a teaching, and to testify to

the majesty of a Personality, not to depict the minute incidents which had but a slight or secondary bearing on the great design. There are vast spaces in the heavens which are not sown with stars, and the 'ceconomy,' both divine and human, which marks the scantiness of the evangelic narrative of the ministry is but a part of that simplicity and reticence which contented itself with so brief and (from the ordinary point of view) so meagre a reference to the thirty long years of the Saviour's growth and preparation.

On the very threshold of any attempt to speak of Christ we are met by the fact that, in the belief of one-third of the human race, He was not a simple man but a Divine man, the God-Man; the Son of Man as the unique representative of humanity at its best and greatest, but also pre-eminently—and in a sense transcendently different from that in which the phrase can be applied to men—the Son of God. To those who take the fact in a bare isolated way it may seem an insuperable stumbling-block; not so to those who do not disconnect it from the whole conception of God and the entire history of the world. Nothing is more unphilosophical than the *a priori* rejection of miracles, because miracles do not come under the range of ordinary experience. 'Historic problems cannot be thus settled by philosophic categories.' If we start with that belief in God which may be regarded as the normal datum of our human consciousness, and if we contemplate the historic fact of the fall and wretchedness of man, the belief that God—in compassion for and in order to redeem and elevate the countless millions of mankind in all their generations—became man, and took our nature upon Him in the person of His Son, so far from seeming a monstrous hypothesis, appears to be in exact accordance with His nature, as the best and highest that we know and can imagine. Those who, like Spinoza, identify God with Nature, which is but the sum total of His visible manifestations, exclude from Nature the sole element which explains it—viz. the element of a Divine and Supreme Will.

Nature alone can furnish us with no explanation of the manifestation of Christ, but it harmonises absolutely with that idea of God which we believe that He has Himself planted within us. So completely is this the case that—as was seen by the great German historian, Julius von Müller—apart from Christ all human history is reduced to a chaotic dream (see his letter to his friend, Karl Bonnet, quoted by Luthardt, *Apology, Vortr.*; Eng. trans. p. 353). All the history of the past, up to the Incarnation, points to Him, and in Him finds its fulfilment; all the development of the ages since He appeared springs from the divine impulse which He gave. As Jean Paul Richter so finely said: 'He lifted the gate of the centuries from off its hinges with His bleeding hand.' The most sceptical of historians cannot fail to see that Jesus stands at the very centre of humanity. Not only was all which is most precious in Hebrew literature full of unspeakable yearnings for this Divine Deliverer, but even heathendom abounds in unconscious prophecies of His advent. Among the Persians we read in the *Zend-Avesta* of 'the victorious Saoshyant, the beneficent one who will benefit the whole bodily world, who will stand against the destruction of the bodily creatures to withstand the *Drug* of the two footed brood.' He is the redeemer, born of Zoroaster, who shall crush the serpent-destroyer Ahriman (see *Zend-Avesta*, Yast XXVIII, *Sacred Books of the East*, p. 220). So, too, in Brahmanism we have the redeemer Krishna, who is constantly represented as crushing and conquering the serpent. Among the Greeks we have the profound legend of Prometheus, the

representative of suffering humanity, who can only be delivered from his fetters on the rock, and the tearing of the vulture's talons, when Herakles the son of Zeus descends for him into Tartarus. (Consider the remarkable lines, *Æsch. Prom.* 1026-30, one of the most striking of the unconscious prophecies of heathendom.) Socrates puts into the mouth of Plato his confession of the necessity for some divine deliverer who is at once both God and man (see Ackermann, *Das Christliche in Plato*, Hamburg, 1835); and some such figure has been dreamed of in all the higher forms of religion as a necessary inference from what we know both of God and man. The revelation of Christ springs as a necessary postulate from our faith in God. For some remarkable passages in the ancients, see Cic. *De Legg.*, ii. 10; Sen. *Ep.* 52; and Schneider, *Christliche Klotung*.

But in speaking of the human life of Jesus it is unnecessary to entangle ourselves in the intense and prolonged theological battles which culminated in the 3d and 4th centuries. The result of those controversies is adequately summed up in the four technical terms *ἀληθῶς, τέλειος, ἀδιακρίτως, ἀσινγύτως*, decided on in the four councils of Nice, Constantinople, Ephesus, and Chalcedon. As against the Arians, Christ was *truly* God; as against the Apollinarians, He was *perfectly* man; as against the Nestorians, He was *indivisibly* God-man; as against the Eutychians, He was *distinctly* God and man. Beyond these elementary decisions all attempts to deal with that *arcanum* of theology, the *περιχώρησις* or *communicatio idiomatum*, can only end in failure and absurdity (see Hooker, *Ecol. Pol.*, Book V., liv. § 10). But if it be assumed that it is impossible or irreverent to narrate the earthly life of such a Being, the answer is that it has been done in the four gospels, and that to shrink from doing it would be only due to the false reverence of Apollinarianism—now quite as common in the church as Arianism is in the world—which denied the full humanity of Christ. It is most necessary, too, to bear in mind that throughout Christ's earthly life, from the Incarnation to the Resurrection, He voluntarily laid aside, in obedience to the perfect conditions of humanity, the divine attributes of omniscience and omnipresence. 'Being in the form of God, He thought it not a prize to be on an equality with God, but *emptied Himself* (*ἐκένωσε ἑαυτὸν*), taking the form of a servant, being made in the likeness of man' (Phil. ii. 5, 6, Revised Version). The doctrine here revealed is known in theology as the *Kenosis* or 'emptying,' and in speaking of Jesus we have constantly to bear it in mind, as the necessary condition of His being 'a man with man,' of His coming *ad Judæos et Judæos apud Judæos*, of His 'wearing a tent like ours, and of the same material.'

We proceed then to sketch in barest outline 'those sinless years which breathed beneath the Syrian blue,' Jesus, as appears by both the genealogies recorded in the gospels, was of the royal house of David. The discrepancies and divergences of those genealogies are believed to be due to the differences between His legal and His natural descent, which in one or two places of the line was affected by a collateral adoption, or a levirate marriage. His virgin birth is attested and assumed by the evangelists, and St Luke, using Hebrew documents which seem to be directly traceable to the memories of the Virgin Mary, preserves for us particulars about the infancy of Jesus which are not found in the other Evangelists. Even the apocryphal gospels revel in impossible and even revolting details, and, stumbling on the very threshold, present us with a picture which would have been instantly destructive of our faith if it had been true. The canonical gospels vindicate

their truthfulness and their supremacy by the severest reticence, which contains no word to mar that ideal which every effort of invention instantly degrades. After the marvels of the Nativity at Bethlehem, we are told of the circumcision, the presentation in the temple, the visit of the Magi, the flight into Egypt, and the massacre of the innocents. The exact date of these events cannot be determined with absolute certainty, but may be brought within narrow limits, and most scholars now acquiesce in the view which places the Nativity about four years earlier than our received era. The historic questions which the narrative raises have been sited to the bottom, and the credibility of the gospel details has been triumphantly established.

After the infancy there is a deep silence which covers all but the concluding fragment of the life of Christ. From the return to Nazareth, while He was yet a very young child, to the baptism by John we have nothing preserved to us except a single anecdote by St Luke, and a single word in St Mark. It is exactly respecting this portion of the life of Christ that the apocryphal gospels most deeply betray incompetent falsity, and the gospels show that grace of superintendency without which they could not have recorded what the apostles had seen and heard when their hands handled the Word of Life. The anecdote of St Luke is Christ's visit to the temple with his parents at the Passover just before His thirteenth year, which marked the age of a Jewish boy's 'confirmation'—his admission to the rank of a 'son of the law' (*ben hat-torah*). It has been called 'the solitary floweret out of the wonderful enclosed garden of the thirty years, plucked precisely there when the swollen bud at a distinctive crisis bursts into flower' (Stier, *Leben Jesu*, i. 18). It is specially precious from the decisive way in which it shows that Christ possessed a human soul, and not only the *Logos* instead of it; and it exactly accords with the testimony of St Luke that our Lord's growth was that of a child in whom there was a *gradual* increase of knowledge (Luke, ii. 40, *πληρούμενον* not *πεπληρωμένον*). Indeed it seems to have been the special purpose of the third evangelist to give us at least one glimpse of Jesus at every phase of His human life, as an infant, a child, a boy, a youth, and a full-grown man.

The one word happily preserved for us by St Mark is 'the carpenter' in the question of the unbelieving Nazarenes, 'Is not this *the carpenter?*' which an irreverent reverence has altered into '*the son of the carpenter.*' It shows us that, as a part of that infinite self-repression and obedience by which Christ 'abode with His parents and was subject unto them,' He shared with Joseph in the humble trade by which he earned his daily bread. Unanimous tradition, implied by the gospels themselves, agrees in the belief that Joseph died early, and that our Lord grew up in a family circle of those whom the evangelists call His 'brothers' and 'sisters.' In that family He was the first-born, and probably helped to support them all. To any imagination which was not divinely guided such a mode of spending all but three years of His life would have seemed impossible and derogatory; but the admission is one of the most striking proofs of the absolute veracity of the gospels. Their silence as to all other records of those thirty years preaches to us with the most majestic eloquence. Some of the greatest lessons of Christ's example are involved in the fact that He did not strive, nor cry, neither was His voice heard in the streets. The central lesson that 'Christ pleased not Himself' is written large over the closed golden portals of those unrecorded years. Coming to live

for man, He chose the lot not of the few but of the countless multitudes, the immense majority. The town and the home which He chose were alike poor, provincial, insignificant. Thus He rebuked pride, which is one of the two great taproots of human aberration; He showed the sacredness of obscurity; He glorified the lot of labour which antiquity despised. Rebuking the restless passion for excitement and the desire to minister to self-importance, He showed to all mankind that the true life is the *interior* life, the life of calm, recollectedness, and companionship with the divine, passed in the sweet seclusion of a home and the ordered routine of lowly duties. It is impossible for most men to live as Christ lived during His brief ministry; but that unknown life of the artisan in dull, provincial Nazareth was meant to teach us that the commonplace ordinary life, which is the normal life of man, may yet be precious with the best sanctities of heaven's beatitude.

Thus ended the first and main part of the life of Jesus. At the age of thirty began the second phase of His life, the public ministry—ending with the Crucifixion and the Resurrection—which occupies all but a fraction of the gospels. St Peter's epitome of that ministry is that 'He went about doing good,' and it was by giving up everything which the earthly and sensual mind can desire that He left us an example that we should follow His steps. To detail the events of that ministry is obviously impossible here, nor is it necessary. We shall but indicate its great phases and divisions, and then touch on some of the considerations which it suggests. It falls into the following great divisions:

I. The call to the ministry in the baptism and preaching of John the Baptist, who first publicly recognised Jesus as the Messiah.

II. The temptation in the wilderness.

III. The call of the first apostles; the first miracle at Cana; the beginning of the preaching in Galilee.

IV. The first Passover visit to Jerusalem, the first cleansing of the temple. The question of the rulers, and the prophecy 'Destroy this Temple,' &c. The interview with Nicodemus; the retirement to Galilee; the discourse to the Samaritan woman at the well; the rejection by the Nazarenes.

V. The 'Galilean springtide' of the ministry amid the gladness of the multitudes; many miracles of healing; the choice of the twelve; the Sermon on the Mount; the message from the imprisoned Baptist; the intercourse with Pharisees, publicans, and sinners; the great day of parables; the visit to Gergesa; the day of Matthew's feast.

VI. The second visit to Jerusalem; the miracle at Bethesda; the murder of the Baptist; the return to Galilee.

VII. The feeding of the five thousand; the discourse at Capernaum; the Sabbath and other disputes, amid ever-deepening conflict and opposition.

VIII. The flight among the heathen; the Syro-Phoenician woman; the return to Decapolis; the epoch of rarer miracles; the feeding of the four thousand; the recognition of the Messiahship by the disciples; the Transfiguration; the healing of the demoniac boy.

IX. The visit to Jerusalem at the Feast of Tabernacles; the woman taken in adultery; the healing of the man born blind; the return to Galilee.

X. The final farewell to Galilee. Incidents and teachings of a slow journey towards Jerusalem. Visit to Jerusalem at the Feast of Dedication. The last stay in Perea; the raising of Lazarus. Jesus, under a ban, withdraws to the town of Ephraim.

XI. The last visit to Jerusalem. The events of Passion Week—Palm Sunday; the day of parables; the day of temptations; the great denunciations; the farewell to the temple; the betrayal.

XII. The Last Supper; the last discourse; the agony in Gethsemane; the arrest; the threefold trials; the Crucifixion; the Resurrection; the great forty days; the Ascension.

Such being the great divisions and landmarks of the life, it only remains to touch on one or two of the important questions which it suggests.

i. What was the length of our Lord's public ministry? We are unable to answer the question with certainty. This is due to the remarkable fact that the synoptic gospels occupy themselves almost exclusively with the Galilean ministry, while St John mainly dwells on the ministry in Judea and Jerusalem. Sceptics have vainly endeavoured to extort any discrepancy from this fact, since the Synoptists most distinctly imply that much of our Lord's time must have been spent in Jerusalem (see Luke, x. 38, xix. 42; Mark, xi. 11)—a fact, indeed, directly stated in the recorded *πρόσῳδος* ('how often') in His lament over Jerusalem (Matt. xxiii. 37; Luke, xiii. 34). We may then decidedly reject the notion of a *one-year's* ministry, which has been most unwarrantably founded on the expression of Isaiah (lxi. 2) and the reference to it by our Lord at Nazareth (Luke, iv. 19). This was the view of Origen (*De Princ.* iv. 5), and Clement of Alexandria (*Strom.* i. xxi. sect. 145), and of the two Gnostic teachers, Ptolemæus (*Ep. ad Florum*) and Herakleon; but not that of Melito and Irenæus. It has found powerful supporters in Browne (*Ordo Sacrorum*, pp. 342-91), and Keim (*Jesu von Nazara*); but the former can only maintain it by eliminating τὸ πάσχα from John, vi. 4, *in spite of all the manuscripts*, and the latter by rejecting the authenticity and credibility of the fourth gospel. The majority of scholars agree in the well-founded inference stated as early as Hippolytus, the scholar of Irenæus, Eusebius (H.E. i. 10), Theodoret (in Dan. ix. 27), and Jerome, that Jesus died at the age of thirty-three, and that the ministry lasted more than two and a half years. Irenæus's extraordinary assertion (*C. Her.* ii. 2515) that Jesus died between the ages of forty and fifty is a blunder (which in him is not isolated), falsely inferred from John, viii. 57. The only element of uncertainty for those who accept the fourth gospel is the identification of the unnamed feast mentioned by St John in v. 1. If that feast was the Jewish feast of Purim we see that St John groups his narrative round *five* festivals—(1) the Passover (ii. 13); (2) Purim (v. 1); (3) the Passover (vi. 4); (4) the Tabernacles (vii. 2); (5) the Dedication (x. 22); (6) the Passover (xi. 65). It is in accordance with this that Purim took place on Veadar 14 (about March 19), and that our Lord (some time before the feast) said to the woman of Samaria 'there are yet four months unto harvest' (John, iv. 35). Since, then, there were three Passovers during the ministry, and that ministry began some time before the first Passover, we see a reason for the view that it lasted about three years—a view which best accords with all the data. And though we cannot here discuss the chronology, the opinion that Christ's baptism by John took place in the summer of 26 A.D., and that He was crucified in the spring of 29 A.D., is probably not far wrong.

ii. Without entering into the subject of apologetics, we may allude to the miracles which enter so largely into the life of Jesus, and which, as they were a support to the faith of former centuries, are regarded as a stumbling-block by modern science. St John puts us into the right point of view when he calls them *works* (*ἔργα*—John, v. 20, and *passim*). Given the Personality of Christ, miracles were natural to Him; 'our supernatural was His natural.' Their occurrence becomes a question of evidence, and the supposed recalcitrant and dangerous formula of Hume 'reduces itself to the very

harmless proposition that anything is incredible which is contrary to a *complete* induction.' When Hume said that no evidence could establish a miracle, because it was more likely that evidence should be false than that a miracle should be true, his statement came to no more than this—that a miracle disturbs the mechanical expectation of a recurrence (Mozley, *Bampton Lectures*, p. 56). Hume did not argue for so unphilosophical an assertion as the *impossibility* of miracles, but he argued against their *credibility*, because his philosophy practically reduced life to a series of impressions and sensations. In answer, it is enough to say with Lord Bacon, 'the soul of man was not produced by heaven or earth, but was breathed immediately from God; so the ways and dealings of God with spirits are not included in Nature—i.e. in the laws of heaven and earth, but are reserved to the law of His secret work and grace.' The evidence for Christ's miracles, and above all for His Resurrection, has been sufficient to convince and potent to ameliorate the whole civilised world.

iii. Christians rightly regard the Resurrection as the one fundamental historic miracle on which rests their *historic* faith. If any fact can be regarded as indisputable it is the fact that on the morning of the first Easter Sunday the astonished disciples found that there was no corpse in the rock-hewn sepulchre. So much is now freely conceded by the most advanced sceptics. The testimony in favour of the fact is overwhelming, and it is impossible to account for the existence of Christianity or of Christendom on any hypothesis other than the firm conviction in a miraculous Resurrection, of which all the early disciples regarded themselves as the chosen witnesses. The modern criticism of unbelief has only attempted to account for the empty tomb by theories which sink to the ground under the weight of their own impossibility. The notion of a merely *apparent* death from which Jesus was revived by the spices and the cool sepulchre; the notion that the apostles stole the body by night; the notion that Jesus was not crucified at all, but only someone in His place; the notion that 'the faith of Christendom is founded on the self-deception of an *hallucination*'—have been in turn adopted and abandoned. Such naturalistic explanations are impossible, unless they be bolstered up by the preposterous supposition that, at some stage, deliberate deception was at work, and that the teachers of the religion which is pre-eminent in inculcating the sanctity of truth founded their preaching upon a lie. It is not possible here to develop the arguments, or to array the evidence, on which our faith in a literal Resurrection of Jesus in a glorified and spiritual body is founded. We must be content to refer to such works as those of Gebhardt (Gotha, 1864), Beyschlag (Berlin, 1865), Steinmeyer (Berlin, 1871), and Bishop Westcott on *The Gospel of the Resurrection* (Lond. 1884).

iv. And it must be borne in mind that, if scepticism could eliminate from the gospels what is called the supernatural element, it would still be confronted with the superhuman grandeur of Christ Himself. So far from tending to discredit the narratives of the miracles which He wrought, it may rather be said that Science tends to throw light upon their accordance with the yet undeciphered laws of nature; but even were every miracle eliminated, Christ still continues to be what even those who have doubted of His divinity call Him, '*ein Mysterium, ein Unicum*.' The proof of His divinity is involved in His perfect sinlessness, which not only transcends the attainments but even the ideal of humanity. Infinite in its many-sidedness, His character is yet supreme from every aspect in which it can be regarded. Not only is He the

sole human being whom sinlessness has claimed, or of whom sinlessness can for a moment be predicated, but the ideal presented by His character stands apart, not only from that in the life of the best pagans, but even of those whose life was a professed imitation of His. And more even than this, imagination has again and again attempted at least to conceive and depict a character absolutely stainless, and yet, in the whole range of the world's poetry and fiction, has never attempted to do so without hopeless failure if it descended for a moment into details. Could the peasants of Galilee have invented the sole perfect ideal which the world has been able either to imagine or describe? To this is attributable the remarkable fact that even the most pronounced sceptics—even those opponents of Christianity who would gladly have got rid altogether of the admiration of Christ—seem to have been unable to contemplate Him without as if were falling on their knees. 'Between Him and whoever else in this world,' said Napoleon to General Bertrand, 'there is no possible form of comparison.' 'Jesus is in all unique,' says Renan, 'and nothing could be compared to him' (*Vie de Jesus*, p. 457). Strauss calls Him 'the Being without whose presence in the mind perfect piety is impossible.' Goethe called Him 'the Divine Man, the Saint, the type and model of all men' (*Conversations with Eckermann*, ii. 3). J. S. Mill said that 'it would not be easy even now, even for an unbeliever, to find a better translation of the rule of virtue from the abstract into the concrete than to endeavour so to live that Christ would approve our life.' The character of Jesus was sufficient to overawe even the lippancy of Voltaire, as we see in the story of his remarkable dream.

v. Nothing short of a divine personality can account for the stupendous and inexhaustible effect produced upon the world by the life and teaching of Christ—a life so short that He died before the full completion of the powers of manhood; a ministry so confined in space, so contracted in time. That life, lived on a stage so narrow, furnished to mankind the sole perfect pattern and example; that teaching involved every element of pure and perfect spiritual religion. It was Christ alone who first brought home to the mind of man that God is love, and that man is the son of God; and first brought life and immortality to light. And as Christ thus became the Saviour of mankind by example and teaching, so also did He redeem the race by the self-sacrifice which culminated in the cross and passion, and which is continued by His Resurrection, Ascension, and session at the right hand of God. By this His life He has redeemed us from sin and death, and reconciled us unto God. That mighty work of individual regeneration which Christ began has been carried on by the gift of the Spirit, which, in the slow process of centuries, has made holiness a common attainment of His saints, and leavened, humanised, ennobled the thoughts, the lives, the families, the society, the kingdoms of mankind. And the Christian believes that that work will continue until 'the kingdoms of this world' become universally, and in reality as well as in name, the kingdom of our Lord and of His Christ.

The literature of this subject is inexhaustible, and every year adds to its enormous accumulations. It begins with the gospels and epistles in the 1st century of the Christian era, and continues in unbroken succession through the Fathers, the Schoolmen, and the Reformers, down to modern days. The first attempt to write a consecutive life of Christ, outside the authentic and apocryphal gospels, was the *Vita Christi*, by St. Bonaventura. The *Paradise Regained* of Milton was practically an effort in the same direction. The lives of Christ of later times are very numerous: in Italian, that by Capecciatro (Naples, 1868); in French, those of De

Pressensé, Dupanloup, Salvador, Wallon, and Renan; in German, those of Caspari, Ewald, Hase, Hofmann, Lange, Neander, Sepp, Strauss, Weiss, Keim, and many more; in English, those of Ellicott, Geikie, Edersheim, and, among others far too numerous to mention, that by the present writer in 1874, which has called out such a multitude of successors. See also the articles on JOSEPH and on MARY.

Jet, a dense variety of lignite passing by degrees of quality into bituminous fossil wood, sometimes perfectly black, capable of being easily cut and carved, and of receiving a very beautiful polish. It takes its name from Gagag or Gages, a place in Asia Minor, where, according to Pliny, the substance was obtained, whence in his time it was called gagates, afterwards corrupted into gagat, the modern German name, and jet. Jet is only a peculiar form of lignite, impregnated with bituminous matter, and containing about 37½ per cent. of volatile matter. It is electrical when rubbed; hence it has been called 'black amber' by the Prussian amber-diggers.

Of substances used for trinkets and personal ornament, apart from metals, jet appears to be one of the most ancient. At numerous places throughout Great Britain necklaces, beads, buttons, and other small objects of jet have been discovered, showing that it had been used in the early bronze period. Probably at that remote time it was obtained from the Yorkshire coast about Whitby, whence the principal supply and the finest quality anywhere obtained continues to come. The jet occurs at Whitby in irregular interbedded patches in the Upper Lias shales, two kinds, hard and soft, being found; but only the hard is of value for ornaments. The industry there gives employment to a large proportion of the population. It is also worked in France in the department of Aude, where it is formed into rosary beads, crosses, and other trinkets. Spain also supplies fine jet, which, like that of the French workings, is found in irregular veins in the lower marls of the Cretaceous series, corresponding with the Sussex gault. The Spanish jet is found at Villavieja, in the province of the Asturias, and is principally manufactured at Oviedo. As a material for mourning ornaments jet is admirably adapted, and for that purpose is largely used. Imitations of jet ornaments are made in the hardened india rubber called Vulcanite or Ebonite, and in glass.

Jeton, a round, flat piece of metal, ivory, &c., formerly used for counting, or as counters at play, and also as a check given to members of a society passing in to its meetings.

Jetsam, JETTISON. See FLOTSAM.

Jennessé Dorée ('gilded youth'), a party name given to those young men of Paris who, during the French Revolution, struggled to bring about the reaction or counter-revolution after Robespierre's fall (27th July 1794). Other nicknames bestowed upon the same party were *Muscadins* ('scented darlings') and *Petits-Maitres* ('elegants'). The term *jeunesse dorée* is still in use to designate young men about town, who always go elegantly dressed, have the air of spending money, and live a butterfly life of enjoyment and pleasure.

Jevons, WILLIAM STANLEY, born in Liverpool in 1835, was educated there and at University College, London, and from 1854 to 1859 held a position in the mint at Sydney. In the London M.A. examinations in 1862 he took the gold medal in philosophy; in 1866 he was appointed professor of Logic and Mental Philosophy, and of Political Economy, at Owens College, Manchester; and in 1876-81 he was professor of Political Economy at University College, London. He was elected

F.R.S. in 1872, and received the degree of LL.D. from Edinburgh in 1876. On 13th August 1882 he was drowned whilst bathing at Bexhill, near Hastings. Jevons was the first to popularise the mathematical methods of Boole (q.v.), and so to bring symbolic logic within the capacity of beginners. Among his works in this field are his *Elementary Lessons in Logic* (1870), a very popular text book; *The Principles of Science* (1874), perhaps his most important work; a collection of useful *Studies in Deductive Logic* (1880); and *Pure Logic, and other Minor Works* (1890). To the science of political economy he contributed, besides a primer and several pamphlets, and a work on *The Coal Question* (1865), which led to the appointment of a Royal Commission, his valuable *Theory of Political Economy* (1871; 3d ed. 1888), in which the conception of 'final utility' was first distinctly formulated. See his *Letters and Journals*, edited by his wife (1886).

Jew. WANDERING. See WANDERING JEW.

Jewel. JOHN, one of the fathers of English Protestantism, was born at Berryarbor, near Hfracombe, in 1522, and was educated at Barnstable school, and afterwards at Merton and Corpus Christi Colleges, Oxford. He was admitted B.A. in 1540, and must early have imbibed Reformed doctrines, as he was closely intimate with Peter Martyr during his visit to Oxford. Soon after the accession of Mary he went abroad for safety's sake, visiting Frankfort and Strasburg, and returned on the accession of Elizabeth, by whom he was almost immediately appointed Bishop of Salisbury. His great controversial ability soon made him one of the foremost churchmen of his age, and indeed his famous *Apologia Ecclesie Anglicane* (1562) retains its value as a triumphant exposure of the pretensions of Rome. Bishop Jewel's unwearied devotedness at once to his episcopal duties and to the demands of a great controversy wore out his strength, and brought him to the rest of the grave in his fiftieth year, 22d September 1571.

A collected edition of his works was published in folio in 1609. More recent editions are those by the Rev. John Ayre in the Parker Society (4 vols. 1845-50), and by the Rev. Dr R. W. Jelf (Oxford, 8 vols. 1847-48). An early life is reprinted in Wordsworth's *Ecclesiastical Biography*. See also the Life by C. W. Le Bas (1835).

Jewellery. The word 'jewel' is from the Old French *joel*, a diminutive of *joie*; Ital. *gioja*, 'joy'; Lat. *ignavia*. Jewellery embraces primarily articles intended for personal decoration, made of precious metals, which may be enriched with stones or enamels. But objects, also, not intended for personal use, such as caskets, when decorated with precious stones are said to be jewelled, and the term jewel has a further restricted signification when it is applied to one of the insignia of the knightly orders. Popularly, there is much confusion between the terms gem and jewel; the former belongs especially to engraved stones (see GEM). The love of personal ornamentation is a primal passion of humanity, which sways with equal force the rudest of tribes and the most advanced and luxurious communities. The craving which impels the rude savage to decorate his or her person with beads and circlets of seeds, shell, bone, horn, and wood is the same which has caused monarchs to lavish their treasures on the costliest materials and the most exquisite workmanship of their crowns and insignia of state. Jewellery thus in its wide acceptance as a purely ornamental adjunct to the person has been in use at all times and by the entire human family. And as on these adornments the highest art and skill at the command of any people was always lavished, they afford some measure of the condition of the handi-

crafts and of the artistic development of the people and the period to which they belong. Further, in the days when banking and money-lending were not a factor in commerce, the accumulation of jewellery formed one of the most convenient of methods for the storing of realised wealth. It is so in India at the present day.

Before the use of metals was known, jewellery, if it can be so termed, consisted of carved beads and fragments of such bright substances as were at the command of prehistoric man. Gold is the first metal of which there is any mention in literature, and there is no doubt that, being always found native, it was the first to be used by mankind. The earliest gold ornaments would be the native pellets of the metal as found, and when mankind possessed no mechanical resources beyond rude hammers of stone, with which to beat out these pellets, the possibilities of decorative treatment of gold were very limited. The ability to melt metals and so to obtain masses of large size upon which to work implies a very advanced knowledge, to which, however, artificers must have attained at a very early period. Among the numerous finds of gold jewellery of prehistoric times there are many specimens which show that the early artificers possessed considerable command over their material in the way of hammering out plates to uniform thickness, drawing or beating the metal into wire, and plaiting and twisting it into torques, armilles, rings, and other forms of ornament. In these earliest gold ornaments there is no attempt at decorative treatment other than what could be produced by the hammer; and it is only by degrees that simple efforts at chasing, engraving, and embossing make their appearance. The most archaic gold ornaments discovered by Dr Schliemann in his excavations at Hissarlik, which he regards as ancient Troy, are treated with the hammer alone; the later gold ornaments of Mycenae are of a much more developed character, showing a knowledge of chasing and embossing. It is only when we come to historical times that we find artificers had obtained command over their material and tools sufficient to enable them to produce jewellery which bears a distinct impress of the art and ornament of their period and nation.

To trace the development of jewellery throughout ancient and mediæval times would simply be to follow the course of art and the arts among the leading civilised communities. Fortunately the tombs of the dead, and hoards which have apparently been hid to escape the ravages of enemies, have been the means of preserving to our days a number of examples of jewellery of all times and all peoples sufficient to illustrate the nature of their ornament and the style of jewellery they wore. In this way examples of the jewels of the ancient Egyptians remain to the present day, from which we learn that the civilised people of the Nile valley even in very early times had greatly improved on the arts of our prehistoric ancestors of the bronze period. For we find the Egyptian artificers could engrave, chase, solder, enrich with enamel, and set precious stones in their jewellery; they were in fact complete masters of the most important processes of the modern jeweller. The jewellery of ancient Greece shows that perfection of form and purity of ornament which was only to be expected of the most highly gifted artistic race of all times. The jewellery of the Romans was, like their art, inherited from the Greeks, and partook of their more robust but less refined character; but with the lapse of time and the influence of northern incursions it modified into Gothic forms. Contemporary with Greek art of the best period, the jewellery of the Etruscans forms the most remarkable example of fine metal-working of ancient times. The Etruscan

jewellers were able to produce on the surface of their gold a rich granulated appearance, as if it were dusted over in a perfectly equal manner with gold powder, which it has long been the despair of jewellers to imitate. About 1860 the late Alessandro Castellani, of Rome, discovered at St Angelo, among the Calabrian mountains, a race of peasant gold-workers who appeared to have inherited the traditional secret; and with the aid of these craftsmen he succeeded in producing fairly satisfactory reproductions of the marvellously fine work of the ancient Etruscans; but, after patient experiment, Castellani himself acknowledged the Etruscan method to be still a lost art. Not less noteworthy is the jewellery of the Celtic and Scandinavian races, which shows remarkable vigour and individuality of character. It is best seen in the ancient brooches of the Scottish Highlands and Ireland, in which the arts of engraving, inlaying, enamelling, filigree-work, Niello (q.v.), and jewelling all in their turns were made use of in the production of works of art of a highly distinctive character (see BROOCH, Vol. II, p. 478). It is well known that a taste for rich and gorgeous jewellery is one of the most outstanding characteristics of the Hindu; and throughout all classes in the East Indies bright, glittering, and richly-coloured personal decorations are looked on as indispensable. The jewellery of India in its styles and methods of manufacture brings down to our own days traditions of the earliest skilled craftsmanship of the world. No other race of jewellers can with so small a weight of gold produce works of such remarkable airiness, grace, and elaboration as the Hindus. Their skill in Filigree-work (q.v.), the gorgeous colouring of their translucent enamels, and generally their masterly and bold use of colours and bright fragments of stone are in the highest degree admirable. Traditional skill and ancient forms are also perpetuated in the 'peasant jewellery' of the various European communities, which yet show in their purity the styles, combinations, and methods of working in use before the harsh mechanical forms of modern cheap jewellery came in to corrupt taste and supplant simple arts.

The distinction between jewellery of the present day and that of earlier times is found in the fundamental fact that the old work is the creation of the craftsman, while the modern jewel is the product of a manufacturer who adopts all labour-saving machines and appliances for the economical finishing of his wares. The lowest class of jewellery—that which forms the staple of the 'gilt-toy trade' in Birmingham—is made from sheet-copper struck up in dies and moulds by means of the screw-press, then gilt by electro-deposit and adorned with glass pastes in imitation of diamonds and all other precious stones. The cheap and rapid production in limitless numbers of imitation articles is thus secured, but the objects themselves are utterly devoid of artistic significance. To a large extent it is the same with jewellery even of the most expensive description, for although it is not stamped out of the sheet, yet the different portions of the work are allotted to separate workmen who perform their task with mechanical accuracy, but in no case is the whole article at once the conception and the execution of the single individual, as was the case with the work of the ancient jeweller.

The headquarters of the jewellery trade as a manufacturing industry is Birmingham, the city in which nearly all the sham jewellery is manufactured. The district of Clerkenwell, in London, is the centre of the higher-class jewellery trade in the United Kingdom. Silver and pebble jewellery is characteristically Scottish, but a great deal of the cheaper Scottish pebble jewellery is of German

manufacture. The manufacture of bog-oak ornaments is a speciality of Dublin, and Jet (q.v.) jewellery is chiefly made at Whitby. All towns of any considerable importance are also centres of jewellery trade; but outside the United Kingdom Paris, Vienna, and New York are the most important places of production. Malta has acquired a reputation for filigree-work; and red coral jewellery comes largely from Naples. See also PRECIOUS STONES.

Jews (corrupted from *Jehudim*), the name given, since the Babylonish captivity, to the descendants of the patriarch Abraham, who, about the year 2000 B.C., emigrated from Mesopotamia, on the east side of the Euphrates, to Canaan or Palestine. They were originally called Hebrews (see HEBREW LANGUAGE). In consequence of a famine in Canaan, Jacob, on the invitation of his son Joseph, who had become chief minister of the king of Egypt, went down thither with all his family, which numbered seventy 'souls,' and obtained from Pharaoh permission to settle in the land of Goshen. Here the Hebrews resided, according to Exod. xii. 40, 430 years. According to the genealogical table of the Levites, in Exod. vi. 16-25, however, their sojourn would not have lasted longer than 210 or 215 years; most of the commentators, therefore, take, with Josephus, the 430 years to indicate the period from Abraham to the Exodus (cf. Galat. iii. 17). During the lifetime of Joseph, and probably for some generations afterwards, the Hebrews were well treated, and prospered; but a new dynasty—probably the 19th—arose, and they were reduced to relentless slavery. A deliverer at length appeared in the person of Moses (q.v.). The circumstances of the exodus (about 1320 B.C.)—such as the ten plagues and the crossing of the Red Sea—are a source of continual controversy between the Rationalistic and the Supra-naturalistic schools of biblical criticism; but the *fact* of an exodus would be disputed only by the wildest scepticism.

The wandering in the wilderness of the Sinaitic peninsula is said to have lasted forty years, though a record of the events of two years only has been preserved. These, however, are obviously the most important, as they contain an elaborate account of the giving of the law (Exod. xix. *et seq.*), which is represented as a direct revelation made to Moses by Jehovah Himself, who descended upon Mount Sinai in fire, amid the roar of thunders and the quaking of hills. The antiquity, however, of the priestly or ecclesiastical portions of the Pentateuch is keenly disputed by a rapidly-growing majority of modern scholars, even so orthodox an authority as Fr. Delitzsch having become a convert to their views shortly before his death. The modern school seek to show the probability of such passages having been composed and inserted subsequent to the great organisation of the priesthood by David; and in proof of this point, among other evidences, to the Book of Judges (q.v.), which narrates the history of the Hebrews some 200 years *after* the conquest of Canaan, and which yet contains scarcely a single trace of the existence of Mosaic institutions among them. For the origin of the law as we now have it, the development of the national consciousness, and the growth of the Old Testament literature, see BIBLE. There is a growing tendency among critics to localise the giving

of the law and the various events connected with revelation at Kadesh rather than in the so-called Sinaitic peninsula.

The 'land of promise' became theirs at last (about 1274 B.C.), under Joshua (q.v.), the successor of Moses. Tribe after tribe was swept from its ancient territory, and for the most part either annihilated or forced to flee. Yet the whole bulk of the native inhabitants was not extirpated or expelled, nor even subdued till a much later period. The country was now divided among the Hebrew tribes. The magnificent pastoral region to the east of the Jordan was now occupied by the tribes of Reuben, Gad, and the half-tribe of Manasseh; while the land west of the Jordan was parcelled out to the remaining—Judah, Simeon, Dan, Benjamin, Ephraim, the second half-tribe of Manasseh, Issachar, Zebulon, Naphtali, and Asher. The tribe of Levi received, instead of a province, forty-eight cities scattered throughout Canaan and the tenth part of the fruits of the field, and were allowed generally to settle individually throughout the land where they chose.

After the death of Joshua (about 1254 B.C.) the want of a chief to the young state became sadly palpable. Little regard was paid to the Mosaic institutions; the single tribes pursued their own individual interests; intermarriages with the idolatrous natives weakened the bond of union still further; and the next consequence was that the tribes were singly subdued by the surrounding nations. At this juncture there arose at intervals valiant men and women, Judges (*Shofetim*), who liberated the people from their oppressors, the Moabites, Philistines, Ammonites, Amalekites, &c. Fifteen of these are named, some of whom appear to have been contemporary with each other, and to have exercised authority in different parts of the country. This period constitutes the 'heroic' age of Hebrew history. Among these Judges the prophetess Deborah, Gideon, Jephthah, the herculean Samson, and the prophet Sammel are especially notable; the last mentioned was, in every sense of the word, the greatest Hebrew that had as yet appeared since the days of Moses. The first of the prophets, he was also the last of the republican chiefs of the confederate tribes. Wearied of their intestine feuds, harassed by the incursions of their predatory neighbours, chiefly, however, goaded by the characteristic desire 'to be like all the other nations' (1 Sam. viii. 5), the people compelled him, in his old age, to choose for them a king (1067 B.C.).

The first who exercised regal authority was Saul, the Benjamite (1067-1055 B.C.). But, though a distinguished warrior, and a man of royal presence, he appears not to have possessed the mind of a statesman; and his wilfulness and paroxysms of insanity finally alienated from him many of the bravest and best of his subjects. After his death on Mount Gilboa, David (q.v.), his son-in-law, was proclaimed king (1055-1015 B.C.). This monarch was by far the greatest that ever sat on the throne of Israel. His reign, and that of his equally famous son, Solomon, are regarded as the golden time of Hebrew history. The remaining aborigines of Canaan and its borders

viz. the Philistines, Edomites, Amalekites, Moabites, &c. were thoroughly subdued; the boundaries of the Hebrew kingdom were extended as far as the Euphrates and the Red Sea; Jerusalem was captured, and made the capital of the conqueror; the priesthood was reorganised on a splendid scale; the arts of poetry, music, and architecture were cultivated; schools of prophecy (first established, probably, by Samuel) began to flourish; a magnificent temple for the worship of Jehovah was built in the capital; and commercial intercourse was

carried on with Phœnicia, Arabia, Egypt, with India and Ceylon, and perhaps with even Sumatra, Java, and the Spice Islands. But there was a canker at the root of all this prosperity. The enormous and wasteful expenditure of Solomon forced him to lay heavy taxes on the people. His wealth did not enrich them; it rather made them poorer; and although gifted with transcendent wisdom and the most brilliant mental powers, towards the end of his life he presents the sad spectacle of a common eastern despot, voluptuous, idolatrous, occasionally even cruel, and his reign (1015-977 B.C.) cannot but be regarded, both politically and financially, as a splendid failure. After his death the Hebrew monarchy, in which the germs of dissension—chiefly jealousy against the influence of Judah—had been silently growing up for many a year, split under Rehoboam into two sections (975 B.C.)—the kingdom of Judah, under Rehoboam, son of Solomon, and the kingdom of Israel, under Jeroboam, the Ephraimite. The former of these countries comprised the two tribes of Judah and Benjamin, together, probably, with some Danite and Simeonite cities; the latter, the remaining ten. After nineteen kings of different dynasties, among whom Jeroboam, Abiah, Joram, Jeroboam II., Pekah may be mentioned, had reigned in Israel, few of whom succeeded to the throne otherwise than by the murder of their predecessors, the country was finally conquered by Sargon, king of Assyria, its sovereign, Hoshea, thrown into prison, the mass of the people carried away captive (720 B.C.) into the far east, the mountainous regions of Media, and their place supplied by Assyrian colonists. These, mingling and intermarrying with the remnant of the Israelites, formed the mixed people called Samaritans (q.v.). Among the twenty kings of the House of David who ruled over Judah, Jehoshaphat, Uzziah, Hezekiah, and Josiah distinguished themselves both by their abilities as rulers and by their zeal for the worship of Jehovah. Yet even they were, for the most part, unable to stay the idolatrous practices of the people, against which the prophets' voices even could not prevail. Other kings were, for the most part, more or less unfaithful themselves to the religion of their fathers, and unable to withstand the power of the Egyptians, Assyrians, and Babylonians, to each of whom they in turn became tributary, until at last Nebuchadnezzar stormed Jerusalem (588 B.C.), plundered and burned the temple, put out the eyes of King Zedekiah, and carried off the most illustrious and wealthy of the inhabitants prisoners to Babylon. The Israelites, who had been exiled 134 years before the inhabitants of Judah, never returned. What became of them has always been matter of vaguest speculation (see BABYLONISH CAPTIVITY, ANGLO-ISRAELITE THEORY, BENI-ISRAEL).

All that we know of the condition of the Hebrews during the captivity relates exclusively to the inhabitants of the Kingdom of Judah. And so mild, especially during the later years, was the treatment which they received in the Babylonian empire that, when liberty was announced to the whole body of the captives, only the lowest of the low returned, together with the Levites and Priests. The Book of Esther likewise bears testimony to the numbers that had remained scattered over the vast empire.

The influence of this exile, however, was of a most striking and lasting nature. Babylon henceforth became, and remained up to about 1000 A.D., the 'second land of Israel'—in many respects even more highly prized than Palestine. To this brief period of the captivity must be traced many of the most important institutions of the synagogue in its wider sense. Common religious meetings, with

prayer, were established; many of the Mosaic laws were re-enforced in their primitive rigour; and the body of the 'oral law' began to shape itself, however rudely, then and there. Besides, there began to grow up and unfold itself the belief in a Messiah, a Deliverer, one who should redeem the people from their bondage. The writer of the last twenty-seven chapters of Isaiah, who is usually called by modern scholars the 'Younger Isaiah,' is held to belong to this period, and expresses in glowing language the hopes of the exiles; no less do many of the Psalms belong to this time. From this period, likewise, the belief in the resurrection of the body and the immortality of the soul, as well as the notion of angels and demons, begins to enter more distinctly into the general creed.

The exile is generally computed to have lasted seventy years. This is not strictly correct; it lasted seventy years if reckoned from the capture of Jerusalem in the reign of Jehoiakim (606), but only fifty counting from the destruction of Jerusalem. When Cyrus, the Persian king, had overthrown the Babylonian kingdom (538 B.C.) he issued an edict permitting the exiles to return home; and a minute account of the circumstances attending this joyous event is given in the Books of Ezra and Nehemiah.

The foundations of the Second Temple were laid in the second year of the return, but in consequence of the interference of the Samaritans the work had to be laid aside. It was not resumed till the second year of Darius Hystaspes (520 B.C.), and was finally completed in the sixth year (516 B.C.). The waste cities were likewise rebuilt and re-peopled. During the long reign of Darius the Jews were blessed with a high degree of material prosperity. Under his successor, Xerxes, probably occurred the incidents recorded in the Book of Esther. In the seventh year of Artaxerxes, the successor of Xerxes, Ezra the priest, invested with high powers, headed a second migration. Thirteen years later Nehemiah, Artaxerxes' cup-bearer, but a man of Jewish family, was ordered to proceed to Jerusalem, and, aided by Ezra and others, succeeded in secretly fortifying the city, notwithstanding the continuous opposition from Samaritans, Ammonites, and Arabians. The strictest observance of the 'written law,' even of those of its parts which had been for some reason or other disregarded, was now rigorously enforced, and many 'oral ordinances' were put into practice which do not seem to have been much heard of previously. The supreme spiritual authority was vested in a society of pious and pre-eminently learned men, founded by Ezra, out of which grew the 'Great Synagogue.' The compilation and transcription of the sacred records began, periodical public readings and expoundings of the law were instituted, and the vast Targumic, as well as the so-called rabbinical literature, generally dates—in its earliest beginnings—from this point. During the life of Nehemiah the breach between the Jews and Samaritans became final, by the erection on Mount Gerizim (q.v.) of a rival temple to that at Jerusalem, and the creation of a rival priesthood.

Alexander the Great, on his way to conquer the whole East, did not deem it necessary to storm Jerusalem. The inhabitants submitted (332 B.C.), and he even deigned to have sacrifices offered on his behalf to the national god of his new subjects, a great number of whom, and of Samaritans, he carried away to Egypt, and with these Jewish captives peopled a third of his newly founded city Alexandria. After him Ptolemy Soter, one of his generals, who had become king of Egypt, invaded Syria, took Jerusalem (301 B.C.), and carried off 100,000 of the inhabitants, whom he forced to settle chiefly in Alexandria and Cyrene.

The Egyptian or Alexandrian 'Dispersion' (*Golah*)—destined to be of vast importance in the development of Judaism and Christianity—gradually spread over the whole country, from Libya to Ethiopia. They enjoyed equal rights with their fellow-subjects, both Egyptian and Greek, and were admitted to the highest dignities and offices, so that many further immigrants followed of their own free-will. The freedom they enjoyed enabled them to reach, under Greek auspices, the highest eminence in science and art. To this period belongs the Greek translation of the Bible, the Septuagint (q.v.), which, in its turn, while it estranged the people more and more from the language of their fathers, gave rise to a vast pseudo-epigraphical and apocryphal literature, not to mention the peculiar Græco-Jewish philosophy, which sprang from a mixture of Hellenism and Orientalism.

For a hundred years Judea herself remained under Egyptian rule. During the reigns of the first three Ptolemies it prospered; but after the accession of Ptolemy Philopator a change for the worse came over the fortunes of the Jews. After his death Antiochus III. (q.v.) of Syria incorporated Palestine with the dominions of the Seleucids, and treated the Jews less favourably than their Egyptian masters had done. Their fate became harder still under his son, Antiochus Epiphanes, or Epimanes ('the Madman'), who, by every means a cruel and foolish policy could devise, outraged the religious feelings of the nation. To force the Jews into the Greek religion, the temple at Jerusalem was dedicated to Jupiter Olympius; idol altars were built in every village, and the people constrained to offer swine daily. Some yielded, many fled, the greater part preferred martyrdom in some shape or other.

At this juncture the heroic family of Mattathias, a priest of the house of the Hasmoneans, rose, together with a few patriots, against the immense power of the Syrians. The national cause quickly gathered strength, and after the death of Mattathias (166 B.C.) Judas Maccabæus (q.v.) led the national hosts to victory against the Syrians. After his death (161) his brothers Jonathan and Simon completed the work of deliverance, and instituted the Sanhedrin (145). During their rule alliances were twice formed with the Romans, and the country once more began to prosper. Under Simon more especially, Syrian rule became a mere shadow: his was an almost absolute power, so much so that in the year 170 of the Seleucidian era (142 B.C.) a new Jewish era was commenced, and public documents bore date, 'In the first year of Simon, high-priest and chief of the Jews.' Simon's son, John Hyrcanus (q.v.), after a brief period of vassalage to the Syrians, extended his authority over Samaria, Galilee, and Idumea—the Idumeans being converted to the Jewish religion. His son, Aristobulus, added Iturea to his dominions; Alexander Jannæus, succeeding his brother, further contrived to enlarge his territories. He was disliked by the mass of his countrymen, and a civil war of six years' duration ensued. His wife, Alexandra, securing the support of the Pharisees (q.v.), governed, on the whole, prudently for nine years. The Pharisaic party, however, abused the power which fell into their hands, and a reaction took place. Aristobulus, youngest son of the queen, marched to Jerusalem, and ejected his elder brother, Hyrcanus II., from the sovereignty. This led to the interference of the Romans, who were then fighting both in Syria and Armenia. Jerusalem was captured (63 B.C.) by Pompey, Judæa made dependent on the Roman province of Syria, and Hyrcanus appointed ethnarch and high-priest.

In 54 B.C. Licinius Crassus plundered the temple,

which Pompey had spared. When the war between Cæsar and Pompey broke out, the partisans of Pompey were numerous in Syria, and contrived to poison Aristobulus and execute his son Alexander, who were Casareans (49 B.C.). After the death of Pompey, however, things changed; and Hyrcanus, or rather Antipater the Idumean (who was both his minister and master), saw the necessity of securing the favour of Cæsar. With Hyrcanus II. ended the line of the *Hasmonean* princes. They were nominally both sovereigns and high-priests; but the real religious authority had passed into the hands of the priesthood, and especially of the Sanhedrin (q.v.). The *Idumean* dynasty virtually commenced with Antipater, who prevailed on Cæsar to restrict Hyrcanus to the high-priesthood, and obtained for himself the office of procurator of Judæa, while his eldest son Phazael was appointed governor of Jerusalem, and his younger son Herod governor of Galilee. The Jewish or national party took alarm at this sudden increase of Idumean power; strife ensued, and ultimately Antipater perished by poison; but Herod, by the assistance of the Romans, finally entered Jerusalem in triumph (37 B.C.), caused Antigonus, the last male representative of the *Hasmonean* line, and his most dangerous enemy, to be put to death, and commenced the difficult task of governing a people who were growing more and more unruly every day. For the history of the next period, see HEROD. After Herod's death (4 B.C.), Archelaus, one of his sons, ruled Judæa and Samaria; but his arbitrariness, and still more his constant attacks upon religion, made him hateful to the people; and Augustus, listening to their just complaints, deprived him of his power, and banished him to Vienne. Judæa was now thrown together with Syria, and was ruled by Roman governors.

In the year 38 A.D. the Emperor Caligula issued an edict ordering divine honours to be paid to himself. Everywhere throughout the Roman dominions the Jews refused to obey. At Alexandria a frightful massacre took place, and for a time it seemed as if the whole of the inhabitants of Judæa, too, were doomed to perish. Herod Agrippa obtained anew from Claudius the dominion over all the parts once ruled by his grandfather Herod, and many privileges were through his influence granted to his Jewish subjects, and even to foreign Jews. They received the rights of Roman citizenship (41 A.D.), and their ruler even tried to conciliate their religious prejudices by the strictness with which he observed their law; yet the national party remained discontented, and in an almost permanent state of mutiny.

After the death of Herod Agrippa I. the country was again subjected to Roman governors. The confusion soon became indescribable. The whole land was overrun with robbers and assassins, some of whom professed to be animated by religious motives, while others were mere ruffianly freebooters and cut-throats; the antipathy between Jews and Samaritans waxed fiercer and fiercer, and the latter waylaid and murdered the orthodox Galileans as they went up to worship at Jerusalem; all sorts of impostors, fanatics, and pretenders to magic made their appearance; the priesthood was riven by dissensions; the hatreds between the populace and the Roman soldiery (mostly of Græco-Syrian origin), and under the command of cruel procurators, such as Albinus and Gessius Florus, increased; frightful portents (according to Josephus) appeared in the heavens, until, in 66 A.D., in spite of all the precautionary efforts taken by Agrippa, the party of Zealots, also called Sicarii or 'Assassins,' burst into open rebellion, which, after a horrible carnage, was terminated (70 A.D.) by the conquest of Jerusalem by Titus, the destruc-

tion of the temple, and the massacre and banishment of hundreds of thousands of the unhappy people, who were scattered among their brethren in all parts of the world.

The defence of Jerusalem as narrated by Josephus is one of the most magnificent and melancholy examples of mingled heroism and insanity that the world affords. Very considerable numbers of Jews were still allowed to remain in their native country, and for the next thirty years, although both hated and treated with rigour, they appear, on the whole, to have flourished. The Emperor Nerva was as lenient to them as to the rest of his subjects; but as soon as they had attained some measure of political vitality, their turbulent and fanatical spirit broke out anew. Their last attempts to throw off the Roman yoke, in Cyrene (115 A.D.), Cyprus (116), Mesopotamia (118), and Palestine, under Bar-Cochba (q.v.), were defeated after enormous and almost incredible butcheries. The suppression of Bar-Cochba's insurrection (135 A.D.) marks the final desolation of Judæa, and the dispersion of its inhabitants. The whole of Judæa was made like a desert, about 985 towns and villages lay in ashes, 50 fortresses were razed to the ground; the name of Jerusalem itself was changed into *Ælia Capitolina*, and a heathen colony settled in the city, from entering which every Jew was strictly debarred. The hardships to which the unfortunate race were subjected were again alleviated in the reign of Antoninus Pius; Alexander Severus placed Abraham on the same divine level as he did Christ. Heliogabalus, among his many senseless whims, patronised various Jewish practices, such as circumcision and abstinence from swine's flesh; and, generally speaking, from the close of the 2d century till the establishment of Christianity under Constantine (330 A.D.), when their hopes were once more dashed to the ground, the Jews of the Roman empire appear to have thriven astonishingly. In this period falls the redaction of the chief code and basis of the 'Oral Law,' the Mishna, completed by Jehuda Hanassi ('the Prince'), or Hakkadosh ('the Saint'), president of the great school at Tiberias (220); and upon this code were grafted subsequently the two gigantic commentaries or complements, the Palestinian and the Babylonian Gemaras. The Babylonian Jews were even more fortunate than their western brethren, though they did not perhaps attain the meridian of their prosperity till the revival of the Persian, on the downfall of the Parthian empire. Their leader was called 'The Prince of the Captivity' (*Rosh Galutha*), and was chosen from among those held to be descended from the House of David. He lived in great splendour, assuming among his own people the style and state of a monarch. The reputation for learning of the Babylonian schools, Nehardea, Sura, and Pumbeditha, was very great. What their condition was at this time further east we cannot tell, but it seems quite certain that they had obtained a footing in China, if not before the time of Christ, at least during the 1st century.

In Europe the ascendancy of Christianity was baneful to the Jews. Imperial edicts and ecclesiastical decrees vied with each other in the rigour of their intolerance towards this unhappy people. They were prohibited from making converts, and from marrying Christian women; they were burdened with heavy taxes; yet no persecution apparently could destroy the immortal race. In the 4th century they are found in large numbers in Illyria, Italy, Spain, Minorca, Gaul, and the Roman towns on the Rhine; they are agriculturists, traders, and artisans; they hold land; their services, in fact, cannot be dispensed with; Constantine, during whose reign a fierce revolution broke out among the Arians and Jews (353), terms them 'that most

hateful of all people; yet in spite of this they fill important civil and military situations, have special courts of justice, and exercise the influence that springs from the possession of wealth and knowledge. The brief rule of Julian the Apostate even shed a momentary gleam of splendour over their destinies, and secured for them permission to rebuild the temple of Jerusalem. The death of this emperor, however, frustrated their labours, and the rapid increase of ecclesiastical power was hurtful to them in a variety of ways; although the emperors now began to protect them as far as they could. In 418 they were excluded from military service. After the fall of the western empire their fortunes were different in different countries. In Italy, Sicily, and Sardinia they were for a time unmolested; in the Byzantine empire they suffered many oppressions; while in the 6th and 7th centuries the Franks and Spanish Visigoths inflicted on them frightful persecutions.

The sudden volcanic outburst of Mohammedanism in the Arabian peninsula was at first disastrous to the Jews in that part of the world. For several centuries a Jewish kingdom had existed in the south-west of Arabia, called Himyaritis or Homeritis, which was in a flourishing condition in 120 B.C. About 230 A.D. a prince of the Jewish faith mounted the throne of Yemen; twice, however, the Jewish kings were driven from it, and the Christian religion was introduced in that part in 530. At first Jewish tribes around Mecca and Medina entertained opinions favourable to Mohammed as an Arabian chief, but when Islam began to threaten their own faith they rose in arms against its founder. Mohammed proved the stronger; he subdued the Chaibar tribes in 627, and the Arabian Jews were finally removed to Syria. The spread of Mohammedanism through Asiatic Turkey, Persia, Egypt, Africa, and the south of Spain was, nevertheless, on the whole advantageous to the Jews. Excepting accidental persecutions, such as those in Mauritania (in 790) and in Egypt (1010), they enjoyed, under the califs and Arabian princes, comparative peace. In Moorish Spain their numbers greatly increased, and they became famous for their learning as well as for trade. They were counsellors, secretaries, astrologers, and physicians to the Moorish rulers; and this period may well be considered the golden age of Jewish literature. Poets, orators, philosophers of highest eminence arose, and in considerable numbers; and it is a well-established fact that to them is chiefly due through the Arab medium the preservation and subsequent spreading of ancient classical literature, more especially philosophy, in Europe. But in Christendom few and far between were the monarchs who rose above the barbarism of the churches. About the beginning of the 11th century the Byzantine emperor Basil II. renewed the persecution. In Babylonia, too, the califate had passed into the hands of rulers hostile to the Jews; and before the close of the 11th century the Prince of the Captivity had perished on the scaffold, the schools were closed, the best of the community had fled to Spain, and those that remained were reduced to an abject condition, from which they have never risen. In Italy their position was made tolerable by considerable pecuniary sacrifices; here and there at intervals a spirit of Christian intolerance might break out, but they enjoyed for the most part the protection of the popes.

Less favourable was their lot in France. Under the weaker of the Carlovingians the church advanced with imperious strides, and a melancholy change ensued: kings, bishops, feudal barons, and even the municipalities, all joined in cruel persecution. From the 11th to the 14th century their history is

a series of successive massacres. All manner of wild stories were circulated against them; it was said that they were wont to steal the Host, and to contemptuously stick it through and through; to inveigle Christian children into their houses, and murder them; to poison wells; and the like. They were also hated for their excessive usury, though there can be no doubt that the principal blame of this is to be attributed to those whose tyranny, by depriving the Jews of the right to possess land, had compressed their activity into the narrower channels of traffic. Occasionally, however, their debtors, high and low, had recourse to a very easy means of getting rid of their obligations. Thus, Philip Augustus, under whose rule the Jews seem to have held mortgages of enormous value, simply confiscated the debts due to them, forced them to surrender the pledges in their possession, seized their goods, and banished them from France. Yet in less than twenty years the same proud but wasteful monarch was glad to let them come back. Louis IX. cancelled a third of the claims which the Jews had against his subjects, 'for the benefit of his soul.' An edict was also issued for the seizure and destruction of their sacred books; and we are told that at Paris twenty-four cart-loads of the Talmud and other books were consigned to the flames. In the reign of Philip the Fair the Jews were again expelled from France (1306) with the usual accompaniments of cruelty; but the state of the royal finances rendered it necessary, in little more than a dozen years, to recall them; and they were allowed to enforce payment of the debts due to them, on condition that two-thirds of the whole should be given up to the king! But a religious epidemic having seized the common people in Languedoc and the central regions of France (1321), they signalled themselves by horrible massacres of the detested race. In the following year the plague broke out, and the wildest crimes were laid to the charge of the Jews. One shudders to read what followed; in whole provinces every Jew was burned, and at Chinon a hundred and sixty of both sexes were burned together! Christianity never produced more resolute martyrs; they sang hymns in the place of torment. Finally, in 1395, they were banished from the centre of France.

In England they are mentioned in the ecclesiastical constitutions of Egbert, Archbishop of York, in 740; they are also named in a charter to the monks of Crowland, 833. William the Conqueror and William Rufus favoured them; the latter carried his contempt for the religious institutions of his kingdom so far that he actually farmed out the vacant bishoprics to Jews; and at Oxford, even then a seat of learning, they possessed three halls—Lombard Hall, Moses Hall, and Jacob Hall, where Hebrew was taught to Christians as well as to the youths of their own persuasion. As they grew in wealth they grew in unpopularity. On the day of the coronation of Richard the Lion-Heart (1189), some Jews being found present at the spectacle, from which their nation had been strictly excluded, a popular commotion against them broke out in London; their houses were pillaged and burned; and though Ranulf de Glanvill, the chief-justiciary of the realm, partially succeeded in arresting the havoc, and even in bringing some of the mob to justice (three were hanged), yet the barbarous bigotry of priests and people prevented anything like just or salutary punishment. Similar scenes were witnessed at Norwich, Edmundsbury, Stamford, and York; in York most of the Jews preferred death to forced baptism. When Richard returned from Palestine their prospects brightened a little; though they still were treated with great rigour, their lives and wealth were protected for a consideration! John at first

covered them with honour, but suddenly turned round on his protégés, after they had accumulated great wealth, and imprisoned, maltreated, and plundered them in all parts of the country. Under Henry III. they were mulcted enormously. Accused of clipping the coin of the realm, they had, as a penalty, to pay into the royal exchequer (1230) a third of their movable property. To this reign belongs the now exploded story of the crucifixion of the Christian boy, Hugh of Lincoln (q.v.). The accession of Edward I. did not mitigate their misery; some efforts were made to induce them to give up their profession of usury, as was also done in France and elsewhere during the same period; but, heavily taxed by the sovereigns or governments of Christendom, and debarred by special decrees or by vulgar prejudice from almost every other trade or occupation, they could not afford to prosecute ordinary callings. The attempt made by the Dominican friars to convert them, of course, failed utterly; and in 1253, the Jews—no longer able to withstand the constant hardships to which they were subjected in person and property—begged of their own accord to be allowed to leave the country. Richard of Cornwall, however, persuaded them to stay. Ultimately, in 1290, they were driven from the shores of England, pursued by the execrations of the infuriated rabble, and leaving in the hands of the king all their property, debts, obligations, and mortgages.

In Germany they were looked upon as the special property of the sovereign, who bought and sold them, and were designated his *Kammerknechte* ('chamber-servants'). About the 8th century they are found in all the Rhenish towns; in the 10th century, in Saxony and Bohemia; in the 11th, in Swabia, Franconia, and Vienna; and in the 12th, in Brandenburg and Silesia. The same sort of treatment befell them in the empire as elsewhere; they had to pay all manner of iniquitous taxes—body tax, capitation tax, trade taxes, coronation tax—and to present a multitude of gifts to mollify the avarice or supply the necessities of emperors, princes, and barons. A raid against the Jews was a favourite pastime of a bankrupt noble in those days. The Crusades kindled a spirit not in Germany only, however, but through all Christendom, hostile to the 'enemies of Christ.' Trèves, Metz, Cologne, Mainz, Worms, Spire, Strasburg, and other cities were deluged with the blood of the 'unbelievers.' At such epochs the passions of the populace and of the lower clergy could not be restrained. The word *Hep* (said to be the initials of *Hiccosolyqua est perdita*, 'Jerusalem is fallen') throughout all the cities of the empire became the signal for massacre, and if an insensate monk sounded it along the streets it threw the rabble into paroxysms of murderous rage. The Jews were expelled from Vienna (1196), Mecklenburg (1225), Frankfort (1241), Brandenburg (1243), Nuremberg (1390), Prague (1391), and Ratisbon (1476). The 'Black Death' occasioned a great and widespread persecution (1348-50). They were murdered and burned by thousands, and the race almost disappeared from Germany; only, however, to return, for their services were indispensable. Here and there they possessed the rights of citizens, or were allowed to hold real estate; in general they were permitted to prosecute only commerce and usury, and the law turned on them its harshest aspect. Repeatedly, too, the emperors gratified at once their piety and their greed by cancelling their pecuniary claims. In many places they were compelled to live in certain parts of the town, known as the *Judenstrasse* ('Jews' Street').

Switzerland commenced to persecute them about

the middle of the 14th century; in the 15th century they were expelled from various places. Their treatment was more humane in Poland and Lithuania; and after 1348 their numbers there were swelled by fugitives from Germany and Switzerland. Russia and Hungary received, persecuted, and banished them.

In Spain the condition of the Jews was long highly favourable; but the horrible persecutions by the Gothic princes in the 6th and 7th centuries made it inevitable that the first gleam of a Moorish scimitar on the coast would turn them into allies of the invaders. During the whole of the brilliant period of Moorish rule in the peninsula they enjoyed, indeed, what must have seemed to them, in comparison with their fate elsewhere, a sort of Elysian life. They were almost on terms of equality with their Mohammedan masters, rivalled them in civilisation and letters, and probably surpassed them in wealth. The Spanish Jews were consequently of a much higher type than their brethren in other parts of Europe. They were not reduced to the one degrading occupation of usury, though they followed that too; on the contrary, they were husbandmen, landed proprietors, physicians, financial administrators, and they had courts of justice for themselves. The Christian monarchs of the north and centre also came to appreciate the value of their services, and we find them for a time protected and encouraged by the rulers of Aragon and Castile. But the extravagance of the nobles and the increasing power of the priesthood ultimately brought about a disastrous change. The estates of the nobles were in many cases mortgaged to the Jews; hence it was not difficult for 'conscience' to get up a persecution. Gradually the Jews were deprived of the privilege of living where they pleased; their rights were diminished and their taxes augmented. In Seville, Cordova, Toledo, Valencia, Catalonia, and the island of Majorca outbursts of priestly and popular violence took place (1391-92); immense numbers were murdered, and wholesale theft was perpetrated by the religious rabble. Escape was possible only by flight to Africa, or by accepting baptism at the point of the sword. The number of these enforced converts to Christianity is reckoned at 200,000. The fate of the Jews in Spain during the 15th century, however, beggars description; we read of nothing but persecution, violent conversion, massacre, the tortures of the Inquisition. Thousands were burned alive; and in one year 280 were burned in Seville alone. Sometimes the popes, and even the nobles, shuddered at the fiendish zeal of the inquisitors, and tried to mitigate it, but in vain. At length the hour of final horror came. In 1492 Ferdinand and Isabella issued an edict for the expulsion within four months of all who refused to become Christians, with the strict prohibition to take neither gold nor silver out of the country. The Jews offered an enormous sum for its revocation, and for a moment the sovereigns hesitated; but when Torquemada, the Dominican inquisitor-general, compared them to Judas, they shrank from the awful accusation; and the ruin of the most industrious, the most thriving, the most peaceable, and the most learned of their subjects—and consequently of Spain herself—became irremediable. Not less than 300,000 resolved to abandon the country, which a residence of seven centuries had made almost a second Judaea to them. The incidents that marked their departure are heartrending. Almost every land was shut against them. Some, however, ventured into France; others into Italy, Turkey, and Morocco, in the last of which countries they suffered the most frightful privations. Of the 80,000 who obtained an entrance into Portugal for

eight months on payment of eight gold pennies a head, many lingered after the expiry of the appointed time, and the poorer were sold as slaves. In 1495 King Emanuel commanded them to quit his territories, but at the same time issued a secret order that all Jewish children under fourteen years of age should be torn from their mothers, retained in Portugal, and brought up as Christians. Agony drove the Jewish mothers into madness; they destroyed their children with their own hands, and threw them into wells and rivers to prevent them from falling into the hands of their persecutors. The miseries of those who embraced Christianity, but who, for the most part, secretly adhered to their old faith (*Oussim, Auussim*, 'yielding to violence, forced ones'), were hardly less dreadful, and it was far on in the 17th century before persecution ceased. *Jatos da Fé* of suspected converts happened as late as 1655.

The wanderers appear to have met with much better treatment in Italy and Turkey than anywhere else. During the 15th and 16th centuries they are to be found in almost every city of Italy, pursuing various kinds of traffic (nearly the whole trade of the Levant, for instance, was in their hands); but chiefly engaged in money-lending, in which they rivalled the great Lombard bankers. Abarbanel (q.v.), perhaps the most eminent Jewish scholar and divine of his day, rose to be confidential adviser to the king of Naples. In Turkey they were held in higher estimation than the conquered Greeks; they were allowed to reopen their schools, to establish synagogues, and to settle in all the commercial towns of the Levant.

The invention of printing, the revival of learning, and the Reformation are generally asserted to have been beneficial to the Jews, but this is only partially true. When the Jews began to use the presses at their earliest stage for their own literature, sacred and otherwise, the Emperor Maximilian was urged—chiefly by converts—to order all Hebrew writings to be committed to the flames; and, but for the strenuous exertions of Reuchlin (q.v.), ignorance, treachery, and bigotry might have secured a despicable triumph. Luther, in the earlier part of his career, looked with no unfavourable eye on the adoption of violent means for their conversion; on the other hand, Pope Sixtus V. was animated by a far more wise and kindly spirit towards them than any Protestant prince of his time. In 1588 he abolished all the persecuting statutes of his predecessors, allowed them to settle and trade in every city of his dominions, to enjoy the free exercise of their religion, and, in respect to the administration of justice and taxation, placed them on a footing of equality with the rest of his subjects. That the Reformation itself had nothing to do with subsequent ameliorations in the condition of the Jews is only too plain from the fact that in many parts of Germany, Protestant as well as Catholic, their lot became actually harder than before. They were driven out of Bavaria (1553), out of Brandenburg (1573); and during the whole of the 17th and the first part of the 18th century the hardships inflicted on them by the German governments positively became more and more grievous. What really caused the change in their favour was the great uprising of human reason that marked the middle of the 18th century. Among the writers who distinguished themselves in Germany by pleading the cause of the Jews we may specially mention Lessing and Mendelssohn. In Holland the Jews were permitted as early as 1603 to settle and trade, though they did not acquire the rights of citizenship till 1796.

In England the edict of Edward I. remained in force for more than 300 years; and the first attempt made by the Jews to obtain a legal recognition

in that country was during the Protectorate of Cromwell in 1655. Cromwell himself was favourable to their admission; so were the lawyers; but the nation generally, and particularly the religious portion of it, were strongly hostile to such a proceeding; and the wearisome controversial jangling of the divines appointed to consider the question prevented anything from being done till the reign of Charles II., who, standing much and frequently in need of their services, permitted them quietly to settle in the island. The English legislature first commenced to take special notice of the existence of Jews in the first half of the 18th century. In 1723 they were distinctly recognised as British subjects in an act which permitted them, when giving evidence in a court of justice, to omit from their oath the words 'On the true faith of a Christian.' In 1753 they obtained the right of naturalisation, but in deference to public clamour it had speedily to be revoked. Most of the civil and political rights of the Jews have been accorded them during the present century. Until 1828 the number of Jewish brokers in the City of London—all of whom were heavily taxed—was limited to twelve. A Jew could not be admitted to the freedom of the City, or exercise any retail trade, till 1832. Since 1833 the profession of barrister, since 1835 the shrievalty, and since 1845 the office of alderman and of lord-mayor have been opened to them. During the reign of Queen Victoria almost every Jewish disability has been removed, so that, in point of law, Jews are now, if natural-born subjects, on practically the same footing as English subjects. By an act of 1845 they were allowed to hold offices in municipal corporations, on condition of signing a declaration (in place of the usual oath) not to exercise their influence so as to injure or weaken the Protestant Church. The privileges of this act were extended by one of 1858, whereby Jews are entitled to be admitted to municipal and other offices on taking the oath, omitting from it the objectionable formula. In 1846 they were placed, as regards their schools and places of worship, of education, and charities, on the same footing as Protestant dissenters. In 1871 the Universities Tests Act was passed, which enabled Jews to graduate at the ancient universities without detriment to their religious principles. Before 1845 doubts had prevailed whether the marriages previously celebrated in England among the Jews, according to their own usages, were valid, and the statute of 1847 put an end to such doubts by declaring all such marriages valid, provided both the parties married had been persons professing the Jewish religion. But now, as then, though it is competent for Jews, like other dissenters, to superadd any religious ceremony they please to their marriages, there must in all cases be notice given to the registrar of the district of such marriage being about to take place, the only exemption being that the marriage may be celebrated in the synagogue or any ordinary dwelling, and not, as with other denominations, in the superintendent registrar's office, or a registered building. A license may also be procured from the superintendent registrar, and the secretaries of the respective synagogues are recognised as the persons to keep the register books of Jewish marriages. In Scotland there is no peculiar legislation affecting Jewish marriages. It was not until 1858 that Jews were admitted to parliament, a statute of that year empowering the House to modify the oath required of members, by omitting in the case of Jews the concluding words of the oath. Baron Rothschild was the first who took his seat in the House of Commons on the passing of this act. But even this statute was only permissive, it being

still left in the power of parliament to refuse to modify the oath if it so determined. It was accordingly superseded by an act of 1866, which prescribed a uniform oath to be taken by members of all religious denominations, except Quakers and other Separatists, who might claim to be admitted by affirmation. Jews were first admitted to the Upper House in 1885, when Sir N. M. de Rothschild was elevated to the peerage as Lord Rothschild, taking the oath, *more Judaico*, with his head covered. The very highest offices of the state are now, with scarcely an exception, within the reach of Jews. Unlike Roman Catholics, Jews may present to livings in the Church of England. But whenever a Jew holds any office in the gift of Her Majesty, to which office shall belong the right of presentation to any ecclesiastical benefice, such right of presentation devolves upon the Archbishop of Canterbury for the time being.

Some of the relics of that mighty host of exiles that left Spain and Portugal found their way into France, where they long lingered in a miserable condition. In 1559 they were received into Bayonne and Bordeaux; they were also to be found in considerable numbers in Avignon, Lorraine, and Alsace. In 1784 the capitation tax was abolished. In 1790, while the French Revolution was still animated by a sincere humanitarianism, the Jews presented a successful petition to the national representatives, Mirabeau being among their advocates. From this time their technical designation in France has been *Israelites*. In 1806 the Emperor Napoleon summoned a 'Sanhedrin' of Jews to meet at Paris, to whom a variety of questions were put, mainly with a view to test their fitness for being French citizens. Since then they have been found not only in the highest offices of the civil administration—very frequently in the ministry (e.g. Crémieux, Gondechaux, Fould)—but they have also filled some of the chief places in the army and navy. We may add here that their bravery in the field has been the subject of frequent remark—although among the vices with which a brutal prejudice loved to brand them, in spite of all historical evidence, was also that of cowardice.

In Denmark since 1814 they have been on a footing of equality as citizens with native Danes. To Sweden they were first invited—the invitation only extending to the rich—in 1746. Norway forbade them to touch its soil till 1800. Admitted into Russia by Peter the Great, they were expelled by the Empress Elizabeth in 1743. Readmitted by the Empress Catharine II., they were further protected by the Emperor Alexander I., who in 1805 and 1809 issued decrees insuring them full liberty of trade and commerce; Nicholas withdrew these privileges. In 1881 a violent agitation against the Jews, accompanied by much outrage and bloodshed, took place in the south and west of Russia, and also in Warsaw. Their residence is strictly confined to certain parts of the empire. Some 225,000 were driven out by further restrictions in 1892, and many were then and later settled in Argentina and elsewhere by Baron Hirsch. In Poland they are more numerous than in any other part of the world. They owed their first humane reception in the 14th century to the love which King Casimir the Great bore for a Jewish mistress. For many years the whole trade of the country was in their hands. During the 17th and the greater part of the 18th century, however, they were much persecuted, and sank into a state of great ignorance, and even poverty; but education—in spite of the severity and barbarism of Russian intolerance—has, since the French Revolution, made progress among them. Frederick the Great, king of Prussia, showed himself singularly harsh towards the Jews; his legislation almost throws us back

into the middle ages. All manner of iniquitous and ridiculous taxes were laid upon them; only a certain number were allowed to reside in the country, and these were prohibited from both the most honourable and the most lucrative employments. This shameful state of matters was ended by the Prussian edict of toleration (1812), by which Jews were placed almost in an equal position as citizens with other Prussians. Since then the tendency, on the whole, had been to enlarge their 'liberties'—until the revolution of 1848 gained them their full emancipation, although it was slowly carried out. In the smaller German states their full rights were grudgingly conceded. The Reichstag of the empire, like the National Assembly in 1848, now contains many prominent Jewish members. However, the progress of Jewish emancipation in Germany has not, of late years, been continuous. Strange to say, the year 1880 was marked by a remarkable revival of hostility against the Jews, especially in Berlin, which, known as the *Judenhetze*, was encouraged by many persons of standing in society. In Austria the Emperor Joseph II. distinguished himself by passing an act of toleration (1782) extraordinarily liberal in its provisions for the Jews. Not till 1860, however (and even then under certain restrictions), did they acquire the right to possess land. But in 1868 they were accorded the complete liberty which they now enjoy, and which is only overclouded occasionally by outbreaks of Anti-Semitism. In Hungary and Transylvania they have long enjoyed important privileges, and have been protected by the nobility. In Roumania they still suffer much ill-usage, being only nominally protected by the treaty of Berlin. Spain began to tolerate them again in 1837, and they can follow trade or agriculture like other Spaniards. Of late years they have even been allowed to assemble for religious worship. Portugal, where they enjoy no civic rights, has only a few German Jews. Switzerland long treated them harshly, and only of late have steps in the right direction been taken.

In Turkey they are very numerous, and have thriven in spite of the exactions of pashas, the insolence of Janizaries, and the miseries of war. Their communities in Constantinople, Adrianople, Salonica, Smyrna, Aleppo, and Damascus are considerable; in Palestine, their ancient home, they are rapidly increasing, but they are still, in spite of the many efforts on the part of their European brothers to ameliorate their condition, very poor. Their numbers in Arabia are not very large, yet they enjoy some independence. Those in Persia have sunk into ignorance. They are found in Afghanistan, and carry on a trade between Kabul and China; in India and Cochin China, where they are both agriculturists and artisans; in Surinam, where there is a flourishing colony; in Bokhara, where they possess equal rights with the other inhabitants, and are skilled in the manufacture of silks and metals; and in China, where, however, they are very insignificant both in numbers and position. They are also found all along the North African coast, where, indeed, they have had communities for perhaps more than a thousand years, which were largely reinforced in consequence of the great Spanish persecutions. They are numerous in Morocco, though not always secure from the perils of Mohammedan fanaticism. In Egypt and Nubia they are few; in Abyssinia, where they are known as Falashas, more numerous; they exist in the Soudan, and are also found farther south in considerable numbers, the mining industries of the Cape and Transvaal being largely in their hands. America, too, has invited their spirit of enterprise. In the United States, as in Great Britain, they enjoy absolute liberty, and have established some

500 congregations. They have been in Brazil since 1625, and are also settled in some parts of the West Indies.

The present distribution of Jews throughout the world, as calculated in 1888, is as follows: Russia, 3,500,000; Anstro-Hungary, 1,800,000; Germany, 600,000; Rumania, 325,000; Turkey in Europe, 160,000; Holland, 90,000; Belgium, 6000; France, 75,000; Great Britain, 100,000; Italy, 40,000; Switzerland, 8000; Scandinavia, 8000; Servia and Bulgaria, 40,000; Greece, 5000; Iberian Peninsula, 2000—making in all Europe above 6½ millions. To this may be added about 500,000 in Asia, 350,000 in Africa, 500,000 in America, and 20,000 in Australasia. This would bring the total number of Jews in the world up to a little over 8 millions. It should be mentioned, however, that some authorities calculate their number as considerably less than this. They assume about 5½ millions for Europe, and 1¼ million for the rest of the world.

Religion.—Generally speaking, Jews believe in the inspiration of the Old Testament, the authority of the Law of Moses, the absolute unity and incorporeality of the Godhead, the immortality of the soul, the ability of mankind to work out their own salvation without the help of priest, mediator, or sacrifice, and the ultimate conversion of mankind to Theism. Such are the main points of agreement between almost all Jews, but on many questions they are sharply divided. For some two thousand years there have been at least two religious sections. In the time of Christ they were known as Pharisees (Rabbinical Jews) and Sadducees (Biblical Jews); in the middle ages as Rabbanites and Karaites, the Rabbanites being adherents of traditional Judaism, and the Karaites insisting on the literal interpretation of Scripture. Since the early part of the 19th century these differences have to some extent been reproduced in the division of Jews into Orthodox and Reformed. The latter (who may also be styled Progressive or Modern Jews) believe in the divine authority of the Old Testament or 'Written Law' only, while Orthodox (otherwise known as Conservative or Rabbinical) Jews ascribe co-ordinate authority to the 'Oral Law' of the Rabbins, which they regard as the key to the explanation of Holy Writ. The Oral Law is embodied in the Talmud and its commentaries, and is believed by them to have been orally transmitted from Moses to his successors down to the time of Jehuda the Holy or the Prince (see *ante*), when it was first committed to writing. To this main distinction most of the divergencies between Orthodoxy and Reform can be traced. Thus the difference of opinion on such questions as sacrifice, the Messiah, the return to Jerusalem, and the restoration of the national life follows as a corollary from the maintenance or repudiation of the Rabbinical standpoint. A Rabbinical Jew believes in the political reconstitution of his nation, the restoration to Palestine, the rebuilding of Jerusalem and of the temple on Mount Zion, and the rehabilitation of the sacrificial ritual. He also looks forward to the coming of a personal Messiah, a descendant of David, who will assert the independence of his race and accomplish the restoration. Such are the hopes which inspire a great portion of the orthodox liturgy. The Reformed Jew, interpreting Scripture in a free and rationalistic spirit, subscribes to none of these beliefs. The sacrifices ordained in the Pentateuch he regards in the light of a temporary concession of Moses to the barbarous customs of his age, and an institution which, having once fallen into desuetude, will never again be revived; and, in support of this view, he points, not merely to the teaching of Maimonides, but to the frequent denunciation

of sacrificial rites by the prophets and psalmists of Israel. Nor does he believe in the restoration of the national life or the return to Jerusalem. Most commonly, indeed, he is even unwilling to admit that Jews can any longer be considered a nation. Nor does he find any difficulty in explaining away those utterances of the prophets which would seem to point to such a return. Such utterances must either be referred to events in the proximate future, such as the return of the Jews to Palestine under the edict of Cyrus, or they are to be regarded as mere rhetorical declamations or poetical pictures without any definite significance. Similarly with the belief in a personal Messiah. Although this is one of the Thirteen Articles of Faith, as laid down by Maimonides, it is gradually being abandoned by modern Jews, who are inclined to substitute for it the belief in a Messianic age in which, as foretold by the prophets, all mankind will be brought to the knowledge and worship of one God, and war and dissension will cease from the face of the earth. From all this it will be seen that Reformed Judaism not merely interprets Scripture in the light of common sense, but also exhibits a more or less decided leaning to the teachings of Rationalism, some of the more advanced Reformers, indeed (for there are various degrees of reform), being pure Rationalists. Such theories as that of two Isaiahs, or the late date of Daniel and Ecclesiastes, are subscribed to by most educated Jews, but the Wellhausen theory of the Hexateuch is held only by the more advanced section of Reformers. Sometimes it is stated that Orthodox Jews believe in the physical resurrection of the body after death. But this is not correct. It was the view of Jews in the time of Christ, and has long since been superseded by the belief in the immortality of the soul.

The distinction between Orthodoxy and Reform further exhibits itself in ceremonial practices and the ritual of the synagogue. Reformed Jews restrict themselves to the practice of the ceremonial laws laid down in the Pentateuch, with the exception of those which, like the institution of sacrifice, have no application at the present day. Orthodox Jews are expected to obey, besides the legislation of the Pentateuch, the entire body of the Oral Law with its many thousands of minutiae, and the several customs which have become sanctified by age and tradition. These are principally set forth in a digest known as the *Shulchan-Aruch*—the text-book of Orthodox Judaism. As in private practice, so in the public worship of the synagogue, Reformed Jews have simplified the ritual and adapted it to modern needs. They have introduced instrumental music and mixed choirs. In the more advanced synagogues, particularly in America, the service is made to approximate to church practices in three particulars: (1) the sexes sit together in family pews; (2) the heads of male worshippers are uncovered; (3) the service is in the vernacular. In some synagogues (Berlin, Philadelphia, and Chicago) innovation has been carried to the extent of substituting Sunday for the seventh-day Sabbath, while several synagogues in America have Sunday services *in addition* to those held on the Sabbath.

The programme of Judaism put forth by Dr Krauskopf of Philadelphia in 1888 is of so very radical a character as hardly to deserve the title of Judaism. But as the congregation which have adopted it not only call themselves Jews, but are regarded as such by the rest of the community, it must be set down as the ultimate phase of Judaism, marking the limits beyond which it would not be possible for Judaism to travel without merging its identity in Theism or Agnosticism. 'We discard,' says Dr Krauskopf, 'the belief in a

God who is a man magnified, who has his abode somewhere in the inter-stellar spaces. We discard the belief that the Bible was written by God, or by man under the immediate dictation of God, and that its teachings are therefore infallible. . . . We discard the belief in the coming of a human Messiah, who will lead us back to Palestine, establish us as the rulers of the world, and make all nations tributaries to us. We discard the belief in bodily resurrection, hell-torments, Paradise rewards, prophecy, superstitions, all Biblical and Rabbinical beliefs, rites and ceremonies and institutions, which neither elevate nor sanctify our lives.

Literature.—For the Hebrew language, see under that head. The extraordinary influence which the religion of the Hebrews has exercised on Christian and Mohammedan nations has given a universal significance to their ancient literature; but of this we possess nothing which, in its original shape, reaches further back than the period of David. The composition of the extant works in *Hebrew Literature* proper would, on this view, extend over a period of nearly 900 years—viz. from the times of David to those of the Maccabees. This period was preceded by a preparatory one of sagas, songs, fragmentary historical notices, inscriptions, laws, and probably also priestly registers. The extant literature may be arranged under the five heads—law, prophecy, history, lyric poetry, and speculation (see BIBLE, and the articles on the separate books of the Old Testament). The same epoch in which took place the transition from Hebraism to Judaism—the epoch of the captivity—was also that which marked the commencement of *Jewish literature*, properly so called. Founded on the earlier and more creative Hebrew, and for the most part written in the same language, it is yet qualified by the presence of religious conceptions borrowed from the Persians, of Greek wisdom, Roman law, and, at a later period, of Arabic poetry and philosophy, and of European science: though everything is strictly subordinated to the great ideas of the ancient faith. Since the return from exile, the Jewish—also, but erroneously, called the *Rabbinical*—literature has, without the slightest external encouragement, actively taken part in the cultivation of the human mind; and in the results of this activity, which are still far from being duly appreciated, there lie concealed the richest treasures of centuries.

Jewish literature has been divided chronologically into nine periods. The *first period* extends to 143 B.C. After the return from exile the Jewish people naturally enough became animated by an intense nationality of feeling. Expositions and additions to the earlier history (*Midrashim*), as well as Greek translations, were executed, and several of the Hagiographa—such as particular psalms, the so-called Proverbs of Solomon, Ecclesiastes, the Books of Chronicles, portions of Ezra and Nehemiah—were written. To this period also, if to any, must belong the uncertain performances of the *Great Synagogue* (q.v.), to whom the work of completing the canon of the Old Testament is chiefly ascribed. Towards its close (190-170 B.C.) several writers appear in *proprio personâ*, as, for instance, Sirach and Aristobulus. The doctors of whom the Great Synagogue chiefly consisted were called *Sopherim* ('Scribes'). At this time Aramaic finally became the popular dialect of Palestine.

The *second period* extends from 143 B.C. to 135 A.D. The *Midrash* (see EXEGESIS), or the inquiry into the meaning of the sacred writings, was divided into *Halacha* and *Hagada*: the former considered the improvement of the law, with a view to practical results; the latter, the essence of the religious

and historical interpretations. At first both were the oral deliverances of the *Soferim*, but gradually written memorials made their appearance. The public interpretation of the Scripture in schools and synagogues, the independence of the Sanhedrin, the strife of sects, and the influences of Alexandrian culture furthered this development. To this period also belong various Greek, but not, as is still erroneously supposed by some, the *written Targums* or Aramaic versions of the Bible (see TARGUMS), which sprang at a much later period from oral translations of the Pentateuch in the synagogues instituted after the return from the exile: further, the whole of the Apocrypha (q.v.), and the earliest Christian writings, which are at least the productions of men nurtured in the principles of Judaism, and which contain many traces of Judaistic culture, feeling, and faith. It was also characterised by the drawing up of prayers, scriptural expositions, songs, and collections of proverbs. The author of the first book of the Maccabees, Jason, Josephus, Philo, Johannes are names specially worthy of mention: so also are the doctors of the oral law—Hillel (q.v.), Shammai, Jochanan-ben-Zaccai, Gamaliel, Eleazar-ben-Hyrecaus, Joshua-ben-Chananja, Ishmael, Akiba, and others of like eminence. *Rabbi* ('Master') *Talmud Charlam* ('Disciple of Wisdom') were titles of honour given to those expert in a knowledge of the law. Besides the Maccabean coins, Greek and Latin inscriptions belonging to this period are extant.

The *third period* reaches from 135 to 475 A.D. Instruction in the Halacha and Hagada now became the principal employment of the flourishing schools in Galilee, Syria, Rome, and after 219 A.D. in Babylonia; the most distinguished men were the masters of the *Mishna* (q.v.) and the *Talmud* (q.v.)—viz. Eleazar-ben-Jacob, Jehuda, Jose, Meir, Simeon-ben-Jochai, Jehuda the Holy, Nathan, Chija, Rab, Samuel, Jochanan, Hunna, Rabba, Rava, Papa, Ashe, and Abina. Besides expositions, additions to Sirach, ethical treatises, stories, fables, and history were also composed; the prayers were enriched, the Targum to the Pentateuch and the Prophets completed, and the calendar fixed by Hillel the second (340 A.D.). After the suppression of the academies in Palestine, those of Persia—viz. at Sura, Pumbeditha, and Nehardea—became the centre of Jewish literary activity. On Sabbaths and festal days the people heard, in the schools and places for prayer, instructive and edifying discourses. Of the biblical literature of the Greek Jews we have only fragments, such as those of the versions of Aquila and Symmachus. With this period terminates the age of direct tradition.

The *fourth period* (from 475 to 740 A.D.). By this time the Jews had long abandoned the use of Hebrew, and instead had adopted the language of whatever country they happened to dwell in. During the 6th century the Babylonian Talmud was concluded, the Palestinian Talmud having been redacted about a hundred years before. Little remains of the labours of the *Jewish Librari* of the 7th century, or of the earliest *Gemara* or presidents of the Babylonian schools, who first appear in 589 A.D. On the other hand, from the 6th to the 8th century the Masora (q.v.) was developed in Palestine (at Tiberias); and, besides a collection of the earlier Hagadas, independent commentaries were likewise executed, as the *Pesikta*, the *Parke of Elizer* (700 A.D.), &c.

In the *fifth period* (740-1040) the Arabs, energetic, brilliant, and victorious in literature as in war, had appropriated to themselves the learning of Hindus, Persians, and Greeks, and thus excited the emulation of the oriental Jews, among whom now sprung up physicians, astronomers, grammarians, commentators, and chroniclers. Religious

and historical Hagadas, books of morality, and expositions of the Talmud were likewise composed. The oldest Talmudic compends belong to the age of Anan (*circa* 750 A.D.), the earliest writer of the Karaite Jews. The oldest prayer-book was drawn up about 880; and the first Talmudic Dictionary about 900. The most illustrious *Gronim* of a later time were Saadia (died 941), equally famous as a commentator and translator of Scripture into Arabic, a doctor of law, a grammarian, theologian, and poet; Seherira (died 998); and his son Hai (died 1038), who was the author, among other things, of a dictionary. From Palestine came the completion of the Masora and of the vowel-system; numerous *Midrashim*, the Hagiographical Targums, and the first writings on theological cosmogony were also executed there. From the 9th to the 11th century Kairwan and Fez, in Africa, produced several celebrated Jewish doctors and authors. Learned rabbins are likewise found in Italy after the 8th century, as Julius in Pavia. Bari and Otranto were at this time the great seats of Jewish learning in Italy. After the suppression of the Babylonian academies (1040) Spain became the central seat of Jewish literature. To this period belong the oldest Hebrew codices, which go back to the 9th century. Hebrew rhyme is a product of the 8th, and modern Hebrew prosody of the 10th century.

The *sixth* period (1040-1204) is the most splendid era of Jewish medieval literature. The Spanish Jews busied themselves about theology, exegetics, grammar, poetry, the science of law, astronomy, mathematics, philosophy, rhetoric, and medicine. They wrote sermons and ethical and historical works. The languages employed were Arabic, Rabbinical Hebrew, and ancient or classical Hebrew. We can only mention here the great doctor, Samuel Halevi (died 1055), and the renowned Maimonides (q.v.), whose death closes this epoch. The literature of the French rabbins was more national in its character, and kept more strictly within the limits of the Halacha and Hagada. The great Rashi (q.v.), the prince of commentators, whose real name was Solomon-ben-Isaac of Troyes (1040-1105), is one of the greatest names in Jewish literature. In Provence, which combined the literary characteristics of France and Spain, there were celebrated Jewish academies at Lunel, Narbonne, and Nîmes. The fame of the Talmudists of Germany, especially those of Mainz and Ratisbon, was very great. Only a few names belong to Greece and Asia; still the Karaite Jews had a very able writer in Jehuda Halassi (1148). The greater portion of the prayer-book was completed before Maimonides. Many of the works, however, produced between 740 and the close of this period are lost.

The *seventh* period (1204-1492) bears manifest traces of the influence exercised by Maimonides. Literary activity showed itself partly in the sphere of theologico-exegetic philosophy, partly in the elaboration of the national law. With the growth of a religious mysticism there also sprung up a war of opinions between Talmudists, Philosophers, and Cabbalists. The most celebrated Jews of this period lived in Spain; later, in Portugal, Provence, and Italy. To Spain belongs (in the 13th century) the poet Jehuda Charisi. In the 15th century a decline is noticeable. Books written in Hebrew were first printed in Spain at Tzar in Aragon (1485), at Zamora (1487), and at Lisbon (1489). During this epoch the chief ornaments of Jewish literature in Provence were Moses ben-Nachman, David Kimchi, Jehnham, Farissol, Isaac Nathan, the author of the Hebrew Concordance. In Italy Jewish scholars employed themselves with the translation of Arabic and Latin works. While

France could show only a few notable authors, such as the collectors of the *Tosafot*, Moses de Coney, and Jehiel-ben-Joseph, the poet and exegete Berachja, Germany produced a multitude of writers on the law, such as Eleazar Halevi, Meyer of Rothenburg, Asher Ben Jehiel, Jacob ben Asher, Eleazar ben Jehudali of Worms. Most of the extant Hebrew MSS. belong to this period; but a great part of medieval Jewish literature lies unprinted in Rome, Florence, Parma, Turin, Paris, Oxford, Leyden, Vienna, and Munich.

The *eighth* period (1492-1755) is not marked by much creative or spiritual force among the Jews. In Italy and the East (1492), in Germany and Poland (1550), in Holland (1620), Jewish scholars worked printing-presses, while numerous authors wrote in Hebrew, Latin, Spanish, Portuguese, Italian, and Judæo-German. Some of the most eminent theologians, philosophers, jurists, historians, mathematicians, poets, commentators, lexicographers, grammarians, &c. of this period were, besides Spinoza, Isaac Abravanel, Elias Levita, Seforno, Bertinoro, Karo, Norzi, Rossi, Moses Isserles, Manasseh ben Israel, Lipman Heller, B. Musaphia.

The *ninth* period extends from 1755 to the present time. Encouraged by the spirit of the 18th century, Moses Mendelssohn (q.v.) opened to his co-religionists a new era, which, as in the middle ages, first manifested itself in the national literature. Its character, contents, expression, and even its phraseology, were changed. Poetry, language, philology, criticism, education, history, and literature have been earnestly cultivated. The sacred books have been translated by them into the languages of modern Europe, and foreign works into Hebrew; and many of this once proscribed and detested race have taken an important part in the public and scientific life of Europe. Among the many illustrious names of this last period we can select only a few like Mendelssohn, Maimon, Ben Zeob, Heidenheim, Rapoport, Krochmal, Zunz, Jost, Geiger, Fürst, Sachs, Z. Frankel, Steinschneider, Graetz, Jellinek, Philippsohn, Munk, Salvador, Reggio, S. D. Luzzatto—chiefly cultivators of literature with reference to their own creed and nationality.

To enumerate names of those who were and are illustrious in general literature, in law, philosophy, medicine, philology, mathematics, belles-lettres, &c. we cannot even attempt, since there is not one country in Europe which does not count Jews among the foremost and most brilliant representatives of its intellectual progress. Of Germany—considered to be in the vanguard of European learning—Bunsen said that the greater part of the professors at its universities and academies were Jews or of Jewish origin (Næander, Gans, Benary, Weil, Benfey, Stahl, Dernberg, Valentin, Lazarus, Herz, Steinthal)—certainly a most startling fact. Oppert, Darmesteter, Bernays, Sanders, Karl Marx, Lassalle, Emil Franzos, Crémieux (q.v.), Jessel, Sylvester, Mehlola, Emma Lazarus are likewise eminent names in literature, law, and science; while in finance, statesmanship, and philanthropy the names of Rothschild (q.v.), D'Israeli, Montefiore (q.v.) are universally familiar. Another extraordinary and well authenticated fact is that the European press, no less than European finance, is to a great extent under their control; while, on the other hand, names like Heine, B. Börne, Berthold Auerbach, Henriette Herz, Jules Janin, Felix Mendelssohn-Bartholdy, Halevy, Meyerbeer, Moscheles, Joachim, Ernst, Rubinstein, Wieniawski, Grieg, Brahms, Giuglini, Da Costa, Rachel, Davison, Bendemann, besides hosts of others less familiar to English ears, who shine in all branches of art—music, sculpture, painting,

the drama, &c.—show plainly how unjust is the reproach of their being an 'abstract' people, without sense for the bright side of life and the arts that embellish it. Briefly—they are, by the unanimous verdict of the historians and philosophers of our times, reckoned among the chief promoters of the development of humanity and civilisation. What has been their reward we have seen. Happily the growth of religious toleration, which is the distinctive feature of the present age, has changed all this. In every country to which modern civilisation has penetrated Jews now enjoy, if not the full social recognition which is accorded them in England and France, all ordinary civil and political rights. Russia and Roumania alone, among western peoples, still maintain towards them an attitude of medieval barbarism. But so anomalous a condition of affairs cannot long continue, and the time is surely not far distant when even in these countries they will be accorded a fair measure of the rights of humanity.

For the history of the Jews during the BIBLICAL PERIOD, consult the histories of Ewald, Stanley, Kuenen, Wellhausen, Renan, Herzfeld, Schurer, Stade, Kittel, and works by Edersheim. GENERAL JEWISH HISTORY: Graetz, Jost, Milman, and the smaller works by Palmer, Hosmer, Adams, Morison, Cassel, Magnus. JEWS IN ENGLAND: Picciotto, Margoliouth, Jacobs. Schaible's *Die Juden in England* (1890), and the publications of the Anglo-Jewish Historical Exhibition. HISTORY OF RELIGION: (1) Biblical: Kuenen's *Religion of Israel*, the books on the Prophets by Kuenen, W. R. Smith, and Duhm; on Old Testament theology generally by Oehler, Schultz, and Kiehm; W. R. Smith's *Old Testament in the Jewish Church*, and *Lectures on the Religion of the Semites*; and Baudissin's *Studien zur Semitischen Religionsgeschichte*. (2) General: Jost, *Geschichte des Judenthums u. s. Sekten*; Geiger, *Judenthum u. seine Geschichte*; Weiss's *History of Jewish Tradition* (in Hebrew). (3) Modern: Ritter, *Geschichte der Jüdischen Reformirung*; Friedlander's *Text-book of the Jewish Religion* (1891). JEWISH LITERATURE: Karpeles, Steinschneider, Etheridge, and Stern. ART: Perrot and Chipiez; Madden's *Coins of the Jews*. JEWISH LIFE: 'The Jewish Library,' edited by Joseph Jacobs, the first vol.—by Israel Abrahams, editor of the *Jewish Quarterly*—being *Jewish Life in the Middle Ages* (1897, based on Gudemann and others); *Jewish Ideals*, by Joseph Jacobs (1896); the works of Emil Franzos (*The Jews of Barnow*, &c., trans.); *Children of the Ghetto* (1892), *Dreamers of the Ghetto* (1898); and other works by Zangwill. The movement called 'Zionism,' founded in 1897 for the purpose of securing the settlement of Jews in the Holy Land, has annual congresses; the Dreyfus case in France revealed an unsuspected amount of anti-Semitic bitterness.

Jew's Ear—*Eridium auricula Judæe*, a fungus, one of the Hymenomyces, which grows on decaying parts of living trees, particularly eldens. Dried Jew's Ear was formerly in repute as an astringent.

Jew's-harp, or JEW'S-TRUMP, a simple musical instrument, which consists of a flat elastic vibrating steel tongue, running between two parallel ribs of metal, and fastened at one end to the farther side of the circle into which the ribs expand; the free end is narrowed to a thin wire and prolonged at right angles to the vibrating piece. The instrument is held between the teeth or lips, kept apart by the rib-frame, and the free projecting end of the vibrating tongue is struck with the finger. The instrument is used from the Highlands of Scotland to Tibet. The first to attain any notable degree of skill as a performer was a soldier of Frederick the Great's army. But his fame was eclipsed by a Wurtenberger named Eulenstein, who played

sixteen Jew's-harps, tuned to different keys; he performed in London in 1828 (died 1890). The derivation of the word seems to be doubtful. It is suggested that 'Jew's' is a corruption of 'jaws' and of 'jeu,' the French word for 'play'; more probably the instrument was called Jew's-harp in derision.

Jew's Thorn. See JUAUBE and PALURUS.

Jeypore (*Jaipur*), a protected native state in Rajputana (q.v.), with an area of 15,349 sq. m., and a population (1891) of 2,832,276, chiefly Hindus. The only city of importance is the capital. The central part of the state is a sandy tableland from 1400 to 1600 feet above the sea-level; in the east and north-west there are mountains, but in the south-east the soil is rich and fertile. The chief manufactures are enamelled gold-wares, marble sculptures, and fabrics. Large quantities of salt, also, are manufactured at the Sambhar Lake. The gross revenue is about £1,200,000, of which £40,000 a year is paid as tribute to the imperial government. The army numbers about 14,000 men of all arms. Great attention is paid to education. The Rajputana State Railway runs over Jeypore territory for about 150 miles. Jeypore, after many vicissitudes, came under British protection in 1818. The maharajah was eminently loyal during the Mutiny, and was rewarded with an extension of territory.—The capital, JEYPORE, is a walled city, 850 miles NW. of Calcutta and 140 NE. of Ajmere by rail. It is a handsome and regularly-built town, with the maharajah's palace in the centre, and is the most important commercial centre of Rajputana. It was founded as late as 1728. The ancient and now deserted capital, Amber, lies 5 miles to the NE. The commercial business of Jeypore is chiefly banking and exchange, with a capital engaged of over £7,000,000. In addition to the banks there are the maharajah's college, an industrial and economic museum, a school of art, an observatory, a mint, the 'Mayo' Hospital, and numerous temples and mosques, besides the beautiful Rām Nēwas Gardens (70 acres). Pop. (1881) 142,578; (1891) 158,905.

Jezeelites, of the NEW AND LATTER HOUSE OF ISRAEL, a religious sect founded in England by a private soldier, James White (1840-85), who adopted the name of James Jershom Jezeel, and professed to be a messenger from God, whose revelations to him are recorded in 'The Flying Roll.' The headquarters of the sect were at Gillingham, in Kent, where a temple, a college, &c. were partially built. Christ, they believed, by his death redeemed only souls, and those souls who have lived since Moses. For the salvation of the soul belief in the Gospel was sufficient; the body must be saved by belief in the Law. When Christ comes to reign for his millennium He will be greeted by the 144,000 (Rev. vii. 5-8), who will be endowed with immortal bodies; to this chosen band the members of the New and Latter House of Israel aspire to belong. After the death of Queen Esther, Jezeel's widow, in 1888, the sect decayed.

Jhansi, a fortified town in Gwalior state, Central India. During the Mutiny of 1857 the native garrison murdered all the Europeans. In the following April the place was recovered by Sir Hugh Rose. The town, till 1861 in the British North-west Provinces, was in that year made over to Gwalior. Pop. 28,000. Close beside it, in the British district of Jhansi, is the civil station and military cantonment of Jhansi Naubat. Pop. 3000. The *district* of Jhansi begins just outside the native fortress of Jhansi, and is part of the division of Allahabad in the North-west Provinces. Area, 1640 sq. m.; pop. (1891) 409,419.

Jhelum, or JHELAM, also called the Bitasta (whence the ancient Hydaspes), one of the rivers of the Punjab. It rises in the mountains of Cashmere, which country forms its upper basin, and is navigable for about 70 out of 130 miles within that state. On emerging from the Himalayas through the Baramulla Pass, it again becomes navigable for small craft. About 250 miles from its source it enters the plains, and, after a total course of 450 miles, joins the Chenab at Timmu. On the banks of this river was fought the battle between Alexander the Great and Porus. The Jhelum passes by the towns of Srinagar (Kashmir), Jelalpur, Jhelum, and Pind Dadan Khan. The Victoria railway bridge near Meeanee, opened in 1887, is 4875 feet long. See DOAB.—Jhelum (*Jehlum*), town, cantonment, and administrative headquarters of Jhelum district (area, 3995 sq. m.; pop. 609,056), in the Punjab, stands on the Jhelum (Jhelum) River, and is an important entrepôt of trade. Pop. of town, with cantonment, 25,580.

Jib. See SAIL.

Jiddah, or JEDDAH, a seaport of the Hedjaz, Arabia, stands on the Red Sea, about 65 miles W. of Mecca. It is an unhealthy town, suffers greatly from want of water, and is surrounded by a desert. It owes its importance to the fact that it is the port of Mecca, and consequently the place of disembarkation for pilgrims (sometimes 100,000 in a year) bound for the holy city. Besides this it has an active trade, which, however, has steadily decreased, although it still amounts in value to about £1,000,000 annually. The imports comprise corn, sugar, metals, earthenware, manufactured textiles, &c.; and the exports consist chiefly of mother-of-pearl, hides, coffee, balsams, dates, carpets, &c. Pop. (1891) 46,950.

Jig. See GIGA.

Jigger. See CRITGOE.

Jihum. See OXUS.

Jimena, or XIMENA, a town of Spain, 21 miles N. of Gibraltar, has some remarkable caves and the remains of a Moorish castle. Pop. 8500.

Jingo, explained by some as a corruption of St Gingham; by others, of 'Jaanko,' the Basque name for the Supreme Being. Hence the familiar expressions 'by Jingo' and 'by the living Jingo.' By supporters of the Basque etymology the expression is alleged to have originated in Wales, whither Edward I. is said to have had a party of Basque soldiers conveyed during his Welsh wars; but 'Hey Jingo' is first met with in literature in Oldham's *Satyr upon the Jesuits* (1679). Jingoism is now understood to be a sort of British Chauvinism, and in this aspect dates only from the Russo-Turkish war of 1878. At the time there was a strong anti-Russian feeling in London, and the most popular music-hall song of the day was a sort of doggerel threat against Russia, beginning:

We don't want to fight, but by jingo if we do,
We've got the ships, we've got the men, we've got the
money, too.

Joachim, JOSEPH, violinist, was born at Kittsee, near Presburg, on 28th June 1831, and received his musical instruction at Vienna and Leipzig. He first appeared in London in 1841. His performances at Vienna, Pesth, Paris, and London have established for him the position of one of the first violinists of the day. In power and brilliancy of execution, and in the mechanical qualities of playing, he is little if at all inferior to Paganini. His works, which include overtures, Hebrew melodies, and other songs, and compositions for the violin, are pervaded by the same

tenderness and depth of musical feeling that characterise his playing. From 1850 he was appointed concert director in Weimar, and from 1854 in Hanover; and in 1869 he became a member of the senate of the Berlin Academy, and director and professor in the Conservatory of Music. He is a Mus. Doc. of Cambridge and a D.C.L. of Oxford; and on 17th March 1889, his jubilee, was presented with a magnificent violin, and by the German emperor with the Gold Medal for Art.

Joachimsthal, a mining town of Bohemia, at an altitude of 2400 feet, on the southern slopes of the Erzgebirge, 10 miles N. of Carlsbad. In the 16th century the mines yielded large quantities of silver; but the production of this mineral has now dwindled down to less than 250 ewt. a year. Besides silver the mines yield nickel, bismuth, and uranium. There is a royal uranium factory. The people manufacture tobacco, gloves, lace, &c. The first German thalers or dollars (see DOLLAR) were coined here. Pop. 6628.

Joan, POPE, a fabulous personage long said to have filled the papal chair as John VIII. for about three years after the death of Leo IV. in 855. According to the latest and accepted form of the story, she was daughter of an English missionary, and was born at Mainz or Ingelheim. Forming an illicit connection with a monk at Fulda, she put on male attire and fled with him to Athens, where her lover soon died. She then came to Rome, where, from her remarkable learning, she became in quick succession notary to the curia, cardinal, and pope, until her sex was discovered by the premature and public birth of a child during a solemn procession. This startling story was universally believed and appealed to in Italy from 1400 to about 1600; it appears in all the chronicles within this period, and even so late as 1550 is found in the popular guide for strangers known as the *Mirabilia Urbis Romæ*. Felix Hemmerlin, Trithemius, Coecius Sabellius, Raphael of Volterra, Pico di Mirandola, and Adrian of Utrecht (afterwards Pope Adrian IV.) are all unanimous in maintaining it, and indeed Aventine in Germany and Omfrio Panvino in Italy were the first to shake the general belief in its truth. One of the severest blows delivered to the story was given later by the hand of the learned Calvinist David Blondel, in his *Familia: Eclaircissement* (Amst. 1649). So unquestioned was the story that about the beginning of the 15th century the bust of the female pope was placed in the cathedral of Sienna, along with those of the other popes, and there it remained undisturbed till 1600, when, at the request of Clement VIII., Joan was metamorphosed into Pope Zacharias.

Baronius thought it a satire on John VIII.; Aventine, Henmann, and Schrock, a satire on the Pornocracy; the Jesuit Seechi, a calumny originating with the Greeks, just as Pagi and Eekhart thought it did with the Waldenses; Leo Allatius believed it to be based on the story of Thiota, a false prophetess of the 9th century; Leibnitz thought it based on a similar story that might have happened in the case of some foreign bishop; while Blasco and Henke believed it a satirical allegory on the origin and circulation of the false decretals of Isidore—an absurd theory developed still further by Girorer. Mosheim, Luden, and Hase were unable to believe that so definite a story could have arisen without some foundation; Kurtz, while saying that the historical evidence is valueless, regards it as an unsolved riddle. At length Dr Dollinger disproved all preceding theories at once by showing that the myth originated not in the 9th or 10th century, as hitherto

believed, but was first put into writing in the middle of the 13th; and advanced the theory that the story was deliberately originated by the Dominicans and Minorites in the time of Benedict VIII., a deadly foe to the two orders.

The story was long supposed to be mentioned by Marianus Scotus (1028-86), but it does not occur in his most ancient MSS., nor yet in those of Sigebert of Gemblours (1030-1112) or of Otto de Freysingen (died 1158). The first to give it currency is the Dominican Stephen de Bourbon (died 1261), on the authority of the lost or as yet undiscovered MS. of his contemporary, the Dominican Jean de Mailly. Thus the earliest account in writing is discovered to be about the years 1240-50, from which source it was transferred to works of history, like the popular but worthless chronicle of the Dominican Martinus Polonus (died 1278). Yet Pope Joan does not appear in his oldest MSS., and the interpolation must have been made between 1278 and 1312. The main vehicle for circulating the myth in Germany was the chronicle *Flores Temporum*, which, connected with various names, comes down to 1290, and is mainly a compilation from Martinus Polonus. Again, the story was inserted in the so-called *Amatusius*, the most ancient collection known of biographies of the popes, but here again it is a later addition. Soon after we find it in Van Maerlant's *Historical Mirror*, a metrical Dutch chronicle, and in the Dominican Tolomeo of Lucca, and later, in the 14th century, in the Dominicans Bernard Guidonis, Leo of Orvieto, John of Paris, and Jacobo de Acqui, as well as in Ocean the Minorite, the Greek Barlaam, the English Benedictine Raunpht Higden, the Augustinian Amalrich Angerii, Boccaccio, and Petrarch. About the close of the 13th century the story spread with great rapidity, and in the 15th hardly any doubt shows itself at all. John Huss, at the Council of Constance, naturally enough employed the pontificate of Joan as an argument without contradiction from either side; and the Chancellor Gerson, in a speech before Benedict XIII. at Tarascon in 1403, uses the circumstance as a proof that the church could err in matters of fact. The scholastic theologians accepted the fact, and we find so redoubtable a defender of papal despotism as Cardinal Torrecremata maintaining it, so that the gibes of some busy compilers at early Protestant writers for making much of so unsavoury a story are but idle and ill informed. The Dominicans, from their numerous libraries, might easily have exposed the fable, but, as we have seen, they were actively instrumental in its diffusion instead. The story reached the Greeks in the second half of the 15th century, and it is to them we owe the revolting detail that the child was born just as the woman was celebrating High Mass. A Greek scholar, Emmanuel Rhodis, in a clever study (Eng. trans. by C. H. Collette, 1886) finds it impossible to believe that so well authenticated a story could be without historical basis; and indeed the chain of authoritative evidence is exceedingly awkward for those disposed to attach high credit to tradition in matters of belief.

Originally the woman is nameless, and there are many discrepancies about her name (Agnes, Gilberta, Joan), about the date, her place of birth and previous abode, and the mode of the catastrophe. Four circumstances, according to Dr Dollinger, contributed especially to the production and elaboration of the fable: (1) the former use of a pierced seat, popularly supposed to be a precautionary means of verifying the sex of a newly-elected pope, but really a practice symbolic of taking possession, the seats being merely bright red *sedes porphyretice*, from an ancient Roman bath; (2) a stone, with an unintelligible but ingeniously

misread inscription, popularly supposed to be a tombstone of the unhappy Joan; (3) a statue found at the same spot, its long robes being gratuitously taken for the dress of a woman; and (4) the custom of making a circuit in papal processions, whereby a street which was directly in the way was avoided. The woman may have been made of English blood from the odium attaching to England because of the struggle between Innocent III. and King John; and besides, many Englishwomen made the pilgrimage to Rome, while St Boniface, even in his day, complains not only of their number, but their dubious character. Her birth at the German city of Mainz might be due to the inveterate German hostility to Roman claims, together with the fact that Mainz was the leading city of Germany.

See Wensing, *Ober de Pausia Johanna* (Hague, 1845), a destructive answer to another Dutch book maintaining the truth of the story, by Professor Kist (1843; 2d ed. 1866), who thinks Pope Joan was probably the widow of Leo IV.; Bianchi-Giovini, *Esame Critico degli Atti relativi alla Papesa Giuanna* (Milan, 1845); and especially Dollinger, *Die Papstfälsch des Mittelalters* (Munich, 1863; Eng. trans. by A. Plummer, 1871), where the historical evidence is examined and conclusively demolished.

Joannes Damascenus. John Chrysorroas ('the golden-flowing') of Damascus, a great theologian and hymn-writer of the Eastern Church, was born at Damascus, it is said, in 676, but certainly before the end of the 7th century, of a Christian family of distinction in this city, known by the Arabic surname of Mansour. He was carefully educated, together with his adopted brother Cosmas, by the learned Italian monk Cosmas, who had been brought a slave to Damascus, and is said to have been called to the office of vizier to the reigning calif. He replied in quick succession to the iconoclastic measures of Leo the Isaurian with two memorable addresses in which he vigorously defended the practice of image-worship. His biographer John, patriarch of Jerusalem (10th century), tells us that Leo, unable to reach his formidable antagonist by open means, caused a treasonable letter to be forged, in consequence of which John's hand was struck off by order of the calif, but after a night of prayer to the Virgin miraculously restored. It is certain that his later years were spent in a monastery, that of St Sabas near Jerusalem, where we are told he mortified his flesh with ascetic practices of unusual severity. Here he found leisure and inspiration to write his learned works and his religious poetry, was ordained a priest, and died soon after 754.

His chief Greek works are *Fons Scientiarum*, a group of three works, together forming an encyclopaedia of Christian theology; *De Imaginibus Oratorum III.*; *De Recta Sententia Liber*, a formal profession of faith; *Contra Jacobitas*; *Dialogus contra Manichaeos*; *Disputatio Christiani et Saraceni*; *De Draconibus et Strigibus*, in which he combats popular superstitions; *De Dualibus in Christo Vehementibus*, an attack on Monophysite and Monothelite heresy; *Adversus Nestorianos*; *Loci Sancti in Epistolis S. Pauli*, mostly from the homilies of St Chrysostom; *Saepe Parallela*, consisting of passages from Holy Writ illustrated by parallel passages from Scripture and the Fathers; *Homilia*, thirteen in number; *Carmena*, including both canons or prose hymns and metrical hymns; and *Vita Barlaam et Joseph*, his most famous work, now known to be a disguised version of the life of Buddha. Of John's *Canons* the noblest is that for Easter, beginning, in Neale's translation, 'Tis the day of Resurrection; Earth, tell it out abroad.' Other hymns known to Englishmen through the same translator are 'Those eternal bowers,' 'Take the last kiss, the last for ever,' and 'Come ye faithful, raise the strain.' The first adequate edition of the works of Joannes Damascenus was that of the Dominican Michael Le Quien (2 vols. folio, Paris, 1712). This was

reprinted at Venice in 1748, and is the basis of the edition in Migne's *Patrologia* (3 vols. 1864).

See the articles BARLAAM AND JOSAPHAT, and HYMNS; also Dr Neale's *Hymns of the Eastern Church* (1870), and Dr Joseph Langen's admirable book, *Johannus von Damaskus* (Götha, 1879); also the Rev. J. H. Lupton's *St John of Damascus* (1882), in the 'Fathers for English Readers.'

Joan of Arc (Fr. JEANNE D'ARC), the Maid of Orleans, one of the most striking figures that ever crossed the stage of history, was born of poor but devout parents, in the village of Domremy, near Vaucouleurs, on the borders of Lorraine and Champagne, 6th January 1412. Like other maidens of her rank she was taught to sew and spin, not to read and write; and in the quietness of her country-life she grew up tall and handsome in form, sweet and womanly in nature, unlike the other girls around her only in her greater modesty, industry, and devotion. Her religious faith was ardent almost from her cradle; she loved to be alone, and she brooded in her waking dreams over the Bible story and the legends of the saints, until these became as real to her as they were to St Teresa. The cold abstraction of patriotism she never discovered for herself, but she mourned with passionate prayers and tears over the sorrows of down-trodden France, until these prayers took real shapes, and returned to her with form and sound as messages from heaven. And thus there gradually grew up within her heart the conviction that she had been chosen by God to do a special work of deliverance for her country. At thirteen, the noon of a summer's day, she first saw a light and heard an audible voice from heaven, and her terror gradually disappeared as these signs were repeatedly vouchsafed and became dear and familiar to her. St Michael, St Catharine, and St Margaret bent over her and whispered in her ears her heavenly mission, and though calm to outward eyes, henceforward she lived an inward life apart, given to God and her saints. During that unhappy time of national degradation a prophecy, ascribed to Merlin, was current in Lorraine, that the kingdom lost by a woman (Queen Isabella) should be saved by a virgin, and no doubt this, together with her visions, helped to define her mission to the brooding and enthusiastic mind of the young peasant girl. 'I had far rather rest and spin by my mother's side,' she said with simple pathos, 'for this is no work of my choosing, but I must go and do it, for my Lord wills it.' Her story was at first laughed to scorn, but her persistence bore down all opposition, and at last she succeeded in making her way to the Dauphin and convincing him by secret signs of her sincerity. 'There is more in God's book than in yours,' she said to the doubting and hesitating theologians. She put on male dress and a suit of white armour, mounted a black charger, bearing a banner of her own device—white, embroidered with lilies, on one side a picture of God enthroned on clouds, on the other the shield of France, supported by two angels, together with a pennon on which was represented the Annunciation. Her sword was one that she divined would be found buried behind the altar in the church of St Catharine de Fierbois. Thus equipped she put herself at the head of an army of 6000 men, dictated a letter to the English, and advanced to aid Dunois in the relief of Orleans, which was hard beset by the victorious enemy. Her arrival fired the fainting hearts of the French with a new enthusiasm, and rough and hardened soldiers left off their oaths and their debauchery under the spell of her pure presence. On the 29th April 1429 she threw herself into the city, and, after fifteen days of fighting, the English were compelled to raise the siege and retreat, carrying with them the tale of terror

at the strange witchcraft by which they had been overcome. At once the face of the war was changed, the French spirit again awoke, and within a week the enemy were swept from the principal positions on the Loire. Amid the carnage and confusion of her strange surroundings, Joan showed the same purity, simplicity, and good sense that had marked the village girl. She shrank with womanly tears from the sight of bloodshed, and trembled with terror at her first wound, while the brutal taunts of the English soldiers stung her purity to the heart, and drew hot tears of indignation from her eyes. But all thoughts of self were lost in devotion to her mission of which heaven had given such infallible proofs, and now, with resistless enthusiasm, she urged on the weak-hearted Dauphin to his coronation. Less than three months later she stood beside him at Rheims, and with tears of joy saluted him as king. 'Would it were God's pleasure,' she said to the archbishop, 'that I might go and keep sheep once more with my sisters and my brothers; they would be so glad to see me again.' But heaven had reserved for her its highest honour—to set the martyr's crown upon her brow.

Joan could not infuse her spirit into the hesitating coward and his corrupt courtiers, and she wore out her heart with vexation as she saw the work of heaven prevented by the unworthiness of man. She continued to accompany the French armies, and was present in many conflicts, and was mortified to the heart by the failure to carry Paris. At length, on the 24th May 1430, she threw herself with a handful of men into Compiègne, which was then besieged by the forces of Burgundy; and, being driven back by them in a desperate sally, was left behind by her men, taken prisoner, and sold to the English by John of Luxembourg, in November, for 10,000 livres. In December she was carried to Rome, the headquarters of the English, heavily fettered and flung into a gloomy prison, and at length arraigned before the spiritual tribunal of Pierre Cauchon, then Bishop of Beauvais and a wretched creature of the English, as a sorceress and a heretic, while the dastard she had crowned a king left her to die. Her trial was long, and was disgraced by every form of shameful brutality, under hardly even the forms of justice. Day after day a host of learned doctors tortured her simple heart with tortuous questions, the aim of which was to get their victim to condemn herself. Even through the untrustworthy forms in which they are recorded for us her answers show forth the noble simplicity of very truth. Innumerable questions on the nature of her visions were answered with the same calmness and strength, and her judges were for very shame driven to finish the interrogations in private, and to resort to the nameless infamy of sending Nicholas Loyseleur, a pretended confessor, to draw matter for her condemnation from the most sacred confidences of religion. In the judgment she was found guilty of sacrilege, profanation, disobedience to the church, pride, and idolatry, and the formal condemnation was conveyed in twelve articles. The judges did not disallow the possibility of heavenly visions, but they declared those of Joan to be illusions of the devil. They were now ready to send her to her doom, but they wished first to force her to an abjuration in order to degrade her in public opinion, and they tortured her by alternate threats and promises, until the bewildered girl at length declared that she submitted to the church, and blindly subscribed everything they asked of her. They then condemned her to perpetual imprisonment, and forced her again to put on woman's dress. But it was far from being meant that she should escape the fire. As she lay in her cell overwhelmed with self-reproach and despair, and

denied what she most longed for and had been solemnly promised—the eucharist, she was subjected to new indignities from the brutality of her guards, who stripped her of her woman's dress, so that to protect her chastity she was compelled again to put on the forbidden dress she had laid aside. This was at once made the grounds for a charge that she had relapsed, and she was without delay brought again to the stake, May 30, 1431. The woman's tears dried upon her cheeks, and she faced her doom with the triumphant courage of the martyr, declaring that she knew her revelations were from God, and that she had only submitted through fear of the fire. Her confessor to the last held up the cross before her eyes, and in the midst of the flames that wrapped her round she ceased not to repeat the sacred name of Jesus, and to invoke his saints; a last time she was heard to exclaim 'Jesus,' then her head sank down: she had finished her prayer in heaven. So perished the great uncanonised saint of France, leaving an ineffaceable stain upon English honour.

But Joan's mission was accomplished, and by the enthusiasm that she awoke the English were driven from the sacred soil of France. Twenty-five years after her death Pope Calixtus III. acceded to the prayer of her mother and her brothers (who had been ennobled under the name De Lys), that the process by which she was condemned should be re-examined. After a careful inquiry the finding was that the twelve articles on which her sentence was based were false, and that therefore the whole proceedings of the Bishop of Beauvais were null and void. The judgment was publicly declared on the spot, in the market-place of Rouen, on which she suffered. But long before this she had been enshrined a saint in the popular imagination, which read the wrath of heaven into the sudden end that had quickly come to every one connected with the trial. Indeed, the people had been slow to accept the fact that the maid was actually dead, and at first readily believed in the impostor who arose in Lorraine five years later.

The story of Joan has been a rich motive in the world of art, from the honest mediocrity of the youthful Southey and the noble tragic sense of Schiller to the heartless ribaldry of Voltaire and the fantastic mummery of Sarah Bernhardt. Painter and sculptor have spent their genius on the theme without as yet adequately realising its simple grandeur. See Quicherat's elaborate work, *Procès de Condamnation et Réhabilitation de Jeanne d'Arc* (5 vols. 1841-49); the books by Michelet, Henri Martin, and Joseph Fabre; the iconoclastic paradox of Lesigne (1889), H. Wallon's richly-illustrated *Jeanne d'Arc* (4th ed. 1883), Janet Tuckey's sketch (1880), and works by Elaze de Bury (1889), Lançry (1889), Sorel (1889), Marchant (1890), Ayrrolles (1890-94), Lord Ronald Gower (1893), and Mrs Oliphant (1896). For the literary development, see Kummer (1874); and for the military question, Marin's *Jeanne d'Arc Stratégiste* (1889).

Job. The Book of Job is so called from the name of the man whose history is the subject of it. In Hebrew the name is Iyyob, of which no certain explanation has been given. As it now exists, the book consists of five parts: (1) The prologue, chaps. i. ii. This tells us of a man called Job in the land of Uz, who was 'perfect and upright, fearing God, and eschewing evil.' The man's worldly prosperity was in correspondence with his godliness. In the council of heaven the disinterestedness of his religion was called in question by the adversary, who successively receives permission first to deprive him of all his possessions and bereave him of his children, and secondly, to afflict him in his person with a frightful malady. In spite of these afflictions Job holds fast his integrity: 'In all this Job sinned not.' Hearing of his calamities, his three friends among the neighbouring emirs come to condole with him. In

the presence of his friends Job loses his self-possession, and breaks out into a passionate complaint, lamenting that he had ever been born (iii.).

(2) The debate between Job and his friends, chaps. iv.-xxxi. Both the tone and the sentiments of Job's complaint seem wrong to his friends, and this feeling on their part initiates a debate between them and Job upon the meaning of his afflictions, which widens out into a general discussion of the causes and purposes of evil and affliction in God's providence. The theory of the friends is that affliction implies previous commission of sins on the part of the sufferer, though in the case of a good man, such as Job, it is not punitive but disciplinary, meant to wean him from evil still clinging to him; they therefore exhort him to repentance, and hold up a bright future before him. Job denies that his sufferings are due to sin, of which he is innocent; God wrongly holds him guilty and afflicts him. And here the dispute with his friends works into the problem raised by Satan, whether Job would renounce God to his face. Under the insinuations of his friends, which, with his consciousness of innocence, left him no escape but deny the rectitude of God, Job is almost driven to openly disown God. Though stopping short of this, he reaches the conclusion, supported not only by his own history but by much which can be seen in the world, that there is not that necessary connection between sin and suffering which the friends insisted on. The discussion between Job and his friends consists of three circles of speeches: (1) chaps. iv.-xiv.; (2) chaps. xv.-xxi.; (3) chaps. xxii.-xxxi. Each of these circles consists of six speeches, one by each of the friends with a reply from Job. In the last circle, however, the third disputant, Zophar, fails to speak. This is a confession of defeat; and Job, left victor in the strife, resumes his parable, protesting before heaven his innocence, and adjuring God to reveal to him the cause of his afflictions.

(3) The speeches of Elihu, chaps. xxxii.-xxxvii. A youthful bystander, named Elihu, who hitherto had been a silent listener to the debate, here intervenes, expressing his dissatisfaction both with Job and his friends. He is shocked by Job's inverteance in charging God with unrighteousness, and indignant that the friends have not brought forward such arguments as to show him to be in the wrong. His abhorrence of Job's sentiments is even greater than that of the three friends, from whose theories of evil he differs mainly in giving greater prominence to the idea that affliction is disciplinary and proceeds from the goodness of God. (4) The words of the Lord out of the storm, chap. xxxviii.-xlii. 6. In answer to Job's repeated demand that God would appear and solve the riddle of his sufferings the Lord speaks out of the tempest. He does not refer to Job's problem directly, but in a series of splendid pictures from the material creation and animated nature he makes all his glory to pass before Job. The sufferer is humbled and silent. Such thoughts of God bring him back to the right position of man before the Creator—he repents his former words in dust and ashes.

(5) The epilogue, chap. xlii. 7-17. Job having humbled himself before God, and attained to a fuller knowledge of him, is restored to a prosperity double that which he enjoyed before, and dies old and full of days. With the exception of the discourses of Elihu, the connection of which with the poem in its original form is liable to doubt, all these five parts appear original elements of the book, though some of them may contain expansions of a later date.

The traditional view among the Jews was that the Book of Job was strictly historical. Dissentients from this view, however, are referred to in

the Talmud, where a rabbi is alluded to who had said: 'A Job existed not, and was not created; he is a parable.' And Maimonides (died 1204) expressed the opinion that 'Job is a parable, meant to exhibit the views of mankind in regard to Providence.' In the Christian church also the prevailing opinion was that the book contained literal history. Luther, however, while admitting a basis of history, was of opinion that the history had been poetically treated. He says in his *Table-talk*: 'I hold the Book of Job to be real history; but that everything so happened and was so done I do not believe, but think that some ingenious, pious, and learned man composed it as it is.' This is perhaps the prevalent opinion in modern times, though there are many scholars, some of them belonging to the most conservative school of criticism, such as Hengstenberg, who hold that the poem is a pure creation of the author's mind with a didactic purpose and without any historical foundation. That the poem is not strict history is shown by the many ideal elements contained in it—e.g. the heavenly council (chap. i.-ii.; cf. 1 Kings, xvii. 19); the addresses put into the mouth of the Almighty (xxxviii.-xli.); the symbolical numbers, *three* and *seven*, used to describe Job's flocks and his children (i. 2-3); and the profound thought and elaborate imagery in the various speeches, which, so far from being the extemporaneous utterances of three or four persons casually brought together, could only be the leisurely production of a writer of the highest genius. On the other hand, it is not so probable that a work of such extent and written at the comparatively early date to which the book belongs should be purely poetical invention. The reference to Job in Ezekiel (xiv. 14), which can hardly be to our present book, suggests that there was a well-known tradition which represented Job as a man famed for piety in ancient times. This tradition the author of the book laid hold of and no doubt embellished with many details in order to convey through it the lessons in regard to Providence which it was his object to teach.

Students of the book have not found it easy to dispose all its contents under a single conception, and some writers, as Bleek, have contented themselves with stating some lessons which it obviously teaches. The prologue, for instance, shows how even pious men may be visited with severe afflictions, which it is wrong to consider due to special sins on their part, or to regard as signs of God's displeasure. Again, the course of the debate, taken in connection with the divine speeches from the storm-cloud, suggests that it is presumption in man to pass judgment on God's providence, which it is beyond human wisdom to comprehend, man's true wisdom lying in fearing the Lord and reverent submission even amidst intellectual darkness and perplexity. This second truth may be said to be the burden of the words of the Almighty spoken out of the storm-cloud, and many writers have concluded that this truth, taught by God himself, must be just the lesson intended by the book. This view, however, neglects entirely the light given to the reader in the prologue, and also Job's restoration narrated in the epilogue, and indeed the whole debate between Job and his friends. A just theory of the purpose of the book must take account of all its elements. Now, first, the books of Scripture have mostly a practical aim, and are directed to the instruction of Israel as a people in special circumstances. The circumstances disclosed by the book are those of great distress and perplexity in regard to the ways of providence arising out of this distress. Job, though represented as an individual, must be regarded as a type of the suffering righteous, or it may be of Israel. His history, with the lessons it teaches,

are the lessons which Israel should comfort itself with in its circumstances of affliction. Now, these lessons partly come out in the debate with the three friends and partly in the history of Job's mind, his perplexity, return to faith, and restoration. When the great calamity of the downfall of the state befell Israel the prophetic view that it was due to the sin of the people was accepted, and was sufficient when the state as a unity was considered. But many pious individuals suffered for sins of which they had not been guilty, and, as in this age the position and worth of the individual began to rise into prominence, this fact occasioned perplexity in regard to the operation of Providence. Further, when the exile was prolonged and a new generation arose, innocent of the sins of a former age, and yet involved in its punishment, this perplexity increased, and questions began to be asked whether the view that sufferings were always due to previous sin was sufficient. This is the question in debate between Job and his friends. They maintained the affirmative, while Job dissented, founding on his own history and on much that he could perceive in the world. When the author of the book allows Job to put his friends to silence, we may infer that it was his purpose to teach that the ancient view left much unexplained, and was not a solution applicable in all cases. And when in the prologue he exhibits the case of an upright man afflicted as a trial of his uprightness; and in the body of the book the man in spite of much doubt and even sinful frailty holding fast his integrity; and then in the epilogue the same man, victorious in his faith and more reverent in his submission to God, crowned with double prosperity, we may infer that it was his design to teach Israel that sufferings may be a trial of the righteous, which, if reverently borne, will lift them up into fuller knowledge of God, and therefore into more assured peace and felicity. This is the lesson which he desires to teach Israel amidst its sorrows and the perplexities occasioned by them.

Objections have been made to the originality of the prologue and epilogue which have little weight. Among modern scholars the prevailing view is that the speeches of Elihu (xxxvii.-xxxviii.) are an insertion of a later date. This view rests on such facts as these: that Elihu is not mentioned either in the prologue or epilogue; that Job makes no reply to him, nor is he referred to in the divine answer from the storm-cloud; that he betrays a mannerism which looks like the creation of a different author; that the language of his speeches is less pure Hebrew than the rest of the book; and that his strong repugnance to the irreverence of Job, and his more profound sense of man's sin and the goodness of God, belong to a later age than the original book. The section is of great interest and significance in a religious point of view. There are other passages—e.g. chap. xxviii., which it is difficult to fit into the general scope of the book, and a good many passages are wanting in the original form of the Greek version.

The age of the Book of Job must not be confounded with the age of Job himself. Job is assumed to have lived in the Patriarchal period, the colours of which the author has skillfully thrown over his composition. The author, however, is an Israelite, whose work is a reflection of the religious life and religious thought of Israel. Two general facts point to the age of the exile as the period to which the book belongs: first, the condition of great disorder and misery which forms the background of the poem (ix. 24; xii. 6; xxiv. 12, &c.); and secondly, the discussions on Providence and the relation of suffering to the righteous, which reveal a condition of perplexity in men's minds occasioned by the miseries of the captivity. Other

things also point to the same period—e.g. the very highly developed doctrine regarding God, which is paralleled only in Isa. xl. lxxi., and the later psalms (Ps. cxxxix.); and the inwardness of the morality inculcated (e.g. chap. xxxi.); and the general affinity of the book in thought and language with writings of the exile age. Job iii. is probably dependent on Jer. xx. 14 *seq.* The author of the book is altogether unknown. It was only the prophets who usually put their names to their writings.

The literature is very copious, comprising A. Schultens (1737); Umbreit (1832); Hirzel-Olshausen-Dillmann, *Eregt. Handbuch* (1839-69); Stöckel (1842); Schlottmann (1851); Renan (1859); Delitzsch, Ewald (both trans.); Hitzig (1874); Cox (1880); Davidson (Cambridge Bible for schools, 1884); Eradley (1887); Froude, *Short Studies* (vol. i.); Budde, *Beiträge zur Kritik d. B. Hiob* (1876); Grill, *Zur Kritik d. B. Hiob* (1890).

Job's Tears (*Coix lachryma*), a corn-plant of India. It is a grass, sometimes rising to the height of eight feet, with the stout habit of maize, to which also it is botanically allied. The name is derived from the tear-like form of the hard, shining, bluish-white seeds, which are sometimes made into bracelets and necklaces, and are also an article of food. Though one of the worst of the cereals, it has become almost naturalised in Spain and Portugal.

Jocelin de Brakelonde, a Benedictine monk at Bury St Edmunds, who held successively the offices of abbot's chaplain and almoner, wrote a domestic chronicle of his abbey from 1173 to the year 1202, and died about 1211. This is the famous *Chronica Jocelini de Brakelonda*, edited by J. G. Rokewode for the Camden Society in 1840, which gave Carlyle the inspiration out of which grew *Past and Present*, one of the happiest of his works. The admiration of this simple and veracious 13th-century monk for his superior, Abbot Sampson, touched the sympathetic imagination of the great 19th-century champion of hero-worship, with whose masterpiece Jocelin's name will remain for ever inalienably linked.

Jockey Club. See HORSE-RACING.

Jodeln, a peculiar manner of singing with the falsetto voice in harmonic progressions, practised by the Tyrolese and the Swiss.

Jodhpur, or MARWAR, the largest in area of the Rajputana states, containing 37,000 sq. m.; and the second in population (2,521,727 in 1891). Agriculture generally is in a backward condition, and there are few manufactures save of salt from the Sambhar lake, half in Jodhpur and half in Jeypore (q.v.). There are no railways, but one good road traverses the state. Education is neglected. The climate is remarkably dry, and the difference of temperature between night and day very great. Jodhpur was taken under British protection in 1818, paying a tribute of £10,000 a year, and providing a 'contingent' of native horse. The country was ill governed; and the contingent joined the mutineers in 1857.—The capital city of the state, Jodhpur, founded in 1459, is of little interest. The marked difference between Jodhpur and the adjacent state of Jeypore (q.v.) is very interesting.

Joel, the second in order of the twelve minor prophets. He is designated in i. 1 as the son of Pethuel, or (as it is given in most of the ancient versions) Bethuel, but of his personal history nothing is told. It can be inferred, however, from his book, with a high degree of probability amounting almost to certainty, that he lived in or near Jerusalem considerably after the exile. The Book of Joel falls into two distinct parts, the separateness of which is obscured for readers of the Authorised

English Version by the use of futures instead of preterites in ii. 18, 19*o*; the passage is correctly given in narrative form in the Revised Version. The first part, addressed by the prophet in his own name to his contemporaries, relates to a present plague of locusts and the calamities caused by it; i. 2—ii. 11 describes with vivid hyperbolic imagery the dire invasion which threatens the destruction of the country and the arrival of the final consuming judgment known as 'the day of Jehovah'; in ii. 12-17, speaking in the name of Jehovah, he summons the people to a solemn fast at the sanctuary and the priests to intercessory prayer. The second part contains Jehovah's answer, prefaced by the words already referred to: 'Then was the Lord jealous for his land, and had pity on his people; and the Lord answered and said unto his people.' First, a promise of fruitful seasons to make up for the ravages of the locusts is given (ii. 19-26); this is followed by the promise of the outpouring of the Spirit on all the Jews and even upon their servants, and the final coming of the day of the Lord, which is to issue in a divine judgment upon their heathen enemies in the valley of Jehoshaphat ('Jehovah judgeth') and in the final establishment of Jerusalem as a holy city, the centre of fertility to the surrounding land (ii. 27—iii. 21). The style of Joel is regarded by scholars as elegant and pure rather than original; his prophetic conceptions are largely modelled on those of older prophets from Amos to Ezekiel. Until recently, indeed, the prevailing inclination of critics was to assign an early date to the book, most of them placing it in the minority of Joash, king of Judah, because the priests, and not a king, appear as heads of the commonwealth. But this goes better with the post-exilic date, to which other features in the prophecy clearly point. The dispersion of Israel is alluded to in iii. 1, 2; Judah and the people of Jehovah are regarded as synonymous; and the reference to the slave-trade with the Grecians is inconsistent with an early date. Ancient and medieval interpreters commonly took the locusts in Joel's prophecy figuratively or allegorically, and the same view has been argued for, though by no means convincingly, by some recent scholars. There are separate commentaries on the Book of Joel by Credner (1831), Wünsche (1872), and Merx (1879). See also the commentaries on the minor prophets mentioned under HOSEA.

Joe Miller's Jests. See JEST-BOOKS.

Johanna, one of the islands of the Comoro (q.v.) group.

Johannesburg, the chief town and mining centre of the Transvaal goldfields, is situated about 6000 feet above sea-level, 298 miles N.E. of Kimberley, and 350 miles N. of Ladysmith. Railway connection, completed in 1892, brought Johannesburg within 60 hours' journey of Capetown; and it is now connected also with Port Elizabeth (714 miles), Durban (437 miles), and Lourenço Marquez on Delagoa Bay (396 miles). In 1886 the Transvaal government proclaimed certain farms on the famous Reef of Witwatersrandt as public goldfields; and the ground on which Johannesburg now stands was selected as the site of the new station or town. From the time of the foundation (1887) the town and the mining industry grew rapidly. In 1895-96 it became the scene of the struggles of the Uitlanders to extort political and other rights from the Boer government (interrupted by the Jameson (q.v.) raid of January 1896), which eventually resulted in the war of 1899-1900, and the annexation of the Transvaal and Orange Free State as British colonies. A dreadful dynamite explosion wrecked part of the town in 1896. As yet in 1899 (with pop. of 60,000) the

streets were not lighted, and only the concession for paving the principal street had been granted. The government buildings consist of the post and telegraph offices, and the mining-commissioner's and the landrost's (magistrate's) offices, &c. Fine banks, churches, hotels, club-houses, with shops and private houses, and a magnificent stock exchange have been erected. The climate is, or would be very healthy, were not the sanitary conditions so unsatisfactory, and were it not for the frequent terrible dust-storms, in consequence of which fevers and pneumonia are often prevalent. The neighbourhood of Johannesburg is delightful, and villas and fine suburban houses are springing up. The population at the census of July 1896 was 102,714, of whom 51,225 were whites.

See TRANSVAAL; Thomas, *Johannesburg in Arms* (1896); Mann, *The Truth from Johannesburg* (1897).

Johannisberg, a village of Prussia, overlooking the Rhine, 13 miles W.S.W. of Wiesbaden. It has a hydropathic, and manufactories of pianos and printing-presses, but is noteworthy chiefly for its castle (1722-32), the property of the Metternich family, and the famous vineyards (38 acres) on the castle hill, producing the choice *Johannisberger* white wine. Pop. 1316.

John, the Apostle, son of Zebedee and younger brother of James, was a Galilean fisherman, probably a native of Bethsaida. From Matt. xxvii. 56, compared with Mark, xv. 40, it is probable that his mother was Salome, whom some infer from John, xix. 25, to have been the sister of the mother of Jesus. In the synoptic gospels James and John, like Peter and Andrew, receive their call to the discipleship while engaged in their daily occupation by the sea of Galilee, and the surname 'Sons of Thunder' is conferred on them by the Master. Henceforward John is always mentioned as one of 'the twelve,' and generally figures also as a member of an inner circle of disciples, of which only his brother James and Peter are members besides himself. In the fourth gospel John is not mentioned by name, but ancient as well as modern expositors identify him with the companion of Andrew, who first became acquainted with Jesus at Bethany, beyond Jordan, while he attended John the Baptist as a disciple, and forthwith attached himself to him, Andrew and Peter becoming disciples of Jesus at the same time. John is further identified with the 'other disciple' who in John xiii. 23, xxi. 7, 20 is distinguished as the disciple 'whom Jesus loved.' This expression is usually taken to imply an exceptional sweetness and loveliness of character in John; but what we read in the Synoptists shows that, originally at least, he must have been somewhat passionate, narrow, and ambitious. After the ascension of Jesus John seems to have remained in Jerusalem, where he still was when Paul visited that city for the second time after his conversion (Gal. ii. 9). He does not appear to have been there at the time of the last visit of the apostle of the Gentiles, about 58 A.D., and his subsequent history is involved in the greatest obscurity. A chronicler of the 9th century, Georgios Hamartolos, claims to have read in the now no longer extant works of Papias that John was slain by the Jews like his brother James; and that he died a violent death is apparently implied also in a passage from Heraclon preserved by Clement of Alexandria. But general ecclesiastical tradition from the time of Justin (about 150 A.D.) has identified him with the author of the Apocalypse (see REVELATION), and from that of Irenaeus (c. 175 A.D.) has represented him as spending the closing years of his ministry at Ephesus, and dying there at an advanced age, after having written not only the Apocalypse but also the Gospel and the three

Epistles which bear his name. The authenticity of this tradition as to his having ever lived in Ephesus has been challenged by many critics, who hold that it rests on a confusion made by Irenaeus between John the apostle and a certain John 'the elder' or 'presbyter,' 'a disciple of the Lord,' mentioned by Papias as distinct from the apostle. For the negative view they also urge the silence of the New Testament (Acts, Eph., Pastoral Epp., 1 Pet.), of the Apostolic Fathers, of Justin, and of Hegeppins, and others. For the literature of the question, see the works mentioned below, under JOHN (GOSPEL ACCORDING TO).

John, EPISTLES OF. Of the three canonical epistles ascribed to the apostle John, the first is not in form an epistle, but a warm practical hortatory treatise based on the theological principles of the fourth gospel, with warnings against Docetic and Antinomian gnosis. The second and third are short letters of an occasional character, addressed to individuals—unless indeed the 'elect lady' of 2 John be a figurative title for a church, a view which has great probability and has found very large acceptance among modern interpreters. The first express mention of epistles as written by John the Apostle is in the Muratorian Canon (about 170 A.D.), which quotes 1 John i. 1, and elsewhere enumerates two under his name. From the time of Origen 2 John and 3 John were classed among the books of the canon whose authenticity was disputed; Eusebius and Jerome attributed them to John 'the Presbyter,' as distinguished from John the Apostle, and this view has been followed by many modern writers, beginning with Erasmus. On the internal evidence critics are for the most part agreed that 1 John has the same author as the fourth gospel, or is at least by a writer of the same school. The epistle has occasionally been attributed to the apostle by critics who denied his authorship of the gospel. As to the priority of the two works in point of date, opinion is almost equally divided. For commentaries, see the expositions of the whole Johannine writings by Lücke, Baumgarten-Crusius, and Ewald; also the special works by Ruther (in Meyer's *Commentar*, 4th ed. 1880; Eng. trans.), Braune (in Lange's *Bibelwerk*, 3d ed. 1885; Eng. trans.), Plummer (2d ed. 1886), and Westcott (2d ed. 1886).

John, GOSPEL ACCORDING TO. The fourth canonical gospel, which express tradition since about 170-80 A.D. (Theophilus of Antioch, Irenaeus of Lyons, Muratorian Canon) has unanimously ascribed to the apostle John (identifying the 'disciple' of John xxi. 24 with the son of Zebedee), is distinguished by a number of strongly-marked characteristics from the first three, usually known as the synoptical (see GOSPELS). The keynote of what Clement of Alexandria has called 'the spiritual gospel' is struck in the prologue (i. 1-8), where the place of the genealogies and detailed accounts of the circumstances of the birth of Jesus in the synoptics is taken by a profoundly metaphysical statement of the doctrine of the incarnation of the Eternal Logos. The scene of the narrative of the earthly life of Jesus which follows this prologue is laid from first to last almost entirely in Judea, while in Matthew, Mark, and Luke it is confined with nearly equal exclusiveness to Galilee. While, again, the synoptics, so far as they suggest any chronology at all, seem to imply that the public ministry of Jesus did not extend much over a year (coinciding in this with the mass of early tradition), the fourth gospel mentions at least three passovers, and possibly more. There are, besides, important differences in various minor chronological details. Thus, the cleansing of the temple, which the synoptics place at the end of

the ministry, is in the fourth assigned to the beginning: the last supper is dated on the evening before the passover, and not on the passover itself; and the anointing at Bethany is stated to have taken place six days, not two, before the passover. Again, there is a most striking difference in the selection of material. The fourth gospel, passing over much that is common to the other three—the temptation in the wilderness, the transfiguration in Galilee, the agony in the garden, the sermon on the mount, and most of the parables and other discourses—introduces us to new persons (Nathanael, Nicodemus, and others), new localities (such as Cana, Enon, Sychar, Ephraim, and Bethany beyond Jordan), and new scenes and situations. Its miracles, which are comparatively few, and include no case of the casting out of devils, are not for the most part even alluded to by the others (that of the raising of Lazarus is a conspicuous instance in point); and it has been remarked that they are presented less as deeds of compassion wrought at the pressing call of human need than as spontaneous displays of supernatural power primarily designed to prove a divine mission. The greater part of the work is composed of relatively long discourses, in their argumentative and theological character on the whole very unlike the aphorisms, parables, and practical or prophetic exhortations attributed to Jesus in the synoptics, while they are all very similar to one another in general type, and their style is indistinguishable from that used by the author himself when writing in his own name. The aspects in which, through these discourses and otherwise, Christ, the incarnate Logos, is presented in the fourth gospel, are widely distinct from those in which Jesus of Nazareth comes before us in the others. The element of human development is wanting, and his own consciousness of a Divine nature and mission, as well as the recognition of these by his followers, are represented as having been operative from the first. Finally, it sets forth a more inward and spiritual type of theology and religious experience, and there is for the most part in its eschatology and doctrine of the life eternal a conspicuous absence of those images and conceptions—everywhere present in the synoptics—derived from the Jewish circle of ideas relating to the kingdom of the Messiah and the doctrine of the last things.

It is less than a century since these and similar features—such as its more elaborate character as a piece of literary composition—began to be discussed in their bearing on the question of the origin and historical character of the fourth gospel. The question was first started by the English deists (see Evanson, *The Dissimilarity of the Four generally received Gospels*, 1792), but was not handled with any approach to the fullness and thoroughness which the importance of the subject demanded until taken up by Bretschneider, whose learned and acute *Probabilia de Evangelii et Epistolarum Joannis apostoli indole et origine* (1820) may still be read with profit. Bretschneider in 1821 professed himself satisfied with the numerous replies elicited by the arguments he had based on the differences between the Johannine and the synoptic traditions, the weakness of the external evidence for the Johannine authorship of the fourth gospel, and the inherent improbability of such a work having been written by the son of Zebedee. In the course of the next twenty years the authenticity was powerfully defended by the speculative insight and rare religious genius of Schleiermacher; but De Wette (1826: 37) found himself unable to ignore the element of developed Hellenism in the discourses, and, while not denying the partial authorship of John, inclined to assign the work as a whole to a disciple. A somewhat similar

view was taken by Credner (1836), and also by Reuss (1840), the former of whom laid emphasis on the 'subjective' character of the gospel, and held that it was to be regarded less as a history than as a doctrinal exposition, in which the discourses of Christ are mixed up with the Logos speculations into which the author has been led by his studies in Greek philosophy. The discussion of the question reached a wholly new stage in the writings of Baur (chiefly between 1844 and 1847) and his followers of the so-called 'Tübingen' or 'Tendency' school—a school the value of whose labours in quickening a true historical sense for New Testament subjects can hardly be overestimated, and whose influence (not yet exhausted) has been powerfully and beneficially felt far beyond the circle of its immediate disciples. Space will not allow a full statement of the position taken by Baur or of the arguments he advanced in its support. They can be adequately appreciated only in connection with his theory of the development of early Christianity as a whole. This he represents as having passed through three stages—first of acute antagonism between Ebionitism and Paulinism (down to about 70 A.D.), and next of abatement of claims on both sides (down to about 140 A.D.), while finally, after the elimination of Ebionitic and Gnostic extremes, came the reconciliation of the two parties—practically in the ascendancy of Catholicism as exhibited in the Roman Church with Peter and Paul as its two recognised founders, and ideally and theoretically in the fourth gospel (see BAUR; also BIBLE, Vol. II, p. 123). Briefly and generally stated, his view of the fourth gospel is that it was produced about 160–70 A.D. by a Gentile Christian, who, firmly and heartily convinced that the historical Jesus was the incarnate Logos and very Son of God, sought to exhibit this truth to his contemporaries with concrete vividness in a persuasive literary form by means of a quasi-historical narrative embodying the ideas and principles which he regarded as essential, for which end he made free and arbitrary use of such elements of the current (but still somewhat fluctuating) tradition as were capable of being adapted to his purpose. Subsequent discussion has led the modern representatives of the Tübingen school to modify several of these positions as originally taken by Baur. Thus, as regards date, it was urged by the other side that the existence of the fourth gospel was demonstrated for at least 130–40 A.D. by the frequent quotations from it in the writings of Justin Martyr; and it is now generally admitted that the passages referred to prove at least the wide currency at that comparatively early period of many of the special ideas of this gospel. This and other considerations have led such writers as Pfleiderer and Keim respectively to carry it back to 140 A.D. and 130 A.D.; and, indeed, Renan has formulated the canon that the earlier we can place it the less inexplicable it becomes. This canon is suggested by the difficulty of accounting for the introduction of a gospel in many respects so new after the synoptics had once had time thoroughly to establish themselves, and they undoubtedly were established in the recognition of the church by the time of Justin. The opponents of the Tübingen school, on the other hand, such as Weiss, set up an opposite canon: the later the date the easier to explain the allusions to Gnosticism and the comparatively tardy manner in which the work made itself felt in the official theology of the 2d century. Another point in which Baur's disciples no longer hold with him has reference to the authorship, which he assigned to a Gentile Christian. In the course of the keen controversy which Baur's writings elicited, much stress has been laid on the evidence supplied by the

gospel itself to the effect that its writer was a Jew, acquainted not only with the LXX, but with the original Hebrew of the Old Testament, familiar with Jewish customs and habits of thought, with the topography and local peculiarities of Jerusalem and the temple, and of Palestine generally. This is now very generally conceded; but it is added that his sympathetic familiarity with the writings of Philo suggests rather an Alexandrian than a Palestinian Jew, while his acquaintance with the Holy Land (which after all cannot be shown to have been exhaustive) may have been acquired in the course of travel. But as regards many of the vivid literary touches on the part of the narrator, which on one theory are held to show consummate descriptive or dramatic skill, and on the other to betoken the eye-witness, it is pointed out that such touches are not wholly absent even from some gospels that are confessedly apocryphal, and, further, that it is not always impossible for one who has only heard the account of an eye-witness to convey in writing some graphic idea of what he has heard. If Baur's view has been in some important respects modified by his successors, concessions have also been made on the 'apologetic' side to such an extent as suggests the possibility of an ultimate agreement between the two parties in the controversy. Thus B. Weiss, in the paragraph of his *Introduction* (1889) devoted to the 'limits of the historicity' of John's gospel, points out that, writing as he did at such a distance of time from the incidents he had witnessed and the discourses he had heard, it is in the nature of the case unreasonable to expect that at least the longer discourses should be reproduced word for word. John's manner of reproducing the words of Jesus is, in fact, characterised by great freedom, his purpose being not merely to reproduce them but at the same time to explain them and bring out their inner meaning. With this view not merely the actual phraseology but also the historical setting has been frequently modified, the evangelist caring only for the eternal significance of what he had to tell. Precisely because he was an apostle could he do this without embarrassment or hesitation. What applies to his reproduction of the speeches applies also to the narrative portion of his work, where he often sacrifices the actual connection, and modifies the historical colour of events in the interests of his one primary object. The failure of memory in an old man must also be taken into account. The view thus boldly taken by Weiss is substantially also that of Beyschlag and others who cannot shut their eyes to the obvious marks of growth and development which are seen when the ideas of the fourth gospel are compared with those set forth in the synoptical tradition, and who recognise that the author of the former, whoever he was, must, whether consciously or unconsciously, to some extent have been carrying back into a previous generation the matured thoughts of his own time. It remains to add that the external testimony to the authorship of the son of Zebedee is extremely weak; his name is not associated with the gospel until the last quarter of the 2d century, and the story of the manner in which, 'exhorted by his fellow-disciples and bishops, he wrote down everything in his own name' while 'all should certify it,' as given in the Muratorian Canon, is obviously legendary (compare JOHN).

For the literature of the subject, see the *New Testament Introductions* of Hilgenfeld (1875), Bleek (4th ed. by Mangold, 1886), Holtzmann (2d ed. 1886), and Weiss (2d ed. 1889; Eng. trans. 1887), and also Sanday's *Authorship and Historical Character of the Fourth Gospel* (1872). Dr Sanday conveniently arranges modern writers on the subject into four classes: (1) Those who maintain the Johannine authorship and complete authenticity of the

gospel, such as Alford, Ellicott, Westcott, Caspari, Wieseler, and (with some qualification) Luthardt; to this list ought to be added the names of Salmon, Lightfoot, Ezra Abbot, and indeed of almost all English or Catholic churchmen who have written on the subject. (2) Writers who maintain Johannine or mediate Johannine authorship and qualified authenticity in the first degree, the names here mentioned being those of Lücke ('whose work is still one of the undisputed classics of biblical criticism'), Bleek, Ewald (with some qualification), Meyer, and Orr, to which add the names of Beyschlag, Ritschl, B. Weiss, and of Dr Sanday himself ('To me it is far more probable that [the discourses] represent only the natural, spontaneous, unconscious development that the original elements of fact have undergone in the apostle's mind. It cannot, I think, be denied that [they] are to a certain extent unauthentic, but this is rather in form and disposition than in matter and substance'). (3) Writers maintaining mediate or immediate Johannine authorship and qualified authenticity in the second degree, such as Renan (*Vie de Jésus*, 13th ed. 1867), Weizsäcker and Wittichen, to which names add those of Reuss and Hase. (4) Writers who deny the Johannine authorship and authenticity entirely—Hilgenfeld, Keim, Scholten, Sir R. Hanson, J. J. Tayler; to this class belong also Meijboom, Hoekstra and Louan (Dutch), Havet, A. Réville, J. Réville (French), and of English writers, S. Davidson, the author of *Supernatural Religion*, and E. A. Abbott, whose able article 'Gospels' in the *Encyclopædia Britannica* contains an interesting view of the Philonic elements in the gospel. There are valuable expository works on the Johannine writings by Locke (1820), Ewald (1861-62), and Reuss (1879); see also the commentaries on the fourth gospel by Meyer (new ed. Meyer-Weiss, 1880; Eng. trans.), Godet (1864-65; Eng. trans. 1877), Keil (1881), Westcott (1882), Plummer (1882), Sadler (1883) and Milligan (1883).

John, the name of a long line of popes, the number of whom is variously stated by different historians. John VIII. (872-82) is styled the IX. by some writers, who, accepting the story of Pope Joan (q.v.), reckon her as John VIII.; and John XV. (985-96) is also called XVI. by those who place before him another John who died within a few days of his election. Without entering into this question, it will suffice to say that the last of the line of popes called John is John XXIII., who filled the papal chair most unworthily in 1410-15. The following popes of this name appear to deserve some special notice.—JOHN XII. was the son of Alberico, and grandson of the notorious Marozia, who, during the pontificate of John X. (913-27), ruled with almost supreme power at Rome. John was originally named Octavianus, and, being elected pope in 956 through the violence of the dominant party when only in his nineteenth year, was the first in the papal line to originate the since familiar practice of changing his name. The Emperor Otto in 963 in a synod of the clergy, overstepping all the ordinary rules of canonical procedure and legal precedent, caused sentence of deposition for scandalous life to be pronounced against John, and Leo VIII. to be elected in his stead. John, however, re-entered Rome in the following year with a strong party and drove out Leo; but his career was cut short by a dishonourable death.—JOHN XXII. is one of the most celebrated of the popes of Avignon. He was born at Cahors in 1244, and was elected pope in 1316, on the death of Clement V. Attempting to carry out in very altered circumstances the vast and comprehensive policy of Gregory VII. and Innocent III., John interposed his authority in the contest for the imperial crown between Louis of Bavaria and Frederick of Austria, by not only espousing the cause of the latter but even excommunicating his rival. The diet of Frankfort refused to obey, and a long contest ensued, not only in Germany but also in Italy, where the Guelph or papal party was represented by Robert, king of Naples, Frederick of Sicily being the chief leader of the Ghibel-

lines. The latter was placed by John under the same ban which had already been proclaimed against Louis; but in 1327 Louis came to Italy in person, and having been crowned at Milan with the iron crown, advanced upon Rome, expelled the papal legate, and was crowned emperor in the church of St Peter's by two Lombard bishops. Immediately on his coronation he proceeded to hold an assembly, in which he caused the pope, under his original name of James de Cahors, to be thrice summoned to answer a charge of heresy and breach of fealty; after which he caused him to be deposed, and Peter de Corvara, a monk, to be elected pope, under the name of Nicholas V. These measures, however, were attended with little result. Louis returned to Germany, and the Guelphic predominance at Rome was restored, the papal representative resuming his authority. But John XXII. never personally visited Rome, having died at Avignon in 1334, when, although without incurring the suspicion of personal aggrandisement, he had accumulated in the papal treasury the enormous sum of 18,000,000 florins of gold.

John, king of England, the youngest of the five sons of Henry II. and Queen Eleanor, was born at Oxford, 24th December 1167. At his birth his father, who had provided for his elder brothers, called him John Lackland, and the name stuck to him. But the boy was Henry's darling, and he betrothed him to his wealthy cousin, Hawisa of Gloucester, made the new feudal tenants of Ireland do homage to John as well as himself in 1177, and sent him to Ireland as governor in 1185. Although John's misconduct and wanton insolence soon compelled his recall, Henry obtained the pope's consent to his being crowned king of Ireland; but the coronation never took place, and in 1189 the announcement that John was among his enemies gave the king his death-blow. Richard on his accession bestowed four English shires and other lands on John, and married him to Hawisa. No sense of gratitude, however, held John from endeavouring to seize the crown during Richard's captivity in Austria; but he was pardoned and treated with great clemency, and was nominated his successor by his brother on his deathbed. In the 12th century the principle of primogeniture was but imperfectly adopted, and although Arthur, the twelve-year-old son of John's elder brother Geoffrey, appears to modern eyes beyond question the rightful heir to the throne, the general opinion of his own day was in favour of John, who had the nomination of the late king. Moreover, at his coronation at Westminster, which took place on 27th May 1199, the old English doctrine of election to the crown was for the last time formally asserted, nor did any man dissent. On the Continent, however, the barons of Anjou, Maine, and Touraine acknowledged Arthur, whose claims were supported by Philip of France. But Aquitaine was secured to John by the energy of his mother Eleanor, and in May 1200 he succeeded in buying off Philip, married his niece Blanche to Philip's son Louis, and received Arthur's homage for Brittany. But in the same year he persuaded his Aquitanian and Norman bishops to annul his marriage with his cousin, and married Isabel, the child-heiress of Angoulême; by which action he offended both the house of Gloucester and the powerful family of La Marche, one of whom was betrothed to the heiress. In the war that ensued, Arthur, while endeavouring to capture his grandmother Eleanor, at the castle of Mirabeau, was surprised by John and taken prisoner. Before Easter 1203 he was dead; murdered by John's orders, if not by the king's own hand, men said. This crime cost John his continental dominions. Philip at once marched against

him, captured city after city, and finally, in March 1204, after a seven months' siege, took King Richard's 'sunny castle,' the Château-Gaillard itself, John making scarcely an effort against him. Only a portion of Aquitaine was left to the English king, nor could he recover more by the short campaigns he made in Poitou in 1206 and 1214.

The first period of John's reign thus ends with the separation of Normandy (1204), which compelled those who held lands in both countries to make choice of one; henceforward the barons of England are English. Immediately after, in 1205, John entered on his quarrel with the church, the occasion being a disputed election to the archbishopric of Canterbury. The matter was referred to the pope, Innocent III., and in 1207 he had Stephen Langton, an English cardinal at Rome, a man of great learning and piety, elected, and consecrated him when John had furiously declined to receive him. In 1208 the kingdom was placed under the Interdict (q.v.). John retaliated by confiscating the property of the clergy who obeyed the interdict, and driving the bishops into exile. Otherwise, too, he acted vigorously. He compelled William, king of Scotland, who had joined his enemies, to do him homage (1209), put down a rebellion in Ireland (1210), and subdued Llewellyn, the independent prince of Wales (1212). Meanwhile John had been solemnly excommunicated (1209), and now, in 1212, the pope issued a bull deposing him from his kingdom, and absolved his subjects from their allegiance; a crusade was proclaimed, and to Philip was intrusted the execution of the sentence. John, outlawed by the church, and hated for his cruelty and tyranny by his subjects, found his position untenable, and was compelled to make abject submission to Rome. On 15th May 1213 he resigned his crown to the pope's envoy at Dover, and agreed to hold the kingdoms of England and Ireland henceforth as fiefs of the papacy, and to pay a thousand marks yearly as tribute. This shameful submission closes the second part of John's reign. For Innocent the degrading exaction was a false step. From this period may be dated the hostility to the papacy which culminated in the Reformation.

Philip, wrathful and disappointed, turned his forces against Flanders; but an English fleet surprised the French fleet at anchor and with only the sailors on board, and captured 300 vessels and burned 100 more. This put an end to all talk of invasion, and in 1214 John made a campaign in Poitou. Most of the barons, however, refused to serve abroad, and, Philip having crushed the emperor and his allies at Bouvines (27th July), John returned to enter on the struggle with his subjects which occupied all the remainder of his reign; and now for the first time in English history we see the barons, clergy, and people ranged side by side against the tyranny of the king. A demand that John should keep his oath and restore the laws of Henry I. was scornfully rejected. John relied mainly upon the support of the pope, but he also took the white cross, and endeavoured to detach the clergy with the heavy bribe of free election to bishoprics—but vainly, to their honour be it said. Preparations for war began on both sides. About Easter 'the army of God and Holy Church,' under four great eals and forty barons, assembled at Stamford and marched to London; they met the king at Runnymede, and on the 15th June 1215 was signed the Great Charter (Magna Charta), the basis of the English constitution. In August the pope annulled the charter, and the war broke out again. John had a share of the military talent of his family, and the first successes were all on his side, until the barons called over

the dauphin of France to be their leader. Louis landed in May 1216, and John's fortunes became desperate. Yet the English leaders had already begun to distrust their foreign allies, and a number were even preparing to renew their allegiance, when death overtook the king at Newark, on 19th October 1216, in the forty-ninth year of his age.

For John's character, see the excellent accounts of his reign in Pearson's *History of England* (vol. ii. 1867), Green's *Shorter History*, and Stubbs's preface to *Walter of Coventry* (vol. ii. 1873). See also Stubbs's *Constitutional History* (vol. i.), and *The Early Plantagenets* in 'Epochs of Modern History'; Pauli, *Geschichte von England* (vol. iii. 1858); and, down to the loss of Normandy, Norgate, *England under the Angevin Kings* (vol. ii. 1887).

John II., king of France, surnamed the Good, the son of Philip VI., was born in 1319, and succeeded his father in 1350. In 1356 he was taken prisoner by Edward the Black Prince at Poitiers and carried to England. After the treaty of Bretigny (1360) he returned home, leaving his second son, the Duke of Anjou, as hostage, till he should fulfil the terms of his ransom. But in the meantime the duke escaped back to France. John, however, chivalrously kept his word, and returned to London early in 1364; but he died on 8th April in that same year, without having regained his freedom. His eldest son, Charles V., succeeded him.

John, the blind king of Bohemia, the son of Count Henry III. of Luxemburg (afterwards the Emperor Henry VII.), was born on 10th August 1296, and, having married (1310) the heiress of Bohemia, was crowned king of that country in 1311. In the struggle between the rival houses of Austria and Bavaria for the imperial crown he gained the victory for the latter at Mühldorf in 1322. In 1333-35 he was warring in Italy on behalf of the Guelphic party. In 1334 he married Beatrix of the French Bourbon house, and thenceforward was an active ally of the French king; he went to his assistance against the English in 1346, and fell at Crécy (26th August). He had been blind since 1340. During his reign Silesia was acquired from Poland.

John Dory. See DORY.

John of Austria was a natural son of the Emperor Charles V. and Barbara Blomberg of Ratisbon, and was born 24th February 1547. He was early brought to Spain, and after the death of his father was acknowledged by his half-brother Philip II. Honours and an annual allowance were bestowed upon him, and he was educated along with the Prince of Parma and the Infant Don Carlos. He was intended for the church, but his own bent was towards war, and in 1570 he received the command of an army sent against the rebellious Moors in Granada, whom he completely rooted out of the country—signalling himself at once by valour and by cruelty. On the 7th October 1571, with the united fleets of Spain, the pope, and Venice, he defeated the Turks in the glorious battle of Lepanto. Discord breaking out among the allies, Don John separated himself from the rest, took Tunis, and conceived the scheme of forming a kingdom for himself in the north of Africa. But Philip, jealous of this design, sent him to Milan to observe the Genoese; and afterwards, in 1576, as viceroy to the Netherlands. In this capacity he sought to win the favour of the people by mildness; but being left unsupported by Philip, he was hard pressed for a time, till the arrival of the Prince of Parma with troops enabled him to restore the fortunes of Spain by the victory of Gemblours over William the Silent in 1577. But Philip was now apprehensive that he might make himself king of the Netherlands, and Don John's untimely death in his entrenched camp at Namur, on 1st October 1578, was not without suspicion of

poison. See Sir W. Stirling-Maxwell's magnificent work, *Don John of Austria* (2 vols. 1883).

John of Gaunt, Duke of Lancaster, fourth son of Edward III., was born 24th June 1340 at Ghent, during his father's visit to Flanders. In 1359 he married Blanche, heiress of the duchy of Lancaster, and himself was created duke in 1362. Three years after her death he married in 1372 Constance, daughter of Pedro the Cruel of Castile, and assumed the title of king of Castile, though the country and crown were seized and held by Henry of Trastamare. The military expeditions which John organised against his rival all proved unsuccessful. Towards the close of his aged father's reign John gradually became the most influential personage in the realm. He was an ambitious man, and put himself in opposition to the party of his brother the Black Prince, and is suspected of having entertained the design of succeeding his father as king. He also opposed the party of the clergy, and lent support to Wyclif and his followers. But he was very unpopular with the common people; and during Wat Tyler's revolt they burned his palace of the Savoy, in London. The young king Richard, distrusting him too, contrived to send him away on another expedition for the recovery of his crown in Spain. On this occasion John concluded a definite peace with Henry of Trastamare, in virtue of which John's daughter Catharine should succeed as queen of Castile. On his return to England after three years' absence he was able to reconcile the young king to his (John's) brother Thomas of Woodstock, Duke of Gloucester. After this Richard II. seems to have reposed more confidence in John, for he made him Duke of Aquitaine, and entrusted him with several embassies to France. But John of Gaunt gradually ceased to be a factor in English politics, and died on 3d February 1399. On the death of his second wife he had married in 1396 his mistress, Catharine Swynford, by whom he was already the father of three sons and a daughter. These were legitimated in 1397, and from the eldest was descended Henry VII.

John of Leyden (properly John Benckelszoon, Benekels, or Boekhold) was born at Leyden in 1509. He wandered about for some time as a journeyman tailor, settled in Leyden as merchant and innkeeper, and was noted for his abilities as an orator. Adopting the opinions of the Anabaptists, he became one of their wandering prophets. In 1533 he came to Münster, and, when Matthiesen lost his life in 1534, became his successor. Setting up in Münster 'the kingdom of Zion,' he applied in an extravagant manner the principles of the Old Testament theocracy, and established polygamy and community of goods. In June 1535 the city was taken by the Bishop of Münster. John and his chief accomplices suffered death with circumstances of fearful cruelty (January 26, 1536). See ANABAPTISTS; and Hamerling's *König von Zion*.

John of Nepomuk. See NEPOMUK.

John of Salisbury. See SALISBURY.

John o' Groat's House, in Caithness, 1½ mile W. of Duncansby Head, and 18 miles N. of Wick, was, according to tradition, an octagonal building with eight doors and windows and an eight-sided table within, built by John o' Groat to prevent dissensions as to precedence among the eight different branches of his family. Whatever the origin of the legend, which resembles that of the Round Table, it is certain that between 1496 and 1525 there was one 'John o' Groat of Duncansby, baillie to the Earl in those parts,' and probably a Hollander. An outline on the turf marks the site of the house; and the neighbouring hotel (1876) has, appropriately enough, an octagonal

tower. 'Frae Maidenkirke to John o' Groat's' (Burns) is the Scottish equivalent of 'from Dan to Beersheba,' Maidenkirke being Kirkmaiden in the Mull of Galloway. For 'John o' Groat's buckies,' see COWRY.

John, PRESTER. See PRESTER JOHN.

John the Baptist, the forerunner of Christ, was the son of the priest Zacharias and Elizabeth, the cousin of Mary, the mother of our Lord. He was a Nazirite from his birth, and he prepared himself for his mission by years of self-discipline in the desert, until at length he appeared to startle his hearers with the preaching of repentance. The rite of baptism which he administered was a token and symbol of repentance and forgiveness of sins, preparatory to that baptism to follow, the distinctive quality of which was to be the gift of regeneration through the power of the Holy Spirit. With the baptism of Jesus the more especial office of the forerunner ceased, and soon after his ministry came to a close. He had fearlessly denounced Herod Antipas for taking Herodias, his brother Philip's wife, and was accordingly flung into prison, where ere long he was executed at the request of Salome, the daughter of the abandoned Herodias. The Mandaeans or Sabians (q.v.) still claim to be his disciples. John the Baptist was from an early date regarded in England as the patron saint of the common people, and great masonic festivals continue to be held on St John's Day, the 24th of June. For the Knights of St John, see HOSPITALIERS.

John's, EVE OF ST, one of the most joyous festivals of Christendom during the middle ages, celebrated on midsummer eve. From the account given of it by Grimm in his *Deutsche Mythologie* it would appear to have been observed with similar rites in every country of Europe. Fires were kindled chiefly in the streets and market-places of the towns; sometimes they were blessed by the parish priest, but, as a rule, they were secular in their character. The young people leaped over the flames, or threw flowers and garlands into them, with merry shoutings, songs, and dances. In England the people on the Eve of St John's went into the woods and broke down branches of trees, which they brought to their homes and planted over their doors, to make good the prophecy respecting the Baptist, that many should rejoice in his birth. It was a lingering belief of the Irish peasantry that the souls of all people on this night leave their bodies, and wander to their ultimate place of death by land or sea—a notion that may throw light on the widespread custom of watching or sitting up awake on St John's eve. In England it was believed that if any one sat up fasting all night in the church porch he would see the spirits of those who were to die in the parish during the ensuing twelve months come and knock at the church door in the order and succession in which they were to die.

Johns Hopkins. See HOPKINS.

Johnson, ANDREW, seventeenth president of the United States, was born at Raleigh, North Carolina, December 29, 1808. His parents were in humble circumstances, and his father was drowned while attempting the rescue of a friend when Andrew was but four years old. At the age of ten he became a tailor's apprentice, and with the help of a fellow-workman learned to read. In 1824 he went to Laurens, South Carolina, to work as a journeyman, and two years later emigrated to Greenville, Tennessee. There he married Eliza McCardle, a young girl of education and refinement, who taught him to write, and in other

ways helped on his studies. He served as alderman and then as mayor for several years; in 1834 took part in framing the new state constitution; and in 1835 and 1839 was elected a member of the legislature. In 1840 he was chosen presidential elector-at-large, and cast his vote for Martin Van Buren. In 1841 he was elected to the state senate, and in 1843 to congress. Successive re-elections continued him a member of the House of Representatives until 1853, when he was chosen governor of the state of Tennessee, and in 1855 he was re-elected to that office. In 1857 he was sent to the United States senate for six years. There he was an earnest advocate of the Homestead Law and other measures for the benefit of working-men. He was a sturdy opponent of all secession and disunion schemes.

When the war broke out in 1861 he found himself in accord with the administration, and during its progress was a leader of the Southern Union men. His efforts and sacrifices in behalf of the Union led to his selection by President Lincoln as military governor of Tennessee (1862), and subsequently to his nomination and election to the vice-presidency (inaugurated 4th March 1865). On the assassination of Lincoln (14th April 1865) he became president. He sought to carry out the policy of his predecessor. He retained all the former cabinet in office, and, when vacancies occurred, filled them with those known to have been Lincoln's personal and political friends. But the assassination had provoked a revulsion of public feeling. Many who had favoured amnesty, leniency, and reconciliation now began to doubt whether the states so recently in rebellion could safely be restored to a share in the government without further guarantees. Congressional sentiment divided on the question of 'reconstruction.' President Johnson's policy was first distrusted, and then denounced as evincing disloyal sympathies. Irritated at the misconstruction of his motives, and resenting the charge of disloyalty as insulting, he retorted by speeches full of bitter and violent invective. This intensified the ill-feeling. Soon a majority of the congress, elected with him, were opposing his policy. While he urged the readmission of Southern representatives to seats, the congressional majority insisted that the Southern states should be kept for a period under military government, until they gave more proof of loyalty. President Johnson vetoed the congressional measures; and the congress passed them over his veto. Extra sessions were held to keep him in check, and laws passed to limit his power. Finally, his removal of Secretary Stanton from the war department precipitated a crisis. He claimed the right to change his 'constitutional advisers' in cabinet, and in return he was charged with violation of the 'Tenure of Office Act,' in doing so without the consent of the senate. Articles of impeachment were presented, and he was formally brought to trial before the senate. The trial resulted in his acquittal, less than two-thirds of the senators voting for conviction (see IMPEACHMENT). Practically this ended the contest, as the election of 1868 was close at hand, at which his successor was to be chosen. Retiring from office in March 1869, he returned to Tennessee. He was an unsuccessful candidate for congress in 1872, but was elected to the United States senate in January 1875, and again took his seat in that body. On 31st July of the same year he died from a stroke of paralysis.

Johnson, RICHARD MENTOR, vice-president of the United States, born in Kentucky in 1781, was admitted to the bar, and was a member of congress from 1807 to 1809, of the United States senate till 1829, and of congress again till 1837. He served with great bravery in the war with Britain in

1812-13. In 1837-41 he was vice-president under Van Buren. He died at Frankfort, Kentucky, 19th November 1850.

Johnson, SAMUEL, so famous in his own day as a lexicographer, an essayist, and a critic, and still so famous, though rather perhaps for personal than for literary reasons, rather as a brilliant conversationalist and a sincere and brave man than as a writer of the highest order, was born at Lichfield, September 18 (N.S.), 1709. His father, Michael Johnson, a native of Derbyshire, of obscure extraction, was an old bookseller—what we call a second-hand bookseller—and seems to have been a person of some mark and importance in his neighbourhood, where booksellers of any kind were then scarce. 'He propagates learning all over the diocese,' wrote Lord Gower's chaplain in 1716, 'and advanceth knowledge to its just height; all the clergy here are his pupils, and suck all they have from him.' His municipal position, too, was good. He served the offices of junior bailiff, of sheriff (the city of Lichfield being then styled a county), of mayor. His wife, Sarah Ford, came of a yeoman's family living in Warwickshire, and seems to have been a woman of some capacity. Thus his early circumstances were not so unfriendly to the future lexicographer as they are sometimes represented. On the other hand, he inherited from his father 'a vile melancholy,' a terrible tendency to depression and despair, which never wholly ceased to dominate him, and possibly some tendency to superstition, as he was credulously taken up to London to be 'touched' for the 'king's evil,' being afflicted with scrofula. Moreover, his father did not prove a successful man of business, however notable his knowledge of books; and pecuniary troubles soon began to be felt. Thus in his social rank, and his early experience of comfort followed by adversity, Johnson's early life closely parallels that of Shakespeare. He was sent to a dame's school, and then to the Lichfield grammar-school (1716-26), and for a while to the school of Stourbridge; and then for two years (1727-29) he studied or idled at home. All through life he was of indolent habits; but his quickness of apprehension and his strength of memory were amazing. As some one said of him, he 'tore out the heart of books.' And so during his school-days he became a prodigy of learning. Probably the hours spent at will amidst his father's books did more to make him so than the lessons and the floggings of Messrs Hawkins and Hunter, and Mr Wentford. At last, in 1729, probably through the assistance of his godfather, Dr Swinfen, he went up to Pembroke College, Oxford. His attainments were soon recognised; a Latin translation of Pope's *Messiah* increased his fame; and he became a figure of note and of influence in the 'nest of singing birds' of which he was a member. But he was 'miserably poor;' though then, as always, he bore his poverty without complaining or in any way abating his independent spirit. When some well-intentioned fellow-student placed at his door a pair of new boots, of which he stood sorely in need, he flung them out of the window. In the year 1731 things grew worse and worse; he left Oxford finally in October, without a degree; in December his father died.

The terrible struggle with poverty which began at Oxford, or even earlier, lasted some thirty years more (1731-62), and might never have ceased but for the intervention of the royal bounty. For some years after he left the university his life is obscure. He attempted schoolmastering, as do so many when there is nothing else before them, though he could scarcely have been less well fitted for such work physically or in his habits than in fact he was. He was liable to convulsive starts and facial contortions; and he never learned how to

control his temper. 'He has the character,' says an extant letter concerning one of his candidatures, 'of being a very haughty, ill-natured gentleman; and that (*sic*) he has such a way of distorting his face (which though he can't help), the gentlemen think it may affect some young lads.' After a few months at Market Bosworth, he relinquished a situation which all his life long he recollected with 'the strongest aversion and even a degree of horror.' Clearly he liked the pedagogic profession as little as it liked him. He now made approaches towards the career to which he was destined. Visiting Birmingham in search of employment, he began his connection with the press by producing an abridged translation of Lobo's *Voyage to Abyssinia*. Also, he wrote to Cave, the proprietor of the *Gentleman's Magazine*, then recently started, proposing to become a contributor. In 1735, his fortunes being at their lowest ebb, he, aged twenty-five, was bold enough to marry the widow of a Birmingham mercer, aged forty-six. She brought him a portion of £800, part of which seems to have been lost by the insolvency of an attorney. The accounts given of his 'pretty charmer,' as he called her, are not very fascinating; but, as he said in after years to Beauclerk, 'Sir, it was a love match on both sides.' And certainly his attachment, at all events, was deep, and tender, and constant. Once more, and no doubt with the remainder of his wife's portion, he attempted schoolmastering; but it is not surprising that parents did not crowd with their offspring to the boarding-house opened at Edial Hall, near Lichfield. There was now nothing for it but to try the metropolis. In 1737, with a tragedy and twopence-halfpenny in his pocket, he came up, along with his Edial pupil, Garrick, to London, which henceforward was to be his abode. Later in the year he fetched Mrs Johnson. It is certain he had a terrible struggle to make a living. One publisher, noticing his burly frame, advised him to buy a porter's knot; another gave him the task of compiling a catalogue of the Harleian Library, and him Johnson knocked down with a folio Septuagint when he accused him wrongfully of negligence. He was sometimes dinnerless (*yours, impronatus*, is his signature to a letter to Cave), occasionally bedless (we hear of his walking round St James's Square with Savage all one night 'for want of a lodging'), always ill fed and shabbily dressed. But he bore all with a splendid courage. He neither whined about hardships he had to endure, nor boasted of the fortitude with which he endured them. There is no more heroic figure in the history of our literature. Meanwhile, in spite of circumstances, he was becoming the foremost writer of his time, and was already obtaining an influence and a power due to something more than his writings—due to the force and the nobility of his character. In 1738 he became a regular contributor to the *Gentleman's Magazine*, and from November 1740 to February 1743 he wrote the debates in parliament published by Cave under the title of *The Senate of Lilliput*, and 'took care that the Whig dogs should not have the best of it.'

In 1738 he attempted to do with Juvenal what Pope had been doing with Horace; he published his *London*, a poem between whose lines may be read the piteous story of the harsh experiences he was undergoing. It is interesting to note that Pope on first reading the poem promised that its unknown author should soon be *déterré*, and got Lord Gower to write to a friend to beg Swift to obtain Johnson a Dublin degree in order to help him to a mastership of £60 a year. A few years later, in 1747, he published his proposal of a new Dictionary of the English Language. It was paradoxical indeed that one in his starving position should undertake a task

so gigantic and so unremunerative. But it was not only undertaken, but achieved. Just when this huge labour was nearing completion a nobleman whose help at an earlier period would have been three welcome extended towards him a patronising hand; and to this overture Johnson replied in the famous letter of February 7, 1755, which for its just indignation, and its passion of independence, to say nothing of its fine quality as a piece of writing, would make its author memorable had he no other claim on the admiration of posterity. During the years mainly devoted to the Dictionary he had produced also his *Vanity of Human Wishes*, another and yet more brilliant adaptation of Juvenal, and also the series of essays called *The Rambler*, in which his genius showed to less advantage, though it is frequently perceptible in the acuteness of the observations he records. In 1752, just after he had concluded *The Rambler*, his wife died. His grief was profound and enduring. For some forty days this man who to the world at large seemed, and often in manner was, so rough and savage, buried his face and wept. 'Sir,' he said some years after to an old fellow Oxonian who asked him if he had been married, 'I have known what it was to have a wife, and I have known what it is to lose a wife. It had almost broke my heart.' Indeed, one of the most striking characteristics of Johnson, when he is seen beneath the surface, is the infinite tenderness of his nature to children, to women, to poverty, and to every form of distress. As Garrick put it, he had nothing of the bear but the skin. During nearly all the Dictionary period and three years beyond it—i.e. from 1748 to 1758—he was living in a house still standing in Gough Square, off Fleet Street. In 1759 his mother died; and to meet the expenses connected with her death he wrote *Rasselas* in the evenings of a single week. The novel had lately arisen in our literature; and so this work took the shape of a tale. But Johnson had little talent for that kind of writing; and the value of *Rasselas* lies in far other directions. In respect of its view of life, it has been well described as but a prose edition of the *Vanity of Human Wishes*; and it has much in common, though the differences also are striking, with Voltaire's *Candide*, which was published almost exactly at the same time. In 1758 he again attempted the periodical essay, adopting *The Idler* for his title. During all these years he performed also much hack work. Yet, for all his efforts, he was more than once arrested for debt.

At last he was relieved from his oppressive and incessant penury by the bestowal upon him by the crown of a well-deserved pension of £300 a year. And for the last twenty-two years of life (1762-84) he lived in what was comparative affluence, finding himself able to accommodate in his house in Johnson's Court, whither he migrated in 1765, and mainly to support two homeless friends—viz. Mrs Williams and Mr Levett, as well as his black servant Francis Barber; and in his house in Bolt Court, which he occupied from 1777 to his death, no less than three others besides—viz. Mrs Desmoulin and her daughter, and a Miss Carmichael, to say nothing of occasional waifs and strays for whom he provided a night's lodging. These strange inmates of what he called his 'seraglio' were far from being always harmonious, but all their petulance could not weary out his benevolence. We read of his carrying home a poor creature he found lying on the streets upon his back, and putting pennies into the hands of the sleeping street Arabs on his way home from the club, that they might have something for breakfast when they awoke in the morning. In the London of that day he filled an almost,

if not quite, unique position. He was a sort of literary monarch. 'He seemed to me,' said one of his many friends, 'to be considered as a kind of public oracle, whom everybody thought they had a right to visit and consult.' In 1763 the lion-hunting Boswell became his eager and faithful follower, and treasured up with wonderful skill every roar that was uttered. It is mainly to his faithful and reverent recollection that we owe our intimate knowledge of the peculiarities of the great man—his insatiable tea-drinking, and love of late hours; his slovenliness in dress and strange gesticulations; his physical strength and courage; his antipathy to Scotchmen, and love of London streets; his insensibility to music and painting; his hearty old Toryism, hatred of Whigs, and honest old-fashioned patriotism; his reverence for the church, and his sincere religion yet strange shrinking from death; his abhorrence of all false sentimentality, and rigid truthfulness; his delight in conversation, his marvellous dexterity in retort, and his frequent browbeating of his antagonists. Even his cat Hodge has become a living personality to posterity from the inspired faithfulness of his chronicler.

In 1764 the famous club known as the Literary Club was formed, having amongst its original members Johnson, Reynolds, Burke, Goldsmith, Langton, Sir John Hawkins. Probably in 1765 Johnson made the acquaintance of Mr Thrale and his sprightly wife, who made a new home for him both in Southwark and at Streatham, and in other ways did much to make his life bright and happy for the long space of more than sixteen years. With them he travelled to Bath, to Brighton, to North Wales, to France. In 1773 Boswell persuaded him to visit Scotland and the Hebrides, which was perhaps the most striking event of his later years. So far as his terrible enemy melancholia permitted, he found life worth living and pleasant to live during this period. He delighted to fold his legs and have out his talk; and there was no lack of appreciative and reverent listeners. But he wrote little. To set himself to write was always an effort; and he shrank from making it. His best thought and wit found an outlet in conversation. His *Journey to the Hebrides* and his *Lives of the Poets* are the only works of any importance belonging to this time of his kingship. Some time in March 1781, he writes, 'I finished the *Lives of the Poets*, which I wrote in my usual way, dilatorily and hastily, unwilling to work and working with vigour and haste.' Meanwhile, his social circle began to be sadly invaded and broken. Goldsmith died in 1774, Garrick in 1779, Beauchamp in 1780, Mr Thrale in 1781, and Levett, whom he commemorated in a touching poem, in 1782. For a while after her husband's death Mrs Thrale kept up the old relationship, but by the autumn of 1782 she had determined to marry Piozzi, an Italian musician and Catholic, and Johnson's displeasure at what he considered a degrading step at length dissolved a friendship which had 'soothed twenty years of a life radically wretched.' The marriage actually took place in June 1784, less than six months before Johnson's death. In 1783 Mrs Williams passed away; and for all her peevishness was sincerely missed. For Johnson, too, the end was approaching. In 1783 he suffered a paralytic stroke. He rallied to some extent, and was once more seen in his old haunts. But in the following year dropsy and asthma attacked him. By November there was but little hope of his recovery. All that medical skill and all that the tenderest affection could do to relieve and to smooth his dying hours was faithfully done. He took solemn leave of Langton, Burke, Reynolds, and other dear friends he had loved with a constant

affection, and sent a tender blessing to his young favourite Fanny Burney, who watched weeping at his door. 'I am afraid,' said Burke one day, 'that so many of us must be oppressive to you.' 'No, sir, it is not so,' replied Johnson, 'and I must be in a wretched state indeed when your company would not be a delight to me.' 'My dear sir,' said Burke, with a breaking voice, 'you have been always too good to me,' as he left him for the last time. The brave-hearted Johnson faced the inevitable with heroic courage, refusing at the last to take his opiates, that he might 'render up his soul to God unclouded.' He died on the evening of December 13, and he was buried in Westminster Abbey near Garrick, Dryden, and Cowley. A monument was raised to him in St Paul's.

The estimate of him as a writer is by no means so high now as in his own day. As a writer, it must be said of him that he was rather of an age than for all time. His greatest interest for us is that he so exactly represents the current ideas of his age, such as they were. He never fully expressed himself in literature. And, excellent as are several of his works, or at least passages in them, we should never have known his real greatness but for Boswell's admirable portraiture of him, and his masterly reports of his conversations. Boswell's skill in these respects is beyond praise, and deserves a better acknowledgment than Macaulay and some other critics have vouchsafed him. In Boswell's pages Johnson will live for ever, and he better known than anybody that ever lived. And the more he is known, the more readily will be recognised the nobleness of his nature, the vigour of his genius, and the value of his literary services.

Editions of his works have been numberless; the best is that published at Oxford in 11 vols. in 1825. See the article BOSWELL, the Life by Sir J. Hawkins (1787), and the editions of Boswell's *Life of Johnson* by Croker, Napier, Henry Morley, and Birkbeck Hill; the *Essays* by Arthur Murphy, Macaulay, and Carlyle, as well as Macaulay's perfect biography in miniature, contributed to the *Encyclopædia Britannica* (1856); also Birkbeck Hill's *Dr Johnson, his Friends and his Critics* (1878), his edition of the *Letters* (2 vols. 1892); Leslie Stephen's admirable book in 'English Men of Letters' (1878), and the little book by Col. F. Grant in 'Great Writers' (with a bibliography, 1887). Matthew Arnold edited the chief six of the *Lives of the Poets* (1878); a good edition of the whole is that by Mrs Napier (1890). See also Madame D'Arblay's *Diary and Letters*, Mrs Piozzi's *Autobiography*, and Mrs Napier's *Johnsoniana* (1884)—the last made up from the writings of Mrs Piozzi, Richard Cumberland, Bishop Percy, T. Tyers, Dr Campbell, Hannah More, Madame D'Arblay, Rev. T. Twining, Miss Reynolds, Sir Joshua Reynolds, and Arthur Murphy.

Johnson. ALBERT SIDNEY, an American general, was born in Kentucky, 3d February 1803, graduated at West Point in 1826, and served in the United States army until 1834. In 1836 he joined the army of Texas as a private soldier, but very shortly became its head; in 1838 he was appointed war secretary of the young state, and in 1839 drove the marauding Indians out of northern Texas. He served in the Mexican war under General Taylor, who in 1849 appointed him a paymaster in the United States army. In 1855 he received a cavalry regiment, and in 1858 he brought the Mormon rebellion to an end without the employment of force. He was then appointed brigadier-general, and commanded in Utah and in the department of the Pacific until 1861, when he resigned and passed over to the South. Appointed to the command of the department of Kentucky and Tennessee, he fortified Bowling Green, and held the Northern army in check until February 1862, when he retreated to Nashville and, on the fall of Fort Donelson, to Corinth, Mississippi. Here he con-

centrated 50,000 men, with which force he attacked Grant at Shiloh before daybreak on Sunday, 6th April 1862. The National army was surprised, and the advantage in the tremendous battle that ensued lay with the Confederates when, at half-past two, while leading a charge, Johnston was mortally wounded. The next day Grant's supports came up, and the enemy, now under Beauregard, was driven back to Corinth. There is a Life of General Johnston by his son (New York, 1878).

Johnston. ALEXANDER KEITH, LL.D., F.R.S.E., cartographer and geographical publisher, was born near Edinburgh, December 28, 1804. His first important work, the *National Atlas* (fol.), occupied him for five years, and was published in 1843. Its merits received immediate recognition, and Johnston was appointed Geographer Royal for Scotland. Acting on a suggestion from Humboldt, he visited Germany, and gathered material for his *Physical Atlas* (1848; 2d ed. 1856). Its publication was the signal for a shower of honours from the geographical societies of Europe. In 1850 appeared a very useful *Dictionary of Geography*, better known as 'Johnston's Gazetteer.' In 1851 he constructed the first physical globe, showing the geology, hydrography, &c. of the earth. His *Royal Atlas of Geography* (1861) was one of the most beautiful and minutely accurate atlases ever executed up till that time. Johnston also published atlases of Astronomy and Geology; a *Military Atlas* for Alison's *History of Europe*; besides educational atlases, physical, general, and classical, which obtained a wide circulation. He died 10th July 1871.—His son, ALEXANDER KEITH, born in 1844, was educated in Edinburgh, trained as a draughtsman in his father's firm, and afterwards extended his experience in London and Germany. He took part in an exploring expedition to Paraguay in 1874, and in 1879 was appointed leader of the Royal Geographical Society's expedition to East Africa, mainly for the purpose of discovering a practical route to the interior. He was scarcely a month on the way when he fell a victim to dysentery at Berobero on the road between Dar-es-Salaam and Lake Nyassa, 28th June 1879. His work was taken up and successfully completed by Mr Joseph Thomson. Johnston, who was a frequent contributor to the *Geographical Magazine*, produced a *Physical Geography* (1877), edited and extended Hellwald's *Africa* (1879) in Stanford's series, and edited a sheet map of Africa and Boyce's *Gazetteer* (1879).

Johnston. or JONSTON, ARTHUR (1587-1641), eminent as a physician and still more so as a humanist, was born of an honourable family at Caskieben, Aberdeenshire, and educated at Marischal College and the university of Padua, where he graduated M.D., June 11, 1610. The same year (says Sir T. Urquhart) he was 'haunted poet at Paris and that most deservedly,' and thereafter visited many seats of learning on either side the Alps from Rome to Sedan, in which latter he sojourned long with his compatriot Andrew Melville, professor of Divinity in the university. For many years he practised medicine in France, whence his fame as a Latin poet spread over Europe. In 1625 appeared in London his elegy on James I., and about the same time he was appointed physician to King Charles. His Latin rendering of the Song of Solomon, dedicated to that monarch (Lond. 1633), contained a specimen of his translation of the Psalms of David into Latin verse, a work on which he had long been engaged, and which was published at Aberdeen in 1637. In that year he helped to bring out the *Delitæ Pœtarum Scotorum hujus Ævi Illustratum* (Amsterdam, 2 vols. 12mo), a collection in

which the scholarship, taste, and poetical power of his countrymen appear to signal advantage, and to which his own contributions are at once the most numerous and the best. On June 24, 1637, he accepted the post of rector of King's College, Aberdeen, and enhanced the lustre of that brilliant era in the university's annals. His avocations as court physician, however, kept him mainly in England, where his fame as man of letters and poet, as well as physician, was steadily increasing till 1641, when he died suddenly on a visit to Oxford. His translation of the Psalms, often reprinted at home and abroad, divides with Buchanan's still more famous version the palm of superiority in that field; but his command, at once comprehensive and refined, of Latin idiom and rhythmical movement, and his imagination, rich without extravagance, are even more conspicuous in his miscellanies, among which his prolation on the great anatomist Casserio would suffice to keep him in the front rank of modern Latin poets. See the monograph by Principal Geddes of Aberdeen (1890).

Johnston, JAMES F. W., a Scottish chemist, was born at Paisley in 1796. He was of humble parentage, and studied at Glasgow University. Having in 1830 married a lady of considerable fortune, he repaired to Stockholm, and became the pupil of Berzelius, the chemist. In 1833 he was invited to take the readership in chemistry and mineralogy in the newly-established university of Durham. But he resided chiefly in Edinburgh, and there carried on his investigations. It is as an agricultural chemist that he is chiefly known. His *Catechism of Agricultural Chemistry and Geology* has gone through more than fifty editions, and has been translated into almost every European language; and his *Lectures on Agricultural Chemistry and Geology* (1842; 17th ed. 1894) are held in high esteem. The last of his works, *Chemistry of Common Life* (1854), has passed through several editions (one edited by Church in 1879). He died at Durham, 18th September 1855.

Johnston, JOSEPH EGGLESTON, an American general, was born in Virginia, 3d February 1807. His mother was a niece of Patrick Henry. He graduated at West Point in 1829, fought in the Seminole war, became captain of engineers in 1846, served with great gallantry in the war with Mexico, where he was wounded at Cerro Gordo—he received altogether ten wounds in the three wars he was engaged in—and in 1860 was commissioned quartermaster-general, with the rank of brigadier-general. He resigned in 1861 to enter the Confederate service, and was appointed brigadier-general and given the command of the Army of the Shenandoah; in August he was made full general. He came to the assistance of Beauregard at the first battle of Bull Run, but waived his claim to precedence, and left him in command. In 1862 he was for several months disabled by a wound received at Seven Pines, while opposing McClellan. In 1863, with a weak force, he failed in an endeavour to relieve Vicksburg. He commanded the force directed to oppose Sherman's advance towards Atlanta, in 1864, and stubbornly contested his progress; he was steadily driven back, however, and in July was relieved of his command. He was again placed in command by General Lee in February 1865, and ordered to 'drive back Sherman'; but he had only a faint of the Northern general's strength, and after a last vigorous resistance at Bentonville, in March, and after learning of Lee's surrender, he accepted the same terms on 26th April. General Johnston afterwards engaged in railway and insurance business, and was elected to congress by Richmond in 1877. He was appointed United States commis-

sioner of railroads by President Cleveland. He died 21st March 1891. See his *Narrative of Military Operations* (1874), and Lives of him by Johnson (1891) and R. M. Hughes ('Great Commanders' series).

Johnstone, a manufacturing town of Renfrewshire, on the Black Cart, 3½ miles W. by S. of Paisley. Founded in 1781, it contains a large flax-mill, cotton-mills, a paper mill, foundries, and machine-shops. Pop. (1831) 5617; (1891) 9668.

Johnstone, FAMILY OF, takes its surname from the lordship of Johnstone in Annandale, Dumfriesshire. In former days it was one of the most powerful and turbulent clans of the west Borders, and was at constant feud with its neighbours, especially the Maxwells. Three branches of the name still exist, Johnstone of Annandale, Johnstone of Westerhall, and Johnston of Hilton and Caskieben in Aberdeenshire. The first named, which retained the ancient patrimony, was ennobled by Charles I., and became successively Lords Johnstone of Lochwood, Earls of Hartfell, and Earls and Marquises of Annandale. These titles, being limited to heirs-male, became dormant in 1792, and more than once rival claims for their revival by the Annandale and Westerhall branches have been repelled by the House of Lords. Both the houses of Westerhall and Caskieben enjoy knightly rank, and a branch of the former was in 1881 raised to the peerage as Baron Derwent.

Johnstown, (1) capital of Fulton county, New York, on Cayadutta Creek, 48 miles WNW. of Albany, and 6 miles S. of Gloversville by rail. It has some mills and large manufactories of gloves and mittens. Pop. 5013.—(2) A town of Pennsylvania, on the Conemaugh River, 78 miles E. by S. of Pittsburg by rail, with large iron and steel works, tanneries, and flour, planing, and woollen mills. Johnstown was overwhelmed by the bursting of a reservoir on 31st May 1889. Pop. (1880) 8380; (1890) 21,805.

Johore, an independent state at the southern extremity of the Malay Peninsula, with an area of 10,000 sq. m. The country is densely covered with timber, and rises into several mountain-peaks, the highest being Mount Ophir (4186 feet). The population numbers about 200,000, mostly Malays and Chinese. The former live by fishing and wood-cutting; the latter are traders and shopkeepers. The chief staples of the country are tea, gambier, and black pepper. All kinds of fruit are plentiful. The climate is tropical but healthy. The capital is Johore, 15 miles NE. of Singapore.

Joiny (anc. *Jovinicum*), an old walled town in the French department of Yonne, 90 miles by rail SE. of Paris, manufactures cloth, linen, and sporting rifles. Pop. 6189.

Joinery. See CARPENTRY.

Joint-fir. See SEA-GRAPE.

Joints, in Anatomy. A joint or articulation may be defined to be the union of any two segments of the skeleton of an animal body, through the intervention of a structure or structures of a different nature. The textures which enter into the formation of the more complex joints are bone, cartilage, fibro-cartilage, ligaments, and synovial membrane. Bone forms the fundamental part of all joints; ligament, in various modifications, is employed as the bond of union between the bony segments; while the three remaining textures chiefly occur in those joints in which there is free motion. The joints vary in the degree of motion from almost perfect immobility to the greatest amount and extent of motion that are compatible with the maintenance of the bony segments in their proper relation to each other.

Joints have been divided by anatomists into two great classes—the *Immovable* and the *Movable*. In the immovable or *Synarthroses* the parts are continuous, that is to say the bones are united together by a prolongation of the periosteal fibrous membrane between them. In some cases the uniting medium is a plate of cartilage. There is no synovial sac intervening between the bones. In movable joints the articular surface of each of the bones is covered with cartilage, and these cartilaginous plates are separated from each other by a synovial sac more or less complete. This sac is lined by a membrane which secretes a viscid fluid for lubricating the articular surfaces—the *synovia* or joint-oil.

In synarthroses the articulation is said to be by *suture* when the bones seem to grow somewhat into one another, and to become interlocked and dovetailed together, each bone having a jagged or serrated margin, or when there is a degree of beveling, so that one bone is overlapped by the other. Both these kinds of suture are at once seen in the human Skull (q.v.).

The movable joints are *Amphiarthroses* and *Diarthroses*. In the former there is partial mobility of one bone upon another, combined with great strength. The contiguous surfaces of the bones are united by a thick and strong layer of fibro-cartilage, the centre of which is usually soft, and may present a cavity lined by a synovial membrane, with which a little elastic tissue is intermixed. As examples of this kind of joint may be mentioned the articulation between the bodies of the vertebrae and that between the two pubic bones at what is termed the symphysis.

Diarthroses are complete joints, the articular surfaces being covered by articular cartilage and separated from each other by a cavity lined by synovial membrane. In these the degree and nature of the motion are very various. There may be merely a little *gliding* motion between the ends of the bones, as, for example, in the articulations between the various bones of the carpus and tarsus. (see HAND, FOOT). In these cases the surfaces are plane, or one is slightly concave and the other slightly convex; and the motion is limited in extent and direction by the ligaments of the joint, or by some projecting point of one of the bones. In some cases, instead of a slight concavity and convexity, one bone presents a cup-like depression, while the termination of the other assumes a hemispherical, or more or less globular shape. Hence the name of *ball and socket* that is applied to such joints. The best example of this variety is the Hip-joint (q.v.), and the next best is the shoulder. In these joints the ball is kept in apposition with the socket by means of what is termed a *capsular* ligament, which may be described as a barrel-shaped expansion of ligamentous structure, attached by its extremities around the margin of the articular surfaces composing the joint, and forming a complete investment of it, but not so tight as materially to restrict its movements. This species of joint is capable of motion of all kinds.

Another important variety of articulation is the *hinge-joint*, in which the contiguous surfaces are marked with elevations and depressions, which exactly fit into each other, so as to restrict motion to one plane. The elbow and ankle joints, and the joints of the fingers and toes, are the best examples of this variety. The knee-joint is a less characteristic example, because in certain positions it is capable of a slight rotation. These hinge-joints are always provided with strong lateral ligaments.

The last kind of joint requiring notice is that which admits only of *rotatory* motion. A pivot and a ring are the essential parts of this joint, the ring being generally formed partly of bone and

partly of ligament. The best example of this articulation is that between the atlas (the first vertebra) and the odontoid or tooth-like process of the axis (the second vertebra). See HAND.

Diseases of the Joints.—In diseases of the joints we may have one or more of the following textures affected: (1) the synovial membrane; (2) the cartilage; and (3) the bones themselves. The synovial membrane may undergo either acute or chronic inflammation, giving rise to the serious affections known as acute and chronic Synovitis (see SYNOVIAL MEMBRANES). Loose substances of a fibrous structure, and usually resembling a small bean in size and shape, sometimes occur in joints, especially in the knee-joint. They commence as little pendulous growths upon the synovial membrane, which after a time become detached. The cartilage may be affected in various ways. There may be (1) simple destruction of cartilage; (2) scrofulous destruction of cartilage; (3) hypertrophy of cartilage; (4) atrophy of cartilage, and other modified forms of disease of this texture, all of which, especially the second, are of a very serious character, but not of a nature that admits of popular explanation. The most important diseases of the osseous structures of the joints are (1) ulcer and (2) caries. These diseases often, but not always, begin with the disorganisation of cartilage, and then extend to the bones. Sometimes, however, they commence in the bones. See ANKYLOSIS.

Resection or Excision of Joints 'is on the whole safer than amputation; less violence is done to the body, fewer great arteries and nerves are injured, and, what is of more consequence, fewer large veins are divided, and as the articular end of the bone only is sawn off, and the medullary canal not touched, there is less chance of pyæmia. Lastly, the patient is left with an imperfect limb, it is true, but with one which, in most cases, is highly useful' (Druitt). The operation has been performed on the shoulder, elbow, wrist, hip, knee, and ankle. Few subjects have in recent times excited more discussion among surgeons than the application of this operation to the knee-joint. The operation was first performed in 1762; and up to the year 1830 there are records of 19 cases, out of which 11 died. From 1830 to 1850 the operation was never performed, and was generally condemned; but in the last-named year it was revived by Professor Fergusson, and is now a frequent and most valuable operation. 'The cases,' says Dr Druitt, 'in which it ought to be performed are, generally speaking, such cases of injury or disease as would otherwise be submitted to amputation. The object of the operation is to produce a firm and useful limb, slightly shortened, and with entire bony union, or fibrous union admitting of some small degree of motion at the situation of the joint. But all cases are not suitable for excision; and those cases are unsuitable and better adapted for amputation in which either the *quantity* of the diseased bone is very great, or the *quality* of the disease may be such as experience has shown to be incompatible with the exudation of healthy material of repair.' In at least 50 per cent. of cases the operation results in a good useful leg. It has already saved so many limbs that it must be regarded as one of the greatest triumphs of modern surgery. Further information on this subject may be found in Holmes's *System of Surgery*, or in any surgical text-book e.g. Erichsen's.

Joints, in Geology, are the natural division-planes or cracks by which rocks of all kinds are traversed. Joints, although very frequently irregular, yet have a tendency to run across rocks in certain directions. Thus, in ordinary bedded aqueous rocks (sandstone, shale, limestone) they are generally developed more or less at right

angles to the bedding, so that, if the strata be horizontal, the leading joints will be vertical or approximately so. Two sets of these joints are usually recognisable (*master-joints*), which cut each other at or nearly at right angles. Hence aqueous rocks, by means of joints and original bedding-planes, are divided into larger or smaller cuboidal blocks. In massive crystalline rocks, such as granite, joints are rarely so regular. Yet even in these two sets of joints, crossing each other, can often be traced; and occasionally another horizontal set may be present—these last simulating the bedding-planes of aqueous strata. Were it not for the presence of such natural division-planes, it is obvious that quarrying would be a much more difficult operation. A peculiar kind of jointing is met with in certain crystalline igneous rocks, as in some fine-grained basalts, in which the division-planes separate the rock into polygonal or more or less perfect hexagonal prisms or columns (see BASALT). Joints have been formed in various ways. They are doubtless due to the strain and tension to which rocks have been subjected during movements of the crust. Others probably owe their origin to contraction on cooling; the prismatic joints of basalt being 'fissures of retreat.' And, in like manner, it seems likely enough that sedimentary strata may sometimes have become jointed during their gradual drying and consolidation.

Joint-stock Company. See COMPANY.

Jointure, in English law, meant originally an estate settled on husband and wife jointly for their lives. Such settlements were made as a substitute for dower, which is that portion of property to which, on her husband's death, the widow is entitled for the maintenance of herself and children—one-third and upwards of the estate for life. The term jointure now includes an estate limited to the wife. The requisites of a jointure are: (1) That it must commence and take effect immediately on the husband's death; (2) it must be for the wife's life, at least; (3) it must be given to the wife herself, and not merely to trustees for her; (4) it must be expressed to be made in satisfaction of her whole dower; (5) it must be made before marriage. The mode of giving a jointure in modern marriage settlements is usually by way of a rent-charge on the husband's real estate. If a jointure be created out of an estate before marriage, the husband cannot sell the estate afterwards, so as to defeat the jointure. A jointure is not lost by the treason or felony of the husband, nor by the elopement and adultery of the wife.

In Scotland the word jointure is also frequently used in a similar sense to denote a conventional provision for a widow, consisting either of an annuity to her or of a life-ent assignment of rents, or of a life-ent of lands, called a locality. In whatever way the jointure is constituted it also excludes the widow's terce, unless it is otherwise expressed.

Joinville, a small town of 4000 inhabitants in the French department of Haute-Marne, 22 miles N. of Chaumont by rail, which was formed into a principality by Henry II., and later supplied the title to the third son of Louis-Philippe.

Joinville, JEAN, SIRE DE, the biographer of St Louis of France, was born in 1224, and became sénéchal to Thibaud, Count of Champagne and king of Navarre. He took part in the unfortunate crusade of Louis IX. (1248-54), returned with him to France, and lived thereafter partly at court, partly on his estates. He declined to go on the fatal expedition to Tunis, and survived till July 11, 1317. During his stay at Acre in 1250, at the age of twenty-six, he occupied his leisure in com-

posing a manual of the Christian faith—his *Credo*, which he retouched thirty-seven years later; and there is extant a letter he wrote to Louis X. at the age of ninety-one. During the crusade he took notes of events and wrote down his impressions. At the age of almost eighty, at the entreaty of Jeanne de Champagne, wife of Philip le Bel, he undertook his *Vie de Saint Louis*, which he finished after the death of his patroness, and presented in 1309 to her son (afterwards Louis X.). The concluding portion of the book bears traces of senility; nothing, on the other hand, is more clear, animated, and real than the part relating to the crusade. Thus the book is obviously a collection of pieces composed at different times. Joinville is an excellent example of the best type of 13th-century cavalier, with all his admirable qualities as well as all his limitations and defects: he is brave, pious, candid, devoted to his king while strictly maintaining against him his feudal rights, considerate for his vassals, a jealous guardian of all traditional privileges; but, on the other hand, his intelligence generally stops short at detail and cannot grasp general causes; he relates unskilful military operations without criticising or apparently even understanding them; he approves intolerance in St Louis, and falls into woeful puerilities in his narration. His style conforms closely to his character: it is veracious, flowing, naive, often singularly expressive, but it has neither the elegance of the best prose-writers of the middle ages nor the vigour and solidity of Villehardouin: it is the tone of an amiable and familiar talker, who sometimes forgets himself a little in his reminiscences, but never fails to charm. The book has the one consummate merit of sympathetically raising up clear before our eyes the breathing image of a romantic figure over whom already there hung the shadow of a tragic destiny.

Unfortunately the text has only come down to us in later MSS. in which the language has been modernised; but the methodical study of competent editors has at length restored with almost complete security both the substance and the form of the book—one of the most precious bequests of the middle ages, holding its place in time between Villehardouin and Froissart. The best edition is that of N. de Wailly (1875). See Duret, *Études sur la Vie et les Travaux de Jean de Joinville* (1870).

Joists. See FLOOR.

Jokai, MAURICE, Hungarian novelist, was born on 19th February 1825 at Komorn. He qualified himself for an advocate, but never practised; literature and journalism were more to his taste. He was an active partisan of the Hungarian struggle in 1848, and when the Austrians gained the upper hand, it was with difficulty that he escaped imprisonment. After 1849 he devoted himself exclusively to literary pursuits. His works number close on 300 volumes, and embrace novels, romances, dramas, humorous essays, poems, &c. Of these the most valuable are the novels and romances, of which *The Turks in Hungary* (1852), *The Magyar Nabob* (1853), and its continuation *Zoltan Karpathy* (1854), *The New Landlord* (1862; Eng. trans. 1868), *Black Diamonds* (1870), *The Romance of the Coming Century* (1873), *The Modern Medea* (1875; Eng. trans. 1885), *The Comedians of Life* (1876), *God is One* (1877), *The White Woman of Leutschau* (1884), and *Tinau's Two Worlds* (Eng. trans. 1888) may be taken as good examples. His skill as a narrator is enhanced by a lively imagination, humour, and a complete grasp of Hungarian life. His work is sometimes marred by improbability, a straining after effect, and superficial treatment. Most of his novels have been translated into German. Jokai has also gained fame as a journalist, as editor first of the revolutionary weekly *Pictures of Life*, then of the political daily *Fatherland*, and lastly of the

humorous weekly *The Comet* (1858-81), and the government organ *Nemzet* ('The Nation'). He is a prominent member of the House of Representatives, being one of the cleverest debaters of the party of the liberal government.

Jokjakarta, a residency of Java, in the central part of the island, has an area of 1191 sq. m., and a population of about half a million, nearly all Javanese; see JAYA. The capital, Jokjakarta, is a town of more than 50,000 inhabitants, with the sultan's palace and ruins of ancient temples.

Joliba. See NIGER.

Joliet, capital of Will county, Illinois, is on Des Plaines River, 35 miles SW. of Chicago by rail, and its water-power is increased by a canal from Lake Michigan. It is the site of the state penitentiary, and has extensive manufactures of flour, steel, rails, wire, stoves, tools, boots and shoes, paper, tiles, cigars, &c. There are large quarries of limestone at Joliet, and a coalfield in the neighbourhood. Pop. (1880) 11,657; (1890) 23,264.

Jolly-boat (Dutch *jolle*, 'yawl'). See BOAT.

Jomelli, NICOLÒ, Neapolitan composer (1714-74), is known by his operas *Armida* and *Ifigenia*, and by a *Miserere* and a *Requiem*.

Jomini, HENRI, BARON, born 6th March 1779 at Payerne, in the canton of Vaud, began his military career in the Swiss Guards at Versailles, and finally rose to be chief of the staff to Marshal Ney; he was created baron after the peace of Tilsit. In 1804 he attracted the notice of Napoleon by his *Traité des Grandes Opérations Militaires*. He distinguished himself at Jena, in the Spanish campaigns of 1808 and succeeding years, during the retreat from Russia, and at Lützen and Bautzen; but, offended at the treatment which he received from Napoleon, he entered the service of Russia in 1814. In 1828 he took an active part in the war Russia waged against Turkey, particularly in the capture of Varna. His fame as a military writer rests upon *Histoire Critique et Militaire des Campagnes de la Révolution* (5 vols. 1806), *L'Art Politique et Militaire de Napoleon* (4 vols. 1827), and *Précis de l'Art de Guerre* (1830; new ed. 1881). Baron Jomini died at Passy, near Paris, 24th March 1869. See the Life by Lecomte (1861); and Sainte-Beuve, in *Nouveaux Lundis*, vol. xiii.

Jonah. The Book of Jonah, unlike the other eleven of the series of the minor prophets in which it occurs, is not a prophetic discourse but a narrative, and does not in any sense claim to have been written by the prophet whose name it bears. It belongs to that special kind of literary composition, common among the late Jews, usually known as haggadic; it is obviously not intended to be taken as literal history, but as a parable attached to a historic name. The name in this instance is that of Jonah, the son of Amittai, who is mentioned in 2 Kings, xiv. 25, as having been a native of Gath-hepher in Galilee, and as having prophesied the victories of Jeroboam II. No writing known to belong to him is now extant; the oracle contained in Isaiah, xvi. xvi., and spoken of by that prophet as already ancient, has been conjecturally attributed to Jonah by Hitzig, but for somewhat inadequate reasons. Whether the story now associated with his name may have had some basis in any word or deed of his, or whether the choice of his name was quite arbitrarily made by the anonymous author, cannot now be determined. The key to the narrative, the details of which are familiar to every one, is to be sought in the closing chapter, where Jehovah asks the prophet whether he does well to be angry because of the sparing of Nineveh, a great city teeming with innocent life for which Jehovah has laboured, and which he has

caused to grow. Nowhere in the Old Testament is that particularism, to which the Jews were ever prone, more clearly or emphatically rebuked. As for the earlier part of the story, its explanation is to be sought in the often-recurring Old Testament figures in which the great world-powers are likened to sea-monsters or dragons (see, for example, Jer. li. 44), and deliverance from any overwhelming calamity is spoken of as a bringing back from the depths of the sea (Ps. lxxviii. 22 [23]). At the time when the Book of Jonah was written, the Jews, who had returned from the Babylonian exile full of bright hopes as to a near and glorious future, had become querulously aware of the failure of these. The object of the writer seems to have been to suggest to them that their existing troubles, in which they seemed as it were to be swallowed up by the world-powers which oppressed them, were due to their neglect of the missionary vocation which had been urged upon Israel by the later prophets (see especially Isa. xl.-lxvi.); once Israel in penitence and prayer shall have shown that she has again become alive to this duty, she may hope to experience the fulfilment of the prophet's words (Hos. vi. 2): 'After two days he will revive us; on the third day he will raise us up.' The prayer of Jonah, whether a composition of the author of the rest of the book or not, certainly cannot be carried back to a date nearly so early as the 8th century B.C.; it is largely a cento from older compositions, the metaphors in verses 3-6 being common in all periods of Hebrew poetry. See the commentaries on the minor prophets mentioned under HOSEA; also Krahnert (1839), Jäger (1840), and F. Bergmann (Strasb. 1885).

Jonas, JUSTI'S (1493-1555), a helper of Luther's in the work of reformation and translation of the Bible, was professor at Wittenberg, pastor at Halle and Coburg, and superintendent at Eisfeld. He took part with Luther in many of the great events of the Reformation, as at Worms, Marburg, and Augsburg. There is a monograph on him by Pressel (1863).

Jonathan, BROTHER, corresponding to the English John Bull, is the personification of the United States, especially of its native born citizens. The original of the name is supposed to be Jonathan Trumbull (1710-85), governor of Connecticut, whose shrewdness, staunch patriotism, and unflinching zeal gained him the esteem and friendship of Washington; and the latter's phrase when perplexed, 'Let us hear what Brother Jonathan says,' passed into a proverb.

Jones, EBENEZER, poet, was born at Islington, 20th January 1820. He was brought up in the strictest sect of the Calvinists, but at thirteen was writing verses, and in secret devouring the Waverley novels. In 1837 he was forced by his father's long illness to turn clerk in a City warehouse; his hours were eight to eight six days a week. Yet he published his *Studies of Sensation and Event* (1843), poems 'full of the very essence of poetry,' and admired by such poets as Browning and Rossetti. But the world rejected them, and he published no more, save a pamphlet on the *Land Monopoly* (1849), which anticipated Henry George by thirty years in proposing to nationalise the land. A Chartist he was not, but a disciple of Carlyle in politics, as of Shelley in poetry. In 1844 he married, miserably, the niece of Edwin Atherstone; and he died at Brentwood, 14th September 1860. See three long articles by Theodore Watts in the *Athenaeum* (1878); and two notices by Sumner Jones (elder brother of the poet, and a poet himself) and W. J. Linton prefixed to a reprint of the *Studies* (1879).

Jones, EDWARD BURNE. See BURNE-JONES.

Jones, ERNEST, Chartist poet, was the son of Major Jones, equerry to the Duke of Cumberland, afterwards king of Hanover. He was born at Berlin in 1819, was educated in Germany, and came to England in 1838. In 1841 he published his romance, *The Wood Spirit*, was called to the bar of the Middle Temple in 1844, and the year following became the most prominent leader of the Chartist movement. He declined all remuneration for his services, and issued *The Labourer*, *Notes of the People*, and the Chartist organ, *The People's Paper*. He voluntarily resigned a fortune of nearly £2000 per annum, left to him on condition that he should abandon the Chartist cause. For the part which he took in the Chartist proceedings at Manchester in 1848 he was condemned to two years' solitary confinement. This vindictive sentence was brought before the House of Commons, but Jones refused to petition for its commutation. While in prison he composed an epic poem, *The Revolt of Hindostan*. The authorities refused him pen, ink, and paper, and the poem was stated to have been written on the leaves of his prayer-book with a bird's feather and blood drawn from his own veins. After his release Jones wrote *The Battleday* (1855); *The Painter of Florence* and *The Emperor's Vigil* (1856); and *Beldouyn Church and Coragda* (1860). He tried for a seat in parliament, but was defeated at Halifax (1847) and Nottingham (1853, 1857). He died 26th January 1869.

Jones, HENRY ARTHUR, playwright, was born at Grandborough, Bucks, 28th September 1851, and was at first in business. *Only Round the Corner* was produced in 1878, but his first hit was *The Silver King* (1882). Other plays are *Saints and Sinners* (1884), *The Middlemen*, *The Daring Girl*, *Rebellions Sussex*, *The Triumph of the Philistines*, *The Lions* (1897), *The Physician*, (1897), &c.

Jones, INIGO, an English architect, was the son of a cloth-worker, and was born in London 15th July 1573. A nobleman sent him to Italy to study landscape-painting, but he was drawn to study architecture instead. While in Venice he paid particular attention to the works of Palladio, whose style he introduced into England, whence he is sometimes called the 'English Palladio.' On leaving Italy he went to Denmark by invitation of Christian IV., and there he is said by some to have designed the royal palaces of Rosenborg and Frederiksborg. Returning to England in 1604, he was employed by James I. in arranging the scenery, &c. for the masques of Ben Jonson, which were at that time the chief amusement of the court. Jonson afterwards satirised his fellow-labourer in *Bartholomew Fair*. In 1612 Jones revisited Italy, still further to improve his style, and on his return to England was appointed surveyor-general of the royal buildings. He was at this time accounted the first architect of England, and, according to some, the first of the age. He died 21st June 1652. His masterpiece is considered to be the Banqueting House (now the Chapel Royal) at Whitehall. Another representative specimen of his work is the church of St Paul, in Covent Garden, London.

See Walpole's *Anecdotes of Painters* (Dallaway's ed. 1828) for the buildings designed by him; his life by Peter Cunningham (1848); Fergusson's *History of Architecture*; and W. J. Loftie, *Inigo Jones and Wren* (1893).

Jones, OWEN, Welsh antiquary, was born in Denbighshire in 1741, and died in London, 26th September 1814. He was all his life a farmer, but had early developed a taste for Welsh poetry. In 1801-7 he published at his own cost the *Mygvaen Archæology of Wales*, a collection of poetic pieces dating from the 6th down to the 14th century (new ed. Denbigh, 1870). The MSS. from which he made his selection, running to one hundred volumes,

are deposited in the British Museum. His son, OWEN JONES, born in 1809, made himself a name as an art-decorator. He laid the foundations of his knowledge in an architect's office in London, travelled for four years in southern Europe, and published *Designs for Mosaic and Tessellated Pavements* (1842), *Plans, Elevations, Sections, and Details of the Alhambra* (1845), and *Polychromatic Ornament of Italy* (1845). He was made superintendent of works for the London Exhibition of 1851, and afterwards director of decorations for the Crystal Palace, where he designed the decorations of the Alhambra, Egyptian, Greek, and Roman courts, and wrote guide-books to the first two. In 1853 he published *Principles regulating the Employment of Colour*; in 1856 the *Grammar of Ornament*, still a valuable text-book; in 1864, *One Thousand and One Initial Letters*; and in 1867, *Examples of Chinese Ornament*. He also illustrated several books. He died in London, 19th April 1874.

Jones, PAUL, United States naval commander, by his countrymen styled 'the Pirate,' was born in Kirkcubright parish on the coast of Kirkcubrightshire, 6th July 1747, the fifth and youngest child of John Paul, head-gardener to Mr Craik of Arbigoiland. Apprenticed at twelve as sailor-boy to a Whitehaven merchant, he made several voyages to America, where he had an elder brother settled in Virginia. This brother's property he inherited in 1773, having meanwhile for five years been mate on a slaver; and about the same date he changed his name John Paul for that under which he is famous. He embraced the cause of the American colonies; and when congress in 1775 resolved to fit out a naval force he offered his services. In April 1778, visiting the British coast in a brig of eighteen guns, he performed some most daring exploits, and took advantage of his familiarity with the scenes of his boyhood to make a hostile descent on the shores of the Solway Firth. At Whitehaven he fired one ship and spiked thirty-six guns; from St Mary's Isle he carried off Lord Selkirk's plate, but six years later restored it; and next morning in Belfast Lough he captured the *Drake* sloop-of-war—the first naval success of the Americans. The year after, as commodore of a small French squadron displaying the stars and stripes, he threatened Leith, and on 23d September fought close off Flamborough Head a most desperate and bloody engagement, in which he captured two British men-of-war. Louis XVI. created him a Chevalier of the Order of Military Merit, and congress voted him a gold medal. In 1788 he entered the service of the Empress Catharine, and as rear-admiral of the Black Sea fleet served creditably in the war against Turkey; but a twelvemonth later he quitted the Russian service. He died at Paris, 18th July 1792, his funeral being attended by a deputation of the Legislative Assembly. 'He was,' says Professor Laughton, 'a man of distinguished talent and originality; a thorough seaman, and of the most determined and ferocious courage. On the other hand, his vanity was excessive . . . and his moral character may be summed up in one word—detestable.'

See Lives by Sherbourne (1825), Janette Taylor (1830), Mackenzie (1841), Simms (1845), James Hamilton (1848), J. C. Abbott (1875), and James Barnes (1900); also an article in *Blackwood's Magazine* for October 1887, and J. K. Laughton's *Studies in Naval History* (1887).

Jones, SIR WILLIAM, one of the earliest English orientalists, was born in London, 28th September 1746, the son of William Jones (1680-1749), a learned mathematician and friend of Newton. He had his schooling at Harrow under Thackeray and Sumner, and entered University College, Oxford, in 1764, where his remarkable attainments quickly attracted attention. In 1765 he left

Oxford to become tutor to the eldest son of Earl Spencer, and with him remained five years. He was called to the bar in 1774, and two years later was appointed Commissioner of Bankrupts. In 1770 he published, at the request of the king of Denmark, a *Life of Nadir Shah*, translated into French from the Persian; in 1772 a *Persian Grammar*; in 1774 his Latin Commentaries on Asiatic Poetry; and in 1780 a translation of seven ancient Arabic poems, known as the *Muallakat*, so called from being 'suspended' in the temple at Mecca. In March 1783 he obtained a judgeship in the Supreme Court of Judicature in Bengal, and was knighted. With characteristic ardour he at once devoted himself to the study of Sanskrit with a view to prepare a digest of Hindu and Mohammedan law. He established the Royal Asiatic Society, 'for investigating the history, antiquities, arts, sciences, and literature of Asia,' and was its first president. He contributed largely to the *Asiatic Researches*. Already in 1789 he had finished his translation of *Sarwatida, or the Fatal Ring* (1799), when in 1794 he published a translation of the Ordinances of Manu, a preparatory task for the greater work. Soon after he was attacked with an inflammation of the liver, which carried him off on the 27th April 1794. The East India Company erected a monument to his memory in St Paul's Cathedral, and a statue in Bengal. A collected edition of his works was published by Lord Teignmouth in six quarto volumes in 1799; two supplementary volumes followed in 1801; and a *Life* in 1804. The impulse that Sir William Jones gave to the study of Sanskrit literature was far more important than the performance his short and busy life enabled him to effect. He was indeed a learned scholar, but his scholarship was of the pre-scientific age, and has long since been superseded. But his noble and generous character and his ardent enthusiasm for learning have done much not only to promote learning, but to elevate the character of the scholar.

Jongleurs (Old Fr. *jongleur, juglere*, Ital. *giocolatore*, from the Lat. *jaculator*), among Provençals and northern Frenchmen, a class of minstrels during the middle ages who sang and often composed poems, songs, and fabliaux, and who frequented courts, tournaments, castles, and towns for that purpose. They made a trade of song, poetry, and story-telling, and often of jesting and buffoonery, and are distinct from the knightly poets, the Troubadours and Trouvères. They were often for their special gifts retained in the service of particular lords, and we find them also named indifferently *menestrels* or *menestriers*. Two of their number, Jacques Grise and Hugues-le-Lorrain, founded the church of St Julien in 1331. See Freymond, *Jongleurs and Menestrels* (Halle, 1883).

Jönköping, a town of Sweden, capital of the *len* or county of Jönköping (area, 4468 sq. m.; pop. in 1888, 195,045), stands on a beautiful situation at the southern end of Lake Wetter, 115 miles by rail nearly due E. of Gothenburg. It is famous for its safety-matches. Paper, carpets, tobacco, &c. are also made. Pop. (1875) 13,142; (1890) 19,682. Here several Swedish parliaments have been held, and peace was signed between Sweden and Denmark in 1809.

Jonquil (Fr. *jonquille*, from Lat. *junceus*, 'a rush'), a name given to certain species of *Narcissus* (q.v.) with rush-like leaves. The Common Jonquil (*N. Jonquilla*), a native of the south of Europe, is one of the most common bulbous-rooted plants in our flower-borders. It has from two to six yellow flowers at the summit of its scape (leafless stem). The Sweet-scented Jonquil (*N. odoratus*), also a

native of the south of Europe, is another species very generally cultivated. Perfumed waters are made from Jonquil flowers.

Jonson, BEN, dramatist, was born at Westminster about 1573, a month after the death of his father, who was a minister. His grandfather was of Amundale (probably a member of one of the Johnstone families). Ben was educated at Westminster School under William Camden, whom he held in the highest veneration. He is said to have spent some time at Cambridge, but certainly did not go through the regular academic course. His mother was remarried to a master-bricklayer; and for a while Ben followed the craft of his step-father. As he 'could not endure the occupation' (see his *Conversations with William Drummond of Hawthornden*) he went off to serve as a soldier in the Low Countries, where he distinguished himself by killing one of the enemy in single combat 'in the face of both the camps.' After a short stay abroad he returned and 'betook himself to his wonted studies.' He married early (about 1592) and had children, whom he survived. Among his poems are two tender elegies on the death of his eldest son and eldest daughter. According to his own account his wife was 'a shrew, yet honest.' On one occasion he stayed five years away from her, as the guest of Lord Aubigny.

We first hear of Jonson's connection with the stage in 1597, but he had doubtless been at work for some time previously both as an actor and dramatist. In 1598 he is mentioned by Meres as one of 'our best for Tragedie.' During these early years he seems to have usually collaborated with other playwrights—Porter, Chettle, Dekker, &c. He had a narrow escape in 1598 from the gallows. An actor in Henslowe's company, Gabriel Spence, challenged him to a duel in the fields at Shoreditch. Jonson killed his adversary, was tried for homicide, pleaded his clergy, and escaped with the penalty of branding in the thumb of the left hand and the forfeit of his goods and chattels. In his conversations with William Drummond (q.v.), whom he visited at Hawthornden in 1618-19, he declared that the quarrel was not of his seeking, but that he 'had been appealed to the fields,' adding that the challenger's sword was 10 inches longer than his own. During his imprisonment he was visited by a priest who converted him to the Roman Catholic creed, to which he adhered for the space of twelve years. The fact that he was branded is a recent discovery, made by Mr Cordy Jeaffreson in the course of his researches in the Middlesex Sessions Rolls.

In 1598 *Every Man in his Humour* was produced. There is a tradition that Shakespeare procured this excellent play to be acted; and we know that Shakespeare himself personated one of the characters. In the original version the scene is laid near Florence; afterwards Jonson gave English names to the characters, and shifted the scene to London. *Every Man in his Humour* is the only play of Jonson's which has been revived in modern times. It is lighter and brisker than the elaborate masterpieces of his maturer years. The success of *Every Man in his Humour* inspired *Every Man out of his Humour* (1599), a somewhat tedious play, which was followed by *The Case is Altered* (1599), *Cynthia's Revels* (1600), and *The Poetaster* (1601). In the last play Jonson made a violent attack on Dekker and Marston, and was in consequence assailed in Dekker's *Satiricall*. Subsequently Jonson and Marston were reconciled; they worked together on *Eastward Ho*, in company with Chapman; and Marston dedicated his *Malcontent* to Jonson in handsome terms. But the quarrel broke out again later. *Sejanus*, a solidly constructed but frigid tragedy, was produced in

1603; and *Volpone, or the Fox*, a dexterously ingenious but uncomfortably cynical comedy, in 1605. Of *Epicure, or the Silent Woman* (1609), a farcical mirth-provoking piece, Dryden observed, 'I prefer it before all other plays, I think justly, as I do its author, in judgment, above all other poets.' *The Alchemist* (1610) is the most elaborate and most masterly of Jonson's writings, the magnificent extravagance of Sir Epicure Mammon being depicted with keenest spirit and inexhaustible learning. *Catiline* (1611) is a companion piece to *Sejanus*. *Bartholomew Fair* (1614) hits off the humours of the old London festival with the liveliest gusto, and in the person of Zeal-of-the-Land Busy gives a capital sketch of a canting Puritan elder. *The Devil is an Ass* (1616) and *The Staple of News* (1625) are of smaller account. *The New Inn* (1629-30) was not successful on the stage (as Jonson records in a famous ode); it has an improbable plot, but contains some of the poet's most eloquent writing. The latest comedies were *The Magnetic Lady* (1632) and *A Tale of a Tub* (1633). A delightful pastoral play, *The Sad Shepherd*, was left unfinished.

Ben Jonson's masques are of singular beauty. He was one of the most learned men of his age, and he lavished all the stores of his knowledge on these entertainments; but his sprightliness of fancy and fertility of invention matched his learning, and his masques are models of elegance and grace. The mechanism was provided by Inigo Jones, with whom he frequently quarrelled. Other poets allowed Jones to take the chief credit for the success of their masques; but Jonson insisted that the poetry was the main thing, and that the mechanic's art was of minor importance. Jones finally succeeded (1627) in ousting Jonson from court favour.

In addition to the masques Jonson wrote many elegies, epistles, love-poems, epigrams, and epitaphs. The famous epitaph on the Countess of Pembroke, beginning 'Underneath this sable hearse,' is most happily turned; and another on Salathiel Pavy is hardly inferior. As a song-writer he had few equals. Of his songs the most popular is 'Drink to me only with thine eyes'; but the Hymn to Diana in *Cynthia's Revels*, 'Still to be neat, still to be drest' in *The Silent Woman*, and many of the songs scattered up and down the masques are equally charming. None knew better than Ben Jonson how to write complimentary poems; the best is perhaps the epigram to the Countess of Bedford. 'This morning, timely rapt with holy fire.' To the collected edition (1623) of Shakespeare's works he prefixed a noble memorial poem. His prose *Discourses* are distinguished by admirable judgment and unaffected purity of diction.

When he was in his forty-sixth year he spoke with humorous complacency of his 'mountain belly' and 'rocky face.' But bodily infirmities came in later years. Towards the end of 1625 he was attacked by the palsy, and afterwards by dropsy. For the last two or three years of his life he was unable to leave his room. His sufferings were intensified by poverty; but he found patrons in King Charles and the Earl (afterwards Duke) of Newcastle. He died in August 1637, and was buried at Westminster Abbey. A collection of poems to his memory, by most of the famous wits of the age, was published in 1638 under the title of *Jonsonus Verbaus*. His arrogance and asperity had procured him some enemies; but he had been liberal in his praise of others' merits, and the younger poets regarded him with reverence and affection. The slab over his grave bears the inscription, 'O rare Ben Jonson!' His works were edited (in 9 vols.) in 1816 by William Gifford, who cleared away the baseless calumnies by which his

memory had been assailed. Gifford's edition was re-issued in 1875 (9 vols.), with additional notes by the late Lieut.-col. Cunningham. See A. C. Swinburne, *A Study of Ben Jonson* (1890).

Joppa. See JAFFA.

Jordaens, JAKOB, a Dutch painter, born at Antwerp, 19th May 1593, and admitted into the St Luke guild in 1615. He ranks next to Rubens amongst Flemish painters in the departments they both cultivated. Jordaens' style is marked by realistic fidelity and vigour of portraiture, and his colouring is generally good; but he is sometimes coarse and inelegant. He excelled in humorous pieces depicting Flemish life, and painted also scriptural and mythological subjects. He died at Antwerp, 18th October 1678.

Jordan ('descending'), the principal river of Palestine, the bed of which forms a great valley stretching from north to south, in the eastern part of the country. It is formed by the junction of three streams. The highest source of the Jordan is the Hasbany, which rises near the Druse town of Hasbeiya, on the west-side of Mount Hermon. There is another spring on the south side of the same mountain at Banias (Panaea or Casarea Philippi), and the Leddan at Dan. The Jordan flows south, and after a course of a little over 100 miles, having passed through the small Hulh-Lake (The Waters of Merom) and the Lake of Tiberias (Sea of Galilee), 682 feet below the Mediterranean, it falls into the northern extremity of the Dead Sea (q.v.), 1292 feet below the Mediterranean. Besides smaller affluents, it receives four streams, the Wady Far'ah and Wady Kelt from the west, the Hieromax and Jabbok from the east. McGregor estimates the Jordan to have 200 miles of channel from the Hasbeiya source to the Dead Sea. The source is 1700 feet above the Mediterranean, making a total fall when it reaches the Dead Sea of 3000 feet. The bed of the river varies much in breadth, from 30 to 50 yards, flows latterly in a sunken channel, and its banks of white marl are in some places flat, in others steep; in the north partly occupied by fields of barley, but barren below Jericho. There are upwards of forty fords, but the two at Jericho are impassable when the river is in flood. The course of the Lower Jordan was explored by Lieutenant Molyneux in 1847, by Lieutenant Lynch in 1848; the Upper Jordan for the first time by John McGregor in his Rob Roy canoe in 1869.

Jordan, MRS DOROTHEA, actress, was born near Waterford in 1762, the daughter of an actress and one Bland, whose father afterwards had the marriage annulled. She appeared first in Dublin, under the name of Miss Frances, as Phoebe in *As You Like It*, but soon became popular in romps and 'brooches' parts. Having had a quarrel with her manager, in 1782 she crossed the channel and obtained an engagement from Tate Wilkinson, of the York circuit, with whom she acted for three years. It was Wilkinson who joked her about 'crossing the Jordan,' and so suggested a new name to her; the 'Mrs' was added to secure a legacy—a theatrical wardrobe—left to her on this condition by an aunt who was a stickler for the proprieties. Mrs Jordan made her debut at Drury Lane in *The Country Girl* in October 1785—just seven weeks before Mrs Clive died—and in a few days she had bewitched the town; the benches, formerly empty on the nights when Mrs Siddons was not playing, were now filled, and her joyous, apparently irrepressible laugh—her *swindling* laugh, a friend called it—captivated all hearts. In November she appeared as Viola in *The Twelfth Night*—a performance of which Lamb, long after, wrote with a kind of rapture; and he added, 'Her joyous pats (in which her memory now chiefly lives) in her

youth were outdone by her plaintive ones. Nevertheless, for nearly thirty years, it was in the roles of romps and boys that she mainly kept her hold on the public: in the part of a youthful and tender heroine she was less successful, as her wonderful voice lost its freshness and sweetness. In 1790 commenced her connection with the Duke of Clarence, afterwards William IV., which endured until 1811. That she was faithful to him all this time, in spite of her youthful follies, there is no reason to doubt, and her considerable income was placed freely at his service. As some return he was warmly attached to her, and caused all who came to his house to treat her as his duchess. No satisfactory explanation has ever been given of the sudden breaking-off of their relations: Mrs. Jordan testified to the Duke's generosity, but there is reason to believe she sacrificed herself in the settlements that followed. At anyrate, after playing in London and in the provinces until 1814, she was compelled to retire to France for a debt of £2000 — and this at a time when she was supposed to be in receipt of a pension of £1500 a year, besides her earnings as an actress. She lived in comparative poverty, though not in actual want, at St. Cloud, and died there, friendless and alone, 3d July 1816. In 1831 King William raised her eldest son to the peerage, as Earl of Munster, and gave the other Fitz-Clarences the rank and precedence of the younger sons and daughters of a marquis. See the *Life* by Boaden (2 vols. 1831), and *Temple Bar* (October 1877).

Jornandes, better JORDANIS, historian of the Goths, was by birth a Goth, or of both Alan and Gothic descent, and flourished in the middle of the 6th century. He was first a notary, but afterwards, adopting the Christian religion, became a monk. He wrote two historical works in Latin — *De Regorum ac Temporum Successione*, a dry compendium of history from the creation to 550 A.D., and only valuable for events subsequent to 450 A.D., and *De Gotarum Origine et Rebus Gestis*, which is based on the earlier work (now lost) of the Roman Cassiodorus. This last is our only source of information about much connected with the Goths and other barbarian tribes. The work is, however, a mere compilation, and has many inaccuracies and inconsistencies. Its text is published in Muratori, *Rer. Ital. Script.* vol. i., and in Grotius, *Hist. Gothorum*, &c. (1655).

Jortin, JOHN, miscellaneous writer, was the son of a Huguenot refugee, and was born in London, 23d October 1698, and educated at Charterhouse and Jesus College, Cambridge. Having taken orders, he held in succession the livings of Swavesey in Cambridgeshire (till 1730), Eastwell in Kent, St. Dunstan's-in-the-East, London (from 1751), and Kensington. He was also a prebendary of St. Paul's and archdeacon of London. He died 5th September 1779. At Cambridge he published a volume of meritorious Latin poems, *Lusus Poeticus* (1722). The works for which he was best known are *Miscellaneous Observations upon Authors, Ancient and Modern* (2 vols. 1734-32); *Remarks on Ecclesiastical History* (5 vols. 1751-53); *Life of Erasmus* (2 vols. 1758-60); and *Treats: Philological, Critical, and Miscellaneous*, edited by his son (2 vols. 1790).

Jorullo, a volcanic mountain in the Mexican state of Michoacan, 4315 feet above sea-level, and 1640 feet above the plain on which it stands, is about 150 miles WSW. of Mexico city, in 19° 9' N. lat. and 103° 51' 48" W. long. It was thrown up during one night, 29th September 1759, after several months of subterranean convulsions. The plain on the northern side is inflated like a gigantic bladder, the surface consisting of lava and cinders — a phe-

nomenon to which the people give the name of *malpaquis*: it has an elevation of 40 feet above the rest of the plain, and is convex, rising in the centre to 335 feet. The southern slope of the mountain is covered with luxuriant vegetation from base to summit.

Josaphat. See BARLAAM.

Joseph, the name of four persons in Scripture. (1) JOSEPH, the elder of the two sons of Jacob by Rachel, and his father's favourite among all his sons. His envious brothers sold him into Egypt, where, after he had endured imprisonment in consequence of the calumnious charges of the wife of his master Potiphar, his conduct and skill in the interpretation of dreams brought him the especial favour of Pharaoh and the first place in the kingdom. His prudent foresight enabled him to stave off famine by measures which enormously enhanced the power of the throne, and soon he had the gratification to find his brothers at his feet, driven down into Egypt for lack of bread. The story is told in full detail in Genesis, how at last he made himself known to his trembling brothers, and sent to Canaan for his aged father and the whole family, placing them after their arrival in the land of Goshen. Joseph died at length full of years and honours, and when the Israelites left Egypt they carried with them his bones to be buried in Shechem in the inheritance of his son Ephraim.

(2) JOSEPH, the husband of the Virgin Mary, and reputed father of Jesus, a carpenter at Nazareth. The earliest genealogy of Jesus makes Joseph a descendant of David, and would seem to favour the natural birth of Jesus from parents both of royal line; but the notion of the miraculous conception is found in both Matthew and Luke, and was early accepted as a part of Christian belief. Later days developed the idea of the perpetual virginity of Mary, and made Joseph into her protector and merely nominal husband, giving him eighty years and a grown-up family of sons by a former wife at the time of his formal espousal of Mary. These stories first occur in the apocryphal gospels, earliest of which is apparently the *Prot-evangelium of James*, a 2d-century production quoted by Origen, and mentioned by Clement of Alexandria and Justin Martyr. The apocryphal *Historia Josephi fabri lignarii*, which now exists in Arabic, is thought by Tischendorf to have been originally written in Coptic. Joseph appears last in the gospel history when Jesus is twelve years old (Luke, ii. 43): he is never mentioned during his ministry, and may be assumed to have been already dead. The controversy about the 'brethren of the Lord' has engaged the attention of many writers from the time of St. Jerome to the present day. The main facts related of them in Scripture itself are their unbelief during the lifetime of the Lord, their distinctness from the Twelve (Acts, i. 13; 1 Cor. ix. 5), and their connection with Joseph and Mary. The two opinions that prevailed until the time of St. Jerome about the close of the 4th century were (1) that they were sons of Joseph by a former wife, as held by most orthodox Christians, and by such Fathers as Clement of Alexandria, Origen, Eusebius, Gregory of Nyssa, Epiphanius, Ambrose, and the later Greek writers; (2) that they were sons of both Joseph and Mary, as maintained by Tertullian, Helvidius, Bonosus, and the heretical Arabian sect of the Antidicomarianites, and Alford and Ferrar among modern scholars. St. Jerome about the year 383 wrote a treatise in answer to Helvidius, maintaining that they were cousins after the flesh, being sons of Mary, the wife of Alphæus (identical with Clopas) and sister of the Virgin. In this opinion Jerome was followed by Pelagius, Augustine, Theodoret, and later Latin

writers. But as Bishop Lightfoot points out in the Dissertation, 'The Brethren of the Lord,' appended to his Commentary on the Epistle to the Galatians (1865), Jerome claims no traditional support for his theory, and does not himself hold it staunchly and consistently. The strongest objection against the Helvidian theory is that Jesus on the cross commended his mother to the keeping of St John (John, xix. 26, 27); against the Hieronymian, that it gives a special sense to 'brethren' unsupported by biblical usage, and that it supposes two if not three of the unbelieving 'Lord's brethren' to be in the number of the Twelve. Lightfoot favours the Epiphonian as traversing less serious scriptural difficulties, and more in accordance with Christian tradition.

(3) **JOSEPH OF ARIMATHEA**, a rich Israelite of high character, who seems to have been a member of the Great Council or Sanhedrim. He opposed the determination of his colleagues to bring about the death of Jesus, but did not openly profess himself a disciple from motives of fear. But the courage of his convictions came to him at the moment of the crucifixion, and on the evening of that day he went boldly to Pilate and begged the body of Jesus, burying it reverently in his own rock-hewn tomb. An ancient tradition makes him carry the Grail (q.v.) to Britain about the year 63 and settle at Glastonbury (q.v.).

(4) **JOSEPH**, called Barsabas and surnamed Justus, one of the two persons chosen as worthy to fill the vacant place of Judas among the Twelve (Acts, i. 23). Papias relates a tradition that he had been miraculously preserved by the Lord from the fatal effects of a cup of poison he had drunk.

Joseph I., emperor of Germany, the eldest son of Leopold I., born at Vienna, 26th July 1678, was crowned king of Hungary in 1689, and king of the Romans in 1690, became emperor in 1705, and died on 17th April 1711. Holding opinions more liberal than those which have generally prevailed in his family, he granted privileges to the Protestants of his dominions, especially in Silesia. In alliance with Britain, he prosecuted actively and successfully the war of the Spanish succession against France. Another favourite scheme of his was the appropriation of Bavaria.

Joseph II., emperor of Germany, son of Francis I. and Maria Theresa (q.v.), was born 13th March 1741. He early gave proof of excellent abilities. In 1764 he was elected king of the Romans, and after the death of his father (1765) emperor of Germany; but until the death of his mother in 1780 his actual share of power amounted to little more than the chief command of the army and the direction of foreign affairs. Although he failed in his object of adding Bavaria to the Austrian dominions (1777-79 and again in 1785), which he hoped to obtain in exchange for the Low Countries, he acquired Galicia, Lodomeria, and the county of Zips, at the first partition of Poland in 1772; and in 1780 he appropriated great part of the bishoprics of Passau and Salzburg. He was a zealous reformer; but having imbibed, like Frederick the Great, the principles of absolute rule which prevailed in that age, he attempted his reforms too rashly, and too much by the exercise of mere authority. As soon as he found himself in full possession of the government of Austria he proceeded to declare himself independent of the pope, and to prohibit the publication of any new papal bulls in his dominions without his *placet*. The continued publication of the bulls 'Unigenitus' and 'In Cœna Domini' was prohibited. Besides this, he suppressed no fewer than 700 convents, reduced the number of the regular clergy from 63,000 to 27,000, prohibited papal dispensations as to marriage, and on 15th October

1781 published the celebrated Edict of Toleration, by which he allowed the free exercise of their religion to the Protestants and Non-united Greeks in his dominions. Pope Pius VI. thought to check this course by a personal interview with the emperor, and for that purpose made a visit to Vienna in 1782, but was unsuccessful in his object. Joseph's other important reforms were the abolition of serfdom and the reorganisation of the system of taxation on a juster basis. He also curtailed the feudal privileges of the nobles. In 1788 he engaged in a war with Turkey, in which he was unsuccessful; and the vexation caused by this, and by the revolts in his own dominions, in Hungary, Tyrol, and the Netherlands, and the necessity under which he felt himself of revoking many of the edicts by which he had sought to promote the welfare of his people, especially in Hungary, hastened his death, which took place on 20th February 1790. He founded many valuable educational and scientific institutions, and did much to promote the progress of arts, manufactures, and commerce in Austria.

See works by Brunner (1868-85), Lustkandl (1881), and Nosinich and Wiener (1885); also Léger's *History of Austro-Hungary* (Eng. trans. 1890).

Joseph, king of Naples. See BONAPARTE.

Joséphine, MARIE ROSE, empress of the French, was born 23d June 1763, in the island of Martinique, where her father, Tascher de la Pagerie, was captain of the port at St Pierre. She had only an indifferent colonial education; but her qualities of mind and heart, even more than her beauty, won universal regard. When about fifteen years of age she came to France, and in 1779 married Viscount Alexandre Beauharnais (q.v.). A daughter of this marriage, Hortense, queen of Holland, was the mother of the Emperor Napoleon III. Joséphine's husband was executed during the Reign of Terror, she herself just escaping. On 9th March 1796 she was married to Napoleon Bonaparte. She accompanied him in his Italian campaign, and exercised a great influence in restraining him from measures of violence and severity. At Malmaison, and afterwards at the Luxembourg and the Tuileries, she attracted round her the most brilliant society of France, and contributed not a little to the establishment of her husband's power. But her marriage with Napoleon proving unfruitful, it was dissolved by law on 16th December 1809. Joséphine retained the title of empress, corresponded with Bonaparte, and, if the allied sovereigns had permitted it, would have rejoined him after his fall. She died at Malmaison, 29th May 1814.

See Aubenas, *Histoire de Joséphine* (1859); *Mémoires de Madame de Réaumont* (2 vols. Paris, 1879-80; Eng. trans. 1880); and two sumptuous French works on Joséphine by F. Masson (1808-09).

Josephstadt, one of the most important fortresses of the Austrian empire, stands at the confluence of the Mettau and the Elbe in Bohemia, 10½ miles N. by E. of Koniggratz. Pop. 5063, of whom 3500 belong to the garrison.

Josephus, FLAVIUS, a celebrated Jewish historian, was born at Jerusalem in 37 A.D. He was of both royal and sacerdotal lineage, being descended, on the mother's side, from the line of Asmonean princes, while his father, Matthias, officiated as a priest in the first of the twenty-four courses. The careful education he received developed his brilliant faculties at an unusually early age, and his acquirements both in Hebrew and Greek literature soon drew public attention upon him. Having successively attended the lectures at the paramount religious schools of his time—sects, as he inaccurately terms them—he withdrew into the desert to sit at the feet of

one Banos, who is conjectured to have been either a follower of John the Baptist or an Essene. Three years later he returned to Jerusalem, and henceforth belonged to the body of the 'Pharisees,' which in fact comprised the bulk of the people. So highly was his ability esteemed that at the age of only twenty-six he was chosen delegate to Nero. When the Jews rose in their last and fatal insurrection against the Romans Josephus was appointed governor of Galilee. Here he displayed the greatest valour and prudence; but the advance of the Roman general Vespasian (67 A.D.) made resistance hopeless. The city of Jotapata into which Josephus had thrown himself was taken after a desperate resistance of forty-seven days. Along with some others he concealed himself in a cavern, but his hiding-place was discovered, and being brought before Vespasian he would have been sent to Nero had he not—according to his own account, for Josephus is his own and his sole biographer—promised that his captor would yet become emperor of Rome. Nevertheless he was kept in a sort of easy imprisonment for about three years. Josephus was present in the Roman army at the siege of Jerusalem by Titus; and after the fall of the city (70 A.D.) was instrumental in saving the lives of some of his relatives. After this he appears to have resided at Rome, and to have devoted himself to literary studies. The exact period of his death is not ascertained. All we know is that he survived Agrippa II., who died 97 A.D. He was thrice married, and had children by his second and third wives. His works are the *History of the Jewish War*, in 7 books, written both in Hebrew and Greek (the Hebrew version is no longer extant); *Jewish Antiquities*, in 20 books, containing the history of his countrymen from the earliest times down to the end of the reign of Nero (the fictitious Hebrew *Josippon*, which for a long time was identified with Josephus' *Antiquities*, dates from the 10th century A.D.); a treatise on the *Antiquity of the Jews*, against Apion, in 2 vols., valuable chiefly for its extracts from old historical writers; and an *Autobiography* (37-90 A.D.), in one book, which may be considered supplementary to the *Antiquities*. The other works attributed to him are not believed to be genuine.

The peculiar character of Josephus is not difficult to describe. He was in the main honest and veracious; he had a sincere liking for his countrymen, and rather more pride and enthusiasm in the old national history than he could well justify; but the hopelessness of attempting to withstand the enormous power of the Romans and an aversion to martyrdom caused him to make his terms with the enemy, perhaps in the faint hope of being thus of some use to the national cause. The influence of Greek philosophy and learning is visible in all his writings, and has given to his conception of biblical history a somewhat rationalistic tinge. He speaks of Moses as a human rather than a divinely inspired lawgiver; he doubts the miracle in the crossing of the Red Sea, the swallowing of Jonah by the whale, and, generally speaking, whatever is calculated to teach that there was a special miraculous Providence at work on behalf of the chosen people. The famous passage about Jesus is generally conceded to be an interpolation. His style is easy and elegant, and Josephus has often been called the Greek Livy.

The *editio princeps* of the Greek text appeared at Basel (Froben) in 1544. Since then the most important editions (with notes) are those of Hudson (Oxford, 1720), Havercamp (Amst. 1726), Dindorf (Paris, 1845-47), Bekker (6 vols. Leip. 1855-56), and Niese (Berlin, 1886 *et seq.*). Josephus has been frequently translated; the most celebrated versions in English have been those by

L'Estrange (1702), Whiston (1737; new and revised edition by Sbilleto, 5 vols. 1889-90), Maynard (1800), and Traill and Taylor (1851). See the German books devoted to Josephus by Barwald (1877), Böttger (1879), Bloch (1879), Destimon (1882), and Olitzki (1886).

Joshua (Heb. *Jehōshua*; Gr. *Iōsons*, from late Heb. *Jēshua*), or HOSHĒA (Num. xiii. 16), the son of Nun, of the tribe of Ephraim, is first mentioned in Ex. xvii. 9 as commanding the warriors of Israel in the battle of Rephidim. He was also one of the twelve spies sent out from Kadesh to collect information about the strength of the Canaanites and the prospects of the intended invasion (Num. xiii.), and when the others returned disheartened he and Caleb alone retained their courage and reported in favour of an armed advance. These two alone, therefore, out of all the grown men of Israel, were exempted from the divine sentence that because of their want of faith they should fall in the wilderness. During the forty years' wanderings Joshua acted as the 'minister' or personal attendant of Moses (Ex. xxiv. 13, &c.), a relation which seems to have marked him out as the favourite disciple and probable successor of the lawgiver. After 'the Lord was angry with Moses' Joshua was expressly designated to lead the people into Canaan (Deut. i. 38), and this designation was solemnly confirmed at the tabernacle (Deut. xxxi. 14 *seq.*) before Moses' death. The book that bears his name is a narrative of the conquest and settlement of Canaan under the leadership to which he thus succeeded. It relates with considerable detail the passage of the Jordan, the fall of Jericho and Ai, the submission of the Gibeonites, the defeat of the five kings of the south at Beth-horon and of the four kings of the north at the waters of Merom, gives a large number of geographical and administrative details as to the distribution of the conquered territory among the tribes that had taken part in the conquest, and concludes with two addresses which Joshua delivered shortly before his death. The Jewish rabbins and early Christian writers all supposed this book to have been written by Joshua himself; but this is an impossible assumption, for besides telling of his death it alludes to a number of things that did not happen until long after that event (see, for example, xv. 63 compared with Judges, xix. 10-12; and xix. 47 with Judges, xviii. 7, 27 *seq.*). In fact, like the other historical books of the Old Testament, it is an anonymous writing, and when critically examined is seen to have been originally united to the Pentateuch, and to have been composed in the same manner. It is made up of extracts from various narratives, pieced together by a later hand in the manner of eastern historians, and in its present form cannot be much earlier than the time of Ezra. Most modern critics are agreed that the documents used by the editor were mainly three—the Jehovistic (known to critics by the symbol JE) of the 8th or 9th century, the Deuteronomistic (D) of the 7th, and the Priestly (P) of the 5th. To the Jehovistic document belong in the main chaps. ii. 1-viii. 29; ix. 1-xi. 9; xxiii., xxiv., and a few short fragments in other chapters. To the Deuteronomist are assigned chaps. i., viii. 30-35; xi. 10-xiii. 14; xiv. 6-15, and some other small portions; while the remainder, including the greater part of the account of the division of the territory, comes from the priestly writer. Its geographical details are characterised by great vagueness, except as regards the portion of the land which was held by Jews after the exile. The best commentary on Joshua is that of Billmann (1886).

Josiah, one of the kings of Judah, was the son of Amon and Jedidah, and succeeded his father at the age of eight in 641 B.C. He grew up an ardent religious reformer, and purged Judah and

Jerusalem from idolatry. It was in his reign that Hilkiah the high-priest is said to have discovered the 'Book of the Torah,' by which some understand Deuteronomy, others Exodus, and others again the whole Pentateuch. The king now vigorously re-established the worship of Jehovah, and instituted the rites in the newly-discovered book. He met his death at Megiddo, in the valley of Esdraelon, when attempting to check the advance of Pharaoh-Necho against the Assyrians, 609 B.C. Josiah was the last of the good kings of Judah. In his days prophesied Jeremiah and Zephaniah.

Josika. See HUNGARY (*Literature*).

Jost, ISAAK MARKUS, a Jewish historian, was born at Bernburg in Anhalt, 22d February 1793. He laboured as a Jewish schoolmaster at Berlin (1826-35) and Frankfort-on-Main (1835-60), and died at Frankfort, 20th November 1860. He wrote *Geschichte der Israeliten* (9 vols. 1829-29), to which were added *Neuere Geschichte der Israeliten, 1815-45* (3 vols. 1846-47), and *Geschichte des Judenthums* (3 vols. 1857-59). He also edited a German translation of the *Mishnah*, with text and commentary (6 vols. 1832-34).

Jotunheim. See GIANTS.

Joubert, GENERAL. See TRANSVAAL.

Joubert, JOSEPH, was born at Montignac in Périgord, 6th May 1754, and studied and taught till twenty-two at the college of Toulouse, then under the direction of the Fathers of the Christian Doctrine. He then went to Paris, and here made the acquaintance of Diderot, D'Alembert, Marmontel, and La Harpe, and lived through all the fever of the Revolution. He became the bosom friend of Fontanes and Chateaubriand, and he carried both to the famous *salon* of Madame de Beaumont. In 1790 his native townsmen elected him as justice of the peace, and in 1809 he was nominated by Napoleon on the recommendation of Fontanes to a seat in the council of the new university. At Villeneuve and at Paris he lived henceforward, and his years glided quietly away, while he read, dreamed, walked, wrote letters, and discoursed to friends who thronged even to his bedroom, which he seldom left before three o'clock in the afternoon. Despite weak health, he carried his head high all his life, and never ceased to read and re-read his favourite books, and jot down his meditations. Yet he published nothing in his life, although he was the keenest as well as the kindest critic to the writings of all his friends. He died 4th May 1824. Fourteen years after, his widow acceded to the prayers of her friends to allow a small volume to be printed from his papers. Chateaubriand edited it; Sainte-Beuve praised it without stint in the *Revue des Deux Mondes*, and Joubert's fame was from the moment of its appearance assured. And his *Pensées*, alike from their intrinsic value and insight and their faultless form, are worthy of their place in the splendid succession of La Rochefoucauld, Pascal, La Bruyere, and Vauvenargues.

At length in 1842 Joubert's nephew, Paul de Raynal, issued an adequate edition of the *Pensées et Maximes* from the more than 200 small manuscript books, with the addition of a number of letters, and an admirable biographical sketch. Another and enlarged edition by his brother, Arnaud Joubert, followed in 1850; yet another, better arranged, by Louis de Raynal in two volumes in 1862. There are translations by G. H. Colver (Boston, 1867) and Henry Attwell (1877). See Sainte-Beuve's *Causeries du Lundi* (vol. 1), *Portraits Littéraires* (vol. ii), and almost every page of his *Chateaubriand et son Groupe*; also Matthew Arnold's *Essays in Criticism* (1865).

Jouffroy, THEODORE SIMON, a French philosopher, was born at Pontets, a village of the Jura, on

7th July 1796. He became a pupil of Cousin, the philosopher, at Paris, and from 1817 onwards taught philosophy at various educational institutions in Paris. Ill-health obliged him in 1838 to exchange his professorial chair for the post of librarian to the university. He died at Paris, 4th February 1842. Jouffroy was not an original thinker, and founded no school. His merit is that he was the lucid interpreter of the teaching of the Scottish philosophers Reid and Dugald Stewart; he translated their works, with critical introductions and notes. His own best books were *Mélanges Philosophiques* (1833; new ed. 1883), *Cours du Droit Naturel* (1835), and *Cours d'Esthétique* (1843; new ed. 1883). A prominent feature of his teaching was the sharp separation of psychology from physiology. For some time Jouffroy was an industrious member of the Chamber of Deputies; he was also well known as a journalist. See Life by Tissot (1876).

Jouffroy d'Abbans, CLAUDE, MARQUIS DE (1751-1832), claimed by the French as the inventor of steam-navigation, served in the army, and did in 1783 make a small paddle-wheel steamboat sail up the Rhone at Lyons—the connection between piston and paddle-wheel axle being rack-and-pinion. Compelled to emigrate by the Revolution, he failed, on account of financial ruin, to float a company till after Fulton had made his successful experiments on the Seine in 1803. See the article SHIPBUILDING; and a monograph on him by J. C. A. Prost (Paris, 1889).

Jongs, JUGGS, or *Joggs*, the name given in Scotland to a form of pillory which was used also in Holland and probably in other countries. The jongs were nothing more than an iron ring or collar, fastened by a chain of two or three links to a pillar or wall in some public place, such as a market-cross, a market tron or weighing post, a prison door, a church door, a churchyard gate, a churchyard tree, a tree beneath whose branches courts were held, and the like. The ring or collar opened by a hinge or joint, so as to enclose the culprit's neck, when it was secured by a loop or staple and a padlock. The jongs were employed as a punishment as well for ecclesiastical as for civil offences. They may be traced as far back as the 16th century, and, although they have not been in use for the last hundred years, they may still be found hanging at a few country churches. The accompanying wood-cut represents the jongs at the churchyard gate of the picturesque village of Duddingston, 2 miles SE. of Edinburgh. The Branks (q.v.) were occasionally hung on the same pillar with the jongs.

Jongs.

Joule, JAMES PRESCOTT, F.R.S., LL.D., one of the most distinguished experimental philosophers, was born 24th December 1818 at Salford. In his youth he had the good fortune to have for instructor in science the celebrated Dalton; and he soon showed, by constructing for himself electrical machines and other philosophical instruments, the bent of his genius. His earliest notable experiments were made with reference to electro-magnetic engines; from which he passed to quantitative

determinations regarding heat, and the transformation of various forms of Energy (q.v.). He is justly entitled to be considered as the experimental founder of the modern theory of conservation of energy—the greatest generalisation ever made in physical science. In 1878 a civil list pension of £200 was conferred upon him. He died 11th October 1889, at Sale, near Manchester. See *Nature* (October 1882); his collected papers (published by the Physical Society, 1884-87); and the *Memoir* by Osborne Reynolds (1893).—The name *Joule* has been suggested, and to some extent used, for the unit of work in practical electricity. It is the work done in one second by the *ampere* or unit current flowing through the *ohm* or unit resistance, and is therefore, according to Joule's Law (see ELECTRICITY), the heat developed in one second in a conductor having that resistance and carrying that current. It is approximately equal to 10,000,000 ergs; so that 'Joule's Equivalent,' defined as the mechanical equivalent of the heat required to raise the temperature of one gramme of water from 0° C. to 1° C., contains to the same approximation 4.16 *joules*.

Jourdan, JEAN BAPTISTE, COMTE, a French marshal, born 29th April 1762, at Limoges. He entered the army at sixteen, and, after seeing service in North America, rose under the Republic to the rank of a general of division. In September 1793 he obtained the command of the Army of the North, and on 16th October defeated the Austrians at Wattignies. In 1794 and 1795 he commanded the Army of the Meuse and Sambre, and with it gained the victory of Fleurus (26th June 1794), drove the Austrians back across the Rhine, took Luxemburg, and laid siege to Mainz. But on 11th October 1795 he was defeated at Höchst, and thus compelled to retreat over the Rhine. Crossing this river again in 1796, he penetrated as far as Bavaria, but was there beaten by the Archduke Charles at Amberg and Würzburg; this discomfiture made him resign his command. In 1799 the Directory entrusted him with the command of the Army of the Danube; but he was again defeated by the Archduke Charles at Ostrach and at Stockach. Although he took no part in the *camp d'Italie* of 18th Brumaire, the First Consul employed him in 1800 in the reorganisation and administration of Piedmont; and on the establishment of the Empire in 1804 he was made a marshal and a member of the Council of State. In 1806 he was nominated governor of Naples, and afterwards accompanied King Joseph Napoleon to Spain as chief of his staff. Louis XVIII. made him a count in 1819. But his republican principles led him to enter heartily into the revolution of 1830. He died at Paris, 23d November 1833.

Jowett, BENJAMIN, the translator of Plato, was born at Camberwell in 1817, and educated at St Paul's School and Balliol College, Oxford, where he had a distinguished career, taking the Hertford scholarship in 1837, a classical first-class in 1839, and the Latin essay in 1841. Already a Fellow in 1838, he was tutor of his college from 1840 till his election as master in 1870. Thus his whole life had been identified with Balliol, and as master his influence is supposed to have permeated the college to a degree almost unexampled. He was a member with Macaulay of the Commission for inquiry into the mode of admission to the Indian Civil Service, and he was appointed in 1855 to the regius professorship of Greek at Oxford. He received the degree of Doctor from Leyden in 1875, Edinburgh in 1884, and Cambridge in 1890, and acted as vice-chancellor

from 1882 till 1886. His theological writings are an article 'On the Interpretation of Scripture' in *Essays and Reviews* (1860), for the alleged heresies in which he was tried but acquitted by the vice-chancellor's court; and a *Commentary on the Epistles of St Paul to the Thessalonians, Galatians, and Romans* (2 vols. 1855); and his *College Sermons* (1895). He is best known by his translation of the *Dialogues* of Plato (4 vols. 1871; 2d ed. 5 vols. 1876), with its admirably learned and lucid introductions, and his less happy versions of Thucydides (2 vols. 1881) and the *Politics* of Aristotle (1885). He died 1st October 1893.

See the *Life and Letters* by E. Abbott and L. Campbell (1897-99), and a sketch by Lionel Tollemache (1895).

Joyce's Country. See GALWAY.

Juan. See DON JUAN, JOHN OF AUSTRIA.

Juan Fernandez, called also MAN-A-TIERRA ('nearer the mainland'), a rocky island in the Pacific Ocean, 420 miles W. of Valparaiso, Chili, to which it belongs. It is 13 miles long and 4 broad, and is for the most part a series of rocky peaks of volcanic origin, the highest of which, Yunque, is 3000 feet above sea-level. The trees are mostly ferns. The sandalwood trees are nearly all exterminated. Horses, pigs, and goats run wild. The island was discovered by the Spaniard whose name it bears in 1563, and was frequently visited by buccaneers down to its occupation by the Spaniards in 1750. Here Alexander Selkirk, a buccaner, a native of the Scotch fishing-village of Largo, lived in solitude from 1704 to 1709. His story is supposed to have suggested the *Robinson Crusoe* of Defoe; though it should be remembered that Robinson's island was on the other side of South America, near the mouth of the Orinoco. When Spain lost her South American colonies Juan Fernandez fell to Chili, which used it as a penal settlement from 1819 to 1835. It is usually inhabited by a few Chilean seal and sea-lion hunters; and in 1877 it was leased by the Chilean government to a Swiss, who established a small colony there. See an article in *Chambers's Journal* (1888); and Mackenna, *Juan Fernandez* (Santiago, 1883).

Juarez, BENITO, president of Mexico, was born of Indian parents in Oaxaca in 1806, became an advocate, and as governor of his native state (1847-52) was distinguished both for his ability and his honesty. Exiled during the dictatorship of Santa-Anna, he returned when the republic was restored, and in 1857 was elected president of the Supreme Court (equivalent to vice-president of the nation). On the overthrow of the Liberal president by the clerical party in 1858 Juarez assumed the executive, but was compelled to retire to Vera Cruz, where his government was recognised by the United States in 1859, and whence he issued decrees abolishing religious orders and confiscating church property. In January 1861 he was able to enter the capital, and in March was elected president for four years. In December of the same year the allied forces of England, France, and Spain occupied Vera Cruz (see MEXICO); in April the British and Spanish withdrew, but the French remained, and declared war against Juarez, who retreated gradually to the northern frontier, and remained for nearly a year at El Paso del Norte. He entered Mexico city again in July 1867, Maximilian (q.v.) having been shot meanwhile by order of court-martial an ungenerous but not impolitic. Juarez was again elected president for four years, years disturbed by repeated revolutionary attempts. In 1871 he was re-elected, and the risings became even fiercer and more frequent; but he faced all his foes with the dogged courage of his race, and was holding his position with unwearied energy

when he died, somewhat suddenly, 18th July 1872. See the *Life* by Ulick R. Burke (1894).

Juba, a great river of eastern Africa, which flows into the Indian Ocean at about 0° 5' S. lat., and whose mouth marks the northern boundary of the coast placed under British control by the agreement with Germany in 1890. The river has been explored to beyond 3° N. lat., and Cecchi identifies the Umo as its upper waters; so that it probably takes its rise in the same mountains as the feeders of the Nile.

Juba. See NUMIDIA.

Jubal, son of Lamech and Adah in the Genesis story, the inventor of the harp and organ, probably general terms for stringed and wind instruments. The meaning of the name is most likely significant, connected with *yobel*, 'jubilee.'

Jubulpore. See JABALPUR.

Jubilate, the 100th Psalm, which in the Vulgate begins *Jubilate Deo omnis terra*. It was added to the English Prayer-book in 1552, to be sung after the Second Lesson, instead of the *Benedictus*, when that canticle occurs in the chapter for the day; but it is used at other times as well, and always at thanksgivings.

Jubilee, THE YEAR OF (Heb. *yobel*), a peculiar theocratic, and apparently theoretical much more than practical, institution among the Hebrews (Leviticus, xxv.), by which, every fiftieth (not forty-ninth) year, the land that in the interval had passed out of the possession of those to whom it originally belonged was restored to them, and all who had been reduced to poverty, and obliged to hire themselves out as servants, were released from their bondage; while at the same time all debts were remitted (Jos. *Ant.* iii. 12). The jubilee forms, as it were, an exalted Sabbatical Year (q.v.), and the land was completely to be left to rest in the former as in the latter. The design of this institution was chiefly to prevent the growth of an oligarchy of land-owners, and the total impoverishment of some families. It was proclaimed at the end of the harvest-time, like the sabbatical year, on the day of atonement, by the 'yobel' (a kind of horn), hence probably also its name. There is no trace in the whole history of the Hebrews down to the Babylonian exile that the jubilee had ever been observed; after the return, however, it appears to have been rigorously kept, like the sabbatical year, for some time at least; but, from its general impracticability, it must soon have fallen into dis-use. Dillmann maintains the 'year of liberty' of Ezek. xlvi. 16-18 to be the year of jubilee, while Kuenen and Wellhausen make it the sabbatical year.

The Christian church adopted the term *Jubilee* from the Jewish, and the jubilee in two forms, the 'ordinary' and 'extraordinary,' is still an institution in the Roman Catholic Church, as a period of remission from the penal consequences of sin. The ordinary jubilee is that which is celebrated at stated intervals, the length of which has varied at different times. Its origin is traced to Pope Boniface VIII., who issued, for the year 1300, a bull granting a plenary indulgence to all pilgrim-visitors of Rome during that year, on condition of their penitently confessing their sins, and visiting the church of St Peter and St Paul, fifteen times if strangers, and thirty times if residents of the city. Innumerable troops of pilgrims from every part of the church flocked to Rome. As instituted by Boniface, the jubilee was to have been held every hundredth year. Clement VI., in a bull of 1343, abridged the time to fifty years. The number of pilgrims that year is said to have been no fewer than 1,000,000! The term of interval was still further abridged by Urban

VI., and again by Paul II., who in 1470 ordered that thenceforward each twenty-fifth year should be held as jubilee—an arrangement which has continued ever since to regulate the ordinary jubilee. Paul II. extended still more, in another way, the spiritual advantages of the jubilee, by dispensing with the personal pilgrimage to Rome, and granting the indulgence to all who should visit any church in their own country designated for the purpose, and should, if their means permitted, contribute a sum towards the expenses of the Holy Wars. The substitution by Leo X. of the fund for building St Peter's Church for that of the Holy War, and the abusive and scandalous proceedings of many of those appointed to preach the Indulgence (q.v.), were among the proximate causes of the Reformation. In later jubilee years the pilgrimages to Rome gradually diminished in frequency, the indulgence being, for the most part, obtained by the performance of the prescribed works at home; but the observance itself has been punctually maintained at each recurring period, with the single exception of the year 1800, in which, owing to the vacancy of the holy see, and the troubles of the times, it was not held.

The extraordinary jubilee is ordered by the pope out of the regular period, either on his accession, or on some occasion of public calamity, or in some critical condition of the fortunes of the church; one of the conditions for obtaining the indulgence in such cases being the recitation of certain stated prayers for the particular necessity in which the jubilee originated.

Jubilee is also used for the celebration of a fiftieth anniversary—as the jubilee of George III.'s accession (1809), and of Queen Victoria's (1857); and for festivals generally, as the 'Peace Jubilees' celebrated at Boston, United States, in 1869 and 1872.

Juby, CAPE, on the west coast of Africa, 100 miles south of the frontier of Morocco, with an anchorage. A trading settlement of an English company was established in 1879-89.

Judaea. See PALESTINE.

Judah (Heb. *Yehuda*, 'the Bepraised One') was the fourth son of Jacob and Leah, and founder of the greatest and most numerous of the twelve tribes, to which belonged the royal house of David. In the march through the wilderness it had the van assigned to it; and tradition narrates that its standard was a lion's whelp, with the words: 'Arise, O Lord, and let thine enemies be scattered!' After the conquest of Canaan its territories stretched from the Dead Sea on the east to the Mediterranean on the west (though the Philistines long held possession of the fertile district west of the mountains of Judah), and from Jerusalem (excluding that city) on the north to the land of the Amalekites on the south. The capital of the tribe was Hebron. For its history, see ISRAEL.

Judaisers. See EBIONITES.

Judas, the betrayer of Jesus, surnamed Iscariot, most probably a native of Kerioth in the tribe of Judah, and, if so, the only southerner among the twelve disciples. He must at first at least have been fired with real faith and zeal, for there was no worldly reward to gain when he first left his old life to obey the call of the new prophet of Nazareth. He acted as steward to the company on their journeys, and John tells us that he was covetous and dishonest from the beginning. It was the temptation of money, according to Matthew and Mark, that made him betray his master to the chief priests for thirty pieces of silver. Luke gives the additional motive that Satan had entered into him. The Synoptics represent Jesus as conscious of the meditated treachery, which, moreover, was plainly

foretold by himself, and even prophesied in the Old Testament; John makes Jesus himself hasten it forward (xiii. 27). Whatever sudden or long-premeditated temptation it was that turned the head of Judas, he had not wholly lost moral sentiment, for when he saw the awful consequences of his guilt he was filled with the remorseful horror of despair, and had the grace to go and hang himself. The two variant accounts of his end in Matthew (xxvii. 3-10) and Acts (i. 16-20) have this much in common, and moreover that the blood-money was exchanged for a piece of ground which bore before or after the ill-omened name of *Aceldama*, or the Field of Blood.

The mere desire for gold can hardly be accepted as a motive adequate enough for a crime so monstrous, which has made its perpetrator's name to all time a synonym for shameful treachery. Yet it is almost as hard to find it in the promptings of disappointed ambition, vindictive hatred, or revenge. Theophylact, the elder Lightfoot, Bahrdt, Niemeyer, and Schmidt sought to explain the treachery by a belief in the miraculous powers of Jesus, which would necessarily protect him from the consummation of any deed of violence. The ancient Gnostics, and Noack among moderns, credited Judas with a desire to bring about the redemptive death of Jesus and the consequent triumph of Christian truth. Again Paulus, Winer, Hase, G. Schollmeyer, and Whately believed that the worldly-minded and ambitious Judas had become impatient of the delay in the establishment of the earthly kingdom, and that he adopted his policy with a view to drive Jesus to action by forcing his hand. Keim's explanation is that the force of old associations may have overcome his wavering belief in the Messiahship of Jesus during the excitement of the festival, when a burning mental struggle burst out in his heart under the immediate influence of relatives ardently devoted, as he himself once was, to the old religion associated with the sanctuary of Israel. The old legal and pietistic prepossessions of his materialistic rather than spiritual temperament glowed up anew within his heart, and hurried him without deliberation to a course, the quick reaction from which was hopeless remorse, horror, and despair. Perhaps none of these explanations throw much light upon an enigma so dark as the motives that drove Judas to his fatal treachery, and it may be doubted if these motives were any less obscure and confused than the motives that sway the human heart usually are. Had his avarice been so deep-seated he would never have had any measure of the grace of the disciple, for surely Jesus must have seen the possibilities of good as well as evil in the young disciple whom he attached to himself. But, spite of outward and at first genuine enough enthusiasm, carnal selfishness was deeply rooted in his nature, and when the manifestation of Christ ceased to be attractive to him, as Neander says, it became repulsive, and more and more so every day. The immediate occasion which turned his last remnants of affection into violent hatred may well have been some sharp reproof, some fancied slight or estrangement that came suddenly, and hurried his hot heart to action which, when too late, he was bitterly to repent.

The treachery of Judas has given rise to a long series of psychological studies which are conveniently enumerated in Winer's *Biblisches Realwörterbuch* (3d ed. 1847-48). In Daub's *Judas Ischariote* (1816-18) a short preliminary investigation of the crime opens up a discussion of evil in relation to good. See also the Lives of Jesus by Neander, Strauss, Renan, Noack, Hase, Keim, Farrar, and Ederstein; the essay by De Quincy, Stier's *Words of the Lord Jesus*, Tragedies by Elisa Schmidt (1832) and Dulk (1865); and Robert Buchanan's ballad, *Judas Ischariot*.

Judas Maccabæus. See MACCABEES.

Judas' Tree (*Ceris*), a genus of trees of the natural order Leguminosæ, sub-order Casalpineæ. The common Judas' Tree (*C. Siliquastrum*) is a native of the south of Europe and of the warmer temperate parts of Asia. It has almost orbicular, very obtuse leaves. The flowers, which are rose-coloured, appear before the leaves. There is a legend that Judas hanged himself on a tree of this kind. The American Judas' Tree (*C. canadensis*) is very similar, but has acuminate leaves. The flower-buds are frequently used in salads and pickled in vinegar. The wood of both species is very beautiful, veined with black, and takes an excellent polish. The young shoots of the American Judas' tree are used in domestic dyeing, and impart a fine colour to wool.

Jude, EPISTLE OF, one of the smallest and least important books in the New Testament canon, which purports to be by 'Jude, a servant of Jesus Christ, and brother of James.' This Jude is most probably the Judas who was one of the 'brethren of the Lord' (Matt. xiii. 55; Mark, vi. 3). There is a Judas in the list of the apostles, as given by St Luke (vi. 16; Acts, i. 13) and recognised by St John (xiv. 22), occupying the place of one who in the lists of Matthew (x. 3) and Mark (iii. 18) is called Lebbeus or Thaddæus, the traditional evangelist of Edessa. The absence of the epistle in the Peshito is of itself proof, according to Canon Venables (Smith's *Dict. of Bible*), that it is not the work of the last. St Luke describes the apostle Judas as *Ἰούδας Ἰακώβου*, which would naturally mean 'Jude, the son of James,' but has been, without sufficient grounds, rendered in the Authorised Version 'Jude, the brother of James.' But the author of our epistle rather seems to distinguish himself from the apostles (verse 17), and on other grounds there seems conclusive proof that he did not belong to the Twelve.

The epistle is recognised by many who are silent about James, as Clement of Alexandria, the Muratorian Fragment, Tertullian, and Origen; although indeed it is not mentioned by Clement of Rome, Ignatius, Hermas, Polycarp, Papias, or Irenæus. As has been said, it is wanting in the Peshito or Syriac version, and it is classed by Eusebius with James among the *Antilegomena*, or disputed books. Fifty years later St Jerome mentions that, though then received, it had been rejected by many as quoting the apocryphal Book of Enoch (verses 14, 15). Origen tells us that in verse 9 again Jude quotes from another apocryphal book, the lost Assumption of Moses. A more serious objection to Jude's authenticity is the question whether the particular immoral perversions of Christian truth against which it seems to be directed existed in the time of the brother of James, who appears to have been dead before the accession of Domitian (81 A.D.). Davidson, Hilgenfeld, Volkmar, Schenkel, Mangold, Lipsius, Holtzmann, Weizsäcker, and Pfeiderer identify these with the Antinomian Gnosticism of the 2d century, which repudiated God and the angels of the Old Testament as subordinate powers (verses 8-10), Jesus as the merely human organ of the higher Christ (verse 4), and ordinary Christians as people psychically inferior to themselves (verse 19), while it afforded a cloak to libertine tendencies (verses 8, 10, 16). But it may be questioned if the epistle specially applies to Gnosticism proper, as there is no distinct hint at the doctrinal basis of the errors denounced, and the whole may reasonably be interpreted as rebuke to private members of the church who led ungodly lives, mis-interpreting the doctrine of grace as a charter for a licentious life, and were disobedient to spiritual authority, not necessarily applicable to special organised forms of immorality and error yet

to be developed. At the same time it should be remembered that other apostles had already had cause to denounce impurity which had crept into the church (2 Cor. xii. 21; Phil. iii. 19; Rev. ii. 20-22). Clement of Alexandria reads into the epistle a prophetic denunciation of the immoral teaching of Carpoerates, and Renan boldly claims it as a diatribe against Paul.

No reader can overlook the striking parallelism at once in thought and language between Jude and 2 Peter, ii., from which we may feel certain that the one writer had the work of the other before him. It is a difficult matter, however, to determine which of the two was the earlier. Most critics conclude in favour of Jude, although to this there are several serious objections on which a strong case has been constructed by Professor Lumby in *The Speaker's Commentary*.

See the Introductions of S. Davidson, Hilgenfeld, Holtzmann, Salmon, Weiss, and Dods; the works on the New Testament canon by Westcott and Zahn; and the special commentaries in the *Kurtzsch. Exe. Handbuch* (3d ed. Brückner, 1865), Meyer (5th ed. Kuhl, 1887), Stier (1850), Arnaud (1851), Ranpf (1854), Fronmüller (1859), Hoffmann (1875), Reuss (1878), and E. H. Plumptre (1886). See also Ritschl in *Theolog. Stud. u. Krit.* (1861).

Judenhetze. See JEW, p. 329.

Judge is the generic descriptive name given to those who are invested with the power of judging and deciding causes in the highest courts of common law. In Great Britain—though it is otherwise in America—it is not usual to designate the highest class of judges by the epithet of judge, and British lawyers never do so. Thus, instead of saying Judge Blackstone, Judge Pollock, Judge Eldon, the proper description is Mr Justice Blackstone, Chief-baron Pollock, Lord Chancellor Eldon, &c., according to the particular court in which they presided. In Scotland the usual prefix to the name of a judge is Lord; and the judges there, on their appointment, often assume territorial titles in addition to the prefix 'Lord'; Robert Macfarlane, for instance, becoming Lord Ormidale, whilst his wife remained Mrs Macfarlane. In England the judges of the superior courts are only called lords while they sit in court or in chambers. The practice has long been for the crown to confer the honour of knighthood on all the judges of the superior courts of law and equity in England, but not in Ireland or Scotland. All the superior judges are appointed by the crown, and since the Act of Settlement (1701) have held their offices during good behaviour; since 1 Geo. III. chap. 23, they have also continued to hold their appointments notwithstanding the demise of the crown. They can only be removed from their office on the address of both Houses of parliament. They are disqualified from sitting in the House of Commons. Judges in England may sue and be sued in their own courts, but none may be judge in his own case. No action may be brought against the judge of a superior court for anything done in his judicial capacity. Judges of inferior courts are liable to be sued, but only when they have acted in bad faith, or beyond the bounds of their jurisdiction. The term judge is the proper title of the judges of the county courts established in England in 1846. In Scotland the phrase is often applied to all judges, superior and inferior, whenever they have a fixed and determinate jurisdiction, in contradistinction to commissioners, who have an occasional and temporary judicial authority delegated to them.

In the United States the judges of the supreme court are appointed by the president with the consent of the senate; in the courts of the several states they are either appointed by the executive, elected by the legislature, or, as in most states of

late years, chosen directly by popular suffrage. A judge is not liable to a civil action for acts performed as part of his official duty, but he may be impeached for any high crime or misdemeanour.

Judge-advocate-general, the adviser of the crown in proceedings to confirm or revise the decisions of courts-martial. He is also the adviser, in legal matters, of the Commander-in-chief and Secretary of State for War. Before confirmation, the sentences of all courts-martial, with the evidence adduced, are submitted to him; and it is for him to represent to the commander-in-chief any illegality of procedure, or other circumstance rendering it undesirable that the Queen should be advised to confirm the court's decision. He does not advise as to the exercise of the prerogative of mercy. The judge-advocate-general receives a salary of £2000, and is usually a member of the House of Commons, and of the ministry—changing, of course, with the latter. The judge-advocate-general is also the title in the United States for the chief of the bureau of military justice at Washington.

The *Deputy-judge-advocate* is an officer holding a temporary commission as legal adviser of court-martial, to assist the court, and to see that no injustice is done to the prisoner.

Judges. THE BOOK OF (Heb. *Shofetim*—compare Carthaginian *Sufetes*; LXX. *Kritai*, but in Philo *Krimata*, 'judgments'), a canonical book of the Old Testament, the second in the series known as the 'former prophets,' relates to the period in the history of Israel from the death of Joshua to the birth of Samuel. Its authorship—or rather the authorship of any part of it, for it is drawn from more than one source—is unknown, and its final redaction, as is shown by the presence of Deuteronomic and other elements, cannot have taken place until after the exile. Its composite character is shown by the fact that it has two beginnings (see i. 1, and ii. 6). The main section of the book, extending from ii. 6 to xvi. 31, consists of an apparently consecutive narrative, grouped round six principal judges—Othniel, Ehud, Deborah, Gideon, Jephthah, and Samson—the intervals being filled with the history of Gideon's son, Abimelech, and references, more or less brief, to six minor heroes—Shamgar, Tola, Jair, Izabai, Elon, and Abdon. The religious pragmatism of this narrative is obvious; the history falls into running cycles, all corresponding to the scheme indicated at the outset by the words: 'After the death of Joshua the children of Israel did evil in the sight of the Lord, and forsook the Lord God of their fathers. . . . And the anger of the Lord was hot against Israel, and he delivered them into the hands of spoilers. . . . and they were greatly distressed. Nevertheless, the Lord raised up unto them judges, and was with the judge, and delivered them. . . . And it came to pass when the judge was dead that they returned and corrupted themselves more than their fathers. . . . And the anger of the Lord was hot against Israel.' &c. The apparently consecutive character of the narrative disappears when its chronological data are carefully analysed; from these we find that the chronology of the section is based on two artificial alternative schemes, either of which, but not both together, can be reconciled with the datum in 1 Kings, vi. 1. Thus the narrative of the greater judges was originally separate from that of the minor ones. The religious standpoint of this main section of the Book of Judges, taken along with other points of internal evidence, shows that in the main it must have been composed about the 8th century B.C. There are signs of Deuteronomic redaction, however; but, on the other hand, the section contains elements that carry us much further back than the century named—such elements, for example, as the

song of Deborah and the history of Abimelech. Of the remaining portions of the book of Judges, i. 1 to ii. 5 is relatively old—older than the book of Joshua, which relates to the same subject, the conquest of Canaan, but treats it in a much later manner. The closing section of the book is made up of two unconnected and independent narratives of very different dates. The history of Micah and the Danites (xvii. 1 to xviii. 31) is a piece of very old history; that of the Levite and the Benjamites is considered by Wellhausen to be post-exilic, and in any case must be regarded as comparatively very late.

See Wellhausen-Bleek, *Einführung* (1878); also Wellhausen, *Religion of Israel* (Eng. trans. p. 228 *seq.*). There are commentaries by Keil (Eng. trans. 1865), also in Lange's *Biblewerk* (1865), in the *Speaker's Commentary*, and in the *Königl. Bibel-Anstalt* by Bertheau (1845), by Studer (1835), and by Moore of Andover (1896).

Judgment. See HELL, RESURRECTION.

Judicature Acts (1873-76). THE, constituted the English Supreme Court, comprising the High Court of Justice, with a Chancery division (see CHANCERY) and a Queen's Bench division (see COMMON LAW); and the Court of Appeal (see APPEAL).

Judicial Committee. See PRIVY-COUNCIL.

Judicial Factor. See FACTOR.

Judicial Separation. In English law, is the separation of two married persons by order of the Court of Divorce. Married persons may, if they please, mutually agree to live separate, and they may enter into a deed of separation for that purpose, which to some extent is recognised as valid by courts of equity. This is called voluntary separation. A deed of separation is always revocable by consent of the parties, though to some extent binding on each, if the other do not consent to renew the cohabitation. When the parties have not mutually consented to separate, one of them can compel a judicial separation for certain grounds of misconduct. Thus, either party may apply on the ground of adultery, or cruelty, or desertion without cause for two years and upwards. When a husband is convicted of an aggravated assault on his wife, the court before which he is tried may make an order which is almost equivalent to a judicial separation.

Married persons separated by deed or judicial order are still married. Not being divorced, they cannot marry again; but there is no longer the duty of cohabiting. The court may award a certain income to the wife after separation, and may also make orders as to the custody and maintenance of children. But, irrespective of this, the wife becomes, to all intents and purposes as regards her future property, in the same position as if she were unmarried. On the other hand, the husband is no longer responsible for maintaining his wife, except so far as he may have been ordered to pay her alimony, and he is not liable for her future debts. In 1857 the law on this head was materially improved, and a new Divorce Court established. See DIVORCE; also MARRIAGE.

In Scotland the law was changed in 1861, and now nearly coincides with the English law in many respects. Whenever a decree of separation *a mensa et thoro* is obtained at the instance of the wife, all property which she may acquire, or which may devolve upon her, is held entirely separate from and independent of her husband; she can bequeath it by will as if he was dead. She can also enter into contracts, and sue and be sued in her own name, and the husband is no longer liable for necessities or her debts, except so far as he is bound by the decree of separation to pay her aliment. The grounds of

judicial separation in Scotland also are nearly the same as in England.

In the United States the courts used till 1838 partial divorce *a mensa et thoro*; but since then the marriage contract is either wholly dissolved or the courts refuse to interfere.

Judith, a Jewish heroine, who saved her native town, Bethulia, by a deed of unexampled daring and devotion. She made her way into the hostile camp, and into the very tent of Holofernes, general of Nebuchadnezzar. The general was bewildered by her beauty, and she plied him with wine till he sank overpowered upon his couch. Then she cut off his head, and found her way out carrying it with her. Her townsmen were inspired with a sudden enthusiasm, rushed out upon the enemy, and completely defeated them. The tale is not mentioned by Josephus, and has from an early period been held to be an allegory. It forms the subject of the apocryphal book of *Judith*, the composition of which is put variously between the time of the Maccabees and the time of the second Jewish war under Hadrian. The exploit of Judith has given a frequent subject to art: here we may merely mention the bronze group of Donatello at Florence; the paintings by Botticelli, Cranach, Horace Vernet, and Etty; the poetic elaborations of the theme by Hans Sachs, Opitz, and Heibel.

Judson, ADONIRAM, American missionary to Burma, was born in Malden, Massachusetts, August 9, 1788. He graduated at Brown University in 1807, passed through Andover theological seminary, and in 1812 married Ann Haseltine and sailed for India. There they joined the Baptists. After many difficulties they settled in Rangoon, and ere long Judson began to preach and write in Burmese, translating portions of the New Testament (1817-21). He received the degree of D.D. from Brown University in 1823. In 1824 the missionaries removed to Ava, where, during the Burmese war, Judson was imprisoned; and he subsequently laboured at Amherst, Promé, Rangoon, Maulmain, and, with remarkable success, among the Karen jungles. His devoted wife died at Amherst in 1826. In 1833 his translation of the Bible was completed, and this was followed by a Burmese-English dictionary. Judson's second wife, widow of G. D. Boardman (q.v.), died in 1845 on the voyage home to America. He returned to Burma in 1846, and completed his dictionary at Maulmain, but his health failed, and he died at sea, on his way to Mauritius, 12th April 1850. His first wife was author of a *History of the Burmese Mission*, and assisted her husband with his translations. His third wife, Emily Chubbuck (1817-54), was known in the literary world as Fanny Forrester. See Lives by Wayland (Boston, 1853) and Judson's son Edward (New York, 1883).

Juggernaut, or PURI, is the name of a town on the coast of Orissa, at the southern end of the delta of the Mahanadi, celebrated as one of the chief holy places in India. With a resident pop. of 22,000, and some 6000 lodging-houses for pilgrims, it owes its reputation to a temple erected there in honour of Vishnu, and containing an idol of this Hindu god, called *Jagannath* or *Juggernaut*, a corruption of the Sanskrit word *Jagannatha*—i.e. Lord of the World. It was long a sacred city of the Buddhists, the abode of the Golden Tooth of Buddha. The first historical mention of Jagannath is in 318 A.D. He represents Vishnu in all his manifestations, and is in a special sense the god of the people. The great festivals sometimes bring 200,000 pilgrims; and the annual offerings may amount to as much as £37,000, besides Jagannath's revenue of £31,000 from lands and various religious houses. The temple enclosure

comprises 120 temples, the chief pagoda being that of Jagannath, with a tower 192 feet high. There are twenty-four annual festivals in his honour, the chief being the ear festival, when Jagannath (who is armless) is dragged on his ear (45 feet high, 35 feet square, with sixteen wheels, each 7 feet in diameter) to his country-house. This is less than a mile distant from the temple, but the heavy sand extends the short journey to several days, until the exhausted devotees resign the task to professional ear-pullers, who have also to assist the idol home again. The ear festival has been currently believed to be the occasion of numerous cases of self-immolation, the frantic devotees committing suicide by throwing themselves before the wheels of the heavy ear. This is, it would appear, a calumny of English writers. See Sir W. W. Hunter's work on Orissa (1872), in which he 'carefully examined the whole evidence on the subject, from 1580, when Abul Fazl wrote, through a long series of travellers, down to the police reports of 1870,' and came to 'the conclusion which H. H. Wilson had arrived at from quite different sources, that self-immolation was entirely opposed to the worship of Jagannath, and that the rare deaths at the ear festival were almost always accidental.'

Jugglers. See CONJURING.

Jugular Vein. See THROAT, VEIN.

Jugurtha, king of Numidia, son of Mastanabal, who was a natural son of Masinissa, was carefully educated along with Adherbal and Hiempsal, the sons of his uncle Micipsa, who succeeded Masinissa on the throne. After Micipsa's death Jugurtha soon caused Hiempsal to be murdered (118 B.C.), whereupon Adherbal fled to Rome. Jugurtha succeeded in bribing great part of the Roman senate, and obtained a decision in his favour, freeing him from the charge of the murder of Hiempsal, and assigning him a larger share of the kingdom than was given to Adherbal (117 B.C.). But Jugurtha soon invaded Adherbal's dominions, and, notwithstanding injunctions by the Romans to the contrary, besieged him in the town of Cirta (112 B.C.), and caused him and the Romans who were captured with him to be put to death with horrible tortures. Thereupon war was declared against Jugurtha by the Roman people; but, by bribing the generals, Jugurtha contrived for years to baffle the Roman power. At last the consul, Q. Cæcilius Metellus, proving inaccessible to bribes, defeated him in 109 and 108 B.C., so that he was compelled to flee to the Mauretanian king, Bocchus. Marius, who succeeded Metellus in the command, carried on the war against Jugurtha and Bocchus, till at last Bocchus delivered him up to Sulla, then the quaestor of Marius. He was carried in the triumph of Marius, January 1, 104 B.C., and then flung into a dungeon under the Capitol to die of hunger. Our interest in Jugurtha is entirely due to the masterpiece of history in miniature which Sallust devoted to his story.

Jujube (*Zizyphus*), a genus of spiny and deciduous shrubs and small trees of the natural order Rhamnaceæ. The species are pretty numerous. The Common Jujube (*Z. vulgaris*) of the south of Europe, Syria, &c. is a low tree, which produces a fruit resembling an olive in shape and size, red or sometimes yellow when ripe. The fruit is dried as a sweetmeat, and forms an article of commerce. *Syrup of jujubes* is used in coughs, fevers, &c.; but the *jujube paste* or *pâte de jujube* of the shops of Britain is made of gum-arabic and sugar, without any of the dried jelly of this fruit.—The jujube of India (*Z. Jujuba*) is a similar small tree, with round or oblong fruit, sometimes of the size of a hen's egg.—A Chinese species of jujube (*Z. nitida*)

has a very pleasant yellow fruit about an inch long; and other species not much inferior are found in Africa, South America, and other warm countries.—The Lotus (*Z. Lotus*), a shrub 2 or 3 feet high, a native of Persia, the north of Africa, &c., produces in great abundance a fruit about as large as a sloe, and with a large stone, but having a sweet farinaceous pulp, which the natives of some parts of Africa make into cakes resembling gingerbread. A kind of wine is sometimes made from it. This is believed by many to be the Lotus of the ancient Lotophagi celebrated by Homer.—*Z. Spina Christi*, another native of the countries near the Mediterranean, is sometimes said to be the plant from the branches of which our Saviour's crown of thorns was made, and is therefore called Christ's Thorn and Jew's Thorn, names which, for the same reason, are also given to *Pulsatilla aculeatus*. The fruit is about the size of a sloe, oblong, and pleasantly acidulous.—*Z. zeylanica*, a native of the coast of Coromandel, has greenish downy fruit about the size of a cherry, with an edible kernel tasting like a filbert. The tree, which grows about 20 feet high, yields a hard, durable, yet light timber, which when mature assumes a fine orange colour.

Jujuy, the most northerly province of the Argentine Republic, is a mountainous tract, bounded on the W. and N. by Bolivia, and has an area of about 27,000 sq. m. Its minerals are rich, but not worked to any extent. The chief industries are agriculture and cattle-raising; sugar and wheat are the principal crops. The exports (mainly to Bolivia) consist of cattle, mules, fruit, chicha brandy, skins, gold-dust, and salt. Pop. (est. 1888) 90,000.—The capital, JUJUY, on the San Francisco River, 44 miles N. of Salta, has a custom-house, a national college, a girls' normal school, sugar-houses and refineries, and 6000 inhabitants.

Jukes, JOSEPH BEETE, geologist, was born near Birmingham, on 10th October 1811, and graduated from St John's College, Cambridge, in 1836, having studied geology under Sedgwick. In 1839 he was appointed geological surveyor of Newfoundland, and in 1842 he took part as naturalist in the exploration and survey of Torres Strait, New Guinea, and the east coast of Australia. After his return home he surveyed part of North Wales for the Geological Survey of the United Kingdom (1846-50), and in 1850 became local director of the survey in Ireland. He also lectured on geology in the Museum of Irish Industry and at the Royal College of Science in Dublin. He died in that city, 29th July 1869. Besides writing many memoirs on geological and kindred subjects, Jukes published *Excursions in and about Newfoundland* (2 vols. 1842), *Narrative of the Surveying Voyage of H.M.S. 'Fly,' in Torres Strait, &c.* (1847), and *A Sketch of the Physical Structure of Australia* (1850); but he is best known as the author of the *Student's Manual of Geology* (1857, 5th ed. 1890). See his Letters, edited by C. A. Browne (1871).

Julfa, a suburb of Ispahan (q.v.) in Persia.

Jülg, BERNHARD, philologist, was born at Ringelbach, in Baden, 20th August 1825; studied classical and comparative philology at the universities of Heidelberg and Berlin; and after teaching in gymnasia at Heidelberg, Freiburg, and Rastatt became in 1851 extra-ordinary professor of Classical Philology at Lemberg; in 1853 ordinary professor at the university of Cracow, and in 1863 at Innsbruck, where he died 14th August 1886. Besides his studies in comparative philology, extended to embrace the tongues of eastern Asia, he devoted much attention to the question of comparative folk tales.

Of his scientific publications the most important are

Vater's *Litteratur der Grammatiken, Lexika und Wörter-sammlungen aller Sprachen der Erde* (2d ed. 1847), *Die Märchen des Südkar* (1866), two collections of Mongolian *Märchen* (1867 and 1868), a work on echoes of the Greek heroic epics amongst the Mongolians (1869), and *Ueber Wesen und Aufgabe der Sprachwissenschaft* (1868).

Julia, the only child of the Roman emperor Augustus, was his daughter by his second wife, Scribonia, and was born in 39 B.C. She was distinguished for her beauty and talents, and was married at fourteen to Marcus Claudius Marcellus, the sister's son of Augustus. After his death two years later, she was married to Marcus Vipsanius Agrippa, to whom she bore three sons and two daughters. He in his turn died in the year 12 B.C., whereupon Julia was given in marriage next year to Tiberius; his mother, Livia, the stepmother of Julia, persuading Augustus to this, in order to secure the succession of Tiberius to the throne. The marriage was an unhappy one, and the conduct of Julia herself far from irreproachable; but it was Livia's hatred rather than any lofty regard for virtue that procured the unhappy Julia's banishment to the isle of Pandataria. From Pandataria, whither her divorced mother, Scribonia, accompanied her, she was removed to Rhegium, where she was allowed by Tiberius to remain destitute even of common comforts till her death in 14 A.D. Her son, Agrippa Postumus, was put to death by Tiberius shortly before the death of his mother. Her other sons, C. and L. Caesar, died in early age. Her daughters survived her. The elder, Julia, inherited her mother's frailty, and died in 28, in the isle of Trimerus, on the coast of Apulia, whither she had been banished by Augustus twenty years before for adultery. The younger, the virtuous Agrippina (q.v.), died in 33, in Pandataria, to which she had been banished by Tiberius.

Julian, surnamed the Apostate, on account of his renunciation of Christianity, Roman emperor from about the end of 361 to the middle of 363 A.D., was born at Constantinople in the later half of the year 331. He was the youngest son of Julius Constantius, the half-brother of Constantine the Great, and his full name was Flavius Claudius Julianus. On the death of the great Constantine in May 337, and the accession of his three sons, there was a general massacre of the male branches of the younger line of the Flavian family descended from Constantius Chlorus and his second wife Theodora. Thus perished the father of Julian, his elder brother, paternal uncle, and cousins, while he himself and his elder half-brother Gallus were alone spared as too young to be dangerous. He lived a loveless youth, under rigorous espionage, at Macellum in Cappadocia and at Nicomedia, embittered moreover by the terrible tragedy he had just escaped, which stripped him of all belief in the reigning religion, and drove his ardent temperament for relief into the literary and philosophical studies of his time. His secret apostasy seems to have been begun at Nicomedia and consummated at Ephesus under the influence of the Neoplatonist Maximus. In 355 he spent a few happy months at Athens in the study of Greek philosophy, and among his fellow-students and acquaintances here were the future Bishops Basil and Gregory Nazianzen. Gallus had been put to death the year before, and in November 355 Julian was summoned to Milan to assume the rank of Caesar, and marry the emperor's sister, Helena.

The shy young student moved awkwardly amid the atmosphere of policy and intrigue at the court, but during the next five years he found more congenial occupation in the camp, and by his skill and vigour showed that he was a soldier as well as a philosopher. He overthrew the stubborn and victorious Alemanni near Strasburg, subdued the

Frankish tribes along the Rhine and across the river, and fixed his winter quarters at Paris. He endeared himself to the people by lightening the public burdens, and to the soldiers by his personal courage, his success in war, and the severe simplicity of his private life. In April 360 the emperor, alarmed at his growing popularity, demanded that he should send some of his best troops to serve against the Persians, but his soldiers rose in insurrection and proclaimed him Augustus. He occupied some time in consolidating his power, then sent forward one portion of his army through Rhaetia and Noricum, another by the northern confines of Italy, while he himself with 3000 chosen soldiers plunged into the gloomy recesses of the Marejan or Black Forest, and sailed down the Danube as far as Sirmium, where he waited to unite his forces. Here he first threw off the mask and openly declared himself a pagan. Here also he learned of the opportune death of his cousin at the foot of Mount Taurus (November 3, 361), which opened up to him the government of the world. The first winter he spent in the imperial city in a course of public reforms, sweeping away a host of corrupt officials who had long battered at will on private bribes and exactions. Towards Christians and Jews alike he ostentatiously adopted a policy of toleration, but none the less he devoted himself with all the enthusiasm of the convert to the task of restoring the dignity of the old religion. He was assiduous in the practice of divination and all other superstitious ceremonies, reopened and rebuilt the deserted temples, and lavished his patronage upon the time-serving reproaches who deluded him into a belief in the reality of their conversion. He stripped the church of its peculiar privileges by every means short of persecution, but was mortified to the heart by the little success of his ardent propagandism alike among the citizens and the soldiers, although the latter were unable to pay their due worship to the person of the emperor without seeming to bow to idols, from the subtle way in which the imperial and the divine symbols were deliberately intermingled. As soon as he had settled affairs in Constantinople he set out on a journey through Asia Minor to Antioch. Here he lived from July 362 to the March of the following year, and found its luxurious citizens as indifferent to his paganism as to Christianity. Yet his zeal in reformation was less hateful than his economic policy in fixing an arbitrary price on corn in order to stave off a threatened famine. The impudent Antiochenes revenged themselves upon the sensitive emperor by lampoons and ridicule; yet he restrained his resentment, or confined it to the pages of his *Misopogon*, an ironical satire on their effeminate manners, full of the interest of self-revelation. His famous attempt to rebuild the temple at Jerusalem was intended to falsify the cherished prophecies of Christianity no less than to please the Jews; and the balls of flame which brought the work to a standstill were with one accord accepted as miraculous evidence of the special interposition of heaven. Much has been written on this startling story, which even Gibbon was obliged to receive with some respect, and the case for the miracle has been admirably put by Newman in his *Essay on the Miracles in Early Ecclesiastical History* (1842).

In March 363 Julian set out on his long meditated expedition against the Persian king Sapor, and after a tedious march crossed the Tigris, and advanced to the walls of Ctesiphon. He was led to advance farther by the false promises of a Persian traitor, and was at length forced to retreat through a barren country, under a burning sun, and harassed by the swarms of the Persian cavalry. The enemy were repeatedly beaten off, but in one

of the attacks the emperor was wounded by a spear-thrust in the side and fell fainting from his horse. Theodoret tells us how as his blood spouted from the wound he exclaimed, 'Thou hast conquered, O Galilee!'—a poetical tale that is at least an embodiment of a historic truth. He was carried to his tent, where, after a few words of brave philosophy to his weeping friends, he died about midnight on the evening of June 26, 363.

'Julian's life was an accident,' says Bengnot, 'and at his death events reverted to their natural channel.' He failed completely in the aims of his life; and history, says Mr Rendall, shows few sadder examples of noble views distorted, great powers misapplied, and high aims worse than wasted. He was at once a soldier and a statesman wrapped in a student's cloak, and his character was made up of strange contrasts. He was superstitious and fanatical; loquacious, restless, and irritable; without either the calm dignity of the Roman, or the graceful ease of the Greek; vain, pedantic, and hungry for applause; yet with a heart passionately devoted to truth and athirst for the cooling waters of divine philosophy. He was chaste and abstinent, just, liberal, and affectionate; yet the story of his wasted life, with more than the pathos, lacks all the charm that hangs around the brow of the imperial philosopher Aurelius.

To Gregory Nazianzen, Chrysostom, Sozomen, Theodoret, and all the early Christian writers, the Apostate was a monster of wickedness; to Claudius Mamertinus he was a figure above all taint of human infirmity. The voracious and competent military historian Ammianus Marcellinus and the rhetorical Libanius are alike warm, yet discriminating, panegyrists. Of modern writers the most illustrious is Gibbon, whose account is fairly just and one of the most splendid passages in historical literature. Yet, as Mr J. W. Barlow has shown (*Hornathona*, vol. iii, 1879), his picture of Julian has suffered from the necessity for the appearance of severe impartiality. He disliked his superstition, and throughout he damns him with faint praise, and sneers at his virtue, as if it lacked the merit of effort. Even the allusion to his uncleanly personal habits—his long nails, ink-stained hands, and populous beard—is scarce justified by the evidence, being based on a mere ironical exaggeration of Julian's own, in his *Misopogon*, to justify the excessive contempt of the over-luxurious citizens of Antioch.

Julian's extant writings are a series of *Epistles*, mostly addressed to men of letters; nine *Orations*; *Cæsars*, a series of satires in which past Cæsars are treated to caustic satire from Silenus; and the *Misopogon*. His most important work, *Kata Christianism*, is lost. A serviceable edition is that by F. C. Hertlein (Leip, 1875). See vols. iii, and iv, of the Duc de Broglie's *L'Église et l'Empire Romain au quatrième Siècle* (1856-69); Neander, *Kaiser Julian und sein Zeitalter* (1813; Eng. trans. 1850); J. F. A. Mücke, *Flavius Claudius Julianus: nach den Quellen* (1867-69); and G. H. Rendall, *The Emperor Julian: Paganism and Christianity*, an expanded Hulsean Essay (1879); Bishop John Wordsworth's article in vol. iii. (1882) of Smith and Wace's *Dictionary of Christian Biography*; and Alice Gardner, *Julian, Philosopher and Emperor* (1895). The essay by Strass, *Der Romantiker auf dem Thron der Cæsaren* (1847), is only a clever pamphlet aimed at Frederick William IV. of Prussia, and his religious reaction. Ibsen's splendid drama, *Emperor and Galilean* (1873; Eng. trans. 1876), sketches a new ideal culture for the world to succeed the Christian, as it replaced the classical.

Julian Calendar. Epoch. Year. See CALENDAR, CHRONOLOGY, YEAR.

Julien. STANISLAS AIGNAN, a great French Sinologue, was born at Orleans, 19th September 1799, and became at twenty-one an assistant professor at the Collège de France. Ere long, under Abel Régnat, he gave himself with such zeal to the study of Chinese that he mastered its difficulties in less than a year, and actually executed a Latin translation of the philosopher Mencius (1824-

26). From that time his labours were directed with uninterrupted assiduity to the languages and literature of the Far East. Ancient and modern Chinese, Manchu, Sanskrit, and the Mongolian tongues were alike familiar to him; and at the same time he knew almost all the European languages. He succeeded Régnat in 1832 at the Collège de France, became in 1839 keeper of the Royal Library, and in 1854 head of the Collège Impériale. He was also conservator of the Bibliothèque Impériale, and was specially charged with the oversight of the Chinese department. He died February 14, 1873. Julien gave admirable French versions of specimens of the Chinese drama in his *Hou-tan-ki* ('the Circle of Chalk,' 1832) and his *Tchou-chi-kou-cul* ('the Chinese Orphan,' 1834); of Chinese romances, by his *Blanche et Bleu* (1834), *Les deux Cousins* (1863); and *Arabianus*, a collection of Indian novels (1859). He was also the first to make Chinese poetry intelligible. But a more valuable service still than these was his translating the great manuals of Chinese religion and philosophy, such as the *Livre des Récompenses et des Peines* (1835), in which are contained the doctrines of Tao-se; the *Livre de la Voie et de la Vertu* (1841) by Lao-tse, written in the 6th century B.C., and forming the oldest and most illustrious monument of Chinese philosophy; and above all, the *Histoire de la Vie d'Houen-Tsang et de ses Voyages* (1852), a work of immense importance for the earlier history and geography of India, and the knowledge of Buddhism. But not content with these brilliant labours, Julien translated Chinese treatises on silk-culture and the manufacture of porcelain. His splendid *Syntaxe Nouvelle de la Langue Chinoise* appeared 1869-70.

Jülich (Fr. *Juliers*), a town of Rhenish Prussia, on the Roer, 20 miles by rail N.E. of Aix-la-Chapelle. It is the *Juliacum* of the Romans. Until its fortifications were razed in 1860 it ranked as a fortress of the second class. Pop. 5234.—From the 12th century Jülich was the capital of an independent countship, created a duchy in 1356. In 1423 Jülich and Berg (q.v.) were united; and Cleves was added in 1521. In 1609 a dispute arose as to the succession, which was not settled till 1666, when a decision was given in favour of the House of Pfalz-Neuburg, the Elector of Brandenburg obtaining Cleves. The Pfalz-Neuburg family becoming extinct in 1742, Jülich passed to the Pfalz-Sulzbach branch, afterwards electors of Bavaria. In 1801 the duchy was annexed to France, in 1814 to Prussia. See Ritter, *Der Jülicher Erbfolgestreit* (2 vols. 1874-78).

Julius, the name of three popes, of whom the second and third deserve especially to be noticed.—JULIUS II., originally Giuliano della Rovere, a nephew of Sixtus IV., was born at Albignola, near Savona, in 1443. He was vehemently opposed during his cardinalate to the designs of Alexander VI. for the aggrandisement of his family, and one of his earliest measures on his election to the pontificate, in 1503, was to resume possession of the duchy of the Romagna, which had been bestowed upon Caesar Borgia. Julius was himself beyond all suspicion of nepotism or selfish designs of aggrandisement; but his public career during his pontificate was almost entirely devoted to political and military enterprises for the complete re-establishment of the papal sovereignty in its ancient territory—Bologna, Ferrara, &c. and for the extinction of foreign domination and foreign influence in Italy. In pursuing his designs, for the purpose of compelling from the republic of Venice the restitution of the papal provinces on the Adriatic, Julius not only entered into the league of Cambrai with the Emperor Maximilian, Ferdinand of Aragon, and Louis XII.

of France, but had recourse to spiritual arms, by placing the republic under the ban of the church; and on the submission of Venice, apprehending the ambitious designs of Louis, he withdrew from the league, and entered into an opposite alliance, the 'Holy League,' to which Spain and England were parties. During this bitter quarrel with Louis XII. the latter attempted, but ineffectually, to enlist the sympathies of the church against the pope. The Council of Pisa, which was convened under Louis's influence, was an utter failure; and the opposing council, fifth of the Lateran, assembled by Julius, but not brought to a close during his lifetime, completely frustrated the designs of the French king. It has been said without grounds that Julius, in his hatred of France, tried to draw even the Turks into the league, but on the contrary one of his most cherished dreams was a holy war under his own command. As an ecclesiastical ruler Julius has little to recommend him in the eyes of churchmen. As a political sovereign he is described by Ranke as 'a noble soul, full of lofty plans for the glory and weal of Italy;' and Professor Leo considers him, with all his defects, as one of the noblest characters of that age in Italy. He was a liberal and judicious patron of art, and a friend of the rising literature of the time. He died in February 1513. There are Lives by Dumesnil (Paris, 1873) and Brosch (Gotha, 1877).—JULIUS III., born at Rome in 1487, was known before his elevation to the pontificate as Cardinal del Monte. He was one of the three legates of the pope under whom the Council of Trent was opened; and after his election to the papacy in 1550 he himself reopened (in 1551) that council, which had been suspended for upwards of two years. He is connected with English history as having sent Cardinal Pole to organise with Mary the reunion of the kingdom with Rome; but his general government of the church is marked by no very striking events, and his private character is sullied by the taint of nepotism. He died in March 1555.

Jullien (originally JULIEN), LOUIS ANTOINE, was born at Sisteron, in the French department of Basses Alpes, 23d April 1812. He studied at Paris, and became a conductor of concerts there in 1836; but leaving in 1838, made London his headquarters, and did much to popularise music in England by means of large bands, the best available players and singers, and the most attractive pieces, including his own 'Monster Quadrilles.' He became bankrupt in 1857, and retired to Paris, where he was imprisoned for debt. He died in a lunatic asylum, 14th March 1869.

Jullunder (*Jalundhar*), a city of the Punjab, stands in the Doab or rich alluvial plain of the same name between the Sutlej and the Beas, in 31° 21' N. lat. and 75° 31' E. long., on the Sindh-Punjab and Delhi Railway between Umballa and Unrisar. The soil of the neighbourhood is very productive; and the city, though fallen from its former greatness, in 1891 had 66,292 inhabitants. Jullunder is a very ancient city, founded before Alexander's invasion of India, and is referred to in the *Mahabharata*. It gives its name to an administrative *district* of 1433 sq. m. area (pop. 907,583), and to a *division* of 12,600 sq. m. area (pop. nearly 3,000,000).

Julus, or JULIUS, a genus of Millepedes, in the class Myriapoda (see CENTIPEDE).

July, the seventh month of the year in our calendar, fifth in the Roman calendar, where it was called Quintilis ('the fifth'). Originally it contained thirty-six days, reduced first to thirty-one, then to thirty, but was restored to thirty-one days by Julius Cæsar, in honour of whom it was named

July (Lat. *Julius*), his birthday falling on the 12th. In this month the sun leaves Cancer and enters the sign of Leo. According to Dove, the mean temperature of July at London is 64° F.; at Dublin, 61; at Archangel, 60; at Berlin, 66; at Rome, 76. The average summer temperature at New York is 72.62; at San Francisco, 58.04.—The 'July Revolution' is that in France in July 1830, by which Charles X. was set aside, and Louis-Philippe became king.

Jumièges, ROBERT OF, Archbishop of Canterbury, was a Norman by birth, and came to England in the train of Edward the Confessor, over whom he acquired great influence. He was made Bishop of London in 1044, and Archbishop of Canterbury in 1050, and from the first was the head of the anti-English party which gained a temporary triumph in 1051 by the banishment of Earl Godwin and his sons. Their return next year quickly drove him into exile in Normandy. The Witenagemot stripped him of his archbishopric, and he spent the remainder of his life in the monastery of Jumièges, 16 miles SW. of Rouen.

Jumièges, WILLIAM OF, a Norman monk who compiled in Latin a history of the Dukes of Normandy from Rollo down to 1071, which is of some value in the contemporary part—the story of the Conquest and early reign of William I. It is printed in Migne's *Patrologia Cursus Completus* (vol. cxlix.).

Jumilla, a town of Spain, 36 miles N. by W. of Murcia, cultivates the vine and esparto grass, and manufactures salt, jurs, silk, &c. Pop. 13,890.

Junna, or JAMUNA, the principal feeder of the Ganges, has its course wholly in Hindustan. Its source, at a height of 10,849 feet above the sea, is in 31° 3' N. lat. and 78° 30' E. long., 5 miles N. of Jamnatri. After a southerly course of 95 miles it breaks into the plains from the Siwalik Hills at an altitude of only 1276 feet. It continues to flow south as far as Hanipur, beyond Agra, and then turns to the east, finally joining the Ganges from the right 3 miles below Allahabad, after a total course of 860 miles. As a rule its banks are high and craggy. Many tributaries add their waters to swell its current. Area of the drainage basin, 118,000 sq. m. The towns of Delhi, Agra, Ferozabad, Etawah, and Allahabad stand on its banks. From each bank of the river, where it emerges from the Siwalik Hills, a canal has been constructed for irrigation purposes—the Eastern Junna Canal (1823-30), on the left bank, 160 miles, and the Western (1817-25), 433 miles.

Jumpers, a term given by opponents to the Shakers (q.v.), as also to some Welsh Methodists, assumed to 'jump' as part of divine worship.

Jumping. See ATHLETIC SPORTS.

Jumping Hare (*Pedetes caffer*), a South African rodent, *Spring Hare* of the Dutch colonists, belonging to the same family (Dipodidae) as the Jerboas (q.v.). The head much resembles that of a hare, although the ears are shorter; the form of the body is also like that of a hare, but the hind-legs are very long and strong, like those of a kangaroo, and the toes both of fore and hind feet are armed with great claws; and the tail is long and bushy. Its powers of leaping are extraordinary; it clears 20 or 30 feet at a bound. Night is its time of activity, and it then makes mischievous inroads on fields and gardens. Its flesh is eaten. Its range extends from Mozambique and Angola to the Cape.

Junagarh, capital of a native state (area, 3283 sq. m.; population, 390,000) of India, in the Bombay Presidency, is situated on the peninsula of Kathiawar, NW. of Bombay. One of the most

picturesque towns in India, it has an old citadel, which contains several Buddhist caves, as does also the ditch surrounding it (see Dr Burgess, *Antiquities of Cutch and Kathiawar*). Pop. (1881) 24,679; (1891) 31,640.

Juncea, or JUNCEÆ, a natural order of endogenous plants, herbaceous, generally perennial, with creeping root-stock; narrow, often fistular leaves; regular flowers; the perianth 6 partite; the stamens six; the fruit a 3-valved capsule. This order is nearly allied to Liliacæ, notwithstanding very great difference of aspect; for rushes (*Juncus*) are the best-known examples of it. The species, about 200 in number, are mostly natives of cold and temperate climates.

June, the sixth month of the year in our calendar, but the fourth among the Romans. It consisted originally of twenty-six days, to which four were added by Romulus, one taken away by Numa, and the month again lengthened to thirty days by Julius Cæsar, since whose time no variation has taken place. During this month the sun leaves the sign of Leo and enters that of Cancer. Dove gives the mean temperature of this month at London as 61° F.; Dublin, 58°; Paris, 63°; Vienna, 67°; Rome, 71°.

Jung, JOHANN HEINRICH, generally called JUNG STILLING, an original German writer, was born at Im-Grund, in Nassau, 12th September 1740. At first he pursued his father's callings—tailor and village schoolmaster; then (1768) he became a student of medicine at Strasburg, where he was intimate with Goethe, who admired his simple, pure, affectionate nature (see *Wahrheit und Dichtung*, ii.). Next he settled (1772) as a medical practitioner at Elberfeld, and won fame as an operator for cataract. Subsequently he held the professorship of Political Economy at Marburg (1787–1804) and Heidelberg. He died at Carlsruhe, 2d April 1817. He was brought up in a pietistic circle, and the effects of his early training clung to him all his life. Although he wrote some semi-mystical, semi-pietistic romances, and later in life works on political economy, he only deserves to be remembered for his charming autobiography, *H. Stilling's Jugend, Junglingsjahre, Wanderschaft, Hausliches Leben, und Lehrjahre* (5 vols. Berlin, 1777–1804; Eng. trans. 1835). His works were published in 12 vols. (Stutt. 1843–44).

Jung, SIR SALAR, chief minister to the Nizam of Hyderabad, was a member of a princely family which since the founding of the Nizam's dynasty in 1713 had furnished the state with its chief ministers, and was born in 1829. Under his uncle, the chief minister, Salar Jung was trained in official work, and in 1853 succeeded his uncle in his important office. He at once began to reorganise the administration of the state, then in a most deplorable condition. The finances were in such a state that the British government had even to pay the troops the Nizam was permitted by treaty to maintain in his own name; and in order to repay the loan the province of Berar was ceded to the British. Salar Jung's first care was to reduce to obedience the mercenary Arab soldiery. Then the robber chiefs of the hill districts were crushed; courts of justice were established at Hyderabad; the police force was organised; the construction and repair of works of irrigation were attended to; and schools were established. During the Mutiny of 1857 Sir Salar Jung remained faithful to British interests in face of the opposition of the people, who sided with the insurgents. The Nizam Afzul, an apathetic, suspicious, and capricious monarch, had lent his reforming minister no aid; he had rather hampered and hindered him. But on his death in 1869 Sir Salar Jung shared with

the most powerful noble of Hyderabad the post of regent. In 1876 he visited England with the hope of obtaining the restoration of the Berar province, but in this he was disappointed. After thirty years of wise government, he died suddenly on 8th February 1883. He was a Knight Grand Commander of the Star of India.

Jung Bahadur, SIR, prime-minister to the Maharajah of Nepal, was born in 1816. His uncle held a high position under the government of Nepal, but was murdered at the instigation of the queen, who appointed the nephew, Jung Bahadur, commander-in-chief of the army. When in 1846 the premier was assassinated, Jung Bahadur took vengeance upon the leading chiefs concerned in the crime and made himself prime-minister. A conspiracy against him was quickly quenched in blood; the queen and the witless king were banished; and the heir-apparent was raised to the throne. During the Mutiny of 1857 he showed his friendly feeling to the British by sending a body of Goorkha troops to their assistance. Jung Bahadur was knighted and received a Grand Cross of the Star of India. He died suddenly, 25th February 1877.

Jungermannia, a Linnean genus of cryptogamous plants, containing a great number of species, which some modern botanists have divided into many genera, and some have even formed into an order, Jungermanniaceæ, although it is more generally regarded as constituting a sub-order of Hepaticæ (q.v.). The distinctive characters of the sub-order are that the *spore-cases* open by four valves, and that the *spores* are mixed with *clavus*. The species much resemble mosses in appearance. Many are natives of Britain, some of them very common in moist places. The tropical species are very numerous, and some of them are to be found even on the young shoots and leaves of plants.

Jungfrau ('the Maiden'), a magnificent peak of the Bernese Alps, attains a height of 13,671 feet. It received its name either from the unswayed purity and dazzling brightness of the snow by which it is covered, or from the fact that no traveller had ever reached its highest point. Its summit was first ascended by two Swiss gentlemen, named Meyer, in 1811. In 1890 a railway from Lauterbrunnen to its summit was projected.

Jungle, a term now fully adopted into the English language from Bengal (Sanskrit *jungala*, 'desert'), and employed to designate those thickets of trees, shrubs, and reeds which abound in many parts of India, and particularly in the unhealthy tract called Terai or Tarayani, along the southern base of the Himalaya, and in the Sunderbans (q.v.) at the mouth of the Ganges. The jungles are often impassable, from the thick growth of underwood, tall grasses, and climbing plants. The soil is generally swampy, and fever and other diseases abound. Tigers and other beasts of prey, elephants, boars, deer, and other quadrupeds may be found in great numbers in these thickets, with gigantic snakes, and multitudes of monkeys. The jungle flora and fauna are very peculiar, and the moisture and heat carry a tropical vegetation beyond its usual limits northward to the lower valleys of the Himalaya. See INDIA, BENGAL.

Jungle-fowl, the name given in India to the wild species of Galline (*Gallus ferrugineus*) which is the parent of our domestic barn door fowl, and to three other closely allied species (see POULETRY).

Juniper (*Juniperus*), a genus of trees and shrubs of the natural order Conifera, sub-order Cupressineæ, having uni-sexual flowers, the male and female generally on separate plants, and the fruit a fleshy *quillule* (popularly a *berry*), containing

three small nuts. The species are all evergreen, and have small, narrow, rigid leaves, which are opposite, or in whorls of three or four, or imbricated in four rows. They are natives chiefly of temperate and cold regions, and are found in Europe, Asia, Africa, and America. The Common Juniper (*Juniper communis*) is found in all parts of Europe and the north of Asia, and in the northern parts of North America. Only in favourable circumstances does it become a tree of 15, 20, or at most 30 feet in height, and in general it is only a shrub from 2 to 6 feet high. The fruit takes two years to ripen. It is round, of a bluish-black colour, with a whitish bloom; is of the size of a small currant, and is produced in great abundance.

Fig. 1.

a, *Juniperus communis*; *b*, *J. sabina*; *c*, *J. chinensis*.

The little nuts or stones of the fruit have on the shell three glands, which abound, before ripening, in an essential oil—*Oil of Juniper*—present also in the young wood. This oil changes to a true turpentine when the fruit reaches maturity, so that to obtain the oil the green fruit must be used. The wood is yellowish red, brownish in the heart, hard, and fragrant. When of sufficient size it is much valued by turners. It is also used for veneering. The berries have a strong and peculiar flavour, and are much used for flavouring gin, which derives its name from them (see GIN). They also enter into several medicinal preparations, being stimulant, sudorific, and diuretic.—Oil of juniper is lighter

Fig. 2.—Branch of *J. communis*, with fruit.

than water; specific gravity, 0.839. It is limpid and nearly colourless, and is obtained by distilling the unripe fruit, or the twigs, with water. — Spanish Juniper (*J. oxycedrus*) grows in arid situations in the countries round the Mediterranean Sea. Its fruit is about the size of a hazelnut; and from its fruit and wood is procured an essential oil of disagreeable odour, called *Huile de Gale*, which is used in veterinary practice, particularly as a cure for scab in sheep. — Virginian Juniper (*J. virginiana*), the Red Cedar of North America, is an evergreen tree, often 30–50 feet high, of conical form, with horizontal branches and very small leaves. The berries are small and bright blue. The heart-wood is of a beautiful red colour, valued by turners,

&c., while for cigar boxes and lead-pencils it has practically superseded the now scarce Bermudas Cedar (*J. bermudiana*), a lofty tree, with very fragrant reddish-brown wood.—The Himalaya Mountains produce several species of juniper trees of considerable size, beautiful appearance, and valuable wood.—The Swedish juniper of British shrubberies is merely a variety of the common juniper. The Savine which is *J. sabina*, is separately treated. See SAVINE.

Junius, LETTERS of, a series of seventy letters signed Junius, which appeared in the *Public Advertiser* between the 21st of January 1769 and the 21st of January 1772. They were revised by the author, and reprinted two months later in two small volumes by Henry Sampson Woodfall. An edition which appeared in 1812 contained one hundred and thirteen letters in addition to the seventy in the author's edition; five only of the one hundred and thirteen were signed Junius, and one of the five, dated 21st of November 1768, was the first which appeared with that signature. Soon after Junius began to write he attracted attention owing both to his apparent familiarity with current politics and notable persons, and to his boldness in commenting upon them, the climax being reached by him in his letter to the king on the 16th of December 1769. Woodfall was prosecuted for printing and publishing it in the *Public Advertiser*, and acquitted on a technical point, while Almon, a bookseller, was punished for selling a reprint of it. The audacity of Junius in bidding George III. remember that 'while the crown was acquired by one revolution, it may be lost by another,' stimulated public curiosity as to the writer of that letter and others. Burke was generally supposed to be Junius till his denial was accepted as conclusive. Among the many supposed authors of the letters were Lord Shelburne, Barré, Lord George Sackville, Wilkes, Home Tooke, and Thomas, Lord Lyttelton. It was not till after the publication of the edition of 1812 that the name of Sir Philip Francis (q.v.) was publicly affirmed to be concealed under that of Junius. John Taylor was the first to advance what is now known as the Franciscan theory. He wrote two books on the subject; the first appeared in 1813, and was entitled *A Discovery of the Author of the Letters of Junius*; the second in 1816, and was entitled *The Identity of Junius with a Distinguished Living Character Established*. In the first Taylor argued that the letters were from the pens of Dr Francis and his son; in the second, that the son was the sole author. De Quincey, Earl Stanhope, Lord Macaulay, and other critics and historians of note have accepted the Franciscan theory. Taylor was led to frame it by reading a letter which had appeared in the *Public Advertiser* on the 23d of March 1772 signed Veteran, in which Lord Barrington is charged with expelling Francis from the War Office. The 'Memoirs' of Sir Philip Francis by Parkes and Merivale appeared in 1867, containing private letters from Francis in which he wrote that he had resigned his clerkship and declined promotion to a higher post in the War Office, and that he was on terms of cordial intimacy with the Lord Barrington whom Veteran vilified. The extant manuscripts of Junius are said to have been written in a disguised hand, and many fancied resemblances have been traced between it and Francis's natural hand. Woodfall, the printer of the *Public Advertiser*, Tomkins, the principal writing-master of his day, and other contemporary authorities considered the handwriting of the manuscripts to be not only natural, but to bear a close resemblance to that of many men and women who lived when Junius wrote. Moreover, it was not till half a century after the publication of Junius's own edition of his

letters that the theory of a disguised handwriting was started in order to get over the difficulty that the natural hand of Francis was unlike that of the Junian manuscripts. No direct or indisputable proof has yet connected Francis with Junius. The authorship of the letters signed Junius remains a mystery. Junius was not the only important political writer of his time, many others being conspicuous and admired, yet the letters of Wilkes and Horne Tooke, to name those of two popular writers, were neither so uniformly brilliant, nor were they so carefully polished, as the letters signed Junius. This great anonymous writer set a pattern for the leading articles, which were unknown in his day, and through which newspapers now influence public opinion.

See *Junius* (2 vols. 1772); *Junius, including Letters by the same Writer under other Signatures* (3 vols. 1812); the articles on 'Junius' in Dilke's *Papers of a Critic*; articles in the *Athenium* by the present writer; Chabot and Twistleton, *The Handwriting of Junius* (1871); and H. K. Francis, *Junius Revealed* (1894).

Junk, a Chinese vessel, clumsy and incapable of much seamanship or speed; yet junks have proved themselves seaworthy on voyages extending even to America and Europe.—*Junk*, in the British navy, is a familiar term for the salt meat supplied to vessels for long voyages—the name being probably derived from the fact that it becomes as hard and tough as old rope, pieces of which are officially styled *junk*.

Junker, WILHELM, traveller, was born of German parents resident in Moscow in 1840, and studied medicine in Göttingen, Berlin, and Prague. Proceeding to Africa in 1874, in the first instance to Tunis and Egypt, he in 1876-78 carried through a series of explorations among the western tributaries of the Upper Nile, going as far south as the Kibbi, a feeder of the Welle. In the year following (1879) Junker started from Cairo on his second and more important journey, his object being to explore the basin and course of the river Welle-Makua, which he followed down to 22° 47' 40" E. long, and 3° 13' 10" N. lat. This river was eventually (end of 1887) proved by Captain Van Gèle to be identical with the Ubangi, a right-hand affluent of the Congo. After spending four years among the Moubutu and Niam-Niam, Junker prepared to return home, but was prevented from getting back to Egypt by the Mahdi's revolt, and had to remain with Emin Pasha and Casati. But in the end of 1886, a favourable opportunity presenting itself, he managed to find his way to the coast through Karagwe, and reached Cairo again in January 1887. He died at St Petersburg, 13th February 1892. See his *Reisen in Africa, 1875-78* (Vienna, 1889; English translation by A. H. Keane, 1890).

Junkers, the name commonly given to the younger members of the squirearchy or landed gentry of Prussia and the adjoining states.—*Junkertum* was a term of reproach used in the middle of the 19th century to designate the party of reaction in Prussia, which found its most strenuous supporters amongst the landed gentry.

Juno was to the Roman the abstraction of womanhood as Jupiter was the abstraction of manhood. This is the genuine Roman conception of Juno, and to this we must look and not to any nature-myth for the explanation of this deity. As Mommsen has said (*Hist. of Rome*, i. 28), what distinguishes Roman religion from Greek is that in the former 'to everything existing, to man and to the tree, to the state and to the storeroom, a spirit was assigned, which came into being with it and perished along with it, the counterpart in the spiritual domain of the physical phenomenon; to

the man the male genius, to the woman the female Juno.' This is the first point to notice in analysing this deity; Juno is the counterpart in the spiritual domain of the female principle in the human world. The next step in the analysis is indicated again by Mommsen: 'In occupations even the steps of the process were spiritualised; thus, for example, in the prayers of the husbandman there was invoked the spirit of following, of ploughing, of furrowing, of sowing, covering-in, harrowing, and so on, to those of in-bringing, up-storing, and opening of the granaries.' Following the indication thus given us we observe that every step in the life of woman, every function of the female principle, was spiritualised by the Romans, as is shown by the various titles given to Juno—e.g. *Virginensis*, *Matrona*, *Natalis*, *Juga*, *Jugalis*, *Curitis*, *Domiduca*, *Heiduca*, *Unxia*, *Pronuba*, *Cinxia*, *Fluonia*, *Ossipaga*, *Opigena*. These spiritual counterparts of the various phases of woman's life were, we may assume, probably not originally all supposed to inhere in one individual deity, but were separate and independent. And here we come to the third step in our analysis; these various spirits—the spirits of marriage, of birth, of travail, &c.—came eventually to be regarded not as separate spirits but as various manifestations of one and the same deity. What, then, was the thread round which these ideas so to speak crystallised? It was in all probability the figure of the Greek Hera. This undoubtedly became known to the Romans through the cities of Magna Græcia at an early period; the 'female Juno' became identified with her; the various attributes of *Virginensis*, *Matrona*, &c. were naturally assigned to the new, anthropomorphic Juno; and the other resemblances between Juno and Hera were loans effected at this and later times by the Romans from the Greek. Juno as she appears in Virgil is, of course, a reproduction of the Hera of Homer. See *HERA*.

Junot, ANDOCHÉ, Duc d'Abrantès, one of the great Napoleon's generals, was born October 23, 1771, at Bussy-le-Grand, in Côte-d'Or, entered the army as a volunteer in 1792, and distinguished himself in the early wars of the republic. His courage at Toulon caught the eye of Napoleon, and he carried him with him to Egypt as adjutant. At Nazareth he covered himself with glory by putting to flight as many as 10,000 Turks with but 500 horse. In 1804 he was made governor of Paris, and, after a short stay as ambassador in Lisbon, was appointed in 1807 to the command of the army for the invasion of Portugal. In a short time by his rapidity and skill he made himself master of all the strong places in the kingdom. For his brilliant success he was created Duc d'Abrantès, and appointed governor of Portugal; but he squandered the fruits of his victory by his absurd prodigality, and was ere long so severely defeated by Wellington at Vimiera that he was obliged to conclude a convention at Cintra and retire from Portugal. He subsequently served in Germany and Russia, and was made one of the scapegoats for the great Russian disaster, and sent to govern Illyria. This, added to the effect of former wounds in the head, brought on mental derangement. He was taken to his father's house at Montbard, near Dijon, and, two hours after his arrival, precipitated himself from a window, July 22, 1813, fracturing his thigh-bone. Amputation was performed, but Junot frantically tore off the bandages, and died seven days afterwards.—His wife, LAURETTE DE SAINT-MARTIN-PERMON (1784-1838), the accomplished and recklessly extravagant Duchesse d'Abrantès, gained a reputation in the literary world by her *Mmoires* (18 vols. 1831-35), and by several minor works.

Junta ('assembly'), the name given in Spain to a body of persons combined for political or administrative purposes, whether summoned by the sovereign or meeting on their own initiative as representatives of the people. The most famous is the central junta of 1808, with its provincial juntas, chosen for the conduct of the war with France.—In English history the Whig *junto* was the name given to the chiefs of that party in the reigns of William III. and Anne. The Junta was also the name of a debating society founded by Benjamin Franklin, which developed into the American Philosophical Society in 1743. Here also may be mentioned the interior committee of the privy-council under Charles I., which was the germ of the modern cabinet, and which Clarendon says was reproachfully called the *Juncto*. Its principal members were Laud, Strafford, and Cottington, the Chancellor of the Exchequer; the others were Juxon, the Lord High Treasurer, the two Secretaries, Vane and Windebank, the Marquis of Hamilton, and the Earl of Northumberland 'for ornament.'

Jupiter, the chief god of the Romans. Etymologically identical with the Sanskrit *Dyaus*, the Greek *Zeus*, and the Teutonic *Tiu* or *Zio*, Jupiter is one of the few gods that can safely claim to be descended from the Indo-European primeval period, and consequently one of the few exceptions to the rule that, if a deity is common to the Greeks and the Romans, he was borrowed by the latter from the former in historical times. But though Jupiter was known to the Italians from the time when they first became a separate branch of the Indo-European people, it would be an error to imagine that everything that can be predicated of the Greek *Zeus* holds good of the Roman god, or that the attributes of Jupiter can be ascribed indiscriminately to the Greek deity. We do indeed find that the same tales are told about Jupiter by Virgil and Ovid as had been related about *Zeus* by the Greek poets whom the Roman writers imitated; but it by no means follows that these tales were known to the Italians before their contact in historical times with the Greeks. On the contrary, it is in some cases perfectly certain that the myths were borrowed by the Romans from the Greeks. For instance, no myth in which Apollo figures along with Jupiter could possibly be an original Italian production, because it was only in historical times that the worship of Apollo was introduced from Greece into Italy. In this article, therefore, we must refer the reader for all that regards the Greek god to the article *ZEUS*. But, although we propose here to confine ourselves to the Roman deity, it is by no means easy to determine the outlines of this figure in mythology as it appeared to the religious consciousness of the Italians before they came in contact with Greek thought. We have but little direct information as to the Italians of that period. A few of the *indigitamenta* or formulae containing the epithets of the gods which were recited as a sort of litany by the Roman priests have survived to us, but not enough for our purpose. We are therefore reduced to general considerations. And from this point of view there is no reason whatever for assuming that the resemblance between Jupiter and the Greek *Zeus* was originally any greater than that between Jupiter and the Sanskrit *Dyaus* or the Gothic *Tiu*. As long as it was an accepted theory that the ancestors of the Greeks and Romans dwelt together, and apart from the rest of the Indo-European family, for some time before immigrating into their respective historical abodes, the case was different.

Now, however, this Pelasgian theory no longer has the sanction of either philology or archaeology. We must, therefore, conceive the difference between

the original Italian Jupiter and the Greek *Zeus* to have been determined by the general differences between Greek and Roman religion. In the striking words of Mommsen (*History of Rome*, i. 28), 'As the Greek, when he sacrificed, raised his eyes to heaven, so the Roman veiled his head; for the prayer of the former was vision, that of the latter reflection.' The Greek gods were thoroughly anthropomorphic; they were represented by their poets and their sculptors alike in the image of man. The gods of the Romans were much nearer the earlier stage of animism; they were powers whose good-favour could be propitiated and ill-will averted by the proper ritual and by sacrifice, but they were not subjects for plastic art until the time of Greek influence. This difference will at once account for the fact that no myths whatever attach to the Italian Jupiter—all that are related of him were borrowed in late times from the Greek *Zeus*. What we do find is that various epithets, such as *Lucretius* and *Elieius*, *Imbricitor*, *Prodigialis*, *Depulsor*, &c., are applied to him. And we may conjecture that all such epithets were probably, as some certainly were, originally part of the *indigitamenta*, with the recital of which the Roman priests sought to secure the favour of the god. In the next place it is to be noted that these epithets tend to show that Jupiter was originally to the Roman just as abstract a figure as *Janus* ('the spirit of opening'), *Juventus* ('the spirit of youth'), or *Foreulus* ('the spirit of doors'), *Limentinus* ('the spirit of thresholds'), or *Cardea* ('the spirit of door-hinges'). And we may conjecture that the Romans, who have retained the original Indo-European word for priest (*flamen* = Sansk. *brahman*) which the Greeks lost, also present to us the original animism of the Indo-Europeans more faithfully than does the anthropomorphism of the Greeks. That Jupiter was to the Italians, as to the Indo-Europeans, the spirit of the sky, is shown by his epithet *Lucretius*, which occurred in the *Salarie Hymns*. The same conception is at the bottom of the epithets which designate Jupiter as the spirit of thunder or of lightning—*Jupiter Tonans*, or *Fulgur*. As *Jupiter Latiaris* he presided over the Latin alliance. As the supreme spirit apparently he was besought to grant victory in war, and hence the names *Stator*, *Feretrinus*, *Victor*. The vintage also stood under the care of *Jupiter Liber*. The *Ides* of every month were sacred to him. He was also the spirit of oaths, *Dius Fidius*. Finally, although many of the epithets applied to him can at once be recognised as appropriate to the original character of Jupiter as spirit of the sky, such as *Elieius*, *Fulminator*, *Pluvius*, *Imbricitor*, *Serenator*, *Almus*, *Fugiferus*, there are others, such as *Stator*, *Victor*, &c., which cannot possibly be derived from his functions as a sky-spirit, and which must therefore be accretions, possibly resulting from the identification of the Roman Jupiter with the chief gods of the various allied states. The epithet *Capitolinus* is derived from the temple on the *Capitol* built by *Tarquin*, and the spirit inhabiting that temple was, compared with the rest, *Jupiter Optimus, Maximus*.

Jupiter. See PLANETS, and SOLAR SYSTEM.

Jura (Scand. *deor-ø*, 'deer-isle'), an Argyllshire island, $\frac{1}{2}$ mile N.E. of Islay, and $2\frac{1}{2}$ miles W. of the nearest point of the mainland. It extends 28 miles north-eastward; varies in width from $\frac{3}{4}$ mile, at *Loch Tarbert* in the middle, to $8\frac{1}{2}$ miles; and is 143 sq. m. in area. The western side is rugged and desolate, the eastern green and pleasing. The conical *Paps of Jura* are 2571 and 2412 feet high; and most of the surface is deer-forest. Pop. (1831) 1312; (1891) 619, nearly all Gaelic-speaking. See HEBRIDES and CORRIEVEKIN.

Jura, a range of mountains of a peculiar limestone formation, oolitic in composition, and generally called Jurassic, which extends from the angle formed by the Rhone and the Ain, in a north-easterly direction (with a gradually declining elevation) for more than 450 miles, to the upper course of the Main. But it is usual to restrict the name to the ranges that lie along the frontier of Switzerland and France—mainly in the departments of Doubs, Jura, and Ain. These constitute a plateau about 155 miles long by 40 wide, with an average height of 2000 to 2500 feet. The loftiest peaks are Roculet (5643 feet), Crêt de la Neige (2653), Mont Tendre (5512), and Dole (5507). The eastern face is much steeper than the western. The ranges are broken by numerous transverse gorges or 'cluses.' Many roads and railways traverse the chains, some of them of great strategic importance. Limestone caves are numerous, and they abound in magnificent stalactites and in the bones of extinct animals. Some rivers of considerable size sink into the ground and reappear after some distance, as the Orbe, the Doubs, and the Creuse. Fine pine-forests are a characteristic feature of the scenery.

Jura, an eastern French department, bounded on the E. by Switzerland. Area, 1928 sq. m.; pop. (1881) 285,263; (1891) 273,028. The slopes of the Jura Mountains are thickly wooded, but have also many pastures and meadows. At the foot of the Jura come rich vine-lands. The river-valleys are devoted to the cultivation of grain crops of various kinds. The chief rivers are the Doubs, Ain, and Ognon. The vines yield 62 million gallons of wine annually. The principal industries are the working of iron, cheese-making, watch-making, and turnery. Iron, salt, marble, clay (for pottery), and turf are the most important minerals extracted. The department is divided into four arrondissements, Lons-le-Saunier, Poligny, Sainte-Claude, and Dole. Capital, Lons-le-Saunier.

Jurassic System, the name given to that great series of Mesozoic strata which includes the Lias and overlying Oolites. The system receives its name from the Jura Mountains, where strata of that age are well developed. In England Jurassic rocks extend over a large area in Yorkshire between the mouth of the Tees and Filey Bay, and stretch south from the Humber along the western borders of the great flats of Lincoln and Cambridge, from which they sweep south-west as a broad belt across the Midlands to the Bristol Channel and the coasts of the English Channel between Lyme Regis and Durdlestone Head. Only a few patches of Jurassic rocks occur in Scotland, as near Brora on the east coast of Sutherland, and in some of the western islands. In Ireland the system is equally sparingly represented, as near Lame and Portrush in Antrim. On the Continent rocks of the same age are developed over extensive regions. They form a ring or zone-like belt surrounding the Cretaceous and Tertiary deposits of the Paris basin, underneath which the Jurassic strata doubtless continue. Farther south another belt sweeps round the central plateau of France, and stretches south to the Mediterranean. The most continuous areas in Germany occur in Franconia, Swabia, and Upper Silesia. Rocks of the same age occupy a wide region in central and northern Russia, while more or less isolated areas are met with in the Caucasus, the Crimea, the Carpathians, the Dinaric Alps, the Apennines, &c. One of the most important Jurassic tracts is that of the Jura Mountains, extending between Basel and Geneva. Narrow and broader belts of the same strata occur along the northern and southern flanks of the Alps. The

system also occurs in considerable force in the north-east and the south of Spain.

The Jurassic system of Europe has been arranged in the following groups:

PERMIAN: mostly of fresh-water origin; they contain traces of old land-surfaces (lirt-beds), with roots and stems of fossil plants.

PORTLANDIAN: chiefly sandstones, marls, and limestone (Portland-stone); marine.

KIMERICIAN: dark shales and clay (Kimeridge Clay); marine.

CORALLIAN: limestones with corals (Coral Rag), clays, and calcareous grits; marine.

OXFORDIAN: dark gray or blue clay (Oxford Clay) and calcareous sandstone (Kellaway's Rock—Callovian); marine.

BATHONIAN: limestones, clays, and sands (Cornbrash, Bradford Clay, and Forest Marble); shelly limestones (Great or Bath Oolite), Stonesfield Slate; Full's Earth; all marine.

BAJOCEAN (or Inferior Oolite): calcareous sandstones and grits (Cheltenham); marine; represented in York-shire by estuarine sandstones, shales, and limestones, with seams of coal and ironstone.

LIASSIC: sands and clays (Upper Lias) resting on limestones, sands, clays, and marls (Middle Lias, Marlstone); below which come limestones and dark shales (Lower Lias); all marine.

In India (Cutch) Jurassic strata, ranging from the Bajocian up to the Portlandian inclusively, attain a considerable thickness. The system is not largely developed in North America (Sierra Nevada and Rocky Mountains), but is notable in Colorado for its remarkable reptilian remains. Finally it may be added that Jurassic rocks have been detected in Spitzbergen, Siberia, Australia, New Caledonia, and New Zealand.

Life of the Period.—The predominant forms among the land-plants were cycads, conifers, ferns, and equisetums, but with these were associated true monocotyledonous angiosperms, represented by fossil fruits which are apparently referable to our screw-pines (Pandaneaceæ). This vegetation was widely spread over the earth's surface, flourishing abundantly in Britain, and extending far into the Arctic Circle.

The lower classes of the animal kingdom were represented by foraminifera and sponges, by a great variety of corals, by erinoids (both stalked and free forms), by starfishes, sea-urchins, &c. Corals are especially numerous, and mostly belong to the reef-building family of star-corals. Many of the limestones of the period, indeed, particularly those of the Corallian, are simply old coral reefs. Amongst erinoids one of the most characteristic forms was *Pentamerus*—a genus still living. Many genera of sea-urchins occur (*Aerosalenia*, *Cidaris*, *Diadema*, &c.), and with these were associated numerous starfishes and brittle-stars. The most prominent crustaceans were long-tailed decapods, to which belong our modern lobsters, prawns, &c.; and true crabs were also present. Insects were represented by ancestral forms of cockroach, grasshopper, earwig, ant, dragon-fly, may fly, beetles, bugs, &c. Brachiopods, which formed so characteristic a feature in the life of the Palæozoic seas, had now ceased to be dominant forms, although they were still individually numerous. Most of the old Palæozoic types had disappeared before Jurassic times two surviving forms (*Spirifer* and *Leptæna*) dying out at last before the close of the Liassic stage. We note, however, the presence of the inarticulate types (*Crania*, *Lingula*, *Discina*) which appeared first in Cambrian times and still flourish in our seas. The most important Jurassic brachiopods are *Terebratula* and *Rhynchonella*, of which there were many species. Both genera have survived to the present, but are represented by only a few species. Amongst the lamelibranch molluscs many forms unknown in Palæozoic times now made their first appearance, the most important types being the oysters (*Ostrea*, *Gryphæa*, and *Exogyra*), together with *Trigonia* and *Pholadomya*. Gastropods were fully numerous, and comprised

representatives of the whelks, spindle-shells, spider-shells, &c. of existing seas; and it may be noted that the earliest recognisable fresh-water univalves (*Laludina*, *Planorbis*) date from Jurassic times. But the most characteristic molluscs of this period were the cephalopods, both tetrabranchiate and dibranchiate types. The former, or chambered division, were represented by many forms of Ammonites, several hundred species having been chronicled; and the latter, or 'cuttle-fish' division, by numerous species of Belemnite. Among fishes were ganoids, usually of small size, and representatives of the sharks and rays. But by far the most important of the vertebrates were the reptiles, which flourished in extraordinary abundance during Jurassic times, and may well be said to be the most striking and characteristic life-forms of the period. Chelonians or turtles, lacertilians or lizards, and crocodiles are all represented; but the most characteristic reptiles were the huge sea-saurians, *Ichthyosaurus* (q.v.), *Plesiosaurus* (q.v.), and *Pliosaurus* (q.v.). Another remarkable group of reptiles were the pterosaurs or winged saurians, of which the most noted was *Pterodactylus* (q.v.). Contemporaneous with these were great Dinosaurs (q.v.), such as *Ceteosaurus*, *Megalosaurus*, *Atlantosaurus*, &c., while bird-life was represented by the toothed *Archæopteryx* (q.v.), with its lizard-like tail. The highest forms of life were small marsupial mammals, some of which seem to have been insectivorous, while others were herbivorous.

Physical Conditions.—During Jurassic times the area now occupied in the British Islands by the older rocks appears to have been for the most part dry land. The sea covered the north-east corner of Ireland, and extended along the west coast of Scotland over the site of what is now Skye, and it seems in like manner to have occupied the North Sea opposite the east coast, a portion of which in Sutherland was covered by it. What are now the high grounds of northern England and Wales and the heights of Devon and Cornwall, together with a ridge of Palæozoic rocks which extends under London, were the chief land-areas in south Britain, so that nearly all England was under water in the earlier stages of the Jurassic period. The same sea swept over vast areas of what is now the European continent. The older rocks in the north-west and north-east of France and the central plateau of the same country formed dry land—all the rest was submerged. In like manner, wide regions in Spain were under water. In middle Europe the sea covered nearly all the low grounds of north Germany, and extended far east into the heart of Russia, whence it passed north, and was doubtless confluent with the Arctic Ocean. It occupied the site of the Jura Mountains, and passed eastwards into Bohemia, while on the south side of the Alps it spread over a large part of Italy, extending eastwards so as to submerge a broad region in Austria-Hungary and the Turkish provinces. In short, what are now the central and southern portions of our continent formed a great archipelago in which appeared numerous islands large and small. The chief land-areas of the European region, therefore, were confined to the north and north-west. The existence of this northern land is shown by the fact that, while the Bajocian of the south of England consists of purely marine accumulations, the contemporaneous deposits in Yorkshire are largely fresh water and estuarine.

The Jurassic strata, which attain a thickness of several thousand feet, point to considerable subsidence; the downward movement, however, was not continuous, but seems to have been interrupted by pauses. Taken as a whole the strata of north-western and central Europe are indicative

of rather shallow-water conditions; but the waters were often sufficiently clear to favour the abundant growth of coral-reefs. After the deposition of the Portlandian beds the sea disappeared from what are now the low grounds of England. The succeeding Purbeckian beds are for the most part of fresh-water origin, and seem to have been laid down at or near the mouth of some large river, which probably took its rise in the hills of England or Wales, and flowed south across the upraised bed of the Jurassic sea. Similar indications of a more or less abrupt change from sea to fresh water are afforded by the Jurassic of central Europe, as in northern France, Hanover, Westphalia, and the Jura in Switzerland. While the Jurassic of central and north-western Europe would seem to have accumulated in somewhat shallow seas, the contemporaneous strata of the Mediterranean basin have a decidedly more pelagic aspect. This southern development of the Jurassic is sometimes called the Tithonian series. It is recognised in the southern Alps, the southern Tyrol, the Venetian and Dalmatian Alps, and the Carpathians, and extends into northern Africa.

The climatic conditions of the Jurassic period appear to have been extremely genial. Reef-building corals, for example, flourished in latitudes which are now some 3000 miles north of the present range of reef-builders, while cuttle-fishes and Ammonites and large enaliosaurians lived far within the Arctic Circle.

Jurieu. See DORPAT.

Jurieu. PIERRE (1637–1713), a French Protestant divine, studied at Sedan and Samur, received Episcopal ordination in England, and after some years of the pastorate, became professor at Sedan. On the revocation of the Edict of Nantes (1685) he became pastor of the Walloon church at Rotterdam, where till his death he busied himself in interpreting the Apocalypse and in defending the Protestant faith alike against Arnault, Bossuet, and Bayle.

Jurisdiction. in Law, means the authority which a court or judge has to entertain a particular case and decide it. The general rule is, that if a court which has no jurisdiction to decide a particular case does decide it, the judgment is a mere nullity. Jurisdiction may be limited either locally, as in the case of a county court; or personally, as where a court has a quorum; or as to amount, as when the Court of Session in Scotland takes cognisance only of cases above the value of £25; or as to the nature of the questions to be determined, whether crimes or civil actions. Jurisdiction is said to be concurrent or cumulative when it may be exercised in the same cause by any one of two or more courts at the choice of the suitor. In criminal procedure, to prevent the collision which might arise from each of the courts claiming to exercise the right, it has been established as a rule that the judge who first exercises jurisdiction in the cause acquires a right, *jure preventionis*, to judge in it exclusive of the others. This right of prevention plainly appears to be peculiar to criminal jurisdiction. In civil process it is the private pursuer who has the only right of choosing before which of the courts he shall sue (see INTERNATIONAL LAW). Jurisdiction is said to be privative, on the other hand, when the court having jurisdiction is the only court entitled to adjudicate in such cases. When a judge appoints another person to act in his place as deputy or substitute he is said to delegate his jurisdiction.

Jurisprudence is the science of law which professes to discuss the principles on which legal rights should be protected and enforced; or it may be called the philosophy of law. In its literal

sense the term means merely knowledge of the law, and seems to have been so used in the Roman law, from which it has been borrowed. The word is often used in a popular sense in Britain as synonymous with law, and it is also so used in France; but it is more correctly used in contradistinction to law, as implying the system or supposed methodical scheme embracing the principles on which positive law is founded. The Institutes of Justinian define jurisprudence, with a certain pomposity, as being the knowledge of things divine and human, the science of right and wrong. A distinction is sometimes made between general jurisprudence, which investigates the principles common to various systems of positive law, divesting these of their local, partial, and other accidental peculiarities; and particular jurisprudence, which confines itself to the particular laws of any country, say England, or France, or Scotland, as an independent system taken by itself. Jurisprudence thus embraces a wide range, as treating of all those duties which are enforced between man and man; and yet it may be safely said that lawyers, though dealing with the results of the science every day of their lives, seldom give any attention to the latent and general principles on which these results are founded. The science has been cultivated rather by students of philosophy than by lawyers; and the distinctive colours of the characteristic philosophies of England and Scotland have tinged the jurisprudence of the several countries. The utilitarianism of Locke and Mill has given a practical or empirical character to English jurisprudence, which may be seen in the legal works of Hobbes and Bentham, and at its hardest in the 'cast-iron' system of Austin, whose lectures were long the first English authority on this subject. In Scotland, on the other hand, a constant tradition of another tendency has been maintained among scientific jurists since the time of Lord Stair. Scottish jurisprudence has always had a closer affinity with the systems of the philosophical writers of France and Germany, and bases its conclusions upon the law of nature rather than upon experimental comparisons of varying systems of positive law. It is developed in the works of Ferguson, David Hume, Adam Smith, Dugald Stewart, and Professor Lorimer. The recent tendency of scientific jurists in England has been to abandon the empirical methods of treatment for the historical method, of which the most prominent and successful follower was Sir Henry Maine. In his work the elementary principles of jurisprudence are drawn from a study of the history of legal conceptions and institutions as they appear in remote ages and among peoples at a primitive stage of civilisation.

Jury, a body of private citizens, sworn to try a question of fact, or to assess the amount of a payment legally due. In almost all systems of law the ordinary citizen or freeman is called to take some part in the administration of justice. The *judices* of Roman law are sometimes compared with modern jurymen; and the *juror* was in fact a private citizen, empowered to try questions of fact and law under the general directions of a superior magistrate. In communities of Teutonic origin, and especially in England, the people, i.e. the qualified freemen, or a selection from their number, performed many important duties in civil disputes and criminal trials. They acted as assessors, to 'present' offenders against the law; they decided what action should be taken on a proof by witnesses, compurgators, or ordeal; they were themselves witnesses to the acts by which a title to land was established; even sales of goods were, in old time, witnessed by a kind of jury of townsmen. Many persons suppose that trial by jury, in the

modern sense, is as old as King Alfred; and a cartoon in the Houses of Parliament embodies this popular belief. Dr Stubbs (see his *Constitutional History*, chap. xiii.) attaches great importance to the popular element in the ancient courts; but he traces the modern jury system to a Frankish origin. Inquiry by sworn recognitors, as described in the Frank Capitularies, may have been adopted in part from the Roman imperial legislation. Introduced into England by the Norman Conqueror, this form of inquiry was developed into trial by jury under the influence of the Plantagenet kings and their legal advisers. In course of time the 'juratores' ceased to be regarded as witnesses, or as judges of law and custom; they acted on proofs laid before them, and they took the law from a presiding judge. The partisans of royal prerogative would have gone further; they would have deprived the jurymen of their independence, and compelled them to find the verdict dictated by the judge or the advisers of the crown. After a long struggle the independence of the jury was vindicated; while at the same time the judges were freed from subservience to the crown; the functions of judge and jury were accurately distinguished; and the rules of evidence were developed into a rational system. Trial by jury is prized as one of the chief safeguards of the liberties of the subject; it is admitted to be the best mode of trial in criminal cases of importance, and in those civil cases where damages may have to be assessed for wrongs which affect the person, family, or reputation of the plaintiff. In ordinary mercantile cases the tendency in England is to dispense with juries; the adjustment of property rights is also left, for the most part, to the judges. In political cases special importance attaches to the rules of law which secure the selection of a fairly representative jury. It is not possible under modern law to pack a jury with partisans of the government. In those parts of Ireland where popular feeling is hostile to the government, counsel for the crown have been frequently charged with making an unfair use of their right to order a juror to 'stand by' when his name is called; but it may be well to point out that jurymen are liable to be intimidated by the people, in cases in which party feeling is deeply aroused in Ireland, and that the democratic spirit is not always favourable to an impartial administration of justice in any country.

In the modern criminal practice of England and Ireland several forms of jury are in use. The Coroner's Jury consists of twelve men, usually householders, summoned by a peace-officer acting under the coroner's warrant, to inquire in cases of sudden death, &c. If their inquisition, or recorded verdict, charges any person with crime, the person accused must be arrested and brought to trial. The Grand Jury is a body of not less than twelve and not more than twenty-three men, summoned by the sheriff to consider the indictments to be preferred at assizes, quarter sessions, or the Central Criminal Court. They hear only the witnesses for the prosecution; if they think the evidence wholly insufficient, they 'ignore' the indictment, and the foreman indorses it with the words 'no true bill.' If they think there is a case which the accused ought to answer, they find 'a true bill,' and the accused is thereupon arraigned before a Petty Jury, who inquire whether he is guilty or not. The petty jury consists of twelve men, householders or owners of property, whose names are called over from the panel, or parchment list prepared by the sheriff. The prisoner may challenge the array, i.e. he may allege that the panel is unfairly made up. He may challenge peremptorily thirty-five jurors in a case of treason, twenty in a case of felony; and either the crown or the

accused may challenge any number of jurors for cause shown. When twelve men have been sworn, counsel and witnesses for the prosecution and defence address themselves to the jury; the judge interposes to decide points of law, or to remind counsel or witnesses of their duty; at the close of the trial he sums up the evidence, and states clearly to the jury the question they have to decide. If the jury retire to consider their verdict an officer is sworn to keep them 'without meat, drink, or fire;' but the judge may allow them to have a fire and reasonable refreshment. The verdict of the jury must be unanimous; and it is, generally speaking, conclusive: the prisoner cannot be tried again on the same charge. Common jurors do not receive any remuneration. On an indictment or criminal information for libel Fox's Act, passed in 1792, empowers the jury to find a general verdict on the whole matter in issue. The judges, in certain political cases, had directed the jury to find the defendants guilty on proof of publication of the paper charged to be a libel; and the act closes the last stage in the struggle for the independence of juries in criminal cases.

Civil cases which come before a judge and jury may be tried by a common jury of twelve men, whose names are called from the sheriff's panel, as in criminal cases. Both parties have the right of challenge to the array, or to the name of an individual juror, for cause shown. Either party may demand a special jury—i.e. a jury chosen from a special list, in which are entered the names of persons possessing a property qualification higher than is required in the case of common jurors. Special jurors are paid; the payment is usually at the rate of one guinea for each case. The jury must be unanimous; but the verdict of a majority may be taken by consent of the parties. If the case is compromised a juror is withdrawn by consent, and the case comes to an end. In the county court small civil cases are sometimes tried by the judge and a jury of five. For the use of the term jury in connection with manorial courts, see **MANOR**.

In Scotland forty-five jurors are summoned in criminal cases, of whom fifteen are chosen by lot to try the case; the verdict of a majority suffices. The crown and the accused have each five peremptory challenges; and any number of jurors may be challenged on cause shown. In some points the position of the accused is better than in England. He is entitled to have a copy of the indictment, a list of the witnesses to be brought forward against him, and a list of the jurors—advantages which an English prisoner has no legal right to demand, unless he is accused of treason or misprison of treason. Evidence is first given on both sides; the counsel for the prosecution then addresses the jury, and the prisoner's counsel speaks last. In England the prosecuting counsel may reply if evidence is given on behalf of the accused; and the Attorney-general or Solicitor-general claims the right to reply, even if no such evidence is given. Again, the jury in Scotland may find the charge 'not proven;' and this verdict is so far final that the prisoner cannot be put on his trial a second time on the same charge. This rule gives the accused an additional chance of escape; but there is something to be said against the expediency of permitting a verdict which leaves the question of guilt or innocence undecided, and allows the accused to go free without clearing his character. Trial by jury in civil cases was no part of the ancient practice of the Court of Session—it was introduced in 1815 by an act which adopted most of the English rules. As in England, the jury in civil cases consists of twelve persons; but unanimity is not essential. If, after being kept three hours in deliberation, nine or more of

the jury agree on a verdict, their verdict is taken as that of the jury. If, after being inclosed nine hours, the jury cannot agree, the judge is entitled to discharge them, and generally does so. The judge may allow the jury refreshment after they are locked up to deliberate.

In Ireland the jury laws are substantially the same as in England. Until the passing of the Act of 1871 (Lord O'Hagan's Act), 34 and 35 Vict. chap. 65, modified by 39 and 40 Vict. chap. 21, by which the empannelling and summoning of juries is made the subject of more stringent provisions, the law in England and Ireland was precisely similar. But special legislation has from time to time withdrawn from the consideration of juries in Ireland for a limited period certain crimes of an agrarian or 'quasi-political' character in times of great national excitement. By the Crimes Act, 50 and 51 Vict. chap. 20, special power, extending as high as that of imposing sentences of six months' imprisonment, on conviction of certain specified offences, were conferred on specially constituted magisterial courts sitting without a jury. And special juries for the trial of criminal charges may be empannelled in certain cases.

The Grand Jury in Ireland was till 1898 entrusted not only with the ordinary criminal business performed by the grand jury in England, but also with the entire local government of the country, county by county, much as the same was formerly carried on in England by the justices in Quarter Sessions; but the Irish Local Government Act of 1898 withdrew all its administrative functions, and conferred them on County Councils elected triennially. The authority of the Irish grand juries dated from Anglo-Norman times; and laws, custom, and tradition of 700 years were summed up and ascertained only in 1836 by the Irish Grand Jury Act.

In the United States English principles have been adopted; and trial by jury is made part of the constitution in most of the states. There are some states in which the jurors are empowered to decide questions of law in criminal cases, and in some the judge is forbidden to charge the jury on the facts. A verdict can be returned only on the unanimous vote of a jury; and, with a view to securing impartiality, each juror is required to swear that he is free from any preconceived opinion as to the case on trial, and has no information calculated to influence his decision. The law permits the challenging of individual jurors, both peremptorily and for cause; and this right has frequently been grossly abused for the purpose of delaying justice, as, for example, on the trial of the murderers of Dr Cronin at Chicago (1889). The British colonies have framed their jury laws, for the most part, on the English model.

Jury trial has been established in France (where the verdict of a majority is sufficient), and in many other continental countries, in most of which the institution will be found to bear a general resemblance to the English jury. There are, of course, endless differences in detail. For the particular rules as to qualifications of jurors, &c. in England, reference may be made to Archbold's *Practice* and Stephen's *Digest of Criminal Procedure*.

Jurymast, a temporary spar, used to replace a mast which has been lost from any cause, and so to enable the vessel to reach some port for more permanent repair.

Jus Devolutum, a phrase of ecclesiastical law used to denote the right of a church to present a minister to a vacant parish if the patron neglect to exercise his right within the legal time. In the Established Church of Scotland, if a cure be vacant by death or otherwise, a fit person must

be presented to the presbytery to supply the cure within six months after the occurrence of the vacancy. If no appointment is made in this time by the congregation the right of presentation accrues to the presbytery, and is called *jus devolutum*.

Jus Gentium. See INTERNATIONAL LAW.

Jus Mariti, a phrase used in Roman law, and adopted in the Scotch law to denote the legal right accruing to a husband *qua* husband over his wife's property. See HUSBAND AND WIFE.

Jus Primæ Noctis, the right of detraction of virgins, granted on the occasion of a marriage to a special person, as a chief or a priest, among many savage races, as the Kinipetu-Eskimo, Caribs, and certain Brazilian tribes. We have accounts by early travellers describing the custom as existing in Nicaragua, Teneriffe, Cambodia, Malabar; and Sugenheim asserts that the French kings Philip VI. and Charles VI. could not, in the 14th century, induce the Bishops of Amiens to give up the ancient right. Among many savages a similar privilege is freely granted to all the guests at a wedding—perhaps a survival of a reward for help in the abduction, although Lubbock ingeniously attempts to explain it as originally an act of expiation for individual marriage. Again, a period of privileged and unlimited license just before marriage is not uncommon; while we often meet with the practice of lending a wife or a daughter to a stranger from primitive notions of hospitality. Dr Karl Schmidt in his erudite work, *Jus Primæ Noctis, eine geschichtliche Untersuchung* (Freiburg, 1881), contends that this 'droit du seigneur' never existed in Europe, having left no evidence of its existence in laws, charters, decretals, trials, or glossaries, and that the later belief in it is merely 'ein gelehrter Aberglaube,' which has arisen in various ways, as from reports of individual cases of tyranny and from an unnecessarily gross interpretation being attached to the fine paid by the vassal to his feudal lord for permission to marry. Bachofen, Girard-Teulon, and Kulischer regard the *jus primæ noctis* accorded to a special person as a survival from a primitive stage of promiscuity or communal marriage, the ancient communal right being in course of time taken away from the community and transferred to the priest, king, or noble, as its chief representative. It is perhaps more simply to be understood as a mere tribute that may be exacted as a right by superior power, as by the kings of Dahomey; or a supreme mark of loyalty or respect offered to a chief or priest. This alleged ancient seigniorial privilege is the central point of Beaumont and Fletcher's odious play, *The Custom of the Country*.

Jus Relictæ, in Scotch law, is the right of a widow to a share in the movable or personal property of her deceased husband. See HUSBAND AND WIFE, SUCCESSION.

Jussieu, DE, the name of a French family which, for a century and a half, numbered among its members some of the first botanists of the age.—ANTOINE DE JUSSIEU, born at Lyons, 6th July 1686, and died at Paris, 22d April 1758, was professor of Botany and director of the Botanical Garden at Paris, wrote various works on botany, and edited Tournefort's *Institutiones Botanice* (1719).—His brother, BERNARD DE JUSSIEU, born at Lyons, 17th August 1699, and died in Paris, 6th November 1777, contented himself with assisting Antoine and his son without seeking renown by the publication of his own observations. In 1758 he was named superintendent of the gardens at the Petit-Trianon, and there arranged the plants in accordance with a natural system substantially the same as that which his nephew Laurent subsequently elaborated in a more perfect manner.

He edited the second edition of Tournefort's *Histoire des Plantes qui croissent dans les Environs de Paris* (2 vols. 1725).—ANTOINE LAURENT DE JUSSIEU, born at Lyons, 12th April 1748, died at Paris, 17th September 1836, the nephew and pupil of Bernard, was appointed professor of Botany at the Paris Botanical Garden in 1770. His *Genera Plantarum* (1789) laid down the principles on which modern botanical classification is based (see BOTANY). On the outbreak of the Revolution the hospitals of Paris were put in his charge. In 1793 he organised the library of the Muséum, one of the best in Europe. In 1826 he resigned his professorial chair to his son Adrien. He published numerous papers on botany in *Annales du Muséum* (from 1801-20), and in *Dictionnaire des Sciences Naturelles*.—ADRIEN DE JUSSIEU, son of Laurent, born at Paris, December 23, 1797, died in the same city, June 29, 1853, succeeded his father in 1826. On taking the degree of M.D. in 1824, he presented as his thesis a valuable memoir on the Euphorbiaceæ. This was followed by equally useful papers on the Rutaceæ, Meliaceæ, and Malpighiaceæ, and a memoir on the embryo of the Monocotyledons. His *Cours Élémentaire de Botanique* (1842) reached a 12th edition in 1884. A number of able botanists of all nations owed their training to him.

Juste, THÉODORE, a Belgian historian, was born at Brussels, 11th January 1818, became in 1839 keeper of the Museum of Antiquities there, and in 1870 professor of History, and died 11th August 1888. Juste was a voluminous writer, but many of his works are of considerable value for the history of his country. He is best known by his *Fondateurs de la Monarchie Belge* (27 vols. 1865-81). Many of his earlier works (1830-80) are abridged in *Le Pantheon National* (1881).

Juste Milieu, a French term, signifying the *just mean*, or, according to the common expression, the *golden mean*. After the revolution of 1830 this term acquired a political signification, and came into very frequent use, because of the declaration of the organs of Louis-Philippe, that the *juste milieu* was the only principle of government which could secure the welfare of France.

Justice, HIGH COURT OR, one of the two great sections of the English supreme courts, as arranged by the Judicature Acts (q.v.). For the Scottish College of Justice, see COURT OF SESSION.

Justice, LORD CHIEF, the title given to the chief judge of the Queen's Bench Division of the High Court of Justice; formerly given also to the chief judge of the Common Pleas. He of the Queen's Bench was, and still is, Lord Chief Justice of England; and on him were conferred, in 1881, the powers of the Lord Chief Justice of Common Pleas, that division of the court being abolished. Puisne (i.e. lesser or ordinary) judges in all divisions of the High Court bear the title of Justice, and are spoken of as 'Mr Justice Smith,' &c.

Justice-general, LORD, the highest judge in Scotland, also called the Lord President of the Court of Session (q.v.). Next to him ranks the Lord Justice clerk. See JUDICIARY COURT.

Justice of the Peace. In 1264 the name *custos pacis* appears for the first time in English history. Until the thirty-fourth year of the reign of Edward III. the officers appointed in each county to maintain internal order were invariably described as guardians or conservators of the peace. Originally royal nominees, the conservators of the peace were after the fifth year of Edward I. chosen (at least occasionally) by the whole community in the county court, under the instructions of the king conveyed by the sheriff. But after the deposition

of Edward II. the appointment of special *custodes pacis* was obtained by parliament (1 Edward III. stat. 2, chap. 16). The right of election thus taken away from the people was soon vested in, and has ever since been exercised by, the sovereign. While the power of appointing justices of the peace now practically belongs to the Lord Chancellor, it must be clearly understood that the commission of the peace is in theory the Queen's commission, and that the Lord Chancellor has no such authority over justices of the peace as he possesses over judges of the county courts. The functions of the *custodes pacis* appointed in 1327 were rapidly and widely extended by subsequent legislation; and 36 Edward III. stat. 1, chap. 12, gave for the first time to the old *custodes pacis* their familiar modern name. In 1590 a new form of commission was agreed upon, in which all the particulars formerly specified from a number of statutes were comprehended in words of general description. This was presented to the chancellor, accepted, sealed, and with slight variations has continued in use ever since. Under Richard II. justices of the peace attending quarter sessions were entitled to 4s. a day, payable out of the fines and amerciaments at such sessions. It appears, however, that these payments were often made out of the emoluments of the sheriff, and they were abolished. The office of justice of the peace has since been entirely gratuitous; but, after the conversion of the constabulary into police, stipendiary magistrates exercising a summary jurisdiction not unlike that of the justices have been appointed in all large cities and in many large towns. The office of justice of the peace seems to have been held on several occasions by a lady.

It is impossible here to trace minutely the history of the multifarious duties which have at different periods been discharged by the justices of the peace. The statute 11 Henry VII. chap. 3, enabled them to determine all offences except treason and felony without a jury upon information in the king's name. But this act was repealed in the first year of the reign of Henry VIII. In 1653, when the Barons' Parliament made marriage a purely civil contract, justices of the peace were empowered to hear the mutual declarations of the contracting parties. They were authorised by their commission, and still have power, to receive information with regard to any indictable offence. They were also invested with important administrative functions, such as the licensing of ale-houses and the appointment of overseers of the poor or surveyors of highways; and as local authority they transacted the chief county business, controlled the county police, and levied the county rates. The summary jurisdiction of justices of the peace has, however, been defined and restricted by recent legislation, and the Local Government Act of 1888 has transferred to the new county councils most of the administrative powers formerly exercised by the county justices in quarter sessions. See COUNTY, and QUARTER SESSIONS.

There are two classes of justices of the peace—those exercising jurisdiction within counties, and those appointed for boroughs. Under the Municipal Corporations Act, 1882, sect. 158, borough justices have no authority to act at general or quarter sessions for the county. County justices, on the other hand, have *primo facie* concurrent jurisdiction within any borough which forms part of the county. This presumption is, however, repelled where the borough charter contains an express clause to the contrary—called a *non intrumitter* clause—and the borough has its separate court of quarter sessions. Again, in the case of borough justices no special qualification beyond that of residence in or within seven miles of the

borough is required. But a county justice must have an estate of freehold, copyhold, or long leasehold in England or Wales of the clear annual value of £100, or a reversion expectant on leases for lives of £300 a year. By 38 and 39 Viet. chap. 51, it has now been further provided that a person shall be deemed qualified to be appointed a county justice who, being of full age, has for the space of two years immediately preceding his appointment been the occupier of a dwelling-house assessed to the inhabited-house duty at a value of not less than £100, and shall have been rated to all rates and taxes in respect of such premises. No sheriff can act during his shrievalty as justice of the peace for the county in which he is sheriff; and no person can be appointed to act during bankruptcy. The office of justice of the peace, being conferred by the crown, subsists only during the pleasure of the sovereign. The commission appoints all the persons named therein to keep the peace in the county specified, and any two or more of them to inquire of and determine offences committed in such county; in which number some particular justices with legal or special qualifications were formerly directed to be always included, and no business was to be done without their presence. The words of the commission ran *quorum aliquum vestrum A, B, C, D, &c. nunc esse volumus*; and the persons so named were called justices of the *quorum*. It is now, however, the practice to include nearly all of the justices in the *quorum* clause.

The functions of justices of the peace are partly administrative and partly judicial. The former, which were exercised at *special sessions*, used to embrace a great variety of subjects, but since the Local Government Act, 1888, sect. 3, are now practically restricted to the licensing of ale-houses and the appointment of overseers of the poor. The control of the police in counties will henceforth be undertaken by a joint committee of the county council and of the justices in quarter sessions. The latter fall into three classes. (1) The justice of the peace, like the ancient *conservator pacis*, is empowered to preserve the peace, to suppress riots and affrays, to take security for good behaviour, and to order the apprehension and committal of criminals. (2) At *petty sessions* the justices are enabled to try certain minor offences summarily and without a jury. (3) The commission of the peace authorises any two or more justices to hear and determine certain graver and indictable offences at *quarter sessions*. The statute 34 Edward III. chap. 1, confirming 18 Edward III. stat. 2, chap. 2, enabled justices of the peace to try at quarter sessions all felonies and trespasses whatsoever committed within the county. Comparatively recent legislation has expressly excepted from the jurisdiction of quarter sessions the most serious offences in the criminal law, such as murder, perjury, forgery, bigamy, abduction, &c., and only the smaller misdemeanours and felonies are now triable at these courts. The orders and convictions of justices out of sessions can be appealed against to quarter sessions; and an order made at quarter sessions may as a general rule be removed into the Queen's Bench Division of the High Court by writ of *certiorari*.

As to the liability of a justice of the peace, in the case of a justice acting erroneously within his jurisdiction, an action will not lie without an express allegation and proof of malice and want of reasonable or probable cause. In the case of a justice who either has no jurisdiction or exceeds it, no such allegation or proof is required, but no action can be brought in regard to a conviction or order till it has been quashed upon appeal. ☉

In Scotland the duty of collecting evidence for

the prosecution of criminals rested originally upon the justice-clerk and the sheriff. When it was proposed to hold a criminal inquiry, the sheriff, under the authority of a writ issued by the justiciar, summoned the best and most capable men of each burgh, town, and barony within his shire to appear before the justice-clerk and give information of the crimes done within their respective bounds. This being done, it lay with the justice-clerk to digest the materials thus returned to him, and to make up from them a roll of the offenders' names, and a file of dittay, or indictments for bringing those persons to justice. When the Scotch circuit system was reorganised, a more regular and effective method of taking 'dittay' was adopted; the act of 1587 empowered the king, on the advice of his chancellor, treasurer, and justice-clerk, to appoint 'honourable and worthy persons . . . in degree earls, lordes, barronnes, knights, and special gentlemen Landed, experimented in the lovable laws and customes of the realme, actual indwellers in the same shires . . . to be constant and continual up-takers of dittay.' This is the first statute dealing with the institution of justices of the peace in Scotland. The office was further regulated by acts in 1609, 1617, 1633, and 1661. The form of commission is practically identical with that which was settled for use in England in 1590. There is no property qualification in Scotland; but under 6 Geo. IV. chap. 48, sect. 27, a solicitor cannot be nominated a justice of the peace for any county in which he is practising. By 19 and 20 Vict. chap. 48, sect. 4, the disqualification does not extend to writers or procurators who may be elected magistrates or deans of guild in any burgh. The functions of justices are partly administrative and partly judicial. The Local Government (Scotland) Act, 1889, sect. 11, has transferred to the new county councils the powers and duties of the justices in relation to the following subjects: (1) the execution as local authority of the acts relating to gas-meters, explosive substances, weights and measures, habitual drunkards, and wild birds; (2) the appointment of visitors of public, private, or district lunatic asylums; and (3) the registration of the rules of scientific societies under 6 and 7 Vict. chap. 36. As in England, the justices have still authority in regard to the licensing of ale-houses, the administration of the poor laws, &c. The jurisdiction of justices of the peace is partly civil and partly criminal. In civil questions between master and servant they have jurisdiction to any amount. The justices can entertain applications for the alimony of bastard children. The civil jurisdiction of the justices is now practically superseded by that of the sheriff court, unless to the limited extent allowed by the Small Debt Act (12 and 13 Vict. chap. 34). There is no trace in Scotland of trial with a jury before justices of the peace, as in England at quarter sessions. The ordinary criminal jurisdiction of justices is confined to breaches of the peace, petty thefts, and trifling assaults, punishable by a small fine and imprisonment. A variety of penal statutes have conferred upon the justices of the peace jurisdiction in relation to the revenue, highways, fishings, and public-houses. In Ireland the justice occupies practically the same position as in England.

The institution of justices of the peace exists in the United States of America. In some of the states these magistrates are appointed by the executive, in others they are elected by the people and commissioned by the executive; in some cases they hold office during good behaviour, but as a general rule they are appointed for a limited period. See Bouvier's *Law Dictionary* and Poore's *Federal and State Constitutions*.

JUSTICES' CLERK.—The justices' clerk is an officer appointed by justices of the peace in England (who, although not themselves trained lawyers, are yet called upon to administer many branches of the law) to assist them in the discharge of their duties, to advise them as to points of law and practice, to take minutes of the proceedings in every case, to receive and transmit fines, &c. Every clerk appointed after the passing of the Justices' Clerks Act, 1877, unless he has previously held a similar appointment for a period of not less than fourteen years, is required (a) either to be a barrister of not less than fourteen years' standing, or a solicitor to the Supreme Court of Judicature, or (b) to have served for not less than seven years as a clerk to a police or stipendiary magistrate, or to a metropolitan police-court, or to one of the police-courts of the City of London. Under the same statute justices' clerks receive a fixed salary instead of deriving their remuneration, as formerly, from the court fees.

Justices, Lords. Since the Norman Conquest it has been the occasional practice in England for the sovereign to nominate one or more persons to exercise the chief powers of government during his temporary absence from the kingdom. At first this duty was imposed, principally although not perhaps exclusively, upon the justiciar. But when, after the death of Hubert de Burgh, the functions of the justiciar were gradually distributed and his office itself was practically abolished, *custodes regni* or 'lords justices' were appointed to govern the realm during the sovereign's absence. The English sovereigns from Edward VI. to James II. were never, while actually reigning, absent from England at all; and William III. in the early years of his reign invariably left Queen Mary to discharge the duties of viceroy when he went to the Continent. But after the death of Mary lords justices appear to have been appointed under the great seal, on the occasion of the king's absence, five times between 1695 and 1699. The names of the Archbishop of Canterbury and the Lord Chancellor were usually placed at the head of these commissions. The Act of Settlement (12 and 13 Will. III. chap. 2) provided 'that no person who shall hereafter come to the crown shall go out of England, Scotland, or Ireland without consent of parliament;' but this clause was repealed by 1 Geo. I. chap. 51; and George I. during five of his absences from England (1719, 1720, 1723, 1725, 1727) left lords justices to represent him. Similar appointments were made by George II. after the death of Queen Caroline; and George IV. on his visit to Hanover in 1821 delegated his authority to nineteen guardians, of whom the Duke of York, heir-presumptive, was one. During the reign of Victoria the propriety of an appointment of lords justices was twice considered on occasion of the royal visit to France, and in 1845, when the Queen was preparing to visit Germany; and on the latter occasion an interesting discussion took place in the House of Lords. The view taken by Lord Chancellor Lyndhurst was that, although the great seal could not be used out of the realm, mandates of the sovereign given by sign-manual out of the realm were valid, and that it was 'in the breast of the sovereign,' on going abroad, to appoint representatives or not, as might be deemed for the public good. This debate practically settled the question, and the nomination of lords justices has fallen into desuetude. These appointments were usually made by letters patent under the great seal, but in one or two cases parliamentary confirmation of the powers conferred by the king's authority was obtained.

The power to create peers has only once been

delegated—by Charles I. in favour of Lord Herbert, afterwards Earl of Glamorgan, in 1644.

Lords justices have sometimes been appointed to carry on the government of Ireland in place of a viceroy: but in modern times this has only been done during occasional absences of the lord-lieutenant, or in the interval between the demise of one lord-lieutenant and the appointment of his successor. These lords justices have usually been the Primate, the Lord Chancellor, and the Commander of the Forces.

LOURS JUSTICES OF THE COURT OF APPEAL.—In 1811 it was found that the work devolving on Lord Chancellor Eldon in the Court of Chancery, and at the same time as Supreme Judge of Appeal in the House of Lords, was too severe for his strength. After considerable discussion it was decided to appoint a new judge, under the title of vice-chancellor, to perform part of his duties; and in 1851 Lord John Russell introduced into the House of Commons a bill for the reform of the Court of Chancery. This statute (14 and 15 Viet. chap. 83) transferred the entire jurisdiction of the Lord Chancellor as head of the Court of Chancery to a new tribunal called the Court of Appeal in Chancery. The members of this court were the Lord Chancellor himself, and two other judges who were required to be at the date of their appointment barristers of not less than fifteen years' standing, took rank and precedence next after the Lord Chief-baron of the Exchequer, and were styled Lords Justices of the Court of Appeal in Chancery. Shortly afterwards the lords justices were 'entrusted with the care and custody of lunatics by warrant under the Queen's sign-manual.' The Judicature Acts established a new Court of Appeal (see APPEAL), in which there are four *ex officio* members—the Lord Chancellor, the Lord Chief-justice, the Master of the Rolls, and the President of the Probate, Divorce, and Admiralty Division—and five ordinary members, who are called 'lords justices' after their predecessors in the old Court of Appeal in Chancery. The lords justices are now merely members of the Court of Appeal, and have no original jurisdiction in the Chancery Division. Their jurisdiction in lunacy, however, remains substantially unaltered; and by section 51 of the Judicature Act of 1873 they were appointed additional judges of the High Court of Justice, so that they might exercise it more effectively, by the aid of all that original jurisdiction in Chancery which was formerly auxiliary to the jurisdiction in lunacy. The lords justices occasionally sit as additional judges of the High Court of Justice. When acting in this capacity they are bound by the judgment of a Divisional Court, even although they may disapprove of it, and would have reversed it in the Court of Appeal.

Justiciary Court, the highest criminal court in Scotland. Its judges are, since 1887, the judges of the Court of Session (q.v.); formerly there used to be but seven justiciary lords, five of them appointed by patent. It sits usually in Edinburgh, but also holds circuit-courts twice a year in a number of towns, four times at Perth, Dundee, and Aberdeen, and six times in Glasgow, the kingdom being divided for that purpose into three divisions or circuits. The jurisdiction embraces all crimes whatever; and it is an appellate court as regards inferior criminal tribunals. Its decisions are final, there being no appeal to the House of Lords.

Justifiable Homicide is the killing of a human being without incurring legal guilt, as where a man who has been duly sentenced is hanged; where one, in self defence, necessarily kills another to preserve his own life, &c.

Justin, surnamed the Martyr, one of the earliest and most distinguished apologists of the Christian church, was a native of Flavia Neapolis, the ancient Sichem, in Samaria. He was born probably near the year 100 A.D. His father Priscus was a heathen, and Justin was educated in the religion of his father. He became an ardent student of the philosophy of his age, beginning with the school of the Stoics, but finally adhering to that of the Platonists. His conversion to Christianity he ascribes in one place to the firmness of the Christian martyrs, in another to a chance meeting with a venerable stranger, who directed him to the study of the Jewish prophets, and though them to the great Christian teacher whom they foretold. After his conversion he retained the garb of a philosopher, and appears to have wandered from place to place, as we find him disputing at Ephesus and Rome, if not in other cities also. His martyrdom is supposed to have taken place some time between 148 and 165, but the story rests on no sure historical evidence. The works of Justin, although not very voluminous, are highly interesting and important. The only books ascribed to him with certainty are two *Apologies for the Christians*, the first (the date is a matter of controversy, and has been placed anywhere between 138 and 160) addressed 'to Antoninus Pius,' the second (perhaps an appendix to the first) 'to the Roman senate;' and a *Dialogue with Trypho the Jew* (date perhaps between 155 and 164), which professes to be the record of an actual two days' disputation held at Ephesus. These are extant in two MSS. only, which agree very closely with each other; one is at Paris (date 1364), the other (date 1541) in the Philipps Library at Cheltenham. The *Speech to the Greeks* is possibly Justin's; the other works once ascribed to him are certainly spurious.

The first edition of his works is that of Robert Stephens (Paris, 1551). The Benedictine edition of Justin, by Maran, appeared in 1742; and Otto's—the best—at Jena (3 vols. 1842-47; 3d ed. 1876 *et seq.*). There are good translations of Justin in the *Library of the Fathers* (1861) and Clarke's *Anti-Nicene Library* (1868), and a popular account in *The Christian Fathers*. See also monographs by Semisch (Ersolan, 1840-42), Aubé (Paris, 1875), Engelhardt (Erlang, 1878), and Bishop Kaye (new ed. 1888); and Donaldson, *Hist. of Christ. Lit. and Doctrines* (vol. ii. 1866).

Justin, a Roman historian who flourished, in all probability, in the 3d or 4th century, although some assign him an earlier date. His *Historiarum Philippicarum Libri XLIV.* is a selection, rather than an abridgment, from the *Historia Philippica* of Trognus Pompeius, a work now lost, and so called from its being in the first instance a history of the Macedonian monarchy, but really a kind of history of the world down to the Roman conquest of the East. There are editions by Dübner (1831), Hartwig (1860), and Rühl (1886).

Justin I. and II. See BYZANTINE EMPIRE.
Justinian I. Flavius Anicius Justinianus, nephew, on the mother's side, of the Emperor Justin, was born in 482 or 483 A.D., in the village of Tauresium, in Illyria. His original name was Flauda. Although of obscure parentage, the son of a Slavonic peasant, he shared the success of his maternal uncle, Justin, being invited at an early age to Constantinople, where he received a careful education. When his uncle assumed the purple in 518 he appointed Justinian commander-in-chief of the army of Asia. His tastes, however, inclining him rather to civic pursuits, he declined this appointment, and remained attached to the court of Constantinople. In 521 he was named consul, and during the remaining years of the reign of his uncle he continued to exercise great influence. In 527 the Emperor Justin, by the advice of the senate, proclaimed him his partner in the empire.

Justin survived this step but four months, and in the same year Justinian was proclaimed sole emperor, and crowned along with his wife, the famous Theodora, whom, despite of her more than dubious antecedents as an actress, he had raised to the position of his wife. Justinian, on his accession, was in his forty-fifth year. His reign, which extends over thirty-eight years, is the most brilliant in the history of the late empire. Although himself without the taste or the capacity for military command, he had the good fortune or the skill to select the ablest generals of the last days of Roman military ascendancy. Under the direction of his generals, and especially of the celebrated Narses (q.v.) and Belisarius (q.v.), his reign may be said to have restored the Roman empire, at least in outward appearance, to its ancient limits, and to have reunited the East and West under a single rule. In his first war—that with Persia—he concluded a treaty by which the crisis that had so long threatened was at least warded off; but the rejoicings which celebrated its termination had, owing to a domestic revolution, almost proved fatal to the authority of Justinian himself. A conflict of the so-called Blue and Green factions in the circus in 532 was but an outburst of political discontent, which went so far as to elect a rival emperor, Hypatius. Justinian himself was struck with dismay, and had made preparations for flight; but the vigour and determination of Theodora arrested the revolt. Narses, with a relentless hand, repressed the tumults, 30,000 victims having, it is said, fallen in a single day. By the arms of Belisarius, the Vandal kingdom of Africa was re-annexed to the empire; and the same general, conjointly with Narses, restored the imperial authority in Rome, in Northern Italy, and in a large portion of Spain. One of the most extraordinary, though in the end ineffectual works of the reign of Justinian was the vast line of fortifications which he constructed, or renewed and strengthened, along the eastern and south-eastern frontier of his empire. These works of defence, and the construction of many public buildings both in his capital and in other cities of the empire, involved an enormous expenditure, and the fiscal administration of Justinian, in consequence, pressed heavily on the public resources.

It is, however, as a legislator that Justinian has gained his most enduring renown. His good fortune in obtaining the services of able generals was not greater than that which attended him in the field of law and legislation. Brilliant as were the triumphs of Narses and Belisarius, they were indeed short-lived in comparison with the work done by the celebrated Tribonian (q.v.) and his coadjutors in the way of reforming and codifying the law. Immediately on his accession Justinian set himself to collect and codify the principal imperial *constitutions* or statutes enacted prior to, and in force at, the date of his accession. In this respect he followed the example set by his predecessor, Theodosian. The code in which these *constitutions* were collected was published in 528-29, and it contained a general provision by which all previous imperial enactments were repealed (see CODE). But Justinian's ambition in the matter of consolidating the laws went much further. Imperial constitutions made up but a comparatively small part of the body of the law. The bulk of it (what might be called the *common law*) was contained in the writings of the *jurists*—i.e. of text writers and commentators. Of these writings there were at this time many hundreds of volumes in existence, and, owing to want of agreement in the opinions of the various writers, the law was in a state of great uncertainty, not to say confusion. To remedy this evil Justinian resolved upon the publication of a single treatise in which

the commentaries and other writings of the jurists might be digested and harmonised. The preparation of this great work was entrusted to Tribonian, with the assistance of Theophilus, a celebrated professor of law at Berytus (modern Beyrout), and two other professors, and eleven advocates, and it was completed in the short period of four years. It was published in fifty books under the title *Digesta* or *Pandectæ* on 31st December 529. While the *Digest* was in course of preparation Justinian resolved on the composition of a third legal work—viz. a systematic and elementary treatise on the law which might serve as a textbook for the use of students and as an introduction to the larger work. The preparation of this was also entrusted to Tribonian and his colleagues, and having been completed a few days before the *Digest*, was published in four books on the same day (31st December 529) under the title of *Institutiones*. It is based upon the Institutes of Gaius, and is familiar to all modern lawyers under the name of 'Justinian's Institutes.' Meantime, while both the *Digest* and the *Institutes* were being prepared, the *Code* of 529 above mentioned was withdrawn from circulation and republished in 534 with some alterations, and especially with the addition of fifty new constitutions (known as the *Quinquaginta Propositiones*) which had in the interim been pronounced by Justinian. This new edition, in twelve books, is known as the *Code Repetitæ Prælectionis*, and is the one which has come down to us, no copy of the earlier codex being extant. All these works (*Code*, *Digest*, *Institutes*) were written originally in Latin, and all of them were prepared with care and skill, and testify to the great ability of Tribonian and his co-editors. Upon the publication of the *Digest* Justinian declared by a constitution that all previous law books and decisions were to be held as superseded, and it was forbidden to refer to them in the practice of the courts. During the subsequent years of his reign Justinian pronounced from time to time several new constitutions or laws, some of them making very important changes in certain departments of the law. These (mostly in Greek) were collected and published under the title of *Novellæ* (i.e. 'the Novels' or 'New Constitution'). There were, so far as can be ascertained, about 170 of these Novels. The Institutes, Digest, Code, and Novels together make up what is known as the *Corpus Juris Civilis*.

The character of Justinian has been much canvassed, and opinions are not agreed about it. Procopius, in two separate works, has painted him in very different lights. Making allowance, however, for much exaggeration of his abilities by contemporary writers, it may be said that he contrasts favourably with most of the emperors, whether of the earlier or the later empire. If his personal virtues be open to doubt (and certainly vanity, avarice, and inconstancy were in no small degree characteristic of him), he, on the other hand, displayed undoubted ability as a ruler, and in the main, just and upright intentions. He died on 14th November 565 at the age of eighty-three, and in the thirty-eighth year of his reign.

A few words must be said about the legislative reforms carried through by Justinian. He was not only a collector and codifier of the laws; he also introduced in many directions the most fundamental changes into the substantive law itself. The following were the most important changes: (1) He ameliorated the condition of slaves—depriving their masters of the power of putting them to death. He declared that any one who put a slave to death at his own hand should be guilty of homicide. (2) He greatly revolutionised the law of intestate succession by giving to *cognati* (relatives on the

mother's side) an equal share with *agnati* (relatives on the father's side) of the same degree. These two changes in the law were probably in a large measure induced by the circumstances of his birth. He made considerable changes in the law of divorce and as to the property of spouses, and he reformed civil procedure in the way of making it uniform, and introducing a system of small-debt courts.

See the *Life* by Isambert (Paris, 1856); by G. Body (6th ed. 1889); Newman, *Doctrines of Justinian* (4th ed. 1885); Roby, *Introduction to the Digest* (1884); Muirhead, *Roman Law* (1886).

Jute and Jute Manufactures. Some attempts on a small scale to utilize jute-fibre for the manufacture of carpets were made at Abingdon, in Oxfordshire, about the year 1820 or soon after it. But it was at Dundee, which had long been one of the principal seats of the linen industry, that, in 1832 or 1833, the spinning and weaving of jute first began to give promise of commercial success. The fibre, then little known in Europe, was at first received with suspicion, and for some years it was slowly and somewhat stealthily introduced as a textile material. By the year 1850,

Jute (*Corchorus capsularis*):
a, flower; b, fruit.

however, the use of jute had become extensive, and since then, owing, among other things, to the improvements in preparing and spinning machinery, the manufacture of this fibre has rapidly extended, and is now carried on at Dundee, the chief seat of the industry, on a gigantic scale. Jute cloth for Gunny-bags (q.v.) and for native clothing has long been woven on hand-loom in Bengal, where the plants yielding the fibre are cultivated. Since 1857 a number of large jute-mills, fitted up with textile machinery, driven by steam-power, have been erected in the neighbourhood of Calcutta. The comparatively small cost at which jute can be raised and manufactured will no doubt secure its permanent success as a textile industry; but the fibre is decidedly inferior to flax in strength and especially in durability.

Jute is obtained from the bark of two closely-allied species of plants belonging to the line tree order (Tiliaceæ). One species, *Corchorus capsularis*, is cultivated in central and east Bengal; the other, *C. olitorius*, is grown, but to a more limited extent, in the neighbourhood of Calcutta. The former grows from 5 to 10 feet, sometimes even to 14 feet, in height, but the latter is rather a smaller plant. The chief difference between the two is in the form of the fruit, which in *C. capsularis* is globular, and in *C. olitorius* much elongated. Both are annuals with yellow flowers, and they can be best cultivated on a loamy soil or upon one of clay and sand. The higher lands produce the finest qualities of jute. Such as is grown upon mud-banks or upon submerged lands is mostly larger and coarser. The sowing

time, which is regulated by the nature and position of the soil, extends from March to June. When the plants flower, which they do in some places in the end of June, the cutting of the crop begins, but this is often not done till the fruit is formed. The harvest is not entirely finished till October, and it is from late reaping, with the plants in seed, that coarse jute is obtained, the crop yielding the best fibre if cut during the flowering period.

The fibre, which is the inner bark, is separated from the stem by retting—i.e. steeping in water (see FLAX). Sometimes the jute is placed in rivers, but more generally in tanks or stagnant pools. To prevent any risk of discoloration of the fibre in the process the jute stalks in some districts are first stacked for a few days to allow the leaves to decay. According to the nature of the water used and the character of the crop, the period of retting lasts from two days to fully three weeks. Care must be taken to stop the process as soon as the fibre begins to separate from the stem, otherwise it rapidly deteriorates. It is believed that retting weakens the fibre, and that if it could be separated from the bark by some inexpensive mechanical process a better quality of jute than it is now possible to obtain would be sent into the market.

The best qualities of jute are of a pale clear yellow or buff colour, with a silky lustre, easily spun and comparatively strong. But there are at least half a score of well-known commercial varieties. Some are bright-coloured, soft, and strong, and such are best for textile fabrics—i.e. comparatively soft, for all jute is of a hard and woolly nature. Other kinds are coarse and strong, and suited for making ropes. One or two varieties which are of weak fibre are suited for making paper. One kind, which is long, soft, and fine, but of bad colour, is largely used for gunny-bags.

In order to lessen the harsh and brittle character of jute it is subjected to a softening process on a kind of crushing mangle, from cisterns attached to the top of which oil and water are at the same time sprinkled evenly upon it. Formerly whale-oil was used for this purpose, but of late years a heavy paraffin oil or some similar mineral oil has been largely substituted for it, a change which caused a great fall in the price of whale oil. The mangle consists of four horizontal rows of fluted rollers, 9 inches in diameter, between which the jute passes in a continuous layer, entering at one end between the first pair of the two upper rows, and coming out at the opposite end between the last pair of the two lower rows. Besides simply turning round, the rollers have also a slight lateral motion, so that the jute is thoroughly crushed or nipped. This crushing—together with the help of the oil and water—softens the fibre, and prepares it for the spinning processes.

Jute was formerly, and to a small extent is still, spun by two distinct processes, called 'line' spinning and 'tow' spinning, which correspond to those in use for flax. The main difference between them is that in 'line' spinning the fibre is hekkled on machines with hekkle-stocks furnished with steel teeth, which dress and separate the line or best part of the fibre from the tow, or least valuable portion. In the 'tow' spinning the fibre is first carded on carding-engines, each of which has a peculiar arrangement of revolving cylinders, armed with card points or pins of steel wire. What may be called the carding process of spinning is no longer confined to jute tow, but the whole of the jute is now, as a rule, spun on this system—i.e. it is not hekkled at all. Jute-fibre as obtained from the plant being from 6 to 7 feet long, and often considerably more,

it requires to be broken into lengths of from 14 to 18 inches. This is done on the machine called the breaker-card, upon which also the jute is cleaned and the fibres laid more or less parallel by the action of the card points. The jute leaves the breaker-card in the form of a continuous lap or sliver, 3 to 4 inches broad, and fifteen of these are drawn out and delivered as a single sliver by the second carding engine, called the finisher-card. This attenuation is accomplished by the doffing-rollers having fifteen times the surface speed of the feed-rollers.

The sliver, or rather slivers, are next taken to the *drawing-frame*, where their fibres are further straightened and equalised. The drawing-frame has feed-rollers, travelling gills with steel teeth, and drawing and delivery rollers. Here four slivers from the finisher-card are caught by the feed or retaining rollers, passed through the travelling gills, and drawn out into one sliver by the drawing-rollers, which, as well as the delivery-rollers, move at $4\frac{1}{2}$ times the speed of the retaining-rollers. The sliver from the drawing-rollers is, besides, usually doubled by passing two of them between the delivery-rollers. The process is repeated on a second drawing-frame with finer and closer teeth than those on the gills of the first. The object of doubling and drawing out the slivers so frequently is that the thick place of one sliver may be corrected by the thin place of another, and also that the different kinds of jute may be thoroughly mixed both as to quality and colour.

Roving is the next operation, and the *roving-frame* in the arrangement of its rollers and gills is similar to the drawing-frame, but in the former the parts are smaller and the gill-teeth finer and more closely set. As the sliver on this machine, after being still further attenuated by drawing-out rollers, requires to be twisted into a loose thread or 'rove,' a spindle and flier are provided, as well as a bobbin upon which to wind it. Finally the bobbins of 'rove' are taken to the *spinning-frame*, and spun into yarn upon the 'throstle' principle. See SPINNING.

Jute fabrics are for the most part woven of yarn retaining its natural colour. But for some purposes it is bleached, and when used for carpets or curtains it is dyed various colours. Although it can only be made pure white with difficulty, it readily bleaches pale enough to admit of its being dyed without injury even to bright colours. Dyes upon jute are, however, fugitive unless they are dyed by a special and expensive process, which is only carried out to a small extent in practice. At Dundee the ordinary fabrics made of jute are Hessians, sackings, carpets, tarpauling, and backings for floorcloth. The last-named are woven on looms of extraordinary width (see FLOOR-CLOTH). Dyed carpets, curtains, table-covers, and the like, of this material, are attractive enough in appearance, and carpets especially are largely made. These are cheap but not very durable. Millions of small, brightly-dyed prayer carpets for Moslems are sent from Dundee to the East. Fabrics made of jute are easily rotted by damp, and cannot be often washed and dried like linen or cotton goods without injuring them. This fault of jute soon betrays itself if it is mixed with flax for towelling. Jute, from its somewhat glossy lustre, is occasionally used to sophisticate silk; and it has been employed to some extent to make wigs and other articles in imitation of those made of human hair, chiefly for theatrical purposes.

The following calculation made by Indian commercial men in 1883, and quoted in Watt's *Dictionary of Indian Products*, gives an idea of the extent of the jute trade in different parts of the world. Of raw jute to supply its factories per week, Scot-

land (Dundee) required fully 18,400 bales, England 1860 bales, and Ireland 730 bales; total for the United Kingdom, 21,000 bales. France required weekly 4000 bales, Germany 2170 bales, and other European countries between them 2000 and 3000 bales. The annual consumpt in all Europe was then estimated at 321,400 tons, or 1,800,000 bales. There were actually shipped in the year 1882 83 to Europe 2,364,400 bales, but some may have been re-shipped. At that time the twenty-two Indian factories consumed yearly 107,000 tons, and other countries not included above (chiefly America and Australia) required another 107,000 tons. The total annual consumpt of raw jute in the world at that time was thus about 535,400 tons, the value of which may be roundly taken at 26,000,000. In 1892-98 the jute annually shipped from Calcutta fluctuated from 2,216,000 bales to 2,990,000 bales; and the price varied from £10 per ton to £13, 15s. In 1896, one of the years when imports were greatest, the total import was 340,649 tons, value £4,167,492; while of jute yarn there were exported from the United Kingdom 37,224,300 lbs., value £378,356, and of jute woven goods, 257,146,200 yards, value £2,269,692. Of British exports, three-fourths go to the United States, and an increasing quantity to Germany. Of 7190 textile manufactories in the United Kingdom in 1890, only 116 were jute-mills.

Dundee has no monopoly: Indian rivalry has become formidable. The number of Indian steam factories, mostly near Calcutta, was, in 1890, twenty-four, giving employment to 49,000 persons, and using up annually 143,450 tons of jute. From a comparative statement of the wages paid to six classes of work-people in a Dundee and in a Calcutta jute-mill, published in 1884, it appears that in Scotland they earn from one-half to two-thirds more than they do in India, with the exception of weavers, whose pay is more nearly equal in the two countries, and of unskilled labourers, whose wages are very small in the East. But it is said that to produce a finished piece of jute fabric seven persons in India are required to do as much as three at home. The classes of goods manufactured are, however, not exactly the same in both countries, and for this, as well as for other reasons, the comparison cannot be very accurately made.

The value of jute manufactures (yarns and woven fabrics) exported from the United Kingdom in 1894 was £2,423,913. The United States import annually some 20,000 tons of jute, besides 70,000 or 80,000 tons of jute-batts (lower part of stem and upper part of roots). The States may be said to pay \$10,000,000 annually for imported jute and jute goods, though the plant is now being grown successfully in the southern states, and though machinery is being developed with the view of rendering America independent of foreign jute.

Jüterbog, or JÜTERBOCK, a town in the Prussian province of Brandenburg, 39 miles by rail SSW. of Berlin. Cloth, cigars, and wine are manufactured. Pop. 6797. Near Jüterbog is Dennewitz, where the Prussians under Bulow defeated the French under Ney and Oudinot, September 6, 1813.

Jutland (Dan. *Jylland*), the only considerable peninsula of Europe that points directly north, has since early in the 10th century formed a portion of the kingdom of Denmark (q.v.). Area, 9754 sq. m.; pop. (1890) 942,120. Jutland is said to have been inhabited in the earliest times by the Cimbric (q.v.); hence it was called the Cimbric Peninsula or Chersonesus. In the 5th century it was inhabited by the Jutes, who took part in the expedition of the Saxons to England. The Jutes were succeeded by the Danes, who, under the name

of Normans (Northmen), frequently desolated the coast of Germany and France.

Juvenal. Decimus Junius Juvenalis was born about 55 A.D. at Aquinum, in the Volscian country, where his father, a free Roman citizen, possessed an estate. He received the usual rhetorical education in Rome, and became the friend of Martial, and at least the acquaintance of Statius and Quintilian. Probably under Titus, or early in Domitian's reign, he served as tribune in the army, and in his native town filled the important posts of censor and flamen of the deified Vespasian. We know from an inscription apparently written by himself that he was in Britain and returned home in safety, but there is no evidence that he was there in a military capacity. That he was in Upper Egypt is certain, but that he was banished thither by Hadrian is merely a more plausible conjecture than that he died an octogenarian under Antoninus Pius.

His interest for posterity depends altogether on his sixteen satires, still extant, which occupy the very first rank in satirical literature, and are of priceless value as pictures of the Roman life of the Empire. The order in which these compositions follow each other in the earliest manuscripts and latest editions seems to have been that in which they were originally published. They were grouped probably by Juvenal himself into five books, and these were given to the world at intervals, during which he seems to have undergone notable changes of mood. The first book contains the first five satires, and saw the light in the early years of Trajan's government. It presents Juvenal's powers at their highest and most sustained pitch, fresh from living experience of Domitian's brutalising sway, the forms and effects of which constitute their main theme. Book second consists of one satire, the sixth, levelled at females in general, of whom, in their degraded, unsexed condition under the empire, he draws a well-nigh savage picture, unrelieved by any touch of that chivalry which belongs to a later and christianised civilisation. By many (chiefly French and Italian) critics it is reckoned his *chef-d'œuvre*. It probably appeared a little before the death of Trajan. The third book was published soon after Hadrian's accession, and comprises the seventh, eighth, and ninth satires. Interwoven with passages of earlier composition than that date, these touch, without uniformly maintaining, the high level of the preceding ones. The fourth book, also published under Hadrian, is made up of the tenth, eleventh, and twelfth satires, and in the best of them, the tenth, on the 'Vanity of Human Wishes,' notwithstanding its fine declamatory swing and its characteristic misogyny, there is a softer spirit, as of the 'years that bring the philosophic mind,' or at least temper the impetuosity of earlier manhood. The fifth book, again given to the world in Hadrian's time, contains satires thirteen, fourteen, fifteen, and sixteen, and even more than its predecessor betrays the softening influence of age, while distinctly the least vigorous and effective of the series.

Juvenal and Horace respectively represent the two schools into which satire has always been divided; and from one or other of them every classical satirist of modern Europe derives his descent. As Horace is the satirist of Ridicule, so Juvenal is the satirist of Indignation. Juvenal

is not a man of the world so much as a reformer, and he plays in Roman literature a part corresponding to that of the prophets under the Jewish dispensation. He uses satire not as a branch of comedy, which it was to Horace, but as an engine for attacking the brutalities of tyranny, the corruptions of life and taste, the crimes, the follies, and the frenzies of a degenerate society. He has great humour of a scornful, austere, but singularly pungent kind, and many noble flashes of a high moral poetry. It should be noted that the old Roman genius—as distinct from the more cosmopolitan kind of talent formed by Greek culture—is plainly discernible in Juvenal. He is as national as the English Hogarth, who perhaps gives a better image of his kind and character of faculty than any single English humorist or moralist that we could name. Juvenal has been better translated in our literature than almost any other of the ancients. Dryden's versions of five of his satires are amongst the best things he ever did. Dr Johnson imitated two of the most famous in his *London* and *Vanity of Human Wishes*; and the version of the whole of them by Gifford is full of power and character.

The latest and best editions of Juvenal are those of O. Jahn (2d ed. by Bucheler, 1886), A. Weidner (Leip. 1889), and J. E. B. Mayor (Lond. 1878-86). Other annotated editions are those of Maclean, Lewis (with a literal prose translation), and Pearson and Strong.

Juvenile Offenders. In the eye of the law persons are considered capable of committing crime when of the age of seven, and are punishable like other persons. But in England and Ireland, whenever a person under the age of sixteen is convicted and sentenced to be imprisoned, the court or magistrates may also sentence him to be sent to a reformatory school for not less than two or more than five years. Such sentence, however, cannot be passed upon an offender under ten years of age, unless his offence is by law punishable with penal servitude or imprisonment, or unless the sentence come from a superior court, such as a court of assize or of quarter sessions. Children who have not yet committed crime, but are in a vagrant and neglected state, may also be sent to an industrial school.

Juxon, WILLIAM, one of the figures on the last 'memorable scene' of Charles I., was born at Chichester in 1582. From Merchant Taylors' School he passed to St John's College, Oxford, and succeeded Laud as its president in 1621. Already he had held livings at St Giles, Oxford, and Somerton in Oxfordshire, and through Laud's influence he became successively dean of Worcester, prebendary of Chichester, dean of the Chapel Royal, and Bishop of London. In 1635 also he was made Lord High Treasurer—a dignity, Laud writes proudly, 'held by no churchman since Henry VII.'s time.' In Charles's vacillation about the fate of Strafford, Juxon advised him to refuse his assent to the bill, 'seeing that he knew his lordship to be innocent.' He ministered to the king in his last moments, and it was into his hands that Charles delivered his Gorge with the word 'Remember.' During the Commonwealth Juxon amused himself with his pack of hounds at his country-house in Gloucestershire, and four months after the Restoration was appointed Archbishop of Canterbury. He died at Lambeth, 4th June 1663.

K

is the eleventh letter in our alphabet. The symbol was derived from the Egyptian hieroglyphic picture of a bowl (see ALPHABET). When taken over by the Phœnicians the letter was called *kaph*, 'the hand,' the two slanting strokes being probably supposed to represent the forefinger and the thumb. With little change of form or name it was transmitted to Greece as *kappa*, and then with the other Greek letters it passed into the primitive alphabet of Italy, where it was retained by the Umbrians and the Oscans, but ultimately discarded by the Etruscans and the Romans. That it belonged originally to the Latin alphabet is proved by its occurrence in two or three of the earliest Latin inscriptions, and by its retention in certain conventional archaic abbreviations, such as *KAL*, for *calendæ*. It was not used in classical Latin, since after the invention of *G* (see *G*) it was superfluous, the letter *C* having acquired precisely the same sound, that of the sharp guttural mute, which is formed by raising the tongue to the back of the palate. Hence this sound came to be denoted by *C* in the Latin alphabet and in all the alphabets derived directly from it, such as Italian, French, and Spanish; while the symbol *k* was retained in the alphabets which were directly or remotely influenced by the Greek, such as Coptic, Russian, Wallachian, Servian, Runic, Gothic, and German. Thus in French the letter *k* is only used in modern loan-words, such as *kopi*, or *Edouatre*; while in German *c* is confined, for the most part, to words derived from Latin or French, such as *criminal*, *ciel*, *consul*, or *canal*.

In England, where the two influences met and encountered each other, the usage is conflicting. In the southern or Saxon shires, into which the alphabet was introduced by Roman monks, *c* was at first universal, *k* being unknown before the 12th century. In the northern or Anglian shires, which possessed the runes, a script ultimately of Greek origin (see RUNES), *k* is found in very early MSS., such as the Rushworth Gospels. To the Northumbrian missionaries, to whom the conversion of Germany is chiefly due, may be attributed the use of *k* instead of *c* in the German alphabet. After the Norman conquest of England the phonetic power of *c* became uncertain, owing to the introduction of its French value of *s* in such words as *city*, and hence in the 12th and following centuries the use of *k* began to spread from the northern counties to the east midlands, and then to East Anglia, being employed in the first instance before the vowels *e* and *i*, where the value of *c* was most ambiguous. Hence in Middle English we find *k* in the words *Kent*, *ken*, *kath*, *ken*, *king*, *keep*, and *key*; and also before *a* in the words *kure*, *knee*, *kneel*, *knave*, *knot*, and *knave*, in all of which *c* had formerly been employed. It is also used in words of Scandinavian, Dutch, or northern origin, such as *ken*, *key*, *kud*, *kitt*, *kuttle*, *kirk*, *kippred*, *kink*, and in such modern loan-words as *Koran*, *knave*, and *kaleidoscope*. But on the

whole the usage in English accords more with Latin and French than with Greek, German, and Russian.

K², a Himalayan peak. See GODWIN-AUSTEN.

Kāaba (Arab., 'square house'), the name of an oblong stone building within the great mosque of Mecca. See MECCA.

Kaama, a large species of Antelope (q.v.).

Kabbala. See CABBALA.

Kabul, or CABUL (the Kabura of Ptolemy), a very ancient town which has figured prominently in modern history. It was taken in 1394 by Tamerlane, and again in 1739 by Nadir Shah, whose son Ahmed Khan founded the Durani dynasty. Timur made Kabul the capital of Afghanistan in 1774. It is memorable for the events which led to the terrible disaster of 1842 (see AFGHANISTAN). It was taken in September of that year by Pollock, and its bazaar was destroyed; after which it remained unvisited by Europeans till the year 1879, when Sir Louis Cavagnari was appointed Resident. The story of his murder is still recent history. On its capture by Sir Frederick Roberts the city was again held by a British force for a time; but after the instalment of the Amir Abdur Rahman on the throne, the British forces again evacuated Afghanistan in August 1880.

Kabul is charmingly situated at the foot of the Takht-i-Shah and Asmai hills which separate it from the Chardeh plain. On a spur of these hills south of the city is the fortress of Bala Hissar (or 'upper fort'), once an important stronghold, but now abandoned. The city, which is composed almost entirely of mud-built buildings with flat roofs, is traversed by the main bazaar, the streets of which diverge from the central square and divide the city into four quarters. The Kabul bazaar rivals that of Kandahar, and includes every variety of trade. Carpets, camel-hair cloth, and skins are perhaps the chief specialities; but there are now many shops in which European goods can be purchased, and Kabul is rapidly assuming the general character of an Indian mart. Roads have been improved and wheel traffic introduced, cultivation has been much developed, and new buildings added which greatly improve the city. Communication with India is now regular and constant, there is a growing trade with central Asia, and the Afghan policy of exclusiveness towards strangers has been greatly modified. The cantonment of Sherpur, situated about a mile north of the Bala Hissar, where the British troops were beleaguered in 1880, is maintained in good repair. Close to it are still to be traced the outlines of the old British entrenchment of 1840. At the western extremity of the Benara ridge, which flanks Sherpur on the north, is the English cemetery, now protected by a high wall and kept in fairly good order. Kabul is celebrated for its fruit, its grapes and melons being especially famous. The elevation of the plain above sea-level is about 6000 feet, which ensures a delightful temperature and fine climate in summer, but is sometimes severely cold in winter, when snow occasionally covers the ground to the depth of

several feet, and communication is frequently interrupted. The population of the city probably does not exceed 70,000, and it is composed of all the varied elements of Afghan nationality. Duranis (or true Afghans), Ghilzais, Hazaras, Tajiks, and Kizzilbashies form the chief Mohammedan part of the population, whilst Hindus are numerous in one quarter of the city, and a few Jews are also to be found.

The **KARL RIVER** rises at Sar-i-Chashma, near the source of the Helmund, flows through Kabul city, and, mainly by a long series of precipitous defiles, finally reaches the Indus at Atrok. The length of its course (generally south-easterly) is about 270 miles, and for the most part its volume is insignificant, although it sometimes floods the country about Naushera.

Kabyles, a branch of the great Berber race of North Africa. See **BERBERS**; also **ALGERIA**, and **TUNIS**.

Kadiak, an island off the S. coast of Alaska, separated from the mainland by Alaska Strait. It is mountainous and heavily wooded, contains good harbours, and has an area of 3465 sq. m. It is inhabited by a tribe of Eskimos, engaged in the salmon-fishery, and has a pop. of 1500.

Kampeviser. See **DENMARK (LITERATURE)**.

Kaf, the mountain which in Mohammedan legend surrounds the world.

Kaffa, or **FEODOSIA**, a seaport in the Russian government of Taurida, on a bay on the east side of the Crimea, 62 miles E. by N. of Simferopol. It is defended by walls and a citadel, and contains the ruined palace of the Khans of the Crimea and a Greek cathedral. Near by is an Armenian monastery (1442). Soap and caviare, camel-hair carpets, and sheep-skin rugs are manufactured; and here is the only oyster-fishery in Russia. The harbour is safe and spacious, but there is comparatively little shipping. Pop. (1891) 10,796.—The ancient Theodosia or Feodosia was a flourishing colony of the Milesians; in the 13th century the Genoese founded here a successful trade-depot, which they called Kaffa. It fell to the Turks in 1475, and to the Russians in 1792.

Kaffir Bread, a name given to several South African species of *Enecephalartos*, which, like many others of their order (*Cycadaceae*, q.v.), have much starch in their stems, and afford a kind of sago and a not nutritious bread.

Kaffir Corn. See **DURRA**.

Kaffirs (also spelt **Kafirs** and **Caffres**), a well-marked division of the Bantu family of the Negro race, inhabiting the districts now known as Swaziland, Zululand, the South African Republic, Orange Free State, Natal, the Cape Colony dependency of Pondoland, Griqualand East, Tembuland, and Transkei. They embrace two main divisions, the Zulus (q.v.) and the Kaffirs proper. The word 'Kaffir' is a corrupt form of the Arab 'Kafir,' meaning 'unbeliever,' and was borrowed from the African Mohammedans by the Portuguese, and from them by the Dutch and English. The Kaffirs proper never at any time formed one united race, but have always been split up into a number of tribes, the most influential of which have been the Ama-Temba, the Ama-Nosa (represented by the Gelekas and the Gaikas), and the Ama-Mpondo. Of these the first named are the tribe of royal blood, though the greatest power has always been in the hands of the Geleka chief. The Kaffirs are a fine, stalwart race of men, well made, muscular, and tall. Their skin varies in colour from light brown to sepia black. The racial characteristics depart more and more from the strict Negro type the further the

tribe lies to the south. Yet in all the nose is broad, the lips thick, and the hair woolly; but it does not grow in tufts, as is generally asserted. They are fond of decorating their persons with beads, shells, and feathers, and they protect their skins from the sun by rubbing them with fat and red clay, which makes them look like polished bronze. The women, upon whom devolves the hard labour of cultivating the fields, are individually of inferior physique to the men. The principal article of dress is a tanned ox-skin; but for this many have within recent years substituted a blanket. They live in beehive-shaped huts, grouped in kraals or villages. These huts are formed of strong wicker-work frames thatched with reeds and grass, the largest about 25 feet in diameter and 7 or 8 feet high in the centre. They are a pastoral people, the chief occupations of the men being stock-breeding and hunting; but in quite recent times the cultivation of the soil has begun to extend amongst them. The care of cattle is the most honourable employment, and belongs entirely to men. They formerly worked in both iron and copper, and were not unskilful in pottery and wood work. The principal articles of food are milk, maize, and millet. Youths are circumcised at fifteen or sixteen, living thereafter for a couple of months by themselves; the entrance into womanhood is marked by the *abonjane*, a dancing festival closing a period of seclusion. They practise polygamy, but the wives are not of equal rank, and cannot belong to the same tribal name as the husband. The custom known as *ukuhlonjane* prohibits females from pronouncing the names of any of their husband's male relatives in the ascending line, or any words whatever in which the principal syllables of such names occur—a usage which leads to the women using different words from the men almost to the extent of a different dialect. The three clicks of the Ama-Nosa, usually represented by the superfluous letters, *c*, *q*, and *x*, are easily sounded separately by Europeans, but are insurmountably difficult to the adult in combination. The religious instinct has never been very strongly developed amongst this people, and their rites consist merely in sacrifices to appease the malignant spirits on every hand. Their supreme being, Qamata, is indifferent to man, and is seldom invoked in prayer. Snakes are treated with great respect, being regarded as a favourite form assumed by ancestral spirits. The belief in witchcraft is deeply rooted, and the witch-doctor is generally a person of great influence in the tribe. The original fine moral qualities of the Kaffirs—hospitality, honesty, and truthfulness—have been greatly contaminated through contact with vicious Europeans. At the same time Christian missions have made considerable progress, and the well-known unsectarian mission settlement of Lovedale (opened 1841), so generously supported by the Free Church of Scotland, with its offshoot, Blythwood, 120 miles distant, in the Transkei, has already brought thousands of natives within the range of its influence. The Kaffirs have ever been notable for their bravery. In war they arm themselves with ox-hide shields, about 5 feet long, wooden clubs with heavy heads, and assegais. Politically they are organised in a number of tribes, each subject to a hereditary chief, whose power is supreme. Yet one chief was recognised as paramount of all the tribes.

Partly owing to the war-loving propensities of the Kaffirs, and partly to their cattle-lifting raids and disputes with the colonists about cattle, Kaffir wars have been frequent. In 1780 the Great Fish River was declared the boundary of Cape Colony to the east, but the Kaffir incursions became so troublesome that in 1810 it they had to be driven back behind the Fish River by force of arms.

After a similar little war, undertaken for a similar reason, in 1819, during which the Kafirs made an unsuccessful attack upon Graham's Town, the boundary was advanced eastwards to the Kat River. But peace was constantly being broken. In 1834 the first of the greater Kafir wars broke out, and lasted until the following year. But, although the enemy were repulsed and their territories up to the Kei River annexed by the colonial government, the annexation was not ratified by the home authorities until the termination of the next war (1846-48). The conquered districts were called British Kaffraria, and from 1853 to 1865 formed a separate crown colony; but in the last-quoted year British Kaffraria was incorporated in Cape Colony. The power of the chiefs was nevertheless still unbroken: in 1850 the turbulent Gaikas, who had waged most of the former wars, in conjunction with the rest of the Ama-Nosa and the Ama-Tembu tribes, and a large body of revolted Hottentots, once more invaded the colony, but after a struggle of nearly three years were successfully driven back. In 1856 the frontier districts were settled by the men of the German legion who had fought in the Crimea, nearly 2500 in number. The last war broke out in 1877: the Gelekas took up arms, and were joined by the Gaikas, and eventually the Zulus also entered the fray (see ZULUS). The war ended in the overthrow of the power of the Kafir chiefs, and the gradual incorporation of their territory in the Cape Colony. By 1888 all Kaffraria up to the frontiers of Natal, with the single exception of East Pondoland which, however, was a British protectorate—had been included within the bounds of the Cape Colony.

The Ama-Fengus, or Fingoes, are the remnants of broken Kafir tribes; they are despised by the organised Kafir races, and but for the protection of the British would probably be little better than slaves to them. They have always been loyal to their protectors, and live scattered from Zululand to Cape Colony.

See G. Fritsch, *Die Eingeborenen Süd-Afrikas* (1872); grammars of the Kafir language by Bleek (1869) and Colenso (1855); Chase and Wilmot's *History of the Cape of Good Hope* (1869); G. McCall Theal's *Kafir Folklore* [1882], and *History of South Africa* (1888); and G. de Rualle, *Les Peuples de l'Afrique* (1880).

Kafiristan, a mountainous region of Asia, lying between the Kabul River on the south and the Hindu Kush on the north-west: its eastern and western boundaries are formed by the Chitral and Panjshir rivers respectively, feeders of the Kabul. Area, about 5000 sq. m. This region of wild, narrow, winding glens and impassable mountains (11,000 to 17,000 feet) has been for centuries the last stronghold of primitive Aryan heathenism against the encroachments of Islam. It is on this account that the inhabitants are called by their Mohammedan neighbours Kafirs—i.e. 'unbelievers,' and their country Kafiristan. These people, about 200,000 in all, although speaking different dialects, are ethnically of one race. But they do not form a political unity; the tribes into which they are divided are often at war with one another. The only points of union between them politically are their hatred of the Mohammedans and their passionate love of independence. This they have successfully maintained at different times against such great conquerors as Mahmud of Ghazni, Timur, and Baber. The mountaineers are fair in complexion, the women often handsome. Contrary to the custom of orientals, they do not sit cross-legged on the ground, but sit on stools; and they shake hands like Englishmen. Their dress is made of goat-skin and goat's hair. They are fond of wine and dancing. Cultivable soil exists only

in small patches alongside the torrents; consequently the people follow chiefly pastoral pursuits. Since 1893-95 Kafiristan is recognised by Britain as under Afghan control, and it is now garrisoned by the Amir's troops.

See Leitner's *Kafiristan* (Lahore, 1881); Tanner in *Proc. R. G. S.* (1881); M'Nair in same (1884); Eddulph, *Tribes of the Hindu Kush* (1880); Sir G. Robertson, *The Kafirs of the Hindu Kush* (1896).

Kagoshi'ma, a town of Japan, on a large bay of the same name, at the south end of Kiu-siu Island, with manufactures of pottery and porcelain, arms, and cotton. Pop. (1896) 55,197. It was bombarded by the British fleet in 1863.

Kaictour Fall. See ESSEQUIBO.

Kai-fung, capital of the Chinese province of Honan, near the southern bank of the Hoangho, where the great inundation occurred in 1887, long the chief settlement of the Jews in China. Among its 100,000 inhabitants are many Mohammedans.

Kailás. See ELLORA, INDUS.

Kain, an old term in Scotch law, used to denote rent paid in kind, as in the shape of poultry or animals, to a landlord.

Kainite, a hydrated compound of the chlorides and sulphates of magnesium and potassium, used as a fertiliser. See MAGNESIUM, MANURE.

Kainozoic. See CAINOZOIC.

Kaira, capital of a district in northern Gujarat, 20 miles SW. of Ahmedabad by rail. Pop. 12,640.

Kairwan, a decayed walled town of Tunis, in an open, marshy plain, 80 miles S. of the capital. It contains about fifty ecclesiastical structures, of which the mosque of Okba, who founded Kairwan about 670, is one of the most sacred of Islam. Outside the city, to the north-west, is the mosque of the Companion—i.e. of the Prophet; this and other sacred tombs have rendered Kairwan—i.e. 'caravan or resting-place—the Mecca or sacred city of northern Africa. As such, it has been jealously guarded from defilement by the presence of Jews and for the most part of Christian travellers; but it was entered and exploited by the French in 1881. Kairwan makes copper vessels, potash, carpets, and articles in leather. Pop. 15,000. See E. Raw, *Country of the Moors* (1877); Boddly, *To Kairuan the Holy* (1885).

Kaisarich. See CESAREA.

Kaiserslautern, or LAUTERN, a town of the Bavarian Palatinate, 52 miles by rail SW. of Worms, has of late years developed into an important manufacturing place. The chief manufactures are tissues, yarn, sewing and other machines, ultramarine, furniture, beer, bricks, &c.; and there are ironworks, steam-sawmills, and railway shops. Pop. (1875) 22,690; (1890) 37,047. Frederick I. built a castle here in 1152 (destroyed by the French in 1713); and near by the French republican armies were defeated in 1793 and 1794. See Jost, *Geschichte Kaiserslauterns* (1886).

Kaiserswerth, a Prussian town on the Rhine, 10 miles below Dusseldorf, with 2400 inhabitants, is the seat of the deaconesses' house founded by Pastor Fliedner. See DEACONESSES.

Kaiser Wilhelm's Land. See NEW GUINEA.

Kaithal, an ancient town in the Punjab, India, 93 miles NNW. from Delhi. It is connected traditionally with the monkey-god Hanuman, and is called in Sanskrit *Kapisthala*, the 'abode of monkeys.' It has salt-petre-refineries, and manufactures lac ornaments and toys. It became British in 1813. Pop. 14,754.

Kakapo, or OWL PARROT (*Strigops habroptilus*), a remarkable bird, a native of New Zealand,

belonging to the Parrot family (Psittacidae), but of very owl-like appearance, and, like the owls, nocturnal, or nearly so, concealing itself in holes during the day, except in very gloomy weather. The kakapo takes possession of a hole, where one exists, among stones or the roots of trees, but seems also to have the power of making a burrow for itself. It lives gregariously. The flesh of the kakapo is more pleasant and delicate than that of any other parrot.

It has disappeared from the northern island of New Zealand, and it will probably soon be extinct, unless means are adopted for its protection. It is the only known bird having large wings which does not use them for flight.

Kakodyle. See CACODYLE.

Kalahari Desert. a vast tract of country lying between Great Namaqualand and Bechuanaland, in South Africa, extending from the Gariep or Orange River northwards to 21° S. lat., or the verge of the Ngami region, a distance of nearly 600 miles, with an average breadth of about 350 miles. Although called a desert, it is not entirely such as that name implies. The region is an elevated basin, 3000 to 4000 feet high, with numerous depressions, and bordered in most parts by a wide belt of sandy waterless country. But the rainfall in the interior is sufficient to nourish a fair amount of vegetation. Many parts are thickly covered with high, thorny bushes, which harbour large quantities of game. The inhabitants, called Bakkalahari, keep cattle and grow corn, and live by these and by the chase. Wandering Bushmen are also found in the 'desert.' See Farini, *Across the Kalahari Desert* (1886).

Kalamata, or KALAME, a seaport in the Peloponnese of Greece, on the Gulf of Koron, is the seat of an archbishop. Its exports (currants, figs, olive-oil, and soap) have an annual value of some £300,000; its imports, of £500,000. Pop. 7609.

Kalamazoo, capital of Kalamazoo county, Michigan, is finely situated on the river of the same name, 144 miles by rail ENE. of Chicago. It is the seat of the state insane asylum and of Kalamazoo College (Baptist). The city is the meeting-place of three important railways, and has some fifty busy manufactories of machinery, paper, flour, carriages, windmills, agricultural tools, furniture, &c. Celery is grown in large quantities near the town. Pop. (1890) 17,853.

Kalbe, a town of Prussian Saxony, on the Saale, 17 miles S. of Magdeburg. It has manufactures of textiles, paper, and sugar. Pop. 8850.

Kale, or BORECOLE. See GREENS, SEA KALE.

Kaleidoscope (from Gr. *kalos*, 'beautiful,' *eidos*, 'image,' and *skopos*, 'I see'), an optical instrument invented by Sir David Brewster in 1817. It consists, in its simplest form, of a tube, through whose whole length pass two mirrors or reflecting planes, which are hinged together along one edge, and make with each other an angle

which is an aliquot part of 180, whilst the one end is fitted up with an eyeglass, and the other is closed by two glasses, at a small distance from each other, between which are placed little fragments of glass or other variously-coloured objects. The eye looking into the tube now perceives these objects multiplied as many times as the angle which the reflecting planes make with each other is contained in the whole circumference of a circle, and always symmetrically disposed; and the slightest shaking of the instrument produces new figures. There are various modifications of the kaleidoscope, by some of which its power is much increased; for example the mirrors may be adjustable at various angles measured with respect to a variably distant centre, so that arched patterns may be obtained; and it is not only a pleasing toy, but is sometimes used by pattern-drawers and others, to whom it supplies endless varieties of figures.

Kalends. See CALEND.

Kalevala. See FINLAND.

Kalgan, a Chinese town, 110 miles NW. of Peking, built opposite the passage through the Great Wall, is one of the chief emporiums of the Chinese tea trade with Mongolia and Siberia, some 21,500,000 lb. being exported from here annually. Textiles and smoked provisions are imported from Siberia and Russia. Pop. 70,000.

Kali. See ALKALI.

Kali, an Indian goddess, the wife of Siva (q.v.).

Kalidasa, the greatest dramatist, and one of the most celebrated poets of India. He is known especially through his drama *Sakuntala* ('The Lost Ring'), which, first introduced to the notice of the western world by Sir William Jones (1789), created so great a sensation throughout Europe. A recent translation is Sir M. Williams' (5th ed. 1887). Another drama of the same poet, and next in renown to *Sakuntala*, is the *Vikramocasi* ('The Hero and the Nymph'). Besides these works, Hindu tradition ascribes to his authorship a third drama, *Maharajagunitra*; two epics, the *Raghu-cansa* and the *Kumara-sambhava*; the *Meghaduta* and other poems. But it seems incredible that these are all by one author, differing as they do in style; and it has been assumed that there were at least three Kalidasas. The date of the author of *Sakuntala* is also extremely debatable; it was in the reign of Vikramaditya of Ujjain. But there have been several sovereigns of Ujjain bearing the name from 57 B.C. to 1050 A.D. Most likely the Vikramaditya in question reigned 500-550 A.D.

Kalif. See CALIF.

Kalilah wa Dinnah. See BIDPAL.

Kalinjar, a hill fortress and hill-shrine in the North-western Provinces of India, stands on an isolated rock (1230 feet high), the termination of a spur of the Vindhya Mountains, overlooking the plains of Bundelkhand. The records of the place go back to a period of great antiquity, the name Kalinjar occurring in the *Mahabharata* as that of a city even at that time famous. The whole rock is thickly studded with ruins of ancient Hindu edifices and other works, including gateways, temples, tanks, caves, statues, inscriptions, &c., the most celebrated of all being the remains of the superb temple of Nil Kantha Mahadeo.

Kalisz, the capital of a government (area, 4390 sq. m.; pop. in 1897, 846,331) of the same name in Russian Poland, lies on the frontier river, the Prozna, 132 miles WSW. of Warsaw, and has manufactures of cloth. The *Kalisia* of Ptolemy, it is one of the oldest towns of Poland; in its vicinity numerous relics of antiquity have been discovered, and many ancient burial-mounds exist.

Kakapo
(*Strigops habroptilus*).

Pop. (1892) 18,804. Two battles have been fought here: on 29th October 1706 King Augustus of Poland routed the Swedes, and on 13th February 1813 the Russians defeated the French and Saxons. Here, too, was signed on 28th February 1813 the treaty of alliance between Prussia and Russia.

Kalmar, a town and seaport of Sweden, capital of a lan or county (area, 4436 sq. m.; pop. 234,275) of the same name, is situated on an island in Kalmar Sound, opposite the island of Öland. The town, which was formerly strongly fortified, though the fortifications are now in great part levelled, has a good harbour, a handsome cathedral, and a fine castle, in which, on 20th July 1397, the 'Union of Kalmar' was signed, which settled the succession to the three northern kingdoms upon Margaret of Denmark and her heirs (see DENMARK). The commerce of the town is considerable, and it has manufactures of matches, chicory, and tobacco, and some shipbuilding. Pop. (1895) 12,030.

Kalmia, a genus of plants of the natural order Ericacæ, consisting of evergreen shrubs, mostly about two or three feet high, natives of North America, with red, pink, or white flowers, generally in corymbs. The flowers are very delicate and beautiful, and the corolla is in the shape of a wide and shallow bell. Some of the species are frequent ornaments of gardens in Britain. They delight in a peat soil. *K. latifolia*, the Mountain Laurel, or Calico Bush, occupies large tracts on the Alleghany Mountains. It grows to the height of ten feet, and the wood is very hard. It is narcotic and dangerous; the leaves are poisonous to many animals, and the honey of the flowers possesses noxious properties. A decoction of the leaves has been used with advantage in cutaneous diseases, but taken internally it is fatal. A decoction of the leaves of *K. angustifolia* is used by the negroes of North Carolina, of which state the plant is a native, as a wash for ulcerations between the toes.

Kalmucks, a Mongolian race of people, scattered throughout central Asia, and extending westwards into southern Russia. The name is not employed by the people themselves, but by the Turkic races of Asia and the Russians to designate the Dorbôn (Dorbend) Ordal or Four Allied tribes of the Zungars, Torgol (Keraits or Eleuths), Khoshod, and Dorbol, who live in Zungaria; around Koko-nor in north-east Tibet; in the district called Ordlus, within the great loop of the Yellow River of China; on the western slopes of the Altai (in Kuldja, &c.); and in the steppes between the Don and the Volga and Caspian. These tribes constitute that great division of the Mongol race known as Western Mongols. They are nomads, possessing large herds of horses, cattle, and sheep. Their physical characteristics are those peculiar to the Mongolian race (see MONGOLS). In religion they are nearly all adherents of Lamaism. Their language differs from true or Eastern Mongolian only in being more phonetic; but they have an alphabet of their own. Their literature consists principally of religious books and folk and fairy tales. In recent centuries the most noteworthy events in their history arose out of the emigration of a large band of the Torgol from Zungaria into Russia in 1659. This band was followed by others composed of Dorbol in 1673 and of Khoshod in 1675. Under Ayuka Khan (1670-1724) the Kalmucks figured as an important factor in Russian politics, sometimes as enemies, sometimes as allies. But in 1774 a large body of them, chiefly Torgol and Khoshod, being dissatisfied with the treatment they received at the hands of Russia, returned to the empire of China; after a march in which they endured terrible sufferings, they settled at Hli among the Altai Mountains. See the

brilliant account of the miseries of this march by De Quincey (vol. vii. of *Collected Works*). But there still remain some 110,000 Kalmucks in European Russia; in Asiatic Russia there are probably 55,000 more. The number within the Chinese empire is not known.

Specimens of Kalmuck fairy tales can be read in Julg's edition of the *Siddhi-Kor* (1866) and in vol. i. of Bergmann's *Nomadische Streifereien unter den Kalmuken* (1804).

Kalna, or CULNA, a town of Bengal, 47 miles N. of Calcutta and 28 E. of Bardwan, on the Bhagirathi (Hooghly). The town contains numerous temples, and is a station of the Free Church (Scotland) Mission. It does a large amount of trade by river, chiefly in rice and other natural products. The population has decreased from 27,336 in 1871 to about 11,000.

Kalocsa, a town of Hungary, near the left bank of the Danube, 86 miles S. from Budapest by rail. It is the seat of an archbishop (bishop's see from 1000 to 1135), and has a cathedral, an archbishop's palace (with a library), some monasteries, and an observatory. The inhabitants grow flax, wine, &c. Pop. (1881) 15,789; (1891) 18,167.

Kalong. See BAT.

Kalpi, a town in the North-western Provinces of India, stands among rugged ravines near the bank of the Jumna, 50 miles SW. of Cawnpore. It figured prominently in the wars waged against the Mogul empire, came definitively into British hands in 1806, and was one of the principal agencies of the East India Company. Here on 23d May 1858 Sir Hugh Rose defeated 12,000 of the rebels. The town is mean in appearance, the houses being chiefly mud huts. The population is decreasing—18,514 in 1865; 12,713 in 1891. They manufacture sugar-candy and paper, and export grain, cotton, &c. to Cawnpore and to Calcutta.

Kaluga, chief town of the Russian government of Kaluga, 76 miles by rail NW. of Tula and 188 SSW. from Moscow. Situated in the centre of the empire and on the navigable river Oka, it carries on an extensive trade, especially in corn. It manufactures leather, oil, bast mats, tallow, candles, &c.; but its speciality is 'Kaluga cakes,' sold throughout Russia to the extent of more than £100,000 annually. Pop. (1896) 40,252. Kaluga has often been a place of banishment for political offenders, among others of Shamyg, the Circassian chief. Area of government, 11,942 sq. m.; pop. (1897) 1,178,835. The surface is flat; the soil sandy, clayey, and only moderately fertile; iron ore is worked.

Kama, the principal affluent of the Volga, rises in the Russian government of Vyatka, and after an almost circular course (north-west by east and south-east to south-west) of 1050 miles joins the Volga from the left 43 miles below the town of Kazan. Its chief tributaries are the Vyatka, the Telussovaya, and the Bielaya, all navigable. The Kama is navigable from Perm, a distance of 930 miles. Area of drainage basin, 177,560 sq. m. The river is free of ice about 200 days in the year, and constitutes one of the most important highways of communication between Siberia and Nijni Novgorod and St Petersburg.

Kāma, or KĀMADEVA, the Hindu god of Love. In later Sanskrit poetry, he is the favourite theme of descriptions and allusions; and mythology exalts his power so much that it allows even the god Brahmā to succumb to it. According to some Purānas, he was originally a son of Brahmā.

Kamāran, a little island in the Red Sea, on the Arabian side, nearly opposite Masowah, with an area of 102 sq. m., and inhabited by a few fisher-

men. The island was annexed by Britain in 1858, while the telegraph cable was being laid to Bombay.

Kamchatka (Ger. *Kamtschatka*), a peninsula of eastern Siberia, stretches south into the Pacific between Behring Sea on the east and the Sea of Okhotsk on the west. Area, 465,590 sq. m. The peninsula is long and narrow, swelling out towards the middle, and terminating in a point only 7 miles distant from the northernmost of the Kurile Islands. A chain of volcanic mountains runs down the centre, and reaches 15,408 feet in Kojerevska and 16,988 in Kluchefskaya. The latter was in active eruption at least twice in the 19th century (1854 and 1885). Hot springs abound. The coast on the south-east is formed of rugged, precipitous cliffs. The principal river is the Kamchatka, which flows into the Pacific. The climate is colder than in corresponding latitudes in Europe, and very humid; grass and tree vegetation are consequently luxuriant. The principal occupations of the inhabitants are fishing and hunting. Furs are the most valuable production of the peninsula. The most useful domestic animal is a peculiar kind of dog, which is employed in hunting and sledging. Kamchatka was annexed to Russia at the end of the 17th century, after the expedition of the Cossack chief Atlasof. Pop. 6500, made up of Kamchadales, Koryaks, Lamuts, and a few Russians. The Kamchadales—the preponderating race (2000 in number)—live mostly in the south. They are a hardy people, who dwell in winter in earth pits and in summer in light huts. Their language has no known cognates; but they are now almost completely Russianised. The fort of Petropavlovsk (pop. 350), with a magnificent harbour that is covered with ice only during a brief period of the year, is picturesquely situated on the east coast. A British and French fleet made an unsuccessful attack upon the place in 1854; since then it has not been fortified. See Kennan, *Trav. Life in Siberia* (5th ed. New York, 1879); and Guillemand, *Cruise of the Marchesa* (2 vols. Lond. 1887).

Kamenetz-Podolsk (Polish *Kamieniec*), capital of the Russian government of Podolia, is picturesquely situated near the frontier of Austrian Galicia, on a steep rock above the river Smotritza, an affluent of the Dniester, 243 miles NW. of Odessa and 40 NE. of Czernowitz. There are a Roman Catholic cathedral (1361), a Greek cathedral (16th century), and an Armenian and several other churches. The town was destroyed by the Mongol chief Batu in 1240; taken by the Turks in 1672; returned to the Poles in 1699; and annexed by Russia in 1795. Previous to the partition of Poland Kamenetz was one of the strongest bulwarks of that country against the Turks. Pop. (1871) 22,611; (1897) 34,483, one half Jews.

Kamenz, a small manufacturing town of Saxony, 22 miles NE. of Dresden by rail. It was the birthplace of Lessing. Pop. 7211.

Kames, the name given by geologists to banks and ridges of gravel, sand, &c. associated with the glacial deposits of Scotland. See ASAR.

Kames, HENRY HOME, LORD, a Scotch philosopher, was born in Berwickshire in 1696, called to the bar in 1723, and by his merits fought his way upwards to a leading position there, being raised to the bench as Lord Kames in 1752, and made lord of justice in 1763. He divided his energies between law and philosophy, and was no less noted for his amiability, his conversational powers, his public spirit, and his agricultural enterprise at Blair-Drummond in Perthshire. He died at Edinburgh, 27th December 1782. Besides books on Scotch law he published a series of works more ingenious and interesting than well written: *Essays on the Principles of Morality and Natural*

Religion (1751), a defence of the doctrine of innate ideas at the expense of the freedom of the will; *An Introduction to the Art of Thinking* (1761), and *Elements of Criticism* (1762), two works much less satisfactory than ingenious; and *Sketches of the History of Man* (1774), a miscellaneous and curious collection of speculations on all manner of subjects.

Kampen, a town of Holland, situated near the mouth of the Yssel, $5\frac{1}{2}$ miles by rail NW. of Zwolle. It was formerly a Hanse town and had a considerable trade, which gradually left it as the mouth of the Yssel sanded up. But since the middle of the 19th century the river approaches have been improved, and the trade of the town is reviving. The church of St Nicholas is one of the finest mediæval churches in the country. Pop. (1840) 7760; (1876) 16,454; (1889) 18,767, who are engaged in shipbuilding, commerce, fishing, and tobacco manufacture. Kampen is the Gotham of the Dutch.

Kämpfer, ENGELBERT, German traveller, was born at Lengo, in Lippe, on 16th September 1651, studied medicine at Königsberg, and travelled (1683-94) in India, Java, Siam, and Japan, during which time he spent two years (1692-94) in the last-named country. He died on 2d November 1716. He published *Amoenitates Æthiopicæ* (1712), and after his death appeared his *History of Japan and Siam* (Lond. 2 vols. 1727). Most of his writings exist in MS. in the British Museum.

Kamptulicon. See FLOORCLOTH.

Kamtschatka. See KAMCHATKA.

Kamthi, or KAMTHI, a town and cantonment of the Central Provinces, India, lying 9 miles NE. by rail from Nagpur, on the Kamhan River, here crossed by a fine stone bridge, has a trade in grain, timber, cattle, salt, and piece-goods. Pop. (1881) 50,987; (1891) 43,159. The town dates from the establishment of the cantonment in 1821.

Kanagawa. See YOKOHAMA.

Kanakas. See COOLIES.

Kanara, NORTH, a coast district of Bombay, the most southerly in the Konkan (q.v.), lies south-east of Goa, and has an area of 3911 sq. m.; pop. (1891) 446,351, mostly Hindus, speaking Kanarese (see INDIA, p. 103). For the most part it is a wild forest-country. —SOUTH KANARA, immediately south of North Kanara, belongs to Madras. Its area is 3902 sq. m.; pop. (1891) 1,056,051, over four-fifths Hindus. This district also contains a great extent of forest land, and numerous wild animals. The capital is Mangalore. Both North and South Kanara are partly occupied by the Western Ghâts, contain numerous rivers, and have a heavy rainfall. In both, also, malaria is very prevalent, especially during the monsoon.

Kanaris, CONSTANTINE, a hero of the Greek war of independence, was born in the Isle of Ipsara in 1785, and was master of a small merchant-vessel before the commencement of the war. In 1822 he blew up the Turkish admiral's ship in the Strait of Chios, and later in the same year repeated his feat in the harbour of Tenedos. In August 1824 he avenged the ravaging of Ipsara by burning a large Turkish frigate and some transport-ships which were carrying troops to Samos, and next year was only prevented from burning the Egyptian fleet in the harbour of Alexandria by an unfavourable wind springing up. He was appointed to important commands by the Greek president, Capo d'Istrias, was made senator in 1847, and was minister of marine (1854-55). He took part in the revolution of 1862, and held office repeatedly under the new king. He died 15th September 1877.

Kanauj, one of the great legendary centres of Aryan civilisation in India, to which the Hinduism

of Lower Bengal attributes its origin, stood originally on the Ganges, 65 miles NW. of Lucknow. At present the site consists of a vast number of ruins, extending over the area of five villages, about 4 miles from the Ganges; the river having slightly altered its bed. The most remarkable buildings are Mohammedan mausoleums. Its most prosperous era was the 6th century; early in the 11th it fell before the sultans of Ghazni. Among the ruins there is a modern town of some 17,000 inhabitants.

Kanawha. See CHARLESTON, GREAT KANAWHA.

Kanazawa, a town of Japan, on the west coast of the main island, NW. from Tokyo, manufactures porcelain and silk. Pop. (1896) 88,877.

Kanchinjanga. See KINGHINJINGA.

Kandahar, or CANDAHAR, the capital of central or southern Afghanistan, situated about 200 miles to the SW. of Kabul. It stands in 32° 37' N. lat. and 66° 20' E. long., 3484 feet above the level of the sea. It is in the form of an oblong square, while all its streets run straight, and cut one another at right angles. At the point of intersection of the two main streets there is a large dome (*Charsa*), 50 yards in diameter. Pop. variously estimated from 25,000 to 100,000. Kandahar is well watered by two canals drawn from a neighbouring river, which send to almost every street its own adequate supply; and the same means of irrigation have covered the immediate vicinity with gardens and orchards. Kandahar is a place of great commerce, trading with Bombay, Herat, Bokhara, and Samarcand. Among its permanent residents Kandahar has a larger proportion of Afghans, chiefly of the Durani tribe, than any other city of Afghanistan. There are numerous Hindu, Tajik, and Persian merchants. About 2 miles to the northward rises a precipitous rock, crowned by a fortress impregnable to everything but heavy artillery. Here, amid all the disasters of the war in 1839-41, the British maintained their ground under Rawlinson. Kandahar has been a pivot for the history of that part of Asia during more than 2000 years. It is supposed to have been founded by Alexander the Great, although the name is Persian. A comparative blank of upwards of thirteen centuries in the history reaches to the famous Mahmud of Ghazni, who wrested the strong hold from the Afghans. From that epoch down to 1747, when the native rule was permanently established, Kandahar, with brief and precarious intervals of independence, was held by Genghis Khan, Tamerlane, and by various rulers of Tartary, India, and Persia in turn. In the war of 1878-80 the British entered Kandahar unopposed, and they held the city till 1881, some months after they had evacuated the rest of Afghanistan (q. v.). Through its being touched by the Sibi-Pishin Railway (1891) on the south, Kandahar has greatly increased in political as well as in commercial importance.

Kandavu, one of the Fiji Islands (q. v.).

Kandy, an inland town of Ceylon, on a beautiful little lake among the mountains, 74 miles by rail NE. of Colombo. It is 1665 feet above the sea, and has a mean annual temperature of 76° F. Here are ruins of the palace of the former native kings, and a temple in which a reputed tooth of Buddha's is jealously preserved (see CEYLON). Pop. (1881) 22,926; (1891) 29,252.

Kane, ELISHA KENT, an Arctic explorer, was born in Philadelphia, United States, 3d February 1820, graduated in medicine at the university of Pennsylvania in 1842, and entered the navy as a surgeon, in which capacity he visited China, the East Indies, Arabia, Egypt, and western Europe,

subsequently the west coast of Africa and Mexico; in this last country he did duty on the coast survey. In May 1850 he commenced his career of Arctic discovery as surgeon, naturalist, and historian to the first Grinnell expedition. His account of it appeared at New York in 1854, entitled *The United States Grinnell Expedition*. In the spring of 1853 he again set out, this time as commander of an expedition; the results of it are fully detailed in his *Second Grinnell Expedition in Search of Sir John Franklin* (2 vols. Phila. 1856). He died at Havana, where he had gone for his health's sake, on February 16, 1857. See Life by W. Elder (Phila. 1858), and the briefer one by M. Jones (Lond. 1890).

Kane, SIR ROBERT, chemist, was born in Dublin, 24th September 1809. He was educated for the medical profession, in 1832 was received as a member of the Royal Irish Academy, and in the same year projected the *Dublin Journal of Medical Science*, which, at first confined to chemistry and pharmacy, was afterwards extended to include practical medicine. In 1840 he received the gold medal of the Royal Society of London for his researches into the colouring matter of lichens, and in 1847 the Cunningham Gold Medal of the Royal Irish Academy for his discoveries in chemistry. From 1834 till 1847 Kane was professor of Natural Philosophy to the Royal Dublin Society. In 1846 he originated the Museum of Industry in Ireland, was appointed its first director, and the same year received from the Lord-lieutenant the honour of knighthood. He held for a number of years the office of president of the Queen's College, Cork, which he resigned in 1873, together with the directorship of the museum. In 1877 he was elected president of the Royal Irish Academy, and he died 16th February 1890. His chief books are *Elements of Chemistry* (1842) and *Industrial Resources of Ireland* (1844).

Kangaroo (*Macropus*), a genus of marsupial quadrupeds, of which there are many species, almost all Australian, although a few are found in New Guinea and neighbouring islands. The genus, as now restricted, contains, according to the most reliable estimate, twenty-three species. The kangaroos are of different sizes: some of the Wallabies, which

The Great Kangaroo (*Macropus giganteus*).

really belong to the same genus, being comparatively small, while the Great Kangaroo (*M. giganteus*) attains a length of 8 feet, counting the long tail.

They are entirely herbivorous—mainly grass feeders—and the two lower incisors, which are elongated, play upon each other like the blades of scissors and crop the grass. The tail is very thick and strong, and the animal uses it as a third leg when moving slowly. The hind-legs are very strong, while the fore-limbs are short. They are very powerful animals, and the hind-limb forms a very effectual weapon for ripping open the bodies of dogs, with the aid of which they are sometimes hunted. They make enormous bounds, and get over the ground very swiftly and gracefully. Some kangaroos can jump a fence 11 feet high; most can jump one of 9 feet. In the districts where they are still numerous, they are formidable consumers of pasture; two kangaroos eat as much grass as three sheep. They are treated as vermin, being hunted, shot, poisoned, or killed by means of extensive battues—'yarding' or 'driving'—when parties of horsemen chase them into enclosures and kill them there, many hundreds at a time. The skin is valuable for leather, both for shoes and gloves. The flesh is good eating, the tail being a delicacy, and producing excellent soup. The great kangaroo was discovered in 1770 on the coast of New South Wales during Cook's first voyage. One of the most remarkable types of kangaroo is the Tree Kangaroo (*Dendrolagus*), in which the hind-limbs have become proportionately shorter in accordance with its arboreal life. The kangaroos and Wallabies breed freely in the Zoological Gardens at London, and the young, as in all Marsupials (q.v.), are born in a very imperfect condition. They remain within the pouch of the mother, or retreat there in case of danger, long after they have ceased to be nourished by the maternal milk.

Kangaroo Apple, a species of Solanum (q.v.) (*S. laetatum*), with a somewhat shrubby succulent stem, smooth pinnatifid or entire leaves, and lateral racemes of flowers; a native of Fern, New Zealand, Australia, and Tasmania, in which latter countries its fruit is called kangaroo apple, and is used as food. When unripe, it is acrid, and produces a burning sensation in the throat; but when perfectly ripe, it is wholesome.

Kangaroo Grass (*Anthistria australis*), the most esteemed fodder-grass of Australia. It grows to a height much above that of the fodder-grasses of Britain, affords abundant herbage, and is much relished by cattle. The genus is allied to Andropogon, and has clusters of flowers with an involucre. The awns are very long and twisted, both in the kangaroo grass and in a nearly allied species, *A. ciliata*, which is one of the most esteemed fodder-grasses of India.

Kangaroo Island, an island of South Australia, at the mouth of the Gulf of St Vincent (see map at ADELAIDE), is 87 miles by 34 broad, with a fine climate, poor and sandy soil, and 379 inhabitants—all white.

Kanizsa, the name of two towns in Hungary. (1) Nagy (or Great) Kanizsa, 136 miles by rail SW. of Budapest, has an active trade in agricultural products, and manufactures bricks, beer, and spirits. Pop. 18,473.—(2) Old Kanizsa (Kanizsa) stands on the Theiss, 15 miles SSW. of Szegedin. It grows corn and tobacco, and rears cattle and sheep. Pop. 15,069.

Kano, capital of a province of the same name, in the Negro state of Sokoto, Central Africa, stands in the middle of the country, about 250 miles SSE. of the city of Sokoto. The province, estimated to contain 500,000 inhabitants, has from its beauty and wealth been called the 'Garden of Central Africa.' The wall which surrounds the town of Kano is 15 miles in circuit; but the wall embraces, besides houses, gardens and cultivated fields. The

place is the chief town of the Haussa (q.v.) race. Pop. (according to Robinson) in 1896, 100,000.

Kansas, the central state of the American Union, and the eighth in area, is bounded N. by Nebraska, E. by Missouri, S. by Indian Territory, and W. by Colorado. It is about 400 miles from east to west, and 200 from north to south, and contains an area of 82,080 sq. m. The surface is for the most part a rolling prairie, rising in the north-west to between 3000 and 4000 feet. Along the eastern boundary the average elevation is 800 feet, and the rise is so gradual as to be imperceptible; there are no mountains in the state. The bottoms along the larger streams are commonly called valleys, and vary from $\frac{1}{4}$ mile to 5 miles in width; in eastern Kansas they are deeply depressed, and are skirted by bold bluffs rising to 300 feet, but in the west the line between valley and upland can hardly be distinguished. Kansas has no navigable river except the Missouri, which forms a portion of its eastern boundary. The Kansas or Kaw drains nearly half the state, and the Arkansas drains another large portion; the Neosho and Marais des Cygnes furnish the water system of south-eastern Kansas. The larger streams, as the Kansas and Arkansas, are rivers of the plains, with light banks and sandy bottoms; but many of the smaller rivers have rock bottoms, and supply abundant water-power. The timber of the state is found in a narrow belt along the watercourses, principally in the east.

Kansas has a climate subject to extremes of temperature, but neither excessive cold nor heat prevails for long periods. There is a great proportion of bright, clear weather in all seasons of the year. While a record of 106° F. above zero has been observed, cases of fatal sunstroke are unknown, and men pursue their ordinary outdoor avocations with scarcely an interruption throughout the year. The mercury rarely falls below zero, and in many seasons the farmers plough during every month of winter. The mean annual rainfall is 37.10 inches; but in the west the supply is much more scanty, and in the upper Arkansas valley irrigation by means of ditches has been introduced. The average annual temperature is 53° F.

The minerals of Kansas include lead and zinc in abundance in the south-east; coal of excellent quality, the coalfield occupying all the eastern portion of the state; lignite in the west; immense beds of rock-salt; and mineral paint, gypsum, good building-stones, brick clay, and material for hydraulic cement. The output of coal in the year 1890 was 2½ million tons, of lead 5000 tons, and of zinc 20,000 tons.

Kansas is an agricultural and pastoral state. The soil throughout is uniformly fertile, but there is a considerable difference in actual productiveness owing to the difference in the rainfall. The area under wheat, maize, and oats is over 10,000,000 acres (1895). The annual produce of wheat may be set down as upwards of 70,000,000 bushels, of maize nearly 150,000 bushels, of oats 45,000,000 bushels, besides rye, barley, buckwheat, flax, potatoes, beans, peas, sorghum (for sugar), and tobacco. Great quantities of prairie hay are cut on the still uncultivated prairie lands. The state is especially suitable for cattle raising, large stocks of cattle and swine (as well as horses, sheep, &c.) are kept, and meat packing is a great industry in Kansas City. Creameries are numerous, and more and more attention is given to the raising of blooded stock. Forestry also has engaged the attention of the farmers, and thousands of acres of planted timber now break the surface of the prairie.

The manufacturing industries are chiefly those

connected with agriculture and stock-raising. Of these the most important is beef and pork packing, the principal establishments being at Kansas City. The flouring-mills are next in importance, and then the foundries, and the manufacture of stoves and agricultural implements. The building of railways began in Kansas in 1860; in 1890 every county in the state save five had one or more lines, their total length exceeding 8800 miles.

Kansas is divided into 106 counties, and sends two senators and seven representatives to congress. State officers and members of the legislature are elected every two years. The marked features of the constitution are the liberal Homestead (q.v.) exemption; the privileges of married women, who may carry on business and hold property as if single; the suffrage provisions, which allow women to vote at school and municipal elections; and the prohibitory statute which forbids the manufacture or sale in Kansas of intoxicating liquors for other than medicinal or mechanical purposes. There are insane asylums at Topeka and Osawatomie, a boys' reformatory at Topeka, an asylum for the blind at Kansas City, a Soldiers' Orphans' Home at Atchison, an institution for the education of the deaf and dumb at Olathe, and an asylum for idiotic and imbecile youths at Winfield; and the state in 1889 adopted also the industrial school for girls at Beloit. In each township two sections (1250 acres) have been given to the common schools, and the sale of these lands forms the basis of the permanent school fund, which amounts to about \$5,000,000. The annual expenditure is also about \$5,000,000. In 1890 there were 12,152 teachers, instructing 389,570 children in the elementary schools, besides 218 teachers in 16 secondary schools, with 3950 pupils. The state also maintains a university at Lawrence, which had 542 students in 1890; an agricultural college at Manhattan (514 students); and a normal school at Emporia (1120 students). There are also a number of denominational and other colleges in the state. Co-education prevails, with hardly an exception.

History.—Kansas when first known to white explorers was occupied by several tribes of Indians, from one of which, the Kaw or Kansas Indians, the river and the state derive their names. The state, save a small fraction, was acquired in the Louisiana purchase, and was organised as a territory by the passage of the Kansas-Nebraska Act in 1854. The act provided that the question of the existence of slavery as a permanent institution in the territory should be decided by its people. Kansas at once became the battle-ground between the partisans of slavery and freedom. Large parties from the bordering slave-state of Missouri repeatedly invaded the territory; and armed colonists from South Carolina and other southern states came to take possession. These were met by immigrants from the northern states. Both parties started towns and settlements. Elections were attempted, but resulted in the seizure of the polls by the pro-slavery party and the refusal of the Free State party to abide by the declared results. Collisions became numerous, and robberies and murders were committed. The Federal administration sided with the pro-slavery party, and used the government of the territory and the United States troops against the Free State party. John Brown (q.v.) took part in the civil war which prevailed, and many fights that were almost battles took place. The Free State party was steadily reinforced from the north, and by the year 1857 seemed everywhere in the ascendant; but as late as May 1858 occurred what is known in Kansas history as the 'Marais des Cygnes massacre,' in which six Free State settlers were killed and four badly wounded by a

party from Missouri. After several futile endeavours to organise, however, the Wyandotte constitution was finally adopted in 1859, and on the 29th of January 1861 Kansas was admitted as a state of the Union. The civil war immediately followed. Out of a population of 100,000 Kansas sent 20,000 soldiers to the field. Kansas suffered greatly throughout the war, but the building of railroads, begun during its continuance, was pushed with energy at its close; immigration poured in on a scale before unknown in America, and the career of the state has since been one of almost uninterrupted prosperity. The population of Kansas in 1860 was 107,206; in 1890 it was 1,427,096. The population of the principal cities in 1890 was: Kansas City, 38,316; Topeka, the capital, 31,007; Wichita, 23,853 (as compared with 4911 in 1880); with Leavenworth, Atchison, and Fort Scott below 20,000 and above 10,000.

Kansas City, the second city of Missouri, and one of the great towns of the west, is situated on the south bank of the Missouri (here crossed by a fine railway bridge), where the river makes a sharp bend to the east, 283 miles by rail W. by N. of St Louis. The notable part of the city is built upon a series of steep hills, but the site has been greatly improved by grading. Large sums have been spent in laying sewers and water and gas pipes; and cable-tramways extend in all directions, the lines having a total length of at least 35 miles. The state frontier-line bounds the city on the west, and consequently a large suburb on this side, also called Kansas City, is in the adjoining state of Kansas. This suburb, connected with Kansas City by a remarkable elevated railway, has a population of some 40,000, and contains great stock-yards and pork-packing establishments. The larger Missouri town possesses numerous fine streets, and handsome residences on the hills. Its public buildings include many well-designed churches, a fine United States court-house, the imposing building of the Board of Trade, and several hospitals; there are two medical colleges here, and about thirty public schools. The city is the terminus of a number of important railways, and is a principal distributing centre for the rich agricultural region to the south and west. The sales of farming implements alone in 1887 reached \$15,000,000. There are great grain-elevators and stock-yards, and pork-packing is a principal industry; while the manufactories, mostly in the lower section of the city, turn out railroad iron and car-wheels, shot, flour, beer, butterine, soap, furniture, &c. Pop. (1860) 4418; (1870) 32,260; (1880) 55,785; (1890) 132,618. The assessed valuation in this last year was \$53,017,290. See a paper by Charles Dudley Warner in *Harper* for October 1888.

Kansas River is formed by the junction of the Smoky Hill Fork and the Solomon River, in Kansas, at about 97° 25' W. long., and flows generally eastward to the Missouri, which it enters just above Kansas City. Length, nearly 300 miles, or including its forks, 900 miles. Its chief tributary, the Republican River, has a length estimated at 550 miles. The importance of the Kansas River for navigation is, however, not great.

Kan-su', the most north-western province of China (q.v.).

Kant, IMMANUEL, probably reputed at present the greatest of all modern philosophers, was born April 22, 1724, at Königsberg, in East Prussia, where, February 12, 1804, in the eightieth year of his age, as professor of Philosophy in the university, he died. His life, as that only of a student and a teacher, offers few vicissitudes. His parents were of humble life, but pious,

respectable, good people—his father a saddler, or, more properly, a strap-maker. The tradition is that the family was of Scottish descent, and that the name was originally spelt Cant. The tradition is probably perfectly correct as regards the descent; but even Kant's grandfather is found to have had his name already spelt Kand or Kant. So far as school and college are concerned Kant may be considered as thoroughly educated; but during the whole course of these, up to his twenty-third year, he must, as regards comfort, have had but a poor and straggling time of it. For the following nine years Kant supported himself as a family tutor, the usual resource of the ordinary German student, or indeed of the poor ambitious student anywhere. Becoming doctor of philosophy in 1755, he qualified himself in the same year as a *privatim docens*, and, as such, he remained for fifteen years what we would call a private lecturer, though in connection with the university. Not till 1770, when he was forty-six years of age, did Kant become an ordinary professor there (about four years before that he had been promoted to a sub-librarianship, with an annual dole of some eleven pounds sterling). For nearly fifty years, then, we may say that Kant was a teacher of philosophy at Königsberg—a very general one, for he had to embrace in his lectures mathematics, physics, logic, metaphysics, natural theology, anthropology, physical geography, and, more still, *Philosophical Encyclopædia*, to say nothing of pyrotechnics and the art of fortification! There can be no doubt that Kant was acceptable as a teacher, and that his lectures were well attended. We have an interesting testimony from Herder to that effect. His most popular course, however, was, probably, his shallowest—that, namely, on physical geography—though not without features, as well curious in Kant's regard, as, in themselves, interesting and instructive. Only during the last twenty years of his life can it be said that Kant was famous. Before that, even the correspondence with Lambert and Mendelssohn is insufficient to show that his excellent reputation locally had ever been sensibly more general. With or without name, he was the author of a separate work or two that had made no mark; and he had occasionally written creditable papers in the public journals, principally of his own neighbourhood. He was a small, thin, somewhat rickety, bundle of bones; scarcely 5 feet high; as the Scotch say, an *unb-firmit* little body; honest, truth-speaking, perfectly well conducted, though not remarkable for his attendance in church; kindly and gracious, and, in his own slender, pedantic-easy way, sufficiently hospitable; but, as evinced by the modest request he refused to the sorely-straitened Fichte, with a tight enough grip on his own little sayings.

The writings of Kant can be respectively assigned to three periods, according as they precede, follow, or belong to the dates of his three great *Kritiken* (Critiques). Of these the first is the critical date, 1781; and of the whole period that precedes it the writings are, letters included, some thirty in number. Now, let them be as they may, it is not perhaps improbable that, had Kant died the author of these writings only, both he and they would have been long ago forgotten. Neither his *Thoughts on the True Estimate of Living Forces*, nor his *General Natural History and Theory of the Heavens*, nor his *Dreams of a Visionary illustrated by Dreams of Metaphysics*, nor even his Latin dissertation *De Mundi Sensibilis atque Intelligibilis Formæ et Principiis*, would have availed, it may be, to operate a diversion whether for works or workman. There is, of course, in one of the smaller papers, the hint on Kant's part that the

opposing course of the tides is possibly acting in retardation of the rotatory motion of the earth; but, otherwise, the four essays named form all that is of any veritable importance in the first literary period of Kant. Not but that, generally, all through this period, there is evidence of much information and much intelligent curiosity on the part of an earnestly-thinking nature that has already attained to a certain largeness and freedom of scope. The *Thoughts on the True Estimate of Living Forces* was Kant's first publication, and is sufficiently creditable to a young man of twenty-three, though on a question that at that moment had been for some time already authoritatively settled. It is, however, difficult to find in it either the comprehensive inaugural programme of his idolaters, or even the prophetic excellences of his more moderate admirers. The *Theory of the Heavens* was published in 1755; and as regards the suggestion of a nebular hypothesis in that reference Kant deservedly claimed for himself the priority whether we look to Herschel or Laplace. Here, too, nevertheless, Kant only met with his usual bad luck for long. The little anonymous booklet of two hundred pages attracted no attention, not even that of the king, to whom it was dedicated. It may be attributed to Kant as a merit that, at this early date, he speaks of the possibility of there being planets in existence beyond Saturn, as there is to be found in the *Physical Geography* a similar conjecture as regards the existence of what are now called the asteroids. But in the latter reference Kant was not the first; while his suggestion in the former was an inspiration from an idea of his own in regard to comets. What, he asked himself, if, out and beyond Saturn, there were planets in paths increasingly eccentric which, as it were, would tend on the whole to make comets of planets! It is but just to note that, a year before its publication, the *Theory of the Heavens* had been already announced in the essay that concerns the earth's rotation. When one thinks of what speculations must have occupied at this time the mind of Kant, one must acknowledge that all this speaks volumes for the industrious inquiries and the ardent and original reflections of this young man of thirty.

Published in 1766, Kant's *Dreams of a Visionary* is a rather remarkable paper. Kant, all his life, at least longed to believe in the immortality of the soul and the actuality in existence of a world of spirits. He was very much impressed, accordingly, by all those stories in regard to the supernatural intuitions of Swedenborg, so much so, indeed, that he had actually bought, at the enormous expense of seven pounds sterling, the eight quarto volumes of the *Arcana Cælestia*. And it is in consequence of his reading in these volumes that he is led to write, half-seriously and half-ashamed, this little, for him exceptional, paper, that is, however, only in the air. Not but that there are, in all probability, signs to be detected in it of that study of Hume at last that led in the end to what has determined itself as his proper work and as his proper worth. These, however, are but obscure and semi-articulate hints, and can hardly be regarded as sufficient to justify the editors of Kant in characterising this writing as 'announcement of his greater enterprises.' The *Dissertatio de Mundi Sensibilis atque Intelligibilis Formæ et Principiis*, published in 1770, is really the first of these, his critical endeavours. It professes to speak of the form and principles of both of the worlds to which we may be said to belong; and it certainly succeeds to its own wish in regard to one of them. For the world of the senses, namely, it does find, before experience, and in anticipation of experience, actual elements of experience that are not due to experience at

all, perceptions of things that are not due to the perception of things, but only to the mind itself, only, as it were, to projections from within that throw themselves without, and stand around without. These are Time and Space, which, original or native to the faculty itself, are the *a priori* forms of perceptive sense. That, at least, is the conclusion of Kant; and, in that regard, he is now about as complete in the *Dissertation* as he was eleven years afterwards in the *Critique*. A similar completeness does not follow him at present, however, in respect to the other or *intelligible* world, the world of ideas, of the intellect, the name of which also runs in the title. Probably no one reads this Latin work in these days; but if any one attempts it, most assuredly he will find himself, in regard to what of the *intelligible* world he is to understand he has learned from it, only exasperated. It is only possible to suppose of Kant here, that, having succeeded to his mind in the discovery of *a priori* forms of sense, he can as yet only search and search, and find himself vaguely and variously *hugged*, in a similar attempt with reference to the *a priori* principles of the understanding, the intellect. For success in that respect he had still to wait for the coming into his mind of the idea of school-logic and the forms of the syllogism.

That was the triumph of the great work of 1781, the *Critique of Pure Reason*. We know that what led to the whole work of Kant was the endeavour on his part to find in the proposition of causality that apodictic necessity, and that rationale of it, which Hume, as against his own solution of custom, habit, challenged from philosophy and the world at large. *Every change must have a cause*. Yes, said Hume, but such an affair as change can only be known by experience; without experience it would be unknown. Consequently, then, it is but a fact of experience, and, like every other such fact, we know that it *is*, but not that it *must* be. The necessity we attribute to its appearance is only a necessity of custom. On the contrary, says Kant, we really do attribute to any appearance of change a perfect certainty of necessity, a necessity absolute, a necessity, not a dot or a jot, not one iota less apodictic than we attribute to any proposition, to any axiom of the mathematics. That the shortest line is the straight line—our conviction in that respect is not more fixed, assured, immovable, than our conviction that every effect, every change, *must* have a cause. And so far, no doubt, Kant was right. But what, then, further, of the reason of this necessity, the rationale of it, the explanation of it? Seeing that the proposition of causality is really an inferential proposition—a proposition with a conclusion, as it were, from premises—one would have thought it natural on the part of Kant to turn, in the first place, to the consideration of reason and reasoning rather than to the consideration of actual perception and sense. But, probably, as has just been named, it was the suggestion of mathematics that led to this. To explain the necessity of mathematics might be to explain also the necessity of causality. We can leave Kant's consequent proceedings to be pictured here; it is not difficult to realise how he came to his conclusion and to his belief in it. A mathematical truth depended just on the fact of perception; but, inasmuch, again, as a mathematical truth was an apodictic truth, the perception on which it depended could not be a perception of experience. Such perception could not be a *posteriori*; it must be a perception absolutely independent of experience; a perception, consequently, then, special, proper, and peculiar; a perception *sui generis*—a perception *a priori*! But how could that be? Why, only by space, which was the source and

the seat, and, so to speak, the blackboard and tablet of mathematics, being itself *a priori*. But if space were *a priori*, so would time be. As we have seen from the *Dissertation*, this of a *proxi* perception, was probably Kant's first acquisition and conquest—towards the rationale he sought. Evidently, however, it was still inadequate to the want. Time and space might be *a priori*, but change, a mere experience of special sense, could not lie there. Could we not add from the intellect an inferential *a priori* form, which, availing itself of the *a priori* perceptive form, might, in combination with it, give birth to an *a priori schema* in supply of the entire virtue of necessity to every actual instance of causality that could possibly emerge? It was here now that the suggestion of logic gave to Kant his whole tree of *Categoris* as *synthesis* in correspondence with the *analysis* of the functions of Judgment. Judgments, propositions, were universal, particular, singular; affirmative, negative, infinite; categorical, hypothetical, disjunctive; problematic, assertoric, apodictic. So far, what was concerned was in its nature analytic; but if we supposed an equal number of synthetic functions, then under the same four general rubrics of Quantity, Quality, Relation, and Modality, we should have the twelve correspondent categories of unity, multitude, allness; reality, negation, limitation; substance, causality, reciprocity; possibility, actuality, necessity. It is impossible to follow Kant here in the working-out of all that; but it is really enough to understand as much.

These categories now were *constitutive*; they actually entered into the composition and constitution of things as these presented themselves for the perception of sense. That is, as acting on the *a priori* perceptive matter, or manifold of space and time, they (the categories) gave rise to a pure or *a priori* perceptive-intellectual *schemata* that, combining with the sensations of sense as these came into consciousness (from whence they might), produced, in projection around us, this ruled and regulated, orderly, intelligible universe, in which the necessity due to the categories was the very source of law. To these constitutive materials there were added, *regulatively*, the three *Ideas*. Determined by the Category of Relation in the three forms which are found under it, there are, generically, three forms also of the logical syllogism, applicable respectively to the unconditioned of the *categorical* synthesis in a subject, of the *hypothetical* synthesis of the terms of a series, and of the *disjunctive* synthesis of parts in a system. And these results, otherwise named, are the objects of psychology, cosmology, and theology, or the soul, the world, and God. These, however, are but ideas—only centres, as it were, for further simplification and regulation among the categories themselves. It is for the *Critique of Practical Reason* now to come in and extend at least the conviction of existence to these transcendental objects of soul, world, God; and what supplies authority and fulcrum to this critique in this is the *categorical imperative*—the fact of the practical ego possessing a categorical imperative in determination of its own will. Considering that the ego, *theoretically*, was declared to be no more than an idea—no more, so to speak, than a mere logical dot on a mere logical *l*—it is hard to understand how, *practically*, it can rise at once into such throne of an autocrat. But this is certain: it is for his practical critique that Kant deserves all our heartiest praise. So much has Kant what he writes at heart here that all seems to issue at once from within him in a single breath. No purer, no more living morality, has ever been professionally produced by philosopher than glows in the *Ethics* of Kant.

It would appear that when Kant had accomplished as much as this, he turned back to look upon it and reflect. I have found, he seems to have said to himself, my Categories in the *a priori* of the understanding, and my Ideas in the *a priori* of the reason. That is enough for our theoretical and practical interests; but what of our only other generic interest that remains—what of our interest that we call *aesthetic*? That refers to a function on our part that seems intermediate between the other two—the theoretical and practical functions. But these depending respectively on the Understanding and Reason, is there nothing similarly intermediate between these two again? Yes, there is Judgment. And so it was that Kant was led to his third great critique, the subjects of which were generally, to say so, the products of Art—i.e. Beauty, Sublimity, Design. Beauty originated in the harmony of our own two constitutive elements—sense on the one side and intellect on the other. Sublimity was the feeling of the exaltation in mind above every menace and magnitude of sense. Since design, so to speak, meant evident arrangement by another hand as though from without, it was impossible to give it place, on such terms, in our world; which, in the contributions of special sense (mere sensations), in time and space, in the categories, the ideas, and all else, was only a world within—a world, indeed, all but wholly of our own construction within. We could only say of it (design), in such circumstances, that we ourselves were so fashioned that we could only see into our world *as though* it were the product of an understanding.

Among the remaining works of Kant there are some of considerable bulk and some interest, but little value—at least so far as originality is concerned. Such are the *Anthropologie* and the *Logik*. The *Streit der Facultäten*, *Rechtslehre*, *Tugendlehre*, *Religion innerhalb der Grenzen der blossen Vernunft*—all are well worth reading, and will greatly help to a general understanding of their author. In that latter respect the *Prolegomena*, the criticism of Eberhard, and the essay on the Progress of Metaphysics since Leibnitz and Wolff, are specially to be signalised, and may even be named indispensable. The essay in the philosophy of nature, *Metaphysische Anfangsgründe der Naturwissenschaft*, cannot well be neglected, and still less, perhaps, various little essays in natural history. Even the critique of Herder will be found good, and, just on the whole, it may be said that no work on Kant's part, however small, should, if belonging to the middle or concluding period, fail to be read. The little essays that bear on natural history, for example, however unimportant they may appear, contain more than one declaration that is of interest, in so far as Kant, though averse, probably, to the dogma of direct creation, has yet, in his perception of the existence of ideas, and of actual concert on ideas, in nature, never a thought of even the suggestion of a mechanical evolution through chance.

It is impossible to overrate the enormous impulse which Kant has been the means of giving to the study of philosophy, both in Germany and everywhere else (as well in America and the East as in Europe). Quite a host of names, besides those of Jacobi, Fichte, Schelling, Hegel, Herbart, Krause, Schopenhauer, Schleiermacher, might be mentioned in this connection. It is not quite certain, however, that Kant's work will prove to have been more in the end than one principally of suggestion. We know not but that, if all that monstrous gaunt machinery—*aesthetic*, analytic, what not—had been offered precisely as the machinery proper for the production of the necessity in causality we know not but that, if all that

monstrous gaunt machinery (time and space themselves shut up within it) had been seriously offered, for that purpose, from Germany, and in the time of *Hume*—we know not but that it might have been received with something more unequivocal than a smile! But be that as it may, and assuming the constructions of Kant to prove in themselves neither a solution for the problem of the universe, nor yet for the problem of causality, we have still to bear in mind what *suggestion* in his regard means. Apart all consideration of his followers, the truth is that it is to Kant we owe—with discount only of all necessary historical addition—our entire metaphysical material at present. Really, whatever metal of speculation is anywhere turned now, the ore of it was Kant's. The *Critique of Pure Reason*, if not precisely to be named a liberal education, very certainly is, has been, and will remain, an education in philosophy.

BIBLIOGRAPHY.—A complete bibliography of Kant would cover pages, and is beyond the proportions of this publication. We name only what will probably be found most useful. Of the whole works four editions may be mentioned, those of Rosenkranz and Schmbert (Leip. 1838 42); of Hartenstein (Leip. 1838-39); again of Hartenstein (Leip. 1867 69); of V. Kirchmann (Leip. 1868, and further). Benno Erdmann (Leip. 1880) edits a notable edition of the *Critique of Pure Reason*, and Reclam, of Leipzig, publishes a very useful small edition of the same work, edited by Kehrbach. Of translations of the *Critique of Pure Reason* into English there are those of Meiklejohn and Max Müller, and the text-book to Kant of Stirling. Abbott and Bax also translate into English important works of Kant, the one the *Ethics* and the other the *Prolegomena*.

Of writers generally in regard to the philosophy of Kant the following may be mentioned—German: Hegel, Michelet, Erdmann, Ueberweg, Schwegler, Kuno Fischer, L. H. Fichte, Chalybaeus, Urici, Biedermann, Weigel, Portlage, Ritter, Kirchner, Drechsler, Liebmann, Haym, Oeschinger, Schaarschmidt, Zeller, Drobisch, Steffen, Wundelband, V. Hartmann, Krause, Volkelt, Hölder, Vaibinger, Staudinger, Lasswitz, Spieker, Paulsen, Thiele, Cohen, Riehl, Stadler, Thilo, Pöhring, Sigwart, Falckenberg. French: Ott, Willin, Wocquier, Foncher de Careil, Barchou de Penhoen, Saintes, Maurial, Saisset, Villers, Vacherot, Cousin. Italian: Galuppi, Testa, Spaventa, Lilla, Cesa. English: Nitsch, Wilhelm, Hodgson, Laurie, Montgomery, Bolton, Ingleby, Adamson, Seth, Hastie, Bowen, Morris, Porter, Caird, Watson, Mahaffy, Maguire, Monck, Green, Wallace, Mansel, Lewes, Nakashima, A. J. Balfour.

Kaolin, or CHINA CLAY, is fine white clay used in making porcelain. Like less pure clays, it is essentially a hydrous silicate of alumina, but it is a comparatively rare substance. The clays found in most localities contain iron in sufficient quantity to colour them red or buff when burned in a kiln, but China clay is of a pure, or nearly pure white both before and after it is fired. This, together with its refractory nature, makes it of great value in the manufacture of porcelain, of which it forms the chief ingredient. It is also used to a considerable extent by paper-makers, and in less quantity in the making of some chemical products. Kaolin is a product of the decomposition of the felspar of a granitic rock. The name Kaolin is derived from the Chinese *Kao-ling*, 'high ridge,' the name of hills near King-tih-chin in Chiang-hsi, a chief seat of the porcelain manufacture in China. Clay from this district was sent to Europe early in the 18th century by Jesuit missionaries; similar clay was discovered in Saxony; and about 1755 it was discovered in Cornwall, whence the chief English supplies are obtained, some being also obtained in Devonshire in all, about 30,000 tons a year. Kaolin is found in France, and in Nebraska and other states of the American Union; in the United States the annual consumption is some 18,000 tons. See CORNWALL, FELSPAR, POTTERY.

Kapellmeister (German), the director of an orchestra or choir, more especially the band of a ruling prince in Germany.

Kapila, the founder of the Sankhya philosophy, one of the philosophical systems of the Hindus. He is usually reputed to have been a son of Brahma; but he is otherwise described as an incarnation of Vishnu.

Kappel. See CAPPEL.

Kara, the name of a gold-mining district, in a dreary valley in eastern Siberia, about 300 miles from Chita and nearly 5000 from St Petersburg. The mines are the private property of the czar, and are worked by convicts, of whom there are generally about 2000 stationed here. The annual yield is 6400 oz. of gold. Since 1879 Russian political prisoners have been regularly sent to this remote region. See Kennan's interesting papers in the *Century Magazine*, June-August 1889.

Kara-köl. See BOKHARA.

Karakorum. (1) a name given, but according to the best geographers erroneously, to the Muztagh range, in the western Himalayas; sometimes also it is given, again erroneously, to the Kuen-Lun range on the north of Tibet. The Muztagh or Muztagh range is that part of the Himalayas which lies to the west of the Indus and extends as far as the head of the Gilgit Valley. It embraces some of the loftiest peaks of the Himalayan system.—(2) The name is properly appropriate to a pass (18,550 feet), the culminating point of the route between India and East Turkestan, in 35° 33' N. lat. and north from Leh.—(3) Karakorum is also used to indicate the old Mongolian capital, to the north of the desert of Gobi, on the Orkhon, a tributary of the Selenga River. The ruins remain. For the mountains, see HIMALAYA; ASIA, p. 485; and Conway, *Climbing in the Karakorum Mountains* (1894).

Kara-kum. See KIZIL-KUM.

Karaman. See CARAMANIA.

Karamnasa, a river of India, divides Bengal from the NW. Provinces, and, after a course of 146 miles, enters the Ganges from the right. The Hindus hold it in the greatest abhorrence, and will neither drink nor touch its waters, although they are of crystal clearness and abound in fish.

Karamsin. NICHOLAS MICHALOVITCH, the greatest of Russian historians, was born on 12th December 1765, at Mikhailovka in Orenburg. His father, an officer of Tartar descent, placed him in the army, but he soon left it to devote himself to literary pursuits, and, after a tour in Germany, Switzerland, and France, established the *Moscow Journal*, and published volumes of tales, critical papers, translations, &c. The work which first gained him a high reputation was his *Letters of a Russian Traveller* (6 vols. 1797-1801). In 1803 he was appointed imperial historiographer, and from this time laboured uninterruptedly at his *History of Russia* (11 vols. 1816-29); but he only brought it down to 1613, dying on 3d June 1826 in the midst of his labours. In this great work, the first really critical history of Russia, Karamsin manifests so much enthusiastic admiration for men like Ivan the Terrible that it has been called the 'Epic of Despotism.'

Kara Sea is the portion of the Arctic Ocean lying between Nova Zembla and the Yabmal Peninsula, off the Siberian coast. The rivers Obi and Yenisei discharge their waters into its north-

eastern corner. Since Nordenskjöld's famous voyage in the *Vega* (1875) the English navigator, Captain Wiggins (who first demonstrated the navigability of the sea in the previous year), has more than once succeeded in carrying a cargo of merchandise to the mouth of the Yenisei, and getting back the same summer. The Kara Sea being thus navigable for about two months (July to September) in the year, it is hoped that it can be made available for an important trade with Siberia. Captain Hoygaard of the Danish navy urged in the *Scottish Geographical Magazine* (January 1890) that this would be the most feasible route whereby to reach the North Pole.

Karategin, a country of central Asia, forms the easternmost province of Bokhara, and has the Russian province of Ferghana (Khokand) on the north. It is a highland region (6000-7000 feet), and is traversed from east to west by the Surkhab or Kizil-su, a tributary of the Amu-Daria. Area, 8310 sq. m. In winter (October to May) the climate is very severe; nevertheless much fruit and corn are grown. The people, Tajiks by race, number about 100,000, with about 5000 nomad Kighiz. The native khans claimed to be descended from one of Alexander's captains, and only lost their independence, to Bokhara, in 1868.

Karauli (*Keroulee*), a native state in Rajputana, separated by the river Chambal from Gwalior. Area, 1208 sq. m.; population, 156,587, nearly all Hindus. It is a hilly country, especially rich in timber.—The capital, Karauli, 75 miles NW. of Gwalior, is defended by a sandstone wall, 2 miles in extent. Pop. 25,607.

Karczag, a town of Hungary, formerly capital of Great Cumania, is situated 99 miles by rail E. by S. of Budapest. Pop. 15,825.

Karelia, an old name for the south-east part of Finland, annexed to Russia by Peter the Great in 1721. The Karelians properly so called are a branch of the Finnic race, about 303,000 in number, who dwell in the eastern parts of Finland and the adjoining provinces of Russia from Archangel to Tver. See Rae's *White Sea Peninsula* (1882).

Karens'. See BURMA, Vol. II. p. 564.

Karikal, the second in importance of the French possessions in India, is on the Coromandel coast, 12 miles N. of Negapatam, and has an area of nearly 53 sq. m. It is a fertile tract, well supplied with rivers and canals, and largely given up to the cultivation of rice. The pleasant little capital, about a mile from the sea, has been four times taken by the British. There is an active trade in rice, principally with Ceylon and the Straits Settlements. The annual revenue is about £16,000. Pop. (1895) 60,376.

Karli, a Chaitya temple cave in Bombay Presidency, on the road between Bombay and Poona. In front stands a lion pillar, supporting four lions, and bearing an inscription which ascribes its date to the 1st century B.C. The outer porch, 52 feet wide, is closed by the remains of a screen. The dimensions of the interior are 126 feet by 45 feet 7 inches, the height being not over 45 feet. The building consists of 'a nave and two side-aisles, terminating in an apse or semi-dome, round which the aisle is carried.' All the pillars are octagonal, the seven behind the dagoba or 'Tape (q.v.) being plain, but the fifteen on either side of the nave having richly ornamented capitals bearing elephants and human figures, all admirably executed. Over the entrance is one great window in the form of a horseshoe directing the light mainly on the dagoba. See Fergusson, *History of Indian Architecture*.

Karlings. See CARLOVINGIANS.

Karlsbad. For Karlsbad, Karl-krona, Karls-miie, &c., see CARLSBAD, &c.

Karlsburg (Hung. *Gyula-Fehervar*), a town and fortress of Transylvania, near the Maros, 170 miles E. of Szegedin by rail. Pop. 7388.

Karma. See BUDDHISM, Vol. II. p. 518.

Karmathians. a religious and communistic sect into which the Ismailis (q.v.) developed in Asia under the lead of Hamdan Karmat, a peasant-prophet in the region of Kufa. The secret society soon organised itself and began a formidable peasant war. Bahrein was overrun, and in 900, under Abu Saïd, the Karmathians took Hajr, north-east of Yambou, and made it their capital. Damascus had to ransom itself; Badbec was taken and its inhabitants put to the sword. Abu Saïd's son, Abu Taher, succeeded him. In 923 he took and plundered Bassora; next year he plundered a caravan of 20,000 pilgrims returning from Mecca; and in 925 captured and plundered Kufa, killing or enslaving the inhabitants. In 930 during the Hajj he took Mecca, killing 30,000 persons, choked the well Zem Zem with corpses, and carried away the black stone. Then he threatened Bagdad with only 500 horse from among his 107,000 armed zealots. During the next eight years there was no Hajj, but it was resumed on a payment of 25,000 dinars by the calif to Abu Taher. This leader died in peace in 943, leaving the control of religion and politics to a council of seven. After a twenty-two years' absence the black stone was brought back to Mecca by the Karmathians and ransomed. During the next hundred years the sect gradually succumbed to the sword and to natural causes, but not until it had acted as a powerful dissolvent on the califate.

Karnac. See THEBES.

Karnal. capital of a district in the Punjab, India, 7 miles W. of the present course of the Jumna, and on the Western Jumna Canal. The population decreased from 27,022 in 1868 to 23,133 in 1881, and to 21,963 in 1891.

Kärnthen. See CARINTHIA.

Karnul. a town in Madras Presidency, India, 110 miles S. by W. from Haidarabad (Hyderabad). Fever is endemic. Pop. (1871) 25,579; (1891) 24,576. The district separated on the north by the Krishna from the Nizam's dominions - contains 2440 sq. m., and in 1891 had a population of 683,718. The canal of the Madras Frigate Company traverses it for 140 miles. Karnul suffered very severely during the famine of 1877-78.

Karr. JEAN BAPTISTE ALPHONSE, a French novelist who long survived his popularity, was born at Paris, November 24, 1808. He was educated at the College Bourbon, and early devoted himself to journalism. His *Sans les Tillands* (1832), the outcome of a disappointment in love, by its originality and wit found its author an audience for a long series of novels, of which *Genevieve* (1838) only need be mentioned here. In 1839 he became editor of *Figaro*, and in the same year he started the issue of *Les Gouges*, the gay and brilliant but sometimes bitter satire of which brought him many readers, no little ill-will, and attempted assassination from a woman's hand. These papers he collected in seven volumes (1833-57)—an attempted revival of the series subsequently to 1870 proved a miserable failure. In 1855 Karr went to live at Nice, where he occupied himself with gardening. His *Voyage autour de mon Jardin* (1845) is one of his best-known books. His *Oeuvres complètes* were collected in 1860. He died September 30, 1890.—His daughter, THÉRÈSE KARR (born 1835), has published tales and historical books.

Karoo. a generic name given to the high plains of Cape Colony. But the word is more usually associated with the Great Karroo, the elevated basin, more than 3000 feet above sea-level, and 350 miles long by 70 to 80 wide, which lies between the Nieuweveld Berge on the north and the Zwarte Berge on the south. It is not a sandy desert; after rain its rich red soil is covered with a thick carpet of grass and flowers. Nevertheless, during nine months of the year, when rain does not fall, it has a parched, barren appearance. Large herds of sheep and goats (Angora), with smaller flocks of ostriches, cattle, and horses, are pastured on it during the season of grass. The dearth of water is now being in some parts obviated by windmills and wells for procuring the water that is generally found at some distance below the surface. Two centuries ago this district was a perfect paradise for game, which even yet is not quite extinct. See H. A. Bryden, *Kloof and Karroo* (1889).

Kars. a fortress of Russian Armenia, lies about 110 miles NE. of Erzerum. It is situated on a tableland of upwards of 6000 feet in elevation; the climate is therefore rather severe. Pop. (1890), since the Turks and Lazes have migrated to Turkey, 8672, mostly Armenians, who carry on an active transit trade. In 1828 Kars was taken from the Turks by the Russians under Paskevitch. It was brilliantly defended by the Turks under General Williams for six months in 1855. At the beginning of the war of 1877-78 Kars was invested by the Russians, but relieved in July by Mukhtar Pasha; besieged again in the autumn, it was carried by storm on 18th November 1877 by General Lazareff. Kars, long a bulwark of the Ottoman empire in Asia, was one of the Armenian fortresses the cession of which to Russia was agreed to by the Berlin Congress in 1878. It forms now a commanding position from a military point of view on the plateau of Asia Minor, facilitating future aggression towards Erzerum and Turkish Armenia in general. Kars, whose fortifications have been recently augmented, is nearly impregnable. See works on the siege of 1855 by Sandwith (1856) and Laurence Oliphant (1856).

Karshi (anc. *Nakhsheb*), a town of Bokhara, central Asia, stands in a plain 95 miles SE. of Bokhara city and 80 SW. of Samarcand. It is surrounded by well-cultivated land and numerous gardens. Commercially it is of great importance in the transit trade between Bokhara, Kalul, and India. Its knives and firearms are exported to all parts of central Asia, Persia, Arabia, and Turkey. The inhabitants, estimated at 25,000, are for the most part Esbeqs, with a mixture of Tajiks, Indians, Afghans, and Jews.

Karst. See CROATIA.

Kartoum. See KHARTOUM.

Kárttikeya. the Hindu Mars, or god of war, a being represented by the Puranic legends as sprung from Siva, after a miraculous fashion.

Kárún River (Persian *Káran*: the *Uai* of Daniel, viii. 2), the sole navigable river of Persia. Rising in the Zardah Koh Mountains, near Ispahan, it flows west through gorges of the Bakhtiari Range to Shuster, the capital of the province of Arabistán, where it becomes navigable. At Ahwáz a reach of rapids and broken water bars the course of vessels to the Lower Kárún, and a canal from Ahwáz to a point about 1½ mile down stream will have to be cut before through navigation is possible. A tramway was in 1890 in course of construction for the conveyance of passengers and merchandise from the limit of navigable water to Ahwáz. Below Ahwáz the river varies in breadth

from 300 to 500 yards, and flows for 117 miles without an obstacle through a country naturally rich and fertile, but now entirely uncultivated. Mohammed lies at the junction of the Karun with the waters of the Euphrates and Tigris (*Shut-el-Arab*). As long ago as 1842 Lieutenant Selby ascended the Karun as far as Shuster, and made a report urging the importance of this waterway to English commerce. But it was not till October 1858 that, through the instrumentality of Sir Henry Drummond Wolff, then British minister at Teheran, the navigation was thrown open by royal proclamation not to England only but to the commerce of the world. It is difficult to exaggerate the importance of this new trade route to Persia, to British India, or to England.

See W. F. Ainsworth, *The River Karun* (1890); *Jour. Roy. Geog. Soc.*, vol. ix, p. 26, vol. xiv, p. 219, and new series, vol. v, p. 120; and the *Times* of 4th February 1890.

Karyokinesis. See CELL.

Kasai. See KASSAL.

Kasanlik, or KEZANLIK, a town of Eastern Roumelia, at the foot of the Balkans, 5 miles from the southern end of the Shipka Pass, and 87 miles NW. of Adrianople. It manufactures otto of roses. Its capture by the Russians on 7th January 1878 led to the surrender of the Turkish defenders of the Shipka Pass. Pop. 20,000.

Kaschan (Hung. *Kassa*), one of the oldest and handsomest towns of Hungary, is situated in the beautiful valley of the Hernad, surrounded by vine-clad mountains, 130 miles by rail NE. of Budapest. The cathedral of St Elizabeth (built 1270-1468) is the finest Gothic edifice in Hungary. The town, which ranks as the provincial capital of northern Hungary, is the seat of a Roman Catholic bishop, has various schools, an agricultural institute, and a royal tobacco-factory; stoneware, furniture, starch, nails, and paper are also manufactured. Kaschan is celebrated for its hams. Of the Jesuit university founded here in 1659 all that now remains is the law academy. Pop. (1891) 28,884. Kaschan figured prominently during the Hungarian revolution of 1848.

Kashan, one of the most flourishing towns of Persia, is situated in a well-peopled, well-cultivated district, 3690 feet above sea-level, and 92 miles N. of Isfahan. The vicinity is celebrated for its fruit, particularly melons and pears, and the town for its extensive manufactures of silk-stuffs, gold brocade, glazed tiles (called all over Mohammedan Asia *kashi*), carpets, and copper-wares. It is a large town, and abounds, like all Persian towns, in mosques, bazaars, and baths. Pop. 30,000.

Kashgar, the political capital of eastern or Chinese Turkestan, and, next to Yarkand, the second place of importance, is divided into Kuhna Shehir ('old city') and Yenghi Shehir ('new city'). The town and district of Kashgar have a population of 120,000 souls. The old city is a small fortified place overlooking the Kizil River, by which it is separated from the new city, said to have been built in 1838. In this last-mentioned part of the town stands the Orda—i.e. the palace of the Chinese governor of the whole province, as well as the Friday Mosque (Juma Masjid). The people, mostly Turks, intermixed with Tajiks, Kashgaris, Hindus, and Andijanis, excel in certain branches of industry, as the making of cottons, silks, carpets, saddlery, &c., and carry on trade, chiefly with Russia through Almati and the Terok Davan Pass, a trade supported by a permanent Russian consul, the only European diplomatist in this part of Asia. Kashgar, the centre of Mohammedan learning in eastern Turkestan, is besides a famous pilgrimage place to the shrine of Hazreti Appak Khodja, who died here in 1693. The capital and

the country round it are noted for great fertility and for a variety of excellent fruits, owing to a rich irrigation derived from several rivers and canals flowing from the north and the west. Its most flourishing period embraces the time from the conquest of Arabs under Kuteiba until the appearance of Genghis Khan, from which time it experienced all the revolutions and wars raging on the confines of Islam and Chinese Buddhism. In 1758 the Chinese took possession of Kashgar, and with short interruption it has remained in their power. The last successful rebellion was that of Yakub Kushbeghi in 1864. Kashgar was visited by the mission of Sir T. D. Forsyth in 1873, resulting in a treaty between England and Yakub; but since the Mohammedan ruler was vanquished and the country retaken by the Chinese in 1877, Kashgar has been left entirely to the political and commercial influence of Russia. See Colonel Kuropatkin's *Kashgaria* (Eng. trans. from Russian, 1883).

Kashkar. See CHITRÁL.

Kashmir. See CASHMERE.

Kashoubish, a Slavonic dialect spoken by 200,000 persons near Danzig. It has been debated whether it should be regarded as a dialect of Polish, or as a form of the extinct Polabian.

Kaskaskia, a river of Illinois, rises in the east-centre of the state, flows south-west, and enters the Mississippi at Chester. Length, nearly 300 miles. On its right bank, a few miles from the mouth, is the village of Kaskaskia, which was the first capital of Illinois Territory.

Kassai, the great southern tributary of the Congo (q.v.). See also Bateman's *First Ascent of the Kasai* (1889).

Kassala, a fortified town, formerly the capital of the Nubian district of Taka, stands on a tributary of the Atbara, 260 miles S. of Suakin. It was formerly the most important commercial centre between the Nile and Abyssinia, and previous to the Mahdi's rise had a population (with garrison) of 20,000. When taken by the Italians in 1894 it had only 3000. In 1897 it was restored to Egypt under the Anglo-Italian convention, and has accordingly been garrisoned by Anglo-Egyptian troops. The re-establishment of order in the Egyptian Soudan (1898) has restored to the place something of its old importance.

Kassassin, a lock on the canal between Ismailia and Zagazig, in Egypt, 21 miles W. of Ismailia. In the Egyptian campaign of 1882, Arabi's forces were routed here August 28.

Kassel. See CASSEL.

Kastamuni, capital of a province of the same name in Asia Minor, stands 76 miles SW. of Sinope. It manufactures cotton goods, leather, &c.; its famous copper-wares are no longer made. Pop. 40,000. Here is the ancestral castle of the Comneni; the word 'Kastamuni' is said to be a corruption of 'Castra Comneni.'

Kasvin. See KAZVIN.

Katahdin, the highest mountain in the state of Maine (q.v.), 5385 feet high.

Kater, HENRY, an English physicist, was born at Bristol, 16th April 1777. Entering the army in 1799, he went out to India, and was actively engaged in the great trigonometrical survey. Ill health compelled him to return home in 1808; then, after labouring for six years in the Royal Military College, Sandhurst, he retired on half pay. He died in London on 26th April 1835. His contributions to science are chiefly to be found in the *Philosophical Transactions* between 1813 and 1832. The most important of his memoirs relate to the determination of the length of the seconds pendulum at

the latitude of London; the 'floating collimator,' an instrument for aiding the determination of the horizontal or zenith points, for which invention he received the gold medal of the Royal Astronomical Society; the British standards of length and mass; and compass needles. Conjointly with Dr Lardner, he was the author of 'A Treatise on Mechanics' in the *Cabinet Cyclopaedia*. For the emperor of Russia he verified the Russian standards of length.

Katharine. See CATHARINE.

Kathiawar, a peninsula on the west coast of India, lying between the Gulf of Cambay and the Gulf of Cutch; the Brahman and native name for it is *Sarashtra*. Politically, the name Kathiawar Agency (formed in 1822) is given to a collection of 187 states, some independent, some tributary to native princes, and some (105) tributary to the British government in India, which between them embrace the greater part of the Kathiawar Peninsula. Area of agency, 20,559 sq. m.; pop. (1891) 2,752,404. The states of the agency supply one-sixth of the total quantity of cotton exported from Bombay. The resident of the agency lives at Rajkot.

Katkov, MICHAEL NIKIFOROVITCH, Russian journalist, was born at Moscow in 1818, studied at the universities of Moscow, Königsberg, and Berlin, and for some time filled the chair of Philosophy at Moscow. In 1861 he became editor of the *Moscow Gazette*, the organ of the university, and eventually made it the most influential journal in Russia. At first an advocate of parliamentary government and reform, Katkov was converted by the Polish rising of 1863 into a leader of the Pan-Slavist movement, and a fanatical supporter of reactionary government in Russia. He was 'the apostle of national Russian ideas' in politics, and acquired an influence in the government equal to, if not greater than, that of the ministers (except the chancellor), and is said to have been mainly instrumental in determining Alexander III. to his conservative and reactionary policy. As the champion of the idea 'Russia for the Russians,' Katkov urged the complete Russification, by force if need be, of Poland and Lithuania, and of the Baltic provinces. He enjoyed an immense popularity as the representative of Russian Chauvinism. He died at Snamensky, near Moscow, 1st August 1887.

Katmandu. See KHATMANDU.

Katrine, LOCH, one of the most celebrated of Scottish lakes, in Stirling and Perth shires, 5 miles E. of Loch Lomond and 9½ W. of Callander. Lying 364 feet above sea-level, it curves 8 miles east-south-eastward, is nowhere quite a mile broad, and has a maximum depth of 468 feet, and an area of 3119 acres. It discharges through Lochs Achray and Venachar, to the Teith; and since 1859 has supplied Glasgow (q.v.) with water. Huge Benvenue (2393 feet) and Ben Van (1500) rise steeply at its lower end, whose shores are beautifully wooded, with the mountain delfile of the Trossachs beyond. Here, too, are the 'Silver Strand' and Ellen's Isle, the chief scene of the *Lady of the Lake*. Scott was often here during 1790-1809, as also in 1805 was Wordsworth with his sister Dorothy. See her *Tour in Scotland*, and Sir G. Airy's *Topography of the Lady of the Lake* (1873).

Kat River, a branch of the Great Fish River, in the Cape Colony, rising in the Didimaberg, in the fertile valley of which a Hottentot settlement was formed in 1829. It was broken up after the rebellion of 1851-52, and the valley now forms the district of Stockenström (after Captain Stockenström), with an area of 240 sq. m., and a mixed population of about 7000.

Kattimundoo, a substance somewhat resembling gutta-percha, is the milky juice of the East Indian plant, *Euphorbia kattimundoo*, used in India as a cement.

Katydid, a name applied to numerous American insects, nearly related to grasshoppers. They are arboreal in habit, and are well concealed in the foliage by their green colour. The true katydid, abundant in the central and western states, is *Cyrtophyllus concavus*, but *Microcentrum reticris* is yet commoner, and there are several other species belonging to these and other genera. In their general habit, e.g. in the 'song' to which the syllables kat-y-did refer, and in the egg-laying accomplished by the long ovipositors of the females, these lively insects resemble Grasshoppers (q.v.).

Katzbach, a river in the Prussian province of Silesia, which falls into the Oder at Parchwitz. On its banks, in the vicinity of Liegnitz, on 26th August 1813 the French under Macdonald, 80,000 strong, were defeated by Prussian and Russian troops under Blücher. The French lost 12,000 killed and wounded, and 18,000 prisoners, with 103 cannon.

Kaub. See CAUB.

Kaufmann, ANGELICA, painter, was born 30th October 1741 at Coire in the Grisons, Switzerland. Whilst still a child she painted the portraits of notabilities in Italy, and in Rome fell under the good influence of Winckelmann. In 1766 Lady Wentworth, wife of the British resident in Venice, persuaded her to go to London. There she soon became famous as a painter of classic and mythological pictures, and as a portrait-painter. She was befriended by Reynolds, and was nominated one of the very first batch of Royal Academicians. But her life was for a while embittered by a marriage (1767) into which she had been tricked by a mere adventurer. It cost her a large part of her fortune to get the marriage dissolved. In 1781 she married the Italian painter Zucchi (1729-95), and, returning to Rome, lived for her art in a circle of distinguished artists, poets, and scholars. She died 5th November 1807. Her numerous paintings are well known from engravings by Bartolozzi and others. As a painter she fails to attain to the first rank. Grace and harmonious colouring do not atone for faulty drawing and lack of originality. Angelica was also an accomplished singer. Her beauty and talents were sung by such poets as Goldsmith, Klopstock, and Gessner, and her story has in recent times furnished a theme to Miss Thackeray. See Wesley's *Life of her in Dohme's Kunst und Künstler* (1877); *Dublin Univ. Mag.*, 1873; *Art Journal*, 1890; and the *Life* by F. A. Gerard (1892).

Kaufmann, CONSTANTINE VON, a Russian general of German (Holstein) descent, was born near Ivangorod in Russian Poland, on 3d May 1818. He entered the army as lieutenant of engineers in 1838, fought against the Circassians in the Caucasus, and especially distinguished himself at the siege of Kars in 1855. In 1867 he was appointed governor-general of Turkestan, and at once set himself to organise this province, then newly conquered; in 1868 he occupied Samarcand, and in 1873 conducted a successful campaign against Khiva. Through his energetic policy Russia became the predominating power in central Asia. General Kaufmann died on 16th May 1882 at Tashkend. See Boulger's *Central Asian Portraits* (1880).

Kaulbach, WILHELM VON, a German painter, was born at Arolsen, in the principality of Waldeck, 15th October 1805, and in his seventeenth year entered the Academy of Arts at Düsseldorf.

He was one of Cornelius's best pupils, and followed him to Munich; from 1849 down to the year of his death he was director of the Academy of Painting in that city. Although painting in the severely ideal and allegorical spirit of his master, Kaubach displayed from the first no lack of individual genius. Among his first important productions were sixteen mural paintings illustrating the myth of Amor and Psyche, in the palace of Duke Maximilian, and Apollo amongst the Muses, for a ceiling in the Odeon. Then he executed a number of designs from the works of Klopstock, Wieland, and Goethe in various royal apartments in Munich. In 1834 Kaubach completed his grandiose 'Battle of the Huns,' representing the legend of the struggle, continued in mid-air, between the sons of the Huns and Romans who had fallen before the walls of Rome, which was regarded as the culmination of the new German school. Nevertheless, the realistic tendencies of his genius came out in his illustrations of Schiller, Goethe's *Faust*, and *Reincke Fuchs*, and in his 'Mad-house.' In 1846 Kaubach completed, on the heroic scale, the 'Destruction of Jerusalem by Titus.' For several years from 1847 onwards he was occupied painting the walls of the vestibule of the new museum at Berlin with a cycle illustrating the progress of civilisation. This series embraced six colossal compositions—'The Tower of Babel,' the 'Glorious Age of Greece,' the 'Destruction of Jerusalem,' the 'Battle of the Huns,' the 'Crusades,' and the 'Reformation,' with numerous smaller designs. His last gigantic painting is the 'Sea-fight of Salamis' in the Maximilianum at Munich. In his later years he composed illustrations to Goethe and Shakespeare, and painted many portraits. He died of cholera at Munich, 7th April 1874. See Mrs Howitt-Watt's *Art-Student in Munich* (2d ed. 1879).—His son, HERMANN, born at Munich on 26th July 1846, studied under Piloty, and paints historical pictures of the genre class—such as 'Louis XI. and Olivier le Dain,' 'Mozart's Last Days,' 'Carousing Knights Templars,' 'Sebastian Bach and Frederick the Great.'—A nephew, Friedrich (born 1822), and a grand-nephew, Friedrich August (born 1850), also became painters of merit.

Kaunitz, WENZELIUS ANTHONY, PRINCE VON, Count of Rietberg, Austrian statesman, was born at Vienna on 2d February 1711, and began his public career under Charles VI. Maria Theresa employed him on diplomatic missions to the courts of Rome, Florence, and Turin, and then appointed him minister to the governor of the Austrian Netherlands. He laid the foundations of his permanent fame as a diplomatist in 1748 at the congress of Aix-la-Chapelle. As Austrian ambassador at the French court in 1750-52 he succeeded in converting the century-long enmity of the two states into relations of amity and goodwill. In 1753 Kaunitz was appointed state chancellor, and in 1756 chancellor for the Netherlands and Italy, and for almost forty years continued to have the principal direction of Austrian politics. On account of the part he played in the affairs of Europe he was jocularly called the European coach-driver. As a man he was very vain and confident of his own abilities, narrow in his political views, regarding exclusively the supposed interests of Austria, yet sincere and upright according to his notions of duty. He took a very active part in the ecclesiastical reforms of Joseph II., and was always an earnest and liberal patron of the arts and sciences; he founded the art school of Vienna, and several academies in Lombardy and the Low Countries. He retired from public life when Francis II. ascended the throne, and died 27th June 1794. See *Lives* by Hornayr (in *Die österreichische Plutarch*, vol. vi.) and Beer (1872).

Kauri Pine, or KOWRIE (*Dammara australis*), a species of Dammur (q.v.), a native of New Zealand. It is a tree of great size and beauty, attaining a height of 140 feet or more, with whorls of branches, the lower of which die off as it becomes old. The timber is white, close-grained, durable, flexible, and very valuable for masts, yards, and planks. The Fiji Islands, New Hebrides, and Australia produce other species. All of them are trees of dark, dense foliage, and produce a resin called Kauri Resin, or Kauri Gum, and sometimes Australian Copal and Australian Dammur, of which large quantities are exported from Auckland. It is sometimes found in pieces as large as a child's head, of a dull amber colour, where forests of these trees have formerly grown; and is now known to lie mingled with coal strata of Tertiary age. It is also collected from the trees from which it has newly exuded, and is then of a whitish colour. *D. orientalis*, a native of the Moluccas, exudes a similar resin, which is at first white like crystal, and is called white dammur, but with age it assumes a yellow amber tint.

Kava. See AVA.

Kavanagh, JULIA, novelist, was born at Thurles, in County Tipperary, in 1824. She was the daughter of Morgan Kavanagh, an accomplished Irishman, author of various philological works, and she grew up a girl of remarkable beauty but of unusually small stature. Great part of her youth was spent in Normandy, her later life in Paris, Rome, or Nice, where she died, October 28, 1877. Her first work which attracted attention was *Madeleine, a Tale of Auvergne* (1848); of its numerous successors the best were *Nathalie* (1850), *Daisy Burns* (1853), *Adèle* (1857), *Queen Mab* (1863), *Beatrice* (1865), *Silvia* (1870), *John Dorrien* (1875), and *The Pearl Fountain* (1876). The scenes of almost all her stories are laid in her adopted country, and her studies of French life and character possess a reality and truth unhappily but seldom found in the fluent novels of foreign writers who have lightly essayed these themes. Her plots move quietly but naturally forward to the *dénouement*, and skilfully preserve the interest, if they do not feel the excitement, of the reader. Other well-known books are *A Summer and Winter in the Two Sicilies* (1858), *French Women of Letters* (1862), *English Women of Letters* (1863), *Women in France during the Eighteenth Century* (1850), and *Women of Christianity* (1852)—a work which reveals beautifully the sympathetic and religious nature of its authoress, herself a devout Catholic.

Kaveri (*Cauvery*), a river of southern India, rises in the Western Ghâts, and flows south east, across Mysore and Madras, to the Bay of Bengal, which it enters through two principal mouths. Length, about 475 miles; drainage, about 28,000 sq. m.; flood discharge above the delta, 472,000 feet per second. The Kaveri is of no value for navigation, its bed being rocky, with numerous rapids and falls—as those at the island of Sivasamudram, in Mysore, famous for their romantic beauty. Other islands formed by this river are Seringapatam, in Mysore, and Srirangam, just above the delta. It is of importance for irrigation in Mysore and in Coimbatore district, but especially in the marvelously fertile delta. For this purpose the main stream has been dammed since the 4th century A.D., the Coleroon (the northern branch) since 1838.

Kawi, a language of Java (q.v.).

Kay, JOHN, a famous Scotch caricaturist, was born near Dalkeith in 1742, and from an early age practised prosperously as a barber in Edinburgh, until in 1785 he opened a print-shop for the sale of miniatures and sketches of local celebrities etched

by himself. He died February 21, 1826. Kay's portraits have but little artistic merit beyond a genuine humour, yet he possessed somehow the trick of catching the likenesses of his subjects, and the series forms a unique and invaluable record of the social life of the Edinburgh of his time. His portraits were collected and published as *A Series of Original Portraits and Caricature Etchings by the late John Kay, with Biographical Sketches and Illustrative Anecdotes* (2 vols. quarto, 1838; new ed. with additional plates, 2 vols. 1877).

Kayak. See ESKIMO.

Kaye, SIR JOHN WILLIAM, the historian of English India, was born in 1814, and educated at Eton and Addiscombe Military College. He served for some years in the Bengal Artillery, but retired in 1841 to devote himself to literature. In 1856 he entered the service of the East India Company in England, and, on the transfer of the government of India to the crown, was appointed to succeed John Stuart Mill as secretary in the Political and Secret Department of the India Office, a post which he retained until failing health obliged him to retire in 1874. Three years before he had been knighted, and two years later he died, July 24, 1876. Kaye's works are *The History of the War in Afghanistan* (4 vols. 1851-53); *History of the Administration of the East India Company* (1853); *The Life and Correspondence of Sir John Malcolm* (1856); *Christianity in India* (1859); *History of the Sepoy War in India in 1857-58* (2 vols. 1866-71); and *Essays of an Optimist* (1870). His account of the mutiny struggle has given rise to much embittered controversy, but despite its faults is a noble monument of historical industry and insight. A revised edition of the *Sepoy War*, along with Colonel Malleon's history of the Indian Mutiny, together forming a connected history, was completed in 6 vols. in 1890.

Kayes, or KHAYES, a town of the French Soudan, on the river Senegal, is the terminus of the railway being constructed from St Louis in 1890. Pop. 6000.

Kay-Shuttleworth, SIR JAMES. See EDUCATION, Vol. IV, p. 211.

Kazan, capital of the Russian government of Kazan, and anciently capital of the Mongol kingdom of the Golden Horde, stands 3 miles from the north bank of the Volga, and 200 miles E. by S. from Nijni-Novgorod. The Mongol kingdom was founded in the middle of the 15th century on the ruins of the still more ancient Bulgarian empire (see KIPCHAKS). At the same time the modern city of Kazan was built 28 miles SW. of the former city. In 1552 the Russians, under Ivan the Terrible, carried the town after a bloody siege, and put an end to the Mongol kingdom. The kremlin or fortress embraces within its walls the cathedral (1552), which has a wonder-working icon of the Virgin, a magnificent monastery (1555), an arsenal, &c. The houses are in general one storied, and stand in the midst of gardens. The town has nearly fifty churches, a dozen mosques, and the Sumbek Tower, an object of veneration to the Tartars. Kazan is the chief intellectual centre of eastern Russia, and a home of oriental study. The university, founded by Alexander I. in 1804, has four faculties and nearly 1000 students; the institutions connected with it include a library of 80,000 vols., an observatory, a botanical garden, an antiquarian museum, &c. Kazan is the seat of a Greek archbishop. The principal objects of industry are leather, soap (made from mare's milk), candles, gunpowder, books, hempen goods, cotton, sacred pictures, &c. Close to the town are the shipbuilding-yards in which Peter the Great built his Caspian

Sea fleet. The Tartar merchants of Kazan trade as far as Bokhara and Persia on the one side and to Asia Minor on the other. The central parts of the town are occupied by Russians; the Tartars dwell for the most part in the suburbs. Pop. (1871) 86,262; (1895) 140,726. The town was destroyed by fire during Pugatcheff's rebellion (1774), and has suffered severely from the same cause more than a dozen times, especially in 1815 and 1825.—The government, lying west of that of Nijni Novgorod, is traversed by the navigable Volga and Kama, with their tributaries. The 'black earth' soil produces rye and oats, with other crops, agriculture being the main occupation of the people. One-third of the total area (24,594 sq. m.) is under forest. Pop. (1871) 1,739,909; (1887) 2,113,954; (1895) 2,231,957.

Kazbek, or CASBECK. See CAUCASUS.

Kazvin, a town of Persia, 95 miles NW. of Teheran, on the road to Resht, manufactures brocade, velvet, cotton, and iron-ware, and breeds camels and horses. Kazvin has obtained a new commercial importance through the opening of the Transcaucasian Railway: the route connecting Persia with Europe goes by Kazvin to Resht and Baku, and to facilitate this communication a *chaussée* has been constructed from Teheran to Kazvin. Pop. 40,000.

Kea is the native (New Zealand) name for a genus of parrots, of which only three species are known; these are *Nestor notabilis*, *N. meridionalis*, and *N. productus*, which last appears to have just become extinct. *N. notabilis* is a mountain species, confined to the South Island; it was originally a vegetable and insect feeding bird, but on the introduction of sheep it began to frequent the stations and to feed on offal; later on the parrot acquired the more objectionable habit of destroying live sheep. A number of birds band themselves together and hunt out a weakly member of a flock, generally at night. The sheep is worried to death by the combined efforts of the parrots, which then proceed to devour the kidney fat. This is one of the most remarkable instances known of a rapid change of habit.

Kean, EDMUND, actor, was born in London, in Gray's Inn, 4th Nov. (some authorities say 17th Mar.) 1787. His parentage also is doubtful, for, though it is tolerably certain that Nance Carey, daughter of George Savile Carey, was his mother, it is quite uncertain who his father was. Kean is said to have declared himself to be an illegitimate son of the Duke of Norfolk, but common tradition assigns to him as parent either a tailor named Aaron Kean or a builder named Edmund Kean. Nance Carey being an actress, Kean from his infancy made occasional appearances upon the stage, and when about sixteen years old became a regular 'stroller,' playing in Richardson's show and other temples of the itinerant drama. After ten years' painful experience in various provincial circuits he succeeded in obtaining an engagement at Drury Lane Theatre, where he made his famous first appearance as Shylock on 26th January 1814. His success was immediate, and he at once took rank as the first actor of the day, displacing even John Philip Kemble, whose powers were by this time declining. A period of wonderful success followed; but unhappily Kean's irregularities were as great as his genius, and he gradually forfeited the public approval, his reputation being finally ruined by the *cause célèbre* of Cox v. Kean (January 1825). In this wretched case Kean was found guilty of misconduct with the wife of one Alderman Cox; and, although he seems to have been at least as much sinned against as sinning, a strange outburst of popular morality literally drove him off the stage, Edin-

burgh particularly distinguishing itself in vigorous denunciation of the unfortunate actor. Kean then paid a long visit to America, where he had on a previous visit been very popular. He remained in America till the end of 1826, and on his return home was cordially received; but both mind and body had given way in his wild career, and he was the mere wreck of his former self. At last, on 25th March 1833, he broke down hopelessly, while playing Othello to the lago of his son Charles, and never acted again. He died at Richmond on 15th May 1833. Regarding Kean's genius as an actor there can be no question. He was a master of passionate expression, and excelled in characters where the emotions are kept at highest tension. In level passages he was absolutely bad, and had no power to represent calm dignity; but in the mental agony of Othello, the wild passion of Shylock, or the cynical devilry of Richard he was unapproachable. No better idea of the irregular grandeur of his playing can be given than is contained in Coleridge's saying, that 'seeing Kean act was reading Shakespeare by flashes of lightning.' Kean's life has been written by Barry Cornwall (1835), F. W. Hawkins (1869), and J. F. Molloy (2 vols. 1888).

CHARLES JOHN, son of the foregoing, was born at Waterford, 18th January 1811. He was educated at Eton for one of the learned professions; but his father's extravagances and dissipations rendered it necessary that he should leave school and do something to support his mother and himself. He accordingly became an actor, in spite of the bitter opposition of his father, who swore that he himself would be the first and last tragedian of his name. Charles Kean made his first appearance, at Drury Lane, on 1st October 1827, in the character of Young Norval, and was received by the critics with almost universal condemnation. But he worked assiduously in the provinces, and studied hard, until in time he attained a fair position in his profession, his efforts being greatly aided by the genius of Ellen Tree, whom in 1842 he married. In 1850 Kean became joint-lessee with Keeley of the Princess's Theatre in Oxford Street, London, and here he produced the long series of gorgeous 'revivals' which were the most conspicuous feature of his career. In these, it is to be feared, upholstery was more studied than acting. In 1859 he retired from management, and virtually from the London stage, though he played in America and the provinces to within a few months of his death. His last appearance was made in Liverpool on 29th May 1867, and he died in London 23d January 1868. His wife died 21st August 1880. As a tragic actor Kean was not in the first or even the second rank, but he was admirable in melodrama, and his acting in such plays as *The Corsican Brothers* and *Louis XI.* could scarcely be surpassed. See his Life by J. W. Cole (2 vols. 1860).

Kearsley, a town of Lancashire, 4 miles S.E. of Bolton. Pop. 7253. In the neighbourhood are coal-mines and paper-mills.

Keary, ANNIE, novelist, was born 3d March 1825, at Bilton, in Yorkshire, where her father was rector, having sold out of the army and taken orders after the loss of his estate in County Galway. Her sympathetic insight into the hearts of children gave her the first impulse to write, and made the success of *Little Wanderlin* and the *Heroes of Asgard* (written together with her sister Eliza), as well as the later books, *A York and a Lancaster Rose*, *Mia and Charley*, and *Real Keays*. She spent her life at Hull, Trent Vale in Staffordshire, London, Brighton, and Eastbourne, wintering twice near Cannes and once in Egypt. Of a sensitive and impressionable temperament wedded to a

strong understanding, she passed through a troubled spiritual experience, but found rest in a fervent Christianity with unwearied devotion to her friends and to the poor. She died after a year's illness at Eastbourne, 3d March 1879. Two admirable books outside her usual province were *Early Egyptian History* and *The Nations Around*. Her first novel was *Through the Shadows*, and this was followed by *Janet's Home*, *Clemency Franklyn*, and *Oldbury Castle Daly*—was hailed as an Irish novel of unusual excellence—while writing it she paid the island the one brief visit of her life. Her latest work, and perhaps her greatest, was *A Doubting Heart*. See the Memoir by her sister (1882).

Keats, JOHN: Oct. 1795—Feb. 1821. Youngest to rise and earliest to set in that brilliant constellation of poets who ennobled England during the first half of the Nineteenth century, John Keats, both in himself and in his work, is one of the most profoundly interesting and attractive figures in literature. In character, true, magnanimous, modest, and tender; much tried and rarely failing; throughout training himself sedulously for the highest achievement in poetry—his life, as man and as artist, was one of persistent growth onward and upward. It is to trace this development, under both aspects, that the following narrowly limited sketch will be mainly devoted.

John Keats was born in Finsbury, London, son of a respectable livery-stable keeper; sent early to school at Enfield, where an elder boy, Cowden Clarke, turned his boyish energies at thirteen towards literature. Henceforward Keats read much and widely. Greek, like Shakespeare, he never learned, but eagerly studied manuals of classical mythology; in Latin he began and (after leaving school) finished a prose version of the *Æneid*; and we cannot doubt that his passion for melody, felicity of phrase, tenderness and beauty in style, was developed or inspired by Vergil's unequalled magical art. Quitting school in 1810, Keats was first apprenticed to a surgeon; then, till 1817, practised diligently in London, and, (for his age), with success. But poetry had now become paramount; and his high sense of duty withdrew him from a profession demanding imperiously a man's entire devotion.

By 1816-17 Keats had found many friends and associates; notably Leigh Hunt, Haydon, Hazlitt;—men of early promise, and (Hunt and Hazlitt at least) of real ability, though sadly marred or blighted by bad taste, vanity, and weakness. His youth naturally led Keats at first to accept their self-estimate and hence overrate their worth and powers. Morally and intellectually he could gain little, except some genial literary impulse, from natures so inferior to his own; yet though familiarity in time cooled, he remained loyal to their better qualities. His friendship was also sought by Shelley. Their names have been united through *Adonais*; but the wild eloquence, the chill Auroral splendour of that great Elegy display no truth in the portraiture of Keats, no touch of human pathos. The two men were in fact, (generally speaking), antagonistic in nature, principles, conduct, and ruling ideas upon that art in which both were so richly gifted; and hence familiarity, on the part of Keats, now and later, was impossible. Others of less note, Reynolds, Dilke, Armitage Brown, were more to Keats; but above all his intense unwavering affectionateness, (one of several points in which he resembles Catullus), placed his two brothers and sister by far highest in value.

This was the poet's student period. Vergil was his first perhaps his most influential love. Clarke led him to Spenser at the close of 1813. Homer in the fine extravagance of Chapman's version, Chaucer, Shakespeare, Milton, Words-

worth, — 'the best sort of poetry' as he said, *color che sanno*, became his bosom-friends. Yet, except in early years, he imitated none: Literature has no poet more decisively original.

Thus far Enfield and Hampstead (then unspoiled) were the landscape, the free nature, whence visions of beauty had been created by the young poet's observant eye, ever 'on the object,' and his vivid imagination. But having (March, 1817) published his first book, Keats found 'pastures new' at Carisbrooke, in the island now for near forty years a home of the one modern poet in whose genius we may trace a certain congenital likeness to his own. Here Keats worked at *Endymion*; but solitude was fever to that tropically developing nature; financial anxiety also, (so badly was his slender fortune handled by a guardian), which never wholly left him, threw the first eland of dejection over his sensitive spirit; and he returned to Hampstead and his friends. Eminent among these was now Bailey, then studying at Oxford, where Keats visited him during Long Vacation, continuing *Endymion* upon the Isis. This may have been the sunniest moment of his life. Bailey was apparently the friend who called out what was best and deepest in Keats: It is he also who has left us the most charming sketch of his conversation: (*Colvin*, p. 76).

In 1818 Keats frequently saw Lamb and Wordsworth, whose poetry, (the *Excursion* especially), amongst that of his contemporaries, most deeply affected him. To nurse his much-loved brother Tom, rapidly failing under consumption, he now moved to Teignmouth; *Endymion* was finished; *Isabella*, for his third volume, began.

These were the last good days allotted to Keats. His character and his aims as Poet were now formed; both have been much misinterpreted; let us here attempt to summarize them. Manliness, magnanimity, unselfishness, force of human affection, chivalry to woman, — are the dominant notes of his nature: Hatred of wrong and meanness, insight and generosity in act and judgment: — and all guided by eminent good sense; Personally proud; — as to his abilities and work, almost pathetically humble-minded. Keats was no sensualist, as has been erroneously reported; no vague idealist; for the first too unselfish, too clear headed for the latter; and from perversity, instability, and self-conceit singularly free.

A man's art is inevitably conditioned by his nature. From that of Keats, sensitive yet strong, modest yet aspiring, when we add a freshness and fullness of genius which recalls Chaucer and Shakespeare, we might justly anticipate that he would not fail to grasp the true idea of poetry under its main heads, the interpretation of nature and of humanity, — both always subordinate to beauty in sound, words, and form. And we find that it was in such wise that Keats, like Sophocles and Pindar, Vergil and Milton, consciously or not, regarded poetry. He was an artist in the rarest and truest sense; this makes him so noteworthy; it is this, not *Endymion* or *Hyperion*, (which ranks him with the Greeks. Pursuing Beauty always as his goal, its sensuous charm, in melody and in wealth of description, — an impulse natural to a youth so gifted — often largely over-dominates his verse to 1818. Yet this style from the first he felt was but the prelude to the higher Muses; the transit from Euphrosyne to Urania. Keats was in truth as exquisitely human as Shakespeare; already in the final piece of his first book he is hoping to quit the mere joys of poetry

for a nobler life,
Where I may find the agonies, the strife
Of human hearts.

By 1818, in an admirable letter comparing Life to

a many-chambered house, he notes how he has passed from Maiden-thought, — the bower of youth, pure yet pleasure-devoted, — to a place of darkness: 'We feel the *Burden of the Mystery*.' Hence, though he dares not yet 'philosophise,' he finds that the only worthy pursuit is the 'idea of doing some good to the world:' that he 'can have no enjoyment . . . but continual drinking of knowledge:' he rejoices that he has kept his old medical books. This feeling gradually masters him: 'Scenery is fine, but human nature is finer:' his longing is, not for vain praise, but for 'the glory of making, by any means, a country happier.' That these were not mere words, the details of his life prove: whilst some realization of his hopes in poetry is given by the volume of 1820. And if, by twenty-four, he was only beginning to handle the higher human interests; yet may we not truly say that his country has been made lastingly happier by what Keats did thus leave us?

Returning to the story: Henceforth, in quick sequence, the shadows deepen. George Keats departed for America: John to the Lakes and Western Scotland, where what was to prove consumption, developed by overfatigue, claimed him. Then, (Dec. 1818) came the death of his brother Tom: Last, the passion of first-love for Miss Fanny Brawne. They became engaged; but it was too late: — Poverty, bodily decline, and above all his own intensely loving heart, morbidly anxious, gradually changed what should have been support and comfort to agony. Yet Keats struggled bravely. As if purified by the trial, his genius now rapidly bore its ripest fruit: almost all that his third volume contains — the 'treasures for ever' he bequeathed us — were written between Hampstead, Shanklin, and Winchester before Autumn, 1819. Even yet he hoped to live by literature; but, returning to Hampstead, health of mind and body began unmistakably to fail: the fatal sign of lung-bleeding appeared in February 1820. Except the one swan-song of the last sonnet, henceforth it is in letters only — letters which throughout his life often rival his poetry itself in loveliness and surpass it in depth of thought — that the sorely-charged heart finds expression.

In September Keats sailed for Italy; the sad and honourable care of nursing him taken by a young artist and friend, Severn. From Naples they moved to Rome. There even the faint delusive sun-gleams of consumption were soon overclouded. It is a relief to the gloom that the generous wounded spirit now found meet reward from Severn's devotedness. Nearing death, the vague 'sentimental optimism' which formed Hunt's substitute, and perhaps his, for religious faith, proved unavailing: Keats 'contrasting now the behaviour of the believer Severn with his own, acknowledged anew the power of the Christian teaching and example, and bidding Severn read to him from Jeremy Taylor's *Holy Living and Dying*, strove to pass the remainder of his days in a temper of more peace and constancy.' (*Colvin*.)

So, though the bodily suffering and agony of remembered love were intense, calm came at last. 'He lay quiet, with his hand clasped on a white cornelian, one of the little tokens' his Fanny 'had given him at starting.' Thus, 'lovable and considerate to the last, — humbly, after his wont, not (as misinterpreted) bitterly, he spoke of his own work and name as 'writ in water:' until with a 'Thank God, it has come,' his soul resigned itself to Him in peace: (23 Feb. 1821.)

Keats lies within the Aurelian Wall of Rome on its southern side, where the faithful Severn was also buried in 1879.

As 'Maker,' Keats presents two main aspects: he is far more an artist in the highest sense than most

modern poets: He has also left us masterpieces in that style of art which his few years allowed him finally to reach. The development of his character and general aims in poetry has been traced; the parallel advance in his writing will be now briefly noticed.

The earliest volume (1817) is frankly experimental. Spenser apparently unseated the spring of poetry for Keats; yet his three imitative pieces, although Spenserian in musical flow and wealth of imagery, are coloured everywhere (in common with a few short lyrics) by the sentimental tone of the later Eighteenth century, and by slipshod mannerisms caught from Hunt. The tender chivalry of his nature glows through the technical inexperience of the *Ode to Woman*: Some trochaic lines prelude to his later success in that rare and difficult metre. Several among the sonnets rise much higher; that on Chapman's Homer alone in the volume shows his final mastery. Most interesting however are five poems in the free, lovely, heroic metre of Chaucer and the Elizabethan dramatists. Here, dashed with youthful extravagance, bad taste, and confused metaphor, we find that 'fascinating felicity' that 'perfection of loveliness' in the interpretation of Nature—(yet Nature externally viewed, without reference to her inner or human meanings)—which, in Matthew Arnold's estimate, is not less than Shakespearian. Delight in beauty for its own sake only is the leading note; yet while he wrote Keats had before him the image of Poetry by Raphael (in the Vatican fresco),—with her outstretched wings and eager glance over *Things that her scarce could tell*—things that lift the thoughts of men; and acknowledges with candour that these spiritual depths and heights of the art are as yet beyond him.

Endymion, (1818), that 'feverish attempt, rather than a deed accomplished' (so, with his delightful union of modesty and clear judgment, Keats named it), in its main features of style carries on the work of 1815-17. We have the over-sensuous pictures, the fanciful and even tasteless coinage of words; but also the myriad felicities of touch; the 'morning freshness' of Chaucer; many passages of splendid vividness. Though the subject be Greek, the treatment lacks Greek sobriety, finish, unity: It is Elizabethan-Romantic. The ground-legend is hardly traceable; a vague allegory may underlie the whole—but the serious purpose of the mediæval allegorists and Spenser, but moral beauty, are wanting.

Two years only separate *Endymion* from the concluding, the treasure-volume of 1820. Keats in this is not yet wholly disengaged from youthful exuberance; Even *Lamia*, his last and strongest poem, is too Asiatic; *Hyperion*, with pictures of un-rivaled magnificence, fails in Epic unity and interest. That supreme beauty, never attained except when it interprets human life in its misery and its greatness, is rarely touched. Yet the growth everywhere is tropical; and praise would be idle for the dignity and tenderness of the Odes, the pictorial splendour, the affluence of charm diffused throughout this little volume. One of Pindar's noblest lyrics, we read, was written in gold upon the walls of a Grecian temple. And not a few of the poems now before us might deserve a like honour.

Keats published only the three volumes of 1817, 1818, 1820, and in one edition each. An absolutely literal reproduction of them, (the reprints to 1883 teeming with errors), with notes, has been edited by the writer; including a few first-rate pieces from the great mass of incomplete and inferior work, withheld by Keats himself, but made public by the cruel kindness of admirers.

See the Lives by Lord Houghton (1848) and Selby

Colvin (1886); the Letters, edited by Mr Colvin (1891); and the *Poems*, edited by Drury (1896).

Keble, JOHN, son of the Rev. John Keble of Cohn St Alwyns, Gloucestershire, and Sarah Maule, a lady of Scotch descent, was born at Fairford, near his father's living, on April 25, 1792. His father, a divine of the school of Ken, educated his son at home, and with such success that at the unusually early age of fifteen he was elected to an open scholarship at Corpus Christi College, Oxford, then a small college, but numbering among its scholars many who rose to eminence in after-life, such as Sir J. T. Coleridge and Dr Arnold of Rugby. His university career was unusually brilliant, for in 1810 he gained a first-class both in classics and mathematics; in 1811 was elected Fellow of Oriel College; and in 1812 gained both the Latin and English prize essays. In 1815 he was ordained deacon, and priest in the following year, beginning active work as the curate of East Leach, near his father's living, while still continuing to reside in Oxford, taking pupils and examining. From 1818 to 1823 he was tutor of his college; but his heart was mainly in parish work, and his mother's death was the occasion which made him leave Oxford and return to assist his father. There in the country he did a work for Oxford and the church which was of the most vital importance. Three points need specially to be singled out in this work. (1) First in time comes the influence of his poetry. In 1827 he published with much diffidence, and only in deference to the wishes of his friends, *The Christian Year, or Thoughts in Verse for the Sundays and Holidays throughout the Year*. The influence of this volume was not very great at first, but its excellence was recognised by true critics, and later on, when the Tractarian movement had made its writer well known, and had stirred a deeper interest in its theme, it had an influence which can scarcely be overrated. For, though some of the poems are rather obscure and somewhat constrained and artificial, as though written to complete the series, yet the greater number have a genuine ring of inspiration in them; the love of home life and of nature, a calming, soothing sense of the ever-present love of God, a sobriety of religious feeling, and a sad undertone of grief for the moral and spiritual degeneracy of the church are its most striking characteristics. His own theory of poetry

that it is the vehicle for the expression of the poet's deepest feelings, controlled by a certain reserve—was explained in an interesting article in the *British Critic* in 1838 on Lockhart's *Life of Sir Walter Scott*. It was worked out at length and illustrated by an examination of the chief Greek and Latin poets in his Latin lectures delivered as professor of Poetry at Oxford, an office which he held from 1831 till 1841.

(2) His intercourse with Oxford was thus kept up, and at the end of 1827 many of his friends wished to see him elected to the vacant provostship of Oriel, and he himself would willingly have accepted such a recall to Oxford. It became, however, clear that a majority was in favour of Dr Hawkins, and Mr Keble withdrew his candidature. But meanwhile a movement was in progress which was to affect Oxford to its centre. Mr Keble had gathered round him in his ennoce a small knot of pupils, of whom the most striking was Hurrell Froude. In that knot was formed the impulse which generated the Tractarian movement. Starting from the desire for a moral and spiritual revival of the English church, revolting from the defects of learning and of taste which characterised the Evangelicals, and much more from the secular Erastianism of the dominant Whig party, these friends fell back upon the primitive ideal of

the church, emphasising its essentially spiritual character, laying stress on the reality of the apostolical succession, of the prerogatives of the priesthood, of the grace conferred in the sacraments, and insisting on a high spiritual ideal of life. In his sermon on National Apostasy (1833) Keble gave the signal for active movement, and for the next few years was busily engaged with Newman, Pusey, I. Williams, T. Keble, and others in the issue of the *Tracts for the Times*, until the series was brought to an end by the publication of Tract No. 90 in 1841. Meanwhile Keble had in 1835 married Miss Charlotte Clarke, the daughter of an old friend of his father, and had removed to the living of Hursley, where he remained until his death.

(3) Keble had not only been one of the originators of the movement; he was also, with Dr Pusey, the steady influence which supported it under the shock caused by Newman's secession to Rome. For the last twenty years of his life he was the trusted correspondent and confessor of many who were in intellectual and spiritual anxiety. He was the constant champion of the church at each critical moment, taking a prominent part by his pamphlets, especially on questions connected with marriage and divorce, with the nature of Christ's presence in the eucharist, and with the independence of the church tribunals. He also contributed much to the cause of theological knowledge by his careful edition of Hooker's works, his life of Bishop Wilson, and his translation of St Irenæus. Perhaps even more than in any of his writings he has influenced the church by his character. The type of dutifulness, whether to parents or to his church, full of affection for home life and of reverence for children, generous to his friends, chivalrous and almost Quixotic in his desire to sacrifice himself for the cause of the truth, indignant against injustice or disloyalty, with an indignation tempered by severe self-restraint, and ever striving after a deep humility, he created an impression of saintliness, and won for himself a rare mixture of love and reverence. He died at Bourne-mouth on March 29, 1866. Besides the works mentioned, he published the *Lyra Innocentium*, *Thoughts in Verse on Christian Children* (1846), a poetical translation of the Psalter, and many theological pamphlets. Since his death have been published a most valuable volume of *Letters of Spiritual Counsel*, twelve volumes of parochial sermons, occasional papers, reviews, *Studia Sacra*, &c. A permanent memorial to him exists in Keble College, Oxford, erected by subscription after his death, and incorporated on June 6, 1870. This was founded on the lines of the report of a committee, in which he himself had been much interested, for extending the university by the building of a new college on more economical principles; and it aims at providing an academic education, at a less cost than the older colleges, for members of the Church of England.

See *Memoir of Keble*, by Sir J. Coleridge (1869); J. C. Sharp, *Essay* (1896), and his *Studies in Poetry and Philosophy* (1872); also a collection of memorials by J. F. Moor (1866); and a short Life by the present writer in 'English Leaders of Religion' (1893).

Keckskemet, a Hungarian town on a plain 55 miles by rail SE. of Budapest. Pop. (1890) 48,493.

Kedah. See QEDAH.

Kedron, or KIDRON, spoken of as a 'brook' in the English Bible, should rather be called (as in John, xviii. 1, new version, margin) 'ravine' or 'winter-torrent.' It is a gorge close to Jerusalem (q.v.) on the east, running away in the direction of the Dead Sea. Water never flows in it, save during the heavy rains of winter. At other times it is a dry *wady*.

Keelhauling, a punishment in use in the navy during the 17th and 18th centuries. The culprit was suspended from one yard-arm, then suddenly dropped into the water, and hauled beneath the keel up to the yard-arm on the other side. This was the mode adopted on large square-rigged vessels. On small fore-and-aft vessels the delinquent was let down over the bows, and was drawn aft underneath and along the keelson by a hauling-line, and brought up at the rudder-chains. (Cf. Marryat's *Dog Fiend*.) Keelhauling was practised on an Egyptian corvette so recently as August 1882.

Keeling (or KOKOS KEELING) **Islands**, a group of more than a dozen coral atolls in the Indian Ocean, 12 S. lat. and about 500 miles SW. of Java, are attached to the Straits Settlements, are covered with cocoa-nut palms, whence oil is extracted, and are inhabited by about 400 Malays, but owned by a Scotchman named Ross. Pigs and rats are the only mammals; there are no land-birds but poultry; crabs, large and small, abound. These islands were discovered by Captain Keeling in 1609 and were visited by Darwin in 1836; it was upon his study of them that he based his subsidence theory of the formation of coral-reefs (see CORAL). Guppy in 1888 found here confirmation of Murray's view. See CORAL.

Keene, a pretty town of New Hampshire, the capital of Cheshire county, on the Ashuelot River, 92 miles by rail NW. of Boston. Pop. 6784.

Keene, CHARLES SAMUEL, an inimitable artist in black and white, born of Ipswich ancestry at Hornsey, 10th August 1823, was educated at Bayswater and Ipswich, and, having tried both law and architecture, was at nineteen apprenticed to a wood-engraver. He worked for *Punch* from about 1851 to within five months of his death at Hammer-smith, on 4th January 1891. See Life by G. S. Lazard (1893), and *The Work of John Keene*, by Pennell and Chesson (1897).

Keep. See CASTLE.

Keeper, or LORD KEEPER OF THE GREAT SEAL, one of the great offices of state, practically merged since 1757 in that of Lord Chancellor (see SEAL). An act was passed at the instance of Sir Nicholas Bacon, lord keeper, assigning or confirming to the holder of that office rank and precedence equal to that of Lord High Chancellor. From 1558 to 1700 there were eleven lord chancellors and twenty-one lord keepers; from 1700 to 1757, six chancellors and four keepers. The last lord keeper, appointed in 1757, was Lord Henley.

Keewatin is little more than a geographical expression for a part of the country lying north of the province of Manitoba. Its extent has been considerably curtailed of late years by the delimitation of the western and northern boundaries of Ontario and the eastern boundary of Manitoba, and its area is now computed at 282,000 sq. m. On the south the district is bounded by Manitoba from its north-east corner to the western shore of Lake Winnipeg. The western boundary is along the west shore of the lake to near Norway House, whence it goes in a northerly direction to the 53th degree of latitude, at the point where it intersects the Nelson River, and then passes west to the 100th degree of longitude, which it follows north to the limits of Canadian territory. On the east the boundary is a continuation of the eastern boundary of Manitoba until it reaches Hudson Bay, where it follows the coast-line to the northern limits of the Dominion. Keewatin is but little known. It is nominally administered by the lieutenant-governor of Manitoba, but is nearly uninhabited, excepting by Eskimos in the north. Norway House, an important station of the Hudson Bay Company, and one or two other posts belonging

to that corporation, are the only settlements in the districts. The principal attraction is the game, large and small, with which it abounds. In some parts valuable minerals are believed to exist, but they have not been developed. The country is well watered and timbered in many places, but is not suitable for cultivation to any extent. It embraces the northern part of Lake Winnipeg, with its important fisheries, and includes the mouth of the Saskatchewan River, which is navigable, except for a short distance, for nearly 1000 miles. The Nelson River passes through the province, as well as the Churchill and numerous smaller streams; and the Chesterfield Inlet on the western side of Hudson Bay penetrates nearly to its western boundary. The projected Hudson Bay Railway is planned to pass through Keewatin. See HUDSON BAY.

Kef, EL, a walled town of Tunis, 95 miles SW. of the capital, perched on the side of a steep hill, was noted in Carthaginian times for its temple to Astarte. There exist a ruined temple, therma, and cisterns of Roman construction. Pop. 4000, exclusive of a small French garrison. A picture of early Christian life at this place is given in Cardinal Newman's *Callista*.

Kehl. See STRASBURG.

Keighley (pronounced *Keethley*), a market and manufacturing town in the West Riding of Yorkshire, on the Aire, amid the moorland scenery of the Brontës' country, 9 miles NW. of Bradford and 17 WNW. of Leeds. It has a parish church (rebuilt 1848), a Gothic mechanics' institute (1870-87), the Drake trade school (1713; rebuilt 1860), extensive water-works (1876), and two public parks of 9 and 15 acres, gifted in 1887-88 by the Duke of Devonshire and Mr. J. Lund. The manufactures of worsted and woollen goods, worsted-spinning machinery, and sewing and washing machines are important. Keighley was constituted a municipal borough in 1882. Pop. (1851) 13,050; (1881) 25,245; (1891) 30,810. See R. Holmes, *Keighley, Past and Present* (1858).

Keightley, THOMAS, a busy writer, was born in Dublin in October 1789, and was educated at Trinity College there. In 1824 he settled in England to a life of letters, which he pursued assiduously till his death, November 4, 1872. His histories of Rome, Greece, and England held their place as school manuals until superseded by better books; of less moment were his notes to Virgil and Horace. But his *Fairy Mythology* (1850) largely retains its value, as also to a less extent does his *Life, Writings, and Opinions of Milton* (1855), and his annotated edition of Milton (1859).

Kei Islands. See KEY.

Keim, THILLOT, a distinguished theologian, was born at Stuttgart, 17th December 1825, studied under F. C. Baur at Tübingen; and was in turn *co-pastor* at Tübingen, vicar in Stuttgart, deacon and next archdeacon at Esslingen, and professor of Theology at Zurich (1860), and at Giessen (1873), where he died, 17th November 1878. He published valuable monographs connected with the religious history of Ulm, Esslingen, and Swabia; two volumes of sermons, entitled *Eraunderschaft zur Gemeinde* (1861-62); *Claus' wahres Wort* (1873); *Aus dem Ueberbretum* (1878); but the work by which his name will best be remembered is the noble contribution he added to the Lives of Christ. The preliminary studies, *Die menschliche Entwicklung Jesu Christi* (1861) and *Die geschichtliche Würde Jesu* (1864), were worked up into *Der geschichtliche Christus* (3d ed. 1866); but all three were preliminary to the great *Geschichte Jesu von Nazara* (3 vols. 1867-72; Eng. trans. 6 vols. 1873-83), a truly epoch-making work,

unequaled in learning, acuteness, and insight. Keim eliminates the miraculous element, but is in the highest degree reverent and spiritual in tone, regarding the person itself as the real miracle, the divinity of Jesus as depending on the elevation of his humanity attained through a sinlessness which of itself evidenced the miracle of God and his presence on earth. Keim's *Geschichte Jesu nach den Ergebnissen heutiger Wissenschaft* (1873) was a successful popular abridgment of his great work.

Kei River, GREAT, a river of South Africa, which in 1848 was made the boundary between Cape Colony and Kaffraria. Transkei is a magistracy of Kaffraria, comprising Fingoland, the Idutwya Reserve, and Gealekaland, and lying between the Great Kei River and the western boundary of Pondoland. The magistracy forms, administratively, a dependency of Cape Colony. Pop. 1020 Europeans and 152,550 natives.

Keith, ADMIRAL LORD. George Keith Elphinstone, Viscount Keith, was the son of the tenth Lord Elphinstone, and was named after his granduncle the tenth Earl Marischal Keith. Born at Elphinstone Tower, near Stirling, 7th January 1746, he entered the navy, saw service in most parts of the world, and distinguished himself in numerous engagements in the American war and the French wars. He commanded the expedition in 1795-97 which took Cape Town, and was made Baron Keith; and having had the command of the fleet which landed Abercromby's army in Aboukir Bay (1801) he was in 1814 made viscount. He died 10th March 1823. There is a *Life* by Allardyce (1882).

Keith, JAMES, best known as Marshal Keith, was born at the castle of Inverurie, near Peterhead, 11th June 1696. He came of a family, represented now by the Earl of Kintore, which from the 12th century had held the hereditary office of Great Marischal of Scotland, and whose principal seat was Dunnottar Castle (q.v.). Sir William Keith, the tenth in descent from the founder of the line, was created Earl Marischal in 1458; and George, fifth earl, his sixth descendant, in 1593 founded the Marischal College in Aberdeen. His fourth descendant, William, ninth earl (d. 1712), married Lady Maria Drummond, a Catholic and strong Jacobite, daughter of the fourth Earl of Perth, and by her was the father of Marshal Keith and of his elder brother, George, tenth Earl Marischal (1693-1778). James was destined for the law, and had studied at Aberdeen and Edinburgh, when in 1715 he engaged with his brother in the Jacobite rising, and in 1719 in Alberoni's expedition to the West Highlands, which ended in the 'battle' of Glenshiel (q.v.). Both times the brothers escaped to the Continent; and James held for nine years a Spanish colonelcy, and took part in the siege of Gibraltar (1726-27). But his creed, the Episcopal, was against him; and in 1728 he entered the Russian service as a major general. He distinguished himself in the wars with Turkey and Sweden, particularly at the siege of Ochakoff (1737) and the reduction of the Aland Islands (1743). To be healed of a wound received on the former occasion he visited Paris, and thence crossed over to London, where he made his peace with the Hanoverian government, and had more than one interview with George II. In 1747, finding the Russian service in various respects disagreeable, he exchanged it for that of Prussia. Frederick the Great knew his merits, and gave him at once the rank of field-marshal. From this time his name is associated with that of the king of Prussia, who relied as much on Keith's military genius as he did on the diplomatic ability of his brother, the Earl Marischal, whom he despatched on embassies to Paris and Madrid. Keith's talents became still

more conspicuous upon the breaking out of the Seven Years' War (1756). He shared Frederick's doubtful fortunes before Prague, was present at the victories of Lobositz and Rossbach, and conducted the masterly retreat from Olmütz. His last battle was not far distant. On 14th October 1758 at Hochkirch (q.v.) Keith, who commanded the Prussian right wing, was shot dead while for the third time charging the enemy. The Austrians buried him honourably in the church at Hochkirch, whence Frederick next year translated his remains to the Garrison church at Berlin. There, too, in the Wilhelmsplatz, Frederick in 1786 erected a statue of the marshal, a replica of which in bronze was gifted by King William to Peterhead in 1868. Keith died poor and unmarried, but he left children by his mistress, the Swedish captive, Eva Merthens, who survived him till 1811.

See his fragmentary but valuable *Memoir, 1717-34* (Spalding Club, 1843); the *Memoir of Marshal Keith, with a Sketch of the Keith Family* (Peterhead, 1869); Carlyle's *Frederick*; and the German Lives of Keith, by Vambagen von Ense (1844; new ed. 1888) and Lient. von Paczynski-Tenczyn (1889).

Keith-Falconer. See FALCONER.

Kekulé, FRIEDRICH AUGUST (1829-96), chemist, born at Darmstadt, and enrolled as Von Stradowitz in 1865, became professor at Ghent and at Bonn (1865). He made important researches in the chemistry of the organic substances, and published a famous handbook of organic chemistry (1861-67).

Kelāt (also spelt Khelat and Kalat), the capital of Beluchistan, stands at an elevation of more than 7000 feet, in 28° 52' N. lat. and 66° 33' E. long., and contains about 14,000 inhabitants. Seated on the summit of a hill, Kelat is a place of great military importance. It was occupied by England (1839-41); and in 1877 a treaty was concluded with the khan, by which a British agent, with military escort, became resident at Kelat. In 1893 the Indian government deposed the khan for misgovernment, his son being proclaimed khan in his stead. See BELUCHISTAN.—**KELAT-I-GHIZAI** is a fortress of Afghanistan, 75 miles NE. of Kandahar.

Kelati Nadiri, one of the strongest natural fortresses in the world, in the Persian province of Khorassan, and close to the Russian frontier of Transcaucasia. It was raised by Nadir Shah as a defence against the Turkomans upon an elevated valley in the Hezar Masjid Mountain, and shut out from external communication by lofty hills with precipices of 300 to 600 feet. Owing to Russia's schemes upon Khorassan, Kelati Nadiri has recently gained considerable importance.

Kellaways Rock, the name given to highly fossiliferous beds of sand and calcareous sandstones which occur near the base of the Oxford clay. See JURASSIC SYSTEM.

Keller, GOTTFRIED, German poet and novelist, was born at Glattfelden, near Zurich, on 19th July 1819. He studied at first landscape-painting at Vienna (1840-42), but shortly afterwards abandoned painting for literature. From 1861 to 1876 he was state secretary of his native canton. The works on which Keller's fame rests are the romance, *Der grüne Heinrich* (1854; new and revised ed. 1879-80); *Die Leute von Seldwyla* (1856), a collection of short tales, of which some, as *Romeo und Juliet auf dem Dorf*, *Kleider machen Leute*, and *Der Schmied seines Glucks*, are excellently told; the humorous *schöne Legenden* (1872); *Zürcher Novellen* (1878); a volume of *Gesammelte Gedichte* (1883); and the romance *Martin Sabander* (1886). Keller has a warm and fertile imagination, a rich humour, and true poetic feeling; he excels in the delineation of Swiss character. A collected edition

of his works appeared in 1889-90. He died 15th July 1890. See Life by Brahm (1883).

Kellermann, FRANÇOIS CHRISTOPHE, Duke of Valmy, born 28th May 1735, at Wolfsbuchweiler, in Alsace, entered a French regiment of hussars at seventeen, and had risen to the rank of major-general before the Revolution broke out. In 1792 he received the command of the Army of the Centre on the Moselle, repelled the Duke of Brunswick, and by his daring promptitude delivered France by the famous cannonade of Valmy. Yet on allegation of treason against the republic, he was imprisoned for a year, and only liberated on Robespierre's fall. He afterwards rendered important services in Italy, and on the erection of the Empire he was made a marshal and a duke. In the campaigns of 1809 and 1812 he commanded the reserves on the Rhine. At the Restoration he attached himself to the Bourbons. He was moderate and constitutional in his views. He died 12th September 1820. It was his son (1770-1835) whose charge turned Marengo (q.v.) into a victory.

Kells (originally *Keolis*), an ancient town of County Meath, Leinster, Ireland, situated on the Blackwater, 26 miles by rail W. of Drogheda. It has several interesting antiquities, including St Columba's house, a round tower, and three or four stone crosses. Kells was made the centre of a bishop's see in 807; this was united to the see of Meath in the 13th century. Previous to the Union Kells returned two members to parliament. Pop. 2822. A manuscript copy of the gospels, called the Book of Kells, is beautifully executed with coloured Celtic ornamentation, and is believed to be the work of the 9th century. It is now preserved in the library of Trinity College, Dublin. See ILLUMINATION OF MANUSCRIPTS.

Kelp (Fr. *carrech*) is the crude alkaline matter produced by the combustion of seaweeds, of which the most valued for this purpose are *Fucus vesiculosus*, *F. nodosus*, *F. serratus*, *Laminaria digitata*, *L. bulbosa*, *Hennanthalia litoria*, and *Chorda filum*. These are dried in the sun, and then burned in shallow excavations at a low heat. About 20 or 24 tons of seaweed yield one ton of kelp. The kelp met with in commerce consists of hard, dark-gray or bluish masses, which have an acrid, caustic taste, and are composed of chloride of sodium, of carbonate of soda, sulphates of soda and potash, chloride of potassium, iodide of potassium or sodium, insoluble salts, and colouring matter. It used to be the great source of soda (the crude carbonate); but, as this salt can now be obtained at a lower price and of a better quality from the decomposition of sea-salt, it is prepared in far less quantity than formerly from kelp. A ton of good kelp will yield about 8 lb. of iodine, large quantities of chloride of potassium, and additionally, by destructive distillation, a large quantity of volatile oil, from 4 to 15 gallons of paraffin oil, 3 or 4 gallons of naphtha, and from 1½ to 4 cwt. of sulphate of ammonia.

Till 1825, before the remission of the duty on salt and on Spanish bailla, the kelp manufacture (introduced into Tyree in 1746) was carried on to a very large extent in the north and west of Scotland, and the value of many estates in the Highlands and Hebrides greatly increased in consequence. About the beginning of the 19th century some 20,000 tons, worth from £200,000 to £300,000, were made annually on the western coasts of Scotland alone. Now the total annual produce in the United Kingdom will hardly exceed 7000 tons, at about £4 a ton. The greater part comes from Ireland, the remainder from the West Highlands and the Channel Islands. The French supplies do

not exceed those of Britain. See SODA, IODINE, SEAWEEDS.

Kelpie. See DEMONOLOGY.

Kelsey Beds, a subdivision of the Pleistocene accumulations, consisting chiefly of gravel, charged with marine shells and remains of mammoth, rhinoceros, &c., which occurs at Kelsey Hill near Heslon, and other places in the neighbourhood of Hull. The gravel rests upon and is covered by boulder-clay, and was probably deposited in the sea, near the mouth of a river.

Kelso, a pleasant market town of Roxburghshire, 23 miles by rail WSW. of Berwick-on-Tweed and 52 (by road 42) SE. of Edinburgh. It stands on the north bank of the Tweed, here joined by the Teviot, and spanned by Rennie's noble five-arch bridge (1803), 165 yards long. In 1126 David I. translated to 'Calehon' a Tironensian abbey, founded by him at Selkirk seven years before. This, wrecked by the English under Hertford in 1545, is now represented by the stately ruin of its cruciform church, Romanesque and First Pointed in style, with a massive central tower 91 feet high. Across the river, on the peninsula formed by the Teviot, stood the royal castle and town of Roxburgh, demolished in 1460; and 1 mile W. is Floors Castle (1718-1849), the seat of the Duke of Roxburgh. Kelso itself has a town-hall (1816), corn exchange (1856), high school (1878), race-course, coach-building and other industries, and memories of the '15, Scott, the Ballantynes, and Sir William Fairbairn. Pop. (1851) 4783; (1881) 4687; (1891) 4175. See works by Haig (1825), Cosmo Innes (1846), and Rutherford (1880).

Kelt. See SALMON.

Kelts. See CELTS.

Kelvin. LOCH. See THOMSON (WILLIAM).

Kemble, JOHN MITCHELL, Anglo-Saxon-scholar, was the son of Charles Kemble, the actor, and was born in London in 1807. He had his education partly under Dr Richardson, author of the *English Dictionary*, and partly at Bury St Edmunds grammar-school, whence in 1826 he passed to Trinity College, Cambridge, graduating B.A. in 1830. While an undergraduate he spent some time at Göttingen, under the brothers Grimm, who seem to have finally determined his natural bent towards Teutonic studies. The first fruit of these was an edition of the poem of Beowulf (1833-37), to a second edition of which he added a translation, with a glossary and notes. Not to mention several minor publications, he edited for the English Historical Society a valuable collection of charters of the Anglo-Saxon period, entitled *Codex Diplomaticus Ævi Saxonici* (6 vols. 1839-48). But his most important work, which contains the chief results of all his researches, is his unfinished *History of the Saxons in England* (2 vols. 1849; new ed. by W. de G. Birch, 1876). Further work was interrupted by sudden death at Dublin, March 26, 1857. Kemble was for a good many years editor of the *British and Foreign Review*; and also held the office of Licensor of Plays.

Kemble, JOHN PHILIP, eldest son of Roger Kemble, a well-known country manager, was born at Prescott, in Lancashire, on 1st February 1757. His father intended him for the Roman Catholic priesthood, and with this view he was sent to a seminary at Sedgeley Park, in Staffordshire, and afterwards to the English college at Douay. But the stage mania was on him, and he became, despite his father's earnest prohibition, an actor. His first professional appearance was made at Wolverhampton on 8th January 1776; he afterwards joined the famous York circuit, under the command of Tate Wilkinson; and he played also

in Ireland. The success of his great sister, Mrs Siddons (q.v.), gave him the eagerly-coveted chance of a London appearance, and on 30th September 1783 he played Hamlet at Drury Lane. His reading of the character was original and striking, and, though his acting was not then what it afterwards became, it aroused the keenest interest. He continued to play leading tragic characters at Drury Lane for many years, until, indeed, the shiftlessness of Sheridan forced him to leave the theatre. In 1788 Sheridan appointed Kemble manager, and his control of the theatre was notable for the care and completeness with which Shakespeare and the legitimate drama were produced. When driven from Drury Lane in 1802 he purchased a share (one-sixth) in Covent Garden Theatre, for which he paid £23,000. He became manager of that theatre, and made his first appearance there on 24th September 1803 as Hamlet. On 20th September 1808 the theatre was burned to the ground, and on the opening of the new building (18th September 1809) the notorious O. P. (i.e. 'Old Price') Riots broke out, in which the Kemble family were the special objects of public execration. Kemble retired in 1817. He took a formal farewell of the Edinburgh public on 29th March of that year, speaking a farewell epilogue written by his warm friend, Sir Walter Scott. His London farewell was taken on 23d June in his great character of Coriolanus. He afterwards settled down at Lausanne, where he died of apoplexy on 26th February 1823. As an actor Kemble probably has had no superior in the dignified, stately characters of tragedy—he was 'the noblest Roman of them all'—and his Coriolanus, his Brutus, and his Cato were perfect impersonations. He was a magnificently handsome man; stately, if rather stiff, in bearing; a thoroughly intelligent and educated speaker, though labouring under the disadvantage of a weak voice; and, above all, a man of remarkable intellectual power. He was also emphatically a gentleman.—STEPHEN, brother of the foregoing, was born in Herefordshire, 3d May 1758. As an actor he was chiefly remarkable for his enormous bulk, which enabled him to play Falstaff without stuffing. He was for some eight years (1792-1800) manager of the Edinburgh theatre, where he was in continual hot water through lawsuits and other troubles. He died in 1822.—CHARLES, younger brother of John and Stephen, was born at Brecon on 27th November 1775. In 1792 he made his first appearance on the stage at Sheffield as Orlando in *As You Like It*, and on 21st April 1794 made his debut in London, playing Malcolm to John Kemble's Macbeth. He continued on the stage till 1849, when, being appointed Examiner of Plays, he retired from the active exercise of his profession. He died on 12th November 1854. As an actor Kemble chiefly excelled in characters of the second rank, and his Laertes, Cassio, and Macduff were scarcely less interesting than his greater brother's Hamlet, Othello, and Macbeth. In comedy he specially distinguished himself, and his name is even yet a tradition for grace, delicacy, and joyous brightness. No man could play gentlemen more perfectly than Charles Kemble. Two of Charles's daughters complete the list of the Kembles. FRANCIS ANNE (Fanny Kemble), born in London, 27th November 1809, made her debut in 1829, when her tragic acting created a great sensation. In 1832 she went with her father to America, where two years later she married Pierce Butler, a Southern planter. They were divorced in 1848; and, resuming her maiden name, she gave Shakespearian readings for twenty years. She published dramas, poems, autobiography, &c., and died in London, 15th January 1893. ADELAIDE (1814-79) was distinguished as an opera singer, but retired before her marriage

with F. Sartoris. She was author of *A Week in a French Country House* (1867) and *Melba and Other Tales* (1868). See Percy Fitzgerald, *The Kembles* (2 vols. 1874).

Kemp, GEORGE MEIKLE, architect, was born at Moorfoot, in Peeblesshire, 26th May 1795, and up to the age of fourteen assisted his father, who was a shepherd. Becoming a carpenter and millwright, he afterwards sought work in England and France, everywhere settling in towns where he could study fresh specimens of Gothic architecture; but his intention of making a tour of Europe was checked by news of his mother's death, and he returned to Scotland in 1826. There he ultimately became a draughtsman in Edinburgh, and executed drawings of Scottish cathedrals for a projected Glasgow publication. This was abandoned, however, as was also a project to complete Glasgow cathedral, for which Kemp had prepared a model; but in 1838 his second design for the Scott Monument at Edinburgh was accepted. It is on this work alone that Kemp's fame rests, for before the completion of his fairy-like structure the architect was drowned in the canal at Edinburgh, on the night of 6th March 1844. See Life by T. Bonnar (1892).

Kempen, a town of Rhenish Prussia, 7 miles N.W. of Krefeld. It manufactures silk goods, wax candles, vinegar, &c. Pop. 5952. There is another Kempen in the Prussian government of Posen, 48 miles by rail N.E. of Breslau. Pop. 5787.

Kempis, THOMAS A. was so called from Kempen, where he was born in 1379. His family name was Hamerken (Latinised, *Malleolus*, 'Little-hammer'). He was educated at Deventer, and in 1400 entered the Augustinian convent of Agnetenberg near Zwole, of which his brother John was prior. Here he took the vows in 1406. He entered into priest's orders in 1413, and was chosen sub-prior in 1429, to which office he was re-elected in 1418. His whole life appears to have been spent in the seclusion of this convent, where he lived to an extreme old age. His death took place in 1471, at which time he certainly had attained his ninetieth, and most probably his ninety-second year. The character of Kempis for sanctity and ascetic learning stood very high among his contemporaries, but his historical reputation rests almost entirely on his writings, which consist of sermons, ascetical treatises, pious biographies, letters, and hymns. Of these, however, the only one which deserves special notice is the celebrated ascetical treatise *On the Following (or Imitation) of Christ*, the authorship of which is popularly ascribed to him. In its pages, says Dean Milman, 'is gathered and concentrated all that is elevating, passionate, profoundly pious in all the older mystics. No book, after the Holy Scripture, has been so often reprinted, none translated into so many languages, ancient and modern, extending even to Greek and Hebrew, or so often retranslated. At least eighty editions were printed between 1470 and 1500; and the total number of editions enumerated by Fr. Aug. de Backer (*Essai Bibliog.*, Liège, 1864) was about 3000. Before his death in 1873 he had collected evidence of more than 3000 additional editions. The earliest English translation, by Dr Atkinson, canon of Windsor, was printed by Pynson in 1503. It is strange that the authorship of a book so popular, and of a date comparatively so recent, should still be the subject of one of the most curious controversies in literary history. The book, up to the beginning of the 17th century, had been ascribed either to Thomas a Kempis or to the celebrated John Gerson (q.v.), chancellor of the university of Paris, except in one MS., which, by a palpable anachronism, attributes it to St Bernard; but from that time another claimant has

been put forward, Gersen, the so-called abbot of Vercelli, whose very existence has not been satisfactorily proved. His claim was strongly argued by Cajetan and many Benedictine writers, and later by M. de Grégory (*Memoire sur le véritable Auteur de l'Imit.*, 1830) and Renan, but the arguments against it of Father Eusebins Amout and Mgr. Malou (*Recherches histor.*, Tonnay, 3d ed. 1858) remain unanswered. These three competitors have divided the voices of the learned, not alone individuals, but public bodies, universities, religious orders, the Congregation of the Index, the parliament of Paris, and even the French Academy; and the assertors of their respective claims have carried into the controversy no small amount of polemical acrimony. Hilton, an English monk, has also been proposed as author; but the learned have now generally come to concede the honour to Kempis. The theology of the *Imitation* is almost purely ascetical, and (excepting the 4th book, which regards the eucharist, and is based on the doctrine of the real presence) the work has been used indiscriminately by Christians of all denominations. The most ancient perfect MS., written by Thomas's own hand, is in the Bourgogne Library at Brussels, and bears the date 1441, but we know that this was not the protograph MS., and indeed two MS. copies exist of 1425. We may therefore date the completion of the work between 1415 and 1424. An exact fac-simile was published at London in 1879, with an introduction by Charles Ruelens. Dr Carl Hirsche of Hamburg discovered that in this its original form the work was characterised by rhythmic periods, cadenced sentences, and frequent rhymes—a device not uncommon among mystical writers. He found also upon the MS. marks of a peculiar system of punctuation, employed not merely to mark the sense, but also to indicate these rhythms to a reader; and in 1874 he printed at Berlin an edition of the text in which these were set forth for the first time by a rearrangement of the matter in the paragraphs. The present division of the chapters into paragraphs was originally made by the Jesuit H. Sommalins (1599); the further division into verses was the work of the 17th-century editors. A new English translation, 'now for the first time set forth in Rhythmic Sentences according to the Original Intention of the Author,' was published in London in 1889, with a preface by Canon Liddon.

See Kettlewell, *Authorship of the De Imitatione* (1877) and his *Thomas a Kempis and the Brothers of the Common Life* (1882); Victor Becker, *L'Auteur de l'Imitation* (1883); Hirsche, *Prolegomena zu der Imitatio Christi* (1873: 94); L. Wheatley, *The Story of the Imitatio Christi* (1891). The translation, with introduction, &c., by Dr Bigg (1897), is based, like all English translations, on that of Anthony Hoskins the Jesuit (1568-1615), itself a modernisation of the older one by Richard Whytford (ed. 1520). See the bibliography in Wolfgruber's *Gersen* (1880).

Kempton, a town of Bavaria, 51 miles S. by E. of Ulm. The upper town grew up around a monastery (8th century) founded by disciples of St Gall; the abbot became a prince of the empire (1360), and the place a free town of the empire (1289). There are some manufactures. Pop. (1875) 12,682; (1895) 17,353.

Kempton Park, in Middlesex, 4 miles W. of Kingston-on-Thames, once a royal residence, is now noted for its race-meetings. See HORSERACING.

Ken, THOMAS, an English bishop of saintly memory, was born at Little Berkhamstead, Herts, in July 1637. His step-sister Anne Ken, twenty-seven years his senior, was the second wife of Isaac Walton. He had his education at Winchester, and at Hart Hall and New College, Oxford, obtained a fellowship in the last named in 1657,

and proceeded B.A. in 1661 and M.A. in 1664. He took orders at twenty-five, and held in succession the country livings of Little Easton in Essex, Brixton in the Isle of Wight, and East Woodhay in Hants. Already he had been elected a Fellow of Winchester College, and he now became also chaplain to the bishop, Dr George Morley. Here it was that he prepared his *Manual of Prayers for the use of the Scholars of Winchester College* (1674), and wrote his famous morning, evening, and midnight hymns, the first two of which, 'Awake, my soul, and with the sun,' and 'Glory to Thee, my God, this night,' are perhaps more widely known than any other English hymns. In 1674 Ken visited Rome, and five years later was appointed by Charles II. chaplain to the Princess Mary, wife of William of Orange, but offended William by insisting that a relative's promise of marriage should be kept, and returned home in 1680, when he was appointed one of the chaplains of the king. It was in March 1683, on the king's visit to Winchester, that Ken refused to give up his house for the accommodation of Nell Gwynne. Later in the same year he sailed to Tangiers as chaplain to Lord Dartmouth, and seven months after his return (in April 1684) was appointed Bishop of Bath and Wells. It is said that as soon as the king heard of the vacancy he remembered Ken's fearless honesty at Winchester, and asked, 'Where is the little man who wouldn't give poor Nelly a lodging? Give it to him.' He was consecrated in January 1685, and one of his first duties was to attend the death-bed of Charles. The chief public event of his bishopric was his trial and acquittal among the 'Seven Bishops' in 1688, for refusing to read the *Declaration of Indulgence*. At the Revolution he found himself unable in conscience to take the oath to William, having already sworn allegiance to King James, and was therefore superseded in his bishopric by Dr Kidder in 1691. He spent the remainder of his days in quiet retirement at Lord Weymouth's seat of Longleat, refusing to perpetuate the schism by consecrating non-juring bishops. On account of his growing weakness he declined to resume the duties of his diocese on Kidder's death in 1703, and gladly recognised his successor, ceasing to sign himself 'Bath and Wells' from that time. He died at Longleat, 19th March 1711, and was buried at sunrise of the 21st, beneath the chancel window in the churchyard of Frome Selwood.

Bishop Ken was esteemed a great preacher in his day, but his name survives now only from his hymns, and from his saintly personal character and the intensity of his devotion. And his morning and evening hymns deserve the world-wide reputation they enjoy, from the transparent simplicity, fervour, and truth with which throughout they are informed. His *Exposition on the Church Catechism* (1685) is his most important work in prose.

Ken's poetical works were collected by his great-nephew and executor, W. Hawkins, in four volumes in 1721; his prose works by J. T. Round in one volume in 1838. Hawkins published a selection from the works, with a Life, in 1713. A convenient collection of the prose works is that by the Rev. W. Benham in 1889 for the 'Ancient and Modern Library of Theological Literature.' There are Lives by the Rev. W. L. Bowles (2 vols. 1830-31), by 'A Layman'—Mr Anderson—(1851), Dean Plumpton (2 vols. 1888), and F. A. Clarke (1896).

Kendal, or **KIRBY KENDAL**, a market-town of Westmorland, on the Kent, 22 miles by rail N. of Lancaster and 13 SW. of Ambleside. It is a gray straggling place, with an ancient Gothic church, a ruined castle (the birthplace of Catharine Parr), a town-hall (1828), and a grammar-school (rebuilt in 1887). Flemings settled here in 1337, and the town became famous for its woollens and 'Kendal-green' buckram; whilst Pooecke in 1751

refers to its 'manufacture of a sort of frieze call'd cotton, at 8d. a yard, sold mostly for the West Indies, for the slaves.' Nowadays the industries include heavy textile fabrics, such as horse-cloths and railway rags, besides leather, snuff, paper, &c. Incorporated as a municipal borough in 1875. Kendal returned one member to parliament from 1832 till 1885. Pop. (1851) 11,829; (1891) 14,430. See two works by C. Nicholson (1832-75).

Kenia, **MOUNT**, an isolated mountain mass in eastern Africa, about 10' south of the equator, and not far north of Kilima-Njaro, nearly in the centre of British East Africa. It is also known as Doenyo Ebor, or White Mountain, because its summit is covered with perpetual snow. The crater wall rises up to a height of 16,000 feet, but the loftiest pinnacle towers up 3000 feet higher. Count Teleki partly ascended it in 1887, and Dr Gregory got to the bottom 17,000 feet in 1893.

Kenilworth, a market-town of Warwickshire, on a small sub-adjunct of the Avon, 5 miles N. of Warwick and 5 SSW. of Coventry. The castle, founded about 1120 by Geoffrey de Clinton, was defended for six months (1265-66) by Simon de Montfort's son, and passed by marriage (1359) to John of Gaunt, and so to his son, Henry IV. It continued a crown possession till in 1563 Elizabeth conferred it on Leicester, who here in July 1575 entertained her for eighteen days at a daily cost of £1000—that sumptuous entertainment described in Scott's *Kenilworth*. Dismantled by the Roundheads, the castle has belonged since the Restoration to the Earls of Clarendon. Its noble ruins comprise 'Cesar's Tower,' the original Norman keep, with walls 16 feet thick; Mervyn's Tower and the Great Hall, both built by John of Gaunt; and the more recent but more dilapidated Leicester's Buildings. There is a fragment also of an Augustinian priory (*c.* 1122); and the parish church has a good Norman doorway. Tanning is the chief industry. Pop. (1851) 2886; (1891) 4173.

Kennebec, a river of Maine, rises in Moosehead Lake, in the west of the state, and, passing Augusta, runs generally south to the Atlantic Ocean. Its length is over 150 miles. It is navigable for large vessels to Bath, 12 miles, and for steamers beyond Augusta. In its course it falls 1000 feet, affording abundant water-power. Except for a few miles from its mouth, the river is closed by ice for from three to four months in the year; and many companies are engaged in harvesting and storing the ice.

Kennedy, **BENJAMIN HALL**, one of the greatest of modern schoolmasters, was born in 1804, son of the Rev. Rann Kennedy, second master of King Edward's School, Birmingham, and had his education there and at Shrewsbury under Dr Butler, whence he passed to St John's College, Cambridge. His course was unusually distinguished: he carried off the Porson prize thrice, the medal for the Latin ode twice, and for the Greek ode once, and graduated in 1827 as senior classic, senior Chancellor's medalist, and senior optime. Next year he became Fellow and classical lecturer of his college, in 1830 an assistant master at Harrow, and in 1836 was appointed to succeed his old master, Dr Butler, at Shrewsbury. Here for thirty years he laboured with assiduous vigour and conspicuous success, forming for almost a generation a series of brilliant scholars, of whom need only here be named the greatest, H. A. J. Munro, the editor of Lucretius. The famous *Sobrietas Corolla* (1850; 4th ed. 1890) is an imperishable memorial at once of his own brilliant scholarship and of the spirit he could inspire. There never was perhaps a more dexterous and clever versifier in both Greek and Latin. In 1867 Dr Kennedy was appointed professor of

Greek at Cambridge and Canon of Ely. He died at Torquay, April 6, 1889.

Among his books were *Palæstra Latina* (1850); *Curriculum Stili Latini* (1858); the *Public School Latin Grammar* (1871); an admirable school edition of Virgil, annotated (1876); and editions, with verse translations, of the *Birds of Aristophanes* (1874), the *Agamemnon* of Æschylus (1878), and the *Oedipus Tyrannus* of Sophocles (1882). In *Between Whites* (1877) are collected many excellent poetical pieces in Greek, Latin, and English. Other works were *Occasional Sermons* (1877), *Plato's Theætetus*, with translation (1881), and *Ely Lectures on the Revised Translation of the New Testament* (1882).

Kenneth Macalpin. See SCOTLAND.

Kennicott, BENJAMIN, an eminent 18th-century biblical scholar, was born at Totnes, in Devonshire, April 4, 1718, son of the parish clerk and master of a charity school, to which latter office he succeeded at an early age. Some rich friends who recognised his promise helped him to enter Wadham College, Oxford, in 1744, and there he soon distinguished himself by his acquirements in Hebrew and theology, publishing, while still an undergraduate, two striking dissertations, *On the Tree of Life in Paradise* and *On the Oblations of Cain and Abel*. Soon after he was elected Fellow of Exeter College. In 1767 he was appointed Radcliffe librarian, and in 1770 canon of Christ Church, Oxford, where he died, August 18, 1783. The great work by which Kennicott's name will be remembered is his *Vetus Testamentum Hebraicum cum Variis Lectionibus* (2 vols. folio, 1776-80). Already in 1753 and further in 1759 he had published a work entitled *The State of the Printed Hebrew Text of the Old Testament considered*. This contained, among other things, observations on 70 Hebrew MSS., with an extract of mistakes and various readings, and strongly enforced the necessity for a much more extensive collation, in order to ascertain or approximate towards a correct Hebrew text. He undertook to execute the work thus projected in the course of ten years, and laboured, until his health broke down, from ten to fourteen hours a day. In spite of considerable opposition from Bishops Warburton, Horne, and other divines, Kennicott succeeded in enlisting the sympathies and obtaining the support of the clergy generally. Subscriptions to the amount of £10,000 poured in, and many foreign scholars, as Bruns of Helmstadt, undertook to help forward the work by collating MSS. in the libraries abroad. For ten years subsequently to 1760 accounts of the progress of the work were issued, and from first to last no fewer than 615 Hebrew MSS. and 16 MSS. of the Samaritan Pentateuch were collated. The text finally printed was that of Van der Hooght (without vowel-points), with the various readings printed at the bottom of the page. The *Variæ Lectiones Veteris Testamenti* (Parma, 1784-88), published by De Rossi, is a valuable addition to Kennicott's Hebrew Bible. Jahn published at Vienna (1806) a very correct abridgment, embracing the most important of Kennicott's readings.

Kemington, a district of Lambeth parish, and a division of Lambeth parliamentary borough, London. Kemington Oval, a little to the south of Vauxhall Bridge, is a famous cricket ground.

Kenosis. See CHRISTOLOGY, JESUS.

Kensal Green, a cemetery on the north-west of London, 77 acres in extent, was consecrated in November 1832; here many of the illustrious sons of England have been buried, as Thackeray, Leigh Hunt, Sydney Smith, Buckle, Sir Charles Eastlake, John Leech, Sir John Ross, Brunel, Mulhenny, Kemble, Dr Dibdin, Tom Hood, Balfe, Liston, Charles Matthews, Madame Vestris, Tietjens, Wilkie Collins, the Duke of Sussex, and his sister the Princess Sophia.

Kensington, a straggling parish in the west of London adjoining Westminster, within which, although noticed here, are Kensington Palace and Gardens. The former, given to the nation in 1899, and built of red brick, was the seat of Heneage Finch, Earl of Nottingham and Lord Chancellor, from whose successor William III. bought it in 1689; he and his wife Mary, Queen Anne and her consort Prince George of Denmark, and George II. all died within its walls, and it was also the birthplace of Queen Victoria. Kensington Gardens, which at first only consisted of the grounds of 26 acres attached to the palace, have been frequently enlarged, and are now 2½ miles in circuit; they are connected with the northern part of Hyde Park by a stone bridge over the Serpentine built by Rennie in 1826. At their southern extremity is the Albert Memorial (1872), designed by Sir Gilbert Scott, and consisting of a bronze gilt statue (by Foley) of the prince seated, placed beneath a gorgons canopy 180 feet high, and surrounded by works of sculpture illustrating the various arts and sciences. Opposite, in Kensington Gore, is the Albert Hall (1867-71), a huge circular building in the modern Italian style, of red brick with yellow dressings, used as a concert-room and capable of holding 10,000 persons; its cost was £200,000, and the interior measures 200 feet by 180 feet and is 140 feet high. Other buildings in the vicinity are the South Kensington Museum, Natural History Museum (see BRITISH MUSEUM), Royal School of Art Needlework, Royal College of Music (1883), City and Guilds of London Institute for the advancement of technical education (1884), and Imperial Institute, the opening of which by Queen Victoria took place in 1893. The parish church of St Mary Abbots—so called from the Abbots of Abingdon, to whom in 1107 a large part of the manor of Kensington was granted—is a fine building in the Gothic style, designed by Sir Gilbert Scott (1869), with a spire 295 feet high. Close by is the town-hall (1880) and the Roman Catholic Pro-cathedral (1869). Next to Kensington Palace, the most interesting building from a historical point of view is Holland House, a quaint mansion in the Elizabethan style, erected (1607) by Sir Walter Cope, and the great resort of the Whig politicians at the commencement of the 19th century. Amongst its occupants have been Fairfax, the Parliamentary general; Addison, who died in it; Shippen, the famous Jacobite; William Penn, the founder of Pennsylvania; and Charles James Fox, the statesman. Campden House, rebuilt in 1862 on its destruction by fire, is noteworthy from the former house, erected in 1612, having been the residence before her accession, of Queen Anne. Of the residences occupied by Swift, Sir Isaac Newton, Jack Wilkes, Wilberforce, George Canning and his son, Dr Dibdin, Sir David Wilkie, William Cobbett, Mrs Inchbald, Count D'Orsay, Talleyrand, Lord Macaulay, Thackeray, and John Leech but few traces now remain. The borough returns two members to parliament. Population of the entire civil parish, which includes Brompton, (1871) 120,299; (1891) 166,308. See Leigh Hunt's *An Old Court Sabuch* (1855), Loftie's *Picturesque Kensington* (1888), and Marie Liechtenstein's *Holland House* (1873).

SOUTH KENSINGTON MUSEUM was at first a temporary edifice of iron and wood (popularly known as 'the Brompton Boilers') which was erected by government (Science and Art Department) on part of the estate purchased out of the surplus funds of the Exhibition of 1851. It was opened in 1857, and to it were removed various collections which had since 1852 been exhibited in Marlborough House. This edifice has been superseded by permanent buildings still incomplete. The institution comprises (1) the Art Museum, (2) the India Museum,

(3) various science collections. The National Art Training School, the Normal School of Science, and the offices of the Department of Science and Art also form parts of the same group of buildings. The art collections comprise original works of decorative art of all periods and countries; paintings, chiefly of the English school, but including the cartoons of Raphael, the property of the crown; and reproductions in plaster, metal, &c. of sculpture, architectural decoration, and silversmiths' work. These have been acquired by purchase, gift, and loan. The cost to the nation has been about £400,000, while the value of the gifts and bequests is estimated at one million sterling. The India Museum, originally belonging to the East India Company, was handed over to the department in 1879. The science collections include machinery, naval models, &c., and apparatus for scientific teaching and research. The museum also contains art and science libraries. The visitors average 850,000 yearly. Monday, Tuesday, and Saturday are free days; on the other three days admission is sixpence. A system of circulation of examples on loan to provincial museums, science and art schools and classes, forms an important part of the operations of the museum. Numerous catalogues, handbooks on art subjects, and other publications have been issued. The original iron building was removed in 1865 and re-erected as the branch museum at Bethnal Green. The contents of this are chiefly loans, and are changed from time to time.

The gradual development of the Science and Art Department of the Committee of Council on Education has been sketched at *Attr.* Vol. I. p. 457. The department grants aid in connection with a system of annual examinations, in which prizes and Queen's medals are awarded; payments to teachers on the results of examinations and, to a limited extent, on attendance; scholarships and exhibitions; grants for buildings and apparatus; and aid to teachers while attending the Normal School of Science and the Royal School of Mines, South Kensington. The science examinations, for which an annual Directory is published, fall under twenty-five heads; and the science division of the department, which in 1872 had under supervision only 948 schools and 36,783 pupils, passed under review, in 1889, 2026 schools, giving instruction to 98,900 pupils in 6856 classes.

Kent, a maritime county in the SE. of England, is bounded by the Thames estuary, the Strait of Dover, Sussex and the English Channel, Surrey, and the county of London, whose creation in 1888 has reduced the area of the administrative county from 995,344 acres to 971,849 acres. Greatest length, 64 miles; breadth, 38 miles. The surface is for the most part hilly, except in the south-east, where lies a marshy tract, some 14 miles long by 8 broad, and in the north, where a line of marshes skirts the banks of the Thames and Medway; these last are backed by a succession of wooded hills, stretching inland and gradually increasing in height until they culminate in the North Downs (see *Downs*), a chalk range which traverses the middle of the county from west to east, attaining at Knockholt Beeches, near Sevenoaks, a height of 782 feet above the sea-level. Below these downs lies the Weald of Kent, a district abounding in beautiful scenery, and occupying nearly the whole southern side of the county. Of rivers in Kent, besides that which forms its northern boundary, the principal are the Medway, Stour, and Darent. The climate is in general mild and healthy, and the soil, which consists principally of chalk, gravel, and clay, is fertile, particularly in the south-east, where the rich meadows of the Romney Marsh afford excellent pasturage for vast flocks of sheep. All branches of agriculture are extensively carried on, especially

market-gardening and the growth of Hops (q.v.) and fruit of various kinds. In 1889 the extent of land under cultivation as hop-gardens was 35,487 acres, or a hop-field almost five times larger than that of any other hop-growing county in England, and orchards and market-gardens covered 27,495 acres. Of other industries the principal are the manufacture of paper, bricks, and gunpowder. In 1890 coal of good quality was found in a heading adjoining the Channel Tunnel (q.v.) at a depth of 1180 feet. Large numbers of hands are employed in the government establishments at the Woolwich arsenal and the dockyards of Chatham and Sheerness; whilst at Ashford are the locomotive and carriage works of the South-Eastern Railway, and at Whitstable and Faversham are important oyster-fisheries. Kent is divided into five lathes, and comprises 73 hundreds, the Cinque Ports (q.v.) of Dover, Hythe, Romney, and Sandwich, the cities of Canterbury and Rochester, and 18 municipal boroughs—in all 435 civil parishes, almost wholly in the dioceses of Canterbury and Rochester. Pop. (1801) 397,624; (1841) 549,353; (1881) 977,706; (1891) 1,142,324 (in administrative county, 785,674). The county includes eight parliamentary divisions, and the parliamentary boroughs of Canterbury, Chatham, Dover, Gravesend, Greenwich, Hythe, Lewisham, Maidstone, Rochester, and Woolwich, with part of the borough of Deptford, each returning one member. The county council numbers 96. The chief towns, in addition to those mentioned above, are Ramsgate, Margate, Folkestone, and Tunbridge Wells, all popular watering-places. A peculiarity in the tenure of land in Kent is that of Gavelkind (q.v.).

In historical associations the county is unusually rich. The earlier incidents down to the Heptarchy are noticed at *ENGLAND*, Vol. III. pp. 348-49; subsequent to the successive occupations of the Danes and Normans, during which the county was the scene of many a battle, the principal events in its history are—the murder of Archbishop Becket at Canterbury (1170); the submission of King John to the Pope's Legate at Dover (1215); the invasions by Louis, Dauphin of France (1216); the insurrections of Wat Tyler (1381), Jack Cade (1450), and Sir Thomas Wyatt (1554); the encampment at Blackheath of the Cornish insurgents under Lord Audley (1497); the rising of royalists at Maidstone (1648), and its subsequent suppression by Fairfax; and the destruction of shipping in the Medway by the Dutch fleet under De Ruyster (1667). Dover was the scene of the death of King Stephen, and Faversham of his burial; at Greenwich Henry VIII. and Queen Mary and Elizabeth were born, and Edward VI. died; Eltham Palace (now in ruins) was for a long time a royal residence; at Sayes Court, Deptford, which occupied a portion of the site of the royal victualling yard, lived Peter the Great whilst learning the trade of a shipwright; and at Chislehurst Napoleon III. died. Of its early inhabitants Kent has numerous traces in the shape of Roman roads, and many camps and barrows; at Aylesford and Hartlip Roman villas and baths have been discovered, and near the former place is a curious dolmen known as Kits Coty House. Of edifices of a historical or antiquarian interest it will suffice to specify here the cathedrals of Canterbury and Rochester, the Norman fortress of the latter place, with those of Chatham and Dover, and the moated mansions of Hever (the home of Anne Boleyn), Ightham Mote (dating back to the 14th century), and Leeds Castle (where Richard II. and Joan of Navarre were imprisoned). Amongst Kentish worthies are included Caxton the printer, Elizabeth Barton the 'nun of Kent,' Sir Nicholas Bacon, Sir Francis Walsingham, Camden the antiquary, Sir Philip Sidney, Harvey the discoverer

of the circulation of blood, the 'judicious' Hooker, the Earl of Chatham and his son William Pitt, General Wolfe, Richard Barham, author of the *Ingoldsby Legends*, the historians Hallam and Grote, Charles Dickens, Gordon Pasha, and Cameron the African explorer.

See the county histories of Hasted (4 vols. 1778-99; new and enlarged ed. 1886, &c.) and Dunkin (3 vols. 1856-58); also T. Frost's *In Kent with Charles Dickens* (1880); Abell's *History of Kent for the Young* (1895); and Bosworth's *Kent, Past and Present* (1900).

Kent, DIKE OF (1767-1820), fourth son of George III., and father of Victoria (q.v.).

Kent, JAMES, an American jurist, was born in New York state, 31st July 1763, graduated at Yale in 1781, and was admitted to the bar in 1787. After serving two terms in the legislature he was professor of Law in Columbia College from 1794 to 1798, when he was appointed a justice of the supreme court of New York; and in 1804 he became chief-justice, and in 1814 chancellor of the state. In 1823 he retired from the bench, but he continued his chamber practice for many years after. Kent's principal publication was his famous *Commentaries on American Law* (4 vols. New York, 1826-30; 14th ed. 1894), a monumental work, which has not yet been superseded in the United States. He died 12th December 1847.

Kentigern, St, the apostle of Cumbria, was son of the Princess Thenew, who, being found to be with child, was first cast from Dimpender or Traprain Law, and next exposed on the Firth of Forth in a coracle. It carried her out to the Isle of May and then back to Culross, where she bore a son (about the year 518). Mother and child were brought by Shepherds to St Serf, who baptised them both, and reared the boy in his monastery, where he was so beloved that his baptismal name Kentigern ('chief lord') was often exchanged for Mungo ('dear friend'). Arrived at manhood, he planted a monastery at Cathures (now Glasgow), whither he had been led by two untamed bulls; and in 543 he was consecrated Bishop of Cumbria. In 553 the accession of a tyrannous prince drove him to seek refuge in Wales, where he visited St David, and where, on the banks of another Clyde, he founded another monastery and a bishopric, which still bears the name of his disciple, St Asaph. In 573 he was recalled by a new king, Rederech Hael ('Roderick the Bountiful'); and first at Hoddam in Dumfriesshire, then at Glasgow, he renewed his missionary labours. About 584 he was cheered by a visit from Columba. He died 13th January 603 ('when he was 185 years old'), and was buried at the right-hand side of the high altar in Glasgow Cathedral. A fragment of a Life, composed at the desire of Herbert, Bishop of Glasgow, and the longer *Vita Kentigerni* by Joceline of Furness, both belong to the later half of the 12th century. Bishop Forbes gives translations of them, and we have adopted his rationalising chronology. Joceline's Life teems with miracles, which were rooted so deeply in the popular fancy, that some of them sprung up again in the 18th century to grace the legends of the Cameronian martyrs. Others are still commemorated by the annual hearings of the city of Glasgow—a frozen hazel branch which his breath kindled into flame, St Serf's pet robin which he restored to life, a hand-bell which he brought from Rome, and a salmon which rescued from the depths of the Clyde the lost ring of Rederech's frail queen. Nor is it St Mungo only whose memory survives at Glasgow; St Enoch's Church commemorates his mother, St Thenew. To the saint himself there are eight dedications in Cumberland, and fourteen in Scotland.

See Bishop Forbes's *Lives of SS. Ninian and Kentigern*

(1874); Skene's *Celtic Scotland* (vol. ii. 1877); and Beveridge's *Culross and Tulliallan* (1885).

Kentish Fire, a form of applause at public dinners or meetings of a political character, consisting in clapping the hands in unison in a peculiar rhythm or cadence, thus: *a a-*, intensified occasionally by the cry of 'rah' at certain intervals. The effect is very striking if the clapping is well led and kept together, and may be taken to bear some resemblance to the rattle of musketry fire. Hence the name. The origin is more obscure, but the 'volleys' were probably first organised at the great Kentish meetings in 1828-29 to protest against Roman Catholic emancipation. In 1834 at a great Protestant meeting in Dublin (August 15) Lord Winchelsea introduced 'his Kentish artillery' as a novel and stirring feature, and Kentish Fire has ever since been a favourite mode of applause at Protestant, Conservative, or 'Orange' meetings especially in the north of Ireland.

Kentish Rag is the local name given to a grayish blue and occasionally arenaceous and cherty limestone, which occurs at Hythe and other places on the coast of Kent, in the Lower Greensand Measures. It is sometimes 60 to 80 feet thick.

Kentish Town, a district in St Pancras parish, in the north of London.

Kent's Cavern, or KENT'S HOLE, is notable for the evidence which it has furnished as to the contemporaneity of man in Britain with various extinct or no longer indigenous mammals. It is situated in a small wooded limestone hill in the immediate neighbourhood of Torquay, and appears to have been known from time immemorial, although it did not attract the attention of scientific men until 1825. The early explorers of the cave, Northmore, Trevelyan, MacEnery, Godwin-Austen, and (in 1846) a committee of the Torquay Natural History Society, all succeeded in finding flint implements mixed up with the remains of extinct animals. But these discoveries received little attention until 1858, when the results of the systematic exploration of Brixham Cave by a committee of the Royal Society led to the appointment in 1864 of a similar committee by the British Association for the examination of the deposits in Kent's Cave. The results of this exploration, carried on under William Pengelley (1812-94), from March 1865 to June 1880, at a cost of £1963, are of the highest importance. They show that the bottom of the cave is paved with a succession of sheets of stalagmite, red earth, and breccia—all of which have yielded relics of man and various extinct or no longer indigenous mammals. Amongst the former are palæolithic flint tools and implements of bone, such as a needle with a well-formed eye, an awl, a harpoon, &c., also perforated badger's teeth, which were probably used for ornamental purposes. The animal remains comprise those of lion, bear, mammoth, machairodus latidens, rhinoceros, hyæna, reindeer, Irish elk, red deer, wolf, fox, badger, gibbon, beaver, &c. In one part of the cave there occurred underneath stalagmite a dark layer some 4 inches thick, which consisted mainly of small fragments of charred wood. This doubtless was an old hearth, round which the palæolithic cave-dwellers gathered to roast bones for the sake of their savoury marrow. The sheets of stalagmite are of inconstant thickness—the lower one attaining in places a thickness of 12 feet, while the upper one does not seem to have exceeded 5 feet, and was frequently very much thinner. The general character and structure of the cave-deposits show that a prolonged time was required for their accumulation. See M. W. Pengelley's address to the British Association (1883), and the Life of him by his daughter (1897).

Kentucky, a river of Kentucky, is formed by two forks which rise in the Cumberland Mountains, and, after a winding north-west course of about 250 miles, enters the Ohio, 12 miles above Madison, Indiana. The river runs through part of its course between perpendicular limestone walls. It is navigable by steamboats to beyond Frankfort.

Kentucky, a state of the American Union, in the great central or Mississippi Valley, lies between 36° 30' and 39° 6' N. lat. and between 82° 3' and 89° 30' W. long. Its greatest length from

east to west is about 400 miles; its breadth from north to south about 175 miles; its area is 40,400 sq. m. The eastern and south-eastern parts of the state are mountainous, broken by the Cumberland Mountains (2000-3000 feet) and their offshoots. Westward from this region is a plateau sloping gradually toward the Ohio and the Mississippi rivers, which bound the state on the north and west. Large cypress-swamps still exist in some parts, especially in the south-west. Kentucky has a river boundary of more than 800 miles in length, including a stretch of nearly 650 miles along the Ohio, 50 miles on the Mississippi, and 120 on the Big Sandy. The Cumberland, Tennessee, Licking, and Kentucky rivers rise among the mountains in the east, and cross the state to the Ohio, whose other large tributaries, the Green and the Trade-water, rise in the west. The considerable extent of water thus available for navigation has lately been increased by a system of river improvements. Besides these natural highways of commerce Kentucky has 2800 miles of railroad. Southward from the Ohio River extends a semicircular tract of land of Silurian formation; here the soil is produced by the disintegration of the fossiliferous blue limestone, and its fertility is unrivalled. This section is the famous Blue Grass (q.v.) country, in which the most exhausting crops, such as tobacco and hemp, may be raised continuously for a series of years without materially impairing the productive value of the soil, the constant crumbling of the fossiliferous shales restoring those constituents which have been withdrawn by the rich growth of vegetation. Surrounding the blue-grass country is a somewhat narrow belt of Devonian shale; its soil is also very fertile, and the lower strata contain petroleum. In the southern and south-eastern parts of the state there are other tracts of Devonian deposits, some of which yield heavy lubricating oils. The eastern, the western, and the southern portions of Kentucky belong mainly to the Carboniferous age, and the structure consists of sub-carboniferous limestone, or of true carboniferous deposits, with extensive coalfields. The coal-measures are the result of several alternate exposures and submersions, and average at least ten good beds of coal. Through the central part of the state is a strip of land which appears to have remained permanently raised above the sea during the Carboniferous period, and thus forms a divide between the eastern and the western coal-areas. The eastern coalfield is a prolongation of the Appalachian deposits, and is about 10,000 sq. m. in extent. The western belongs to the Illinois tract, and measures about 4000 sq. m. The coal is bituminous, and some excellent cannel occurs. Next in importance to coal are the iron ores, which are of excellent quality, and are found throughout a district of 20,000 sq. m. in extent. Neither the coal nor the iron deposits are worked as thoroughly as their quality and their abundance would seem to justify, but the output is increasing. Gadsen is found in some sections; valuable building-stones occur almost everywhere; and salt is obtained by boring in the coal and the oil regions.

Through the limestone formations the streams

have cut deep gorges, and within a region of about 6000 sq. m. in the sub-carboniferous structure, much of the drainage is subterranean. The surface topography is peculiar, as there are many round or oval-shaped 'sinks' through which the water reaches the underground streams. The long-continued erosive action of the water has undermined a large part of this region, and produced the numerous and often extensive caverns which form one of the remarkable physical features of this state. Of these the best known, though possibly not the largest, is the Mammoth Cave (q.v.).

Kentucky is densely wooded, except in those places that are under cultivation; at present about two-thirds of the state is covered with virgin forests. Among the prevailing species of trees are the blue ash, the black walnut, various kinds of oak, the pine, the maple, the tulip-tree, and the sweet gum. Notwithstanding this large proportion of forest land, Kentucky has always been one of the leading agricultural states, and its products are noted for their variety. It is the principal tobacco-producing state in the union. The state has always been a centre for rearing domestic animals, and for breeding the finest grades of stock. A very large percentage of the successful racehorses of the United States have been bred in Kentucky. The peculiar advantages for stock-raising are due in part to the excellent quality of the grass, and in part to the mild salubrious climate, which permits the cattle to remain unhoused in the pastures during the greater part of the winter. Kentucky's principal manufacture is whisky, which is made in large quantities in the central section. The smelting and working of iron are the only other manufacturing industries of any considerable importance.

Kentucky is divided into 117 counties, and contains 19 cities and over 300 towns and villages. The most important cities are Louisville, Covington, Newport, Lexington, and Frankfort, the capital. The governor and the 38 state senators serve for four years, the 100 representatives for two. Besides two senators, Kentucky sends eleven representatives to congress. The state is practically out of debt, and has a permanent school fund of \$1,799,447. The enrolment of pupils in the common schools exceeds 300,000. There are several important colleges and schools of higher education, some of them affiliated with the Kentucky University at Lexington. Pop. of the state (1860) 1,155,684; (1880) 1,648,690; (1890) 1,858,635.

History.—Numerous remains indicate that the mound-builders lived here in considerable numbers; but at the time of its first occupation by the whites this region seems to have been a hunting-ground visited by both the northern and the southern tribes of Indians, and not permanently occupied by settlements. The name Kentucky, signifying 'the dark and bloody ground,' is supposed to commemorate the conflicts between the various warlike tribes. One of the earliest pioneers was Daniel Boone (q.v.). This whole territory was included in the original grant to the colony of Virginia, and in 1776 received the name of Kentucky county. In 1790 it was made a separate territory of the United States, and in 1792 was admitted as a state. Kentucky did not secede during the civil war, and several campaigns were waged within its borders.

Keokuk, a city of Iowa, is situated almost at the south-east extremity of the state, on the Mississippi River (here crossed by a railroad bridge), 161 miles by rail ESE. of Des Moines. Keokuk has a large trade, nine lines of railway touching the town. The largest steamboats could always come up to Keokuk, and the 'Des Moines rapids,' immediately above, are now passed by a great canal, 11

miles long, which cost some 5 million dollars. The town contains law, medical, and commercial colleges, and has several foundries, saw and flour mills, and factories. Pop. (1890) 14,101.

Kepler, or **KEPLER**, **JOHANN**, one of the very greatest astronomers, was born at Weil der Stadt, a village in Wurtemberg, 10 miles from Stuttgart, 27th December 1571. He was left to his own resources when a mere child, his education depending on his admission into the convent of Maulbronn. He afterwards studied at the university of Tübingen, applying himself chiefly to mathematics and astronomy. In 1593 he was appointed professor of Mathematics at Gratz, and about 1596 commenced a correspondence with Tycho Brahe (q.v.), which resulted in his going to Prague in 1599 to aid Tycho in his work. Tycho obtained for him a government appointment, but the salary was not paid, and Kepler lived for eleven years there in great poverty. He then obtained a mathematical appointment at Linz, and fifteen years afterwards was removed to the university of Rostock, poverty still pursuing him. He died shortly afterwards at Ratibon, 15th November 1630.

In character he was intensely enthusiastic, imaginative, laborious, and persevering, all qualities fitting him for the great task of transforming astronomy from a merely formal into a true physical science. Though Copernicus (q.v.) had transferred the centre of the planets' movements to the sun, these were still considered as compounded of various circles, the only curve thought fit for celestial bodies to pursue. No cause was assigned for their movements, and no unity observed among them, except in the one fact of the sun being their centre. Kepler says, 'I brooded with the whole energy of my mind' on this subject, asking 'why they are not other than they are—the number, the size, and the motion of the orbits.' In fact he had first to determine what the orbits were before answering some of these questions. But one question lay open before him. The periods of the planets were fairly well known, so were their proportionate distances from the sun. Was there any invariable relation between these? In his *Mysterium*, published in 1596, he triumphantly proclaims that five kinds of regular polyhedral bodies govern the five planetary orbits. Yet after publication he still continued to 'brood,' becoming at length convinced that this theory was only an error, until after twenty-two years of patient study and numberless speculative failures, he was able at last to announce (in his *Harmonice Mundi*, 1619) that the 'square of a planet's periodic time is proportional to the cube of its mean distance from the sun.' This rule is known as Kepler's Third Law. He saw clearly enough that it implies that the planets are moved by a force greater near the sun, and lessening with distance, but he did not grasp, as Newton after him did, the truth that this is an attractive force constantly acting towards the sun, nor could he therefore guess the law of its action. Finding the theory of epicycles unable to bear the strain of Tycho Brahe's accurate observations, especially in the case of the planet Mars, he endeavoured to find a law for the planet's movements which would be simple and satisfactory. After enormous labour, and by a process of trial and error, he found that (1) *the planet's orbit was an ellipse, of which the sun is in one focus*, and (2) *that, as the planet describes its orbit, its radius vector traverses equal areas in equal times*. These rules (published in 1609 in his work on *The Motions of Mars*) are known as Kepler's First and Second Laws respectively. These laws formed the groundwork of Newton's discoveries, and are the starting-point of modern astronomy. Besides, we owe to Kepler many discoveries in optics, general physics,

and geometry. A collected edition of his works was published by Frisch (1858-71).

For further information, see Brewster's *Lives of Galileo, Tycho Brahe, and Kepler* (1841); Reithinger, Neumann, and Gruner, *Johannes Kepler* (1868); and Whewell's *Hist. of Inductive Sciences* (vol. i.).

Keppel, **AUGUSTUS**, **VISCOUNT**, English admiral, was the son of William, second Earl of Albemarle, and was born on 20 April 1725. Entering the navy, he served under Hawke in 1757, captured Goree in 1758, took part in the battle of Quiberon Bay in 1759, and in the capture of Belleisle in 1761, and commanded at the capture of Havana in 1762. In 1778 he encountered the French fleet off Ushant on 27th July; a sharp but indecisive action ensued; but owing to a disagreement between Keppel and Sir Hugh Palliser, his second in command, the French were suffered to escape without a renewal of the combat. Both admirals were brought before a court-martial, but both were acquitted. The affair made a great stir in the country, the popular verdict being on the side of Keppel. In 1782, in which year he was created Viscount Keppel of Elveden in Suffolk, he became First Lord of the Admiralty, but resigned on Pitt's accession to government. Keppel died, unmarried, on 3d October 1786. See Life by T. Keppel (1842).

Keppel, **SIR HENRY**, British admiral, a younger son of the fourth Earl of Albemarle, was born 14th June 1809. He saw service as captain during the war against China in 1842, and in the campaign against the pirates of the East Indian Archipelago shortly afterwards. During the Crimean war he commanded a vessel in the Baltic and Black Seas, and finally the operations of the naval brigade before Sebastopol. In 1857 he took an important part in the destruction of the Chinese fleet in Fatshan Bay. He was promoted to be vice-admiral in 1867, full admiral in 1869, a G.C.B. in 1871, and admiral of the fleet in 1877. Sir Henry Keppel has written *Expedition to Borneo with Rajah Brooke's Journal* (3d ed. 1847), *Visit to the Indian Archipelago* (1853), and *A Sailor's Life under Four Sovereigns* (1899).

Ker, **THE FAMILY OF**, supposed to be of Anglo-Norman extraction, is found in Scotland in the end of the 12th century. The present representatives derive their descent from John Ker of Altonburn in 1357, whose great grandson Andrew acquired Cessford about 1440, and gave origin in his three sons to the families of Cessford, Linton, and Gateshaw, and in a grandson to that of Fernihirst. Sir Andrew Ker of Cessford (died 1526), whose younger brother, George, was ancestor of the Kers of Fandonside, had two sons—Sir Walter, whose grandson, Robert, was created Earl of Roxburghe in 1616, and Mark, commendator of Newbattle, whose son, Mark, was created Earl of Lothian in 1606. The second Earl of Roxburghe was only a Ker by his mother. He assumed the surname of Ker, and his grandson, the fifth Earl of Roxburghe, was created duke in 1707. John, third Duke of Roxburghe (1740-1804), was the famous book-collector. Robert Carr, the favourite of James VI., created Viscount Rochester in 1611 and Earl of Somerset in 1613, belonged to the family of Fernihirst.

Ker, **JOHN**, D.D., Presbyterian minister and professor, was born in 1819 at the farmhouse of Bield, in Peeblesshire, and early in life removed with his parents to Edinburgh. He was educated at the High School and university, and was for a time under Tholuck at Halle. He was licensed as a preacher in 1844, and ordained at Abwick in 1845. He accepted a call as assistant to East Campbell Street Church, Glasgow, in 1851, where, in the course of a few years, his popularity and the demands made upon his services

broke his health. From 1863 onwards he travelled much, visiting America, and residing in Italy. He occupied the chair of Practical Training in the United Presbyterian Theological Hall from 1876 till his death, October 3, 1886, and his ability, culture, large heartedness, and quiet earnestness made a deep impression. His *Sermons* (1868, 14th ed. 1888; second series 1886, 3d ed. 1888), by their intellectual power, chastened eloquence, insight, and spiritual tone, carried his name far beyond the bounds of his own denomination. His other works, mostly posthumous, are *The Psalms in History and Biography* (1886); *Lectures on the History of Preaching* (1888); *Letters, 1864-85* (1890); *Thoughts for Heart and Life* (1888). See *Memorial Discourses on his Death* (1886).

Keratin. See HORN.

Kerbela, a town and holy place in Asiatic Turkey, 60 miles SW. of Bagdad. Pop. 60,000. The pilgrims number at least 200,000 annually; and a railway was projected by Midhat Pasha, when governor of the provinces, from Bagdad to Kerbela in 1869. The contractors, however, failed to carry out the works, though actually commenced. The sanctity of Kerbela arises from the fact that it is built on the site of the battlefield on which Hussein, son of Ali and Fatima, lost his life (689) in attempting to maintain his right of succession to the califate. Every Shi'ite Moslem throughout the world who can afford it seeks sepulture in the holy ground. The number of dead Moslems conveyed from Bombay alone is considerable. See Geary, *Asiatic Turkey* (1878).

Kerguelen's Land, or DESOLATION ISLAND, of volcanic origin, situated in the Antarctic Ocean, between 48° 39' and 49° 44' S. lat. and 68° 42' and 70° 35' E. long., being 85 miles long by 79 wide. The surface is mountainous (Mount Ross, 6120 feet), and most of the interior is covered with an ice-sheet and its glaciers. Numerous islands and rocks encircle the coasts. The shores are very irregular, long fjords penetrating far inland and forming good harbours. The climate is raw, and storms are nearly constant. The island was discovered in 1772 by a Breton sailor, Kerguelen-Trémarec, and was visited by Captain Cook (who christened it Desolation Island) in 1776, and in 1874 by the *Challenger*, and by English, American, and German expeditions to observe the transit of Venus. It was annexed by France in 1892.

Kerguelen's Land Cabbage (*Pringlea antiscorbutica*), the only known species of a very curious genus of plants of the natural order Crucifere, found only in Kerguelen's Land. It has a long, stout, perennial root-stock, and a *bolled* head of leaves very similar to those of the common garden cabbage. Captain Cook first discovered this plant, and directed attention to it. The root-stocks have the flavour of horse-radish. The dense white heart of the cluster of leaves tastes like mustard and cress, but is coarser. The whole foliage abounds in a very pungent pale yellow essential oil, which is confined in vessels that run parallel to the veins of the leaf. The Kerguelen's Land cabbage is used by voyagers, boiled either by itself, or with beef, pork, &c., chiefly on account of its antiscorbutic qualities.

Kerki, a town belonging formerly to Bokhara, central Asia, about 120 miles S. of Bokhara city, on the left bank of the Amu Daria or Oxus. An important place both commercially and strategically, it is the halting place of the caravans trading from Bokhara to Herat, and stands near the chief ferry over the Oxus. The fortress, consisting of a high mud wall, flanked by bastions, was in 1885

strengthened by Russia, who in May 1887 occupied it, and garrisoned it with regular troops.

Kermadec Islands, a group of volcanic islands in the Pacific Ocean, 700 miles NE. from Auckland in New Zealand. It consists of four principal islands—Raoul or Sunday (7200 acres), Macaulay (756 acres), Curtis, and L'Esperance, and several smaller islands. A Mr Bell settled in 1878 on the islands, which in 1887 were declared part of New Zealand. The climate resembles that of New Zealand. The group was discovered in 1788, and annexed by Great Britain in 1886. See S. Percy Smith's *Kermadec Islands* (1887).

Kerman, or KARMAN (anc. *Caramania*), one of the eastern provinces of Persia, lying south from Khorassan, and having an area of about 59,000 sq. m. The north and north-east are occupied by a frightful salt waste called the *Desert of Kerman*, which forms a part of the great central desert of Iran. On this extensive tract not a blade of grass is to be seen. The southern portion, although mountainous, is equally arid and barren with the north, except the small tract of Numanshir, towards the east, which is fertile and well watered. Roses are cultivated for the manufacture of otto of roses; silk and various gums are exported. The inhabitants, who number about 300,000, are chiefly Persians proper; the rest are Guebres or Parsees, Beluchis, and other wandering tribes.

Kerman, the chief town, is situated near the middle of the province, in the central mountain-range, and contains a population estimated at 30,000. The trade, though still considerable, is very small compared with what it was during the 18th century, when Kerman was the great emporium for the trade by the Persian Gulf and the Indian Ocean. In 1722 the town was destroyed by the Afghans; in 1791 it was taken and pillaged by Aga Mohammed, and 30,000 of the inhabitants made slaves. But the chief cause of the decline of its trade was the fall of Gombroon (q.v.), its port, before the rising prosperity of Bushire. At present Kerman is only noted for the manufacture of the famous Kerman carpets (a sort of woollen rugs), felts, and brass cups.

Kermanshah (also KARMANSHAH and KIRMANSHAHAN), a flourishing town of Persia, capital of Persian Kurdistan, near the right bank of the river Kerkhah. It is the centre of converging routes from Bagdad, Teheran, and Ispahan. Its commerce is considerable, and there are manufactures of carpets and weapons. A railway has been projected from Bagdad, the intervening country presenting no engineering difficulties. But between Kermanshah and Teheran the country is mountainous. Pop. 30,000.

Kermes, a dyestuff obtained from an insect (see DYEING). The name is also given to a cherry-red mineral, usually in tufts of capillary crystals; a mixture of sesquioxide and sesquisulphide of antimony; approximate composition (Sb²S₃)₂.Sb₂O₃. It was formerly much used for the same purposes as James's Powder (q.v.).

Kerner, ANDREAS JUSTINI'S, one of the leading members of the 'Swabian School' of poets, was born at Ludwigsburg, in Wurttemberg, 18th September 1786. He studied at Maulbronn, and afterwards medicine at Tübingen, and settled in 1818 as a physician at Willbad, and finally at Weinsberg. Here he died, 21st February 1862. Along with his friends Uhland and G. Schwab he published *Der poetische Almanach* (1812) and *Der deutsche Dichtersaal* (1813). But his chief poetical works are *Reiseballaden aus dem Schattenspiegel der* (1811); *Romantische Dichtungen* (1817); and *Der alte Blutstocuss* (1852). His poetry approaches closely to the *Folkslieder* in freshness and simple

city, and is lit up with gleams of humour: but it sometimes drops to the lower levels of romanticism. He took a keen interest in the phenomena of animal magnetism, and wrote several books on the subject, one of which, *Die Schwinen von Prevorst* (1829; 6th ed. 1892), excited great attention. See Lives by Niehammer (1877) and Reinhard (1886), and Du Prof's *De Schwinen von Prevorst* (1886).

Kerosene (Gr. *kēros*, 'wax'), one of many names under which petroleum, paraffin, or shale oils are sold in different countries for burning in lamps. The name originated in America, and is still much used there in reference to petroleum for domestic use. It is the name also by which generally these mineral oils are known in India, China, and the colonies, and under which they are imported in tins and cases from America, Russia, or Great Britain.

Keronalle, LOUISE DE. See CHARLES H.

Kerowlie. See KARAWL.

Kerry, a maritime county in the south-west of Ireland, in the province of Munster, is bounded on the N. by the estuary of the Shannon, and on the W. by the Atlantic Ocean. Area, 1,185,918 statute acres, or 1853 sq. m. There are under crops about 170,000 acres, and of these 93,000 are laid down as permanent pasture, some 30,000 are planted with potatoes, and 25,000 sown with oats. One-fourth of the area is barren mountain land, and more than 11 per cent. bog and marsh. Maximum length, north to south, 67 miles; maximum width, 55 miles. Its coast-line is about 220 miles in length; is fringed with islands, of which the chief are Valentia (pop. 2920), the Blasquets, and the Skelligs; and is deeply indented by Kenmare, Dingle, and Tralee Bays. Between these and the smaller bays are extensions of the mountain-system which stretches westward from the county of Waterford. The principal group is Maegillieuddy's Reeks, the chief summit of which, Carran Tuail, 3414 feet, is the highest in Ireland. The rivers are short and of little consequence. The county contains numerous lakes, some of them, especially the Lakes of Killarney (q.v.), of exquisite beauty. The climate is mild, but moist, especially on the coast. The soil rests on slate and sandstone, with limestone. Iron, copper, and lead ores abound, but are not much worked. Slate and flagstone are quarried in Valentia. The manufactures are inconsiderable; oats and butter are the chief exports. The fisheries on the coast employ nearly 2000 men and boys. Since 1885 Kerry returns four members to the House of Commons. Pop. (1841) 293,880; (1871) 496,914; (1881) 201,639; (1891) 179,136, nearly all Roman Catholics. The county is rich in ancient ruins, including the remains of Muckross Abbey and Innisfallen.

Kersanton, the name given to several varieties of igneous rock which are rich in plagioclase felspar and dark mica, and contain carbonates. They occur in the form of dykes traversing the palaeozoic rocks of Brittany. The name is from Kerzanton, a small hamlet on the Brest Roads. Granular varieties of kersanton are called *kersantite*, while those which have a marked porphyritic structure are known as *mica-porphyrates*.

Kersey, or KERSEMYERE, a variety of woollen cloth, differing from ordinary broad cloth by being woven as a *twill* (see TWILL). It is easily distinguished from the common cloth by the diagonal ribbed appearance of its upper side, where the nap, not being raised, allows its structure to be seen. A very thin line make of Kersey is called *cassimere*.

Kertch, previous to being levelled with the ground by the allies in 1855 the most important

port of the Crimea, with a large trade in the export of corn, is situated on the eastern shore of the peninsula, on the strait of Kaffa or Yenikale, which, 26 miles long and 3 to 25 wide, connects the Sea of Azov with the Black Sea. The port still has a trade to the extent of nearly £200,000 annually in grain, linseed, leather, fish, and caviare (all exported). The museum for the Greek and other antiquities discovered in the neighbourhood was removed to the Hermitage at St Petersburg after having been partly filled by the allied soldiers in 1855 (cf. D. Macpherson, *Antiquities of Kertch*, 1857). Two and a half miles to the south of the town are the fortified works designed to protect the passage of the straits. Kertch, the ancient *Pantikapum* or *Bosporus*, founded in the middle of the 6th c. B.C. by Milesians, was the capital of the ancient kingdom of the Bosporus, and subsequently of a state founded by the son of Mithridates, about 100 B.C. From 1318 to 1475 it was a depot of the Genoese; then it came into the hands of the Turks; and finally, in 1771, it was acquired by the Russians. Pop. with the neighbouring Yenikale (1890) 30,900.

Kesteven, THE PARKS OF, the south-west division of Lincolnshire (q.v.).

Kestrel, or WINDHOVER (*Falco tinnunculus*), a small species of falcon found in the north of Europe in the warmer months, resident in the

Kestrels (*Falco tinnunculus*):
1, the male; 2, the female.

south all the year round, and particularly abundant in Spain. In Britain it is one of the commonest birds of prey, though its numbers were considerably reduced by persecution before its harmlessness and its utility as a check on the too rapid multiplication of mice were fully recognised. The name windhover refers to the bird's graceful habit of balancing itself in gale or calm, as some other birds do, by a slight, continuous flapping of the wings. Jeffries thus describes the mechanism of hovering: 'While hovering there are several forces balanced: first, the original impetus onwards; secondly, that of the depressed tail dragging and stopping that onward course; thirdly, that of the wings beating downwards; and fourthly, that of the wing a little reversed beating forwards, like backing water with a scull.' The food of the kestrel consists chiefly of mice, but it also eats insects, which it catches while on the wing, and occasionally small birds. It rarely builds a nest of its own, but appropriates one forsaken by another bird, or lays its eggs in any convenient cavity. The eggs are creamy

white, thickly mottled with reddish brown, or sometimes entirely reddish brown. The adult male measures about 13 inches; the prevailing colour is a pale brown marked with black; the head, neck, and tail are bluish gray. The female is larger than the male, and is reddish brown with bars of black. The Lesser Kestrel (*F. cenchris*), which has occasionally been found in Britain, closely resembles the common species, but has the claws white instead of yellow. The common sparrow-hawk of the United States (*F. sparverius*) is also a near relative, and allied species are found in nearly all parts of the world. The whole group is sometimes separated off from Falco as a sub-genus *Tinnunculus*.

Keswick, a market-town of Cumberland, near the confluence of the Greta and the Derwent, 16 miles NNW. of Ambleside, and by a branch-line (1865) 18 W. of Penrith junction, 36 SSW. of Carlisle. In its immediate vicinity are wooded Castle Head and beautiful Derwentwater (q.v.), whilst to the north towers Skiddaw (3058 feet). A great tourist centre, it is a pleasant little place, lighted with the electric light in 1890, and possessing half-a-dozen hotels, a good public library, a recreation ground, a town-hall (1813), lead-pencil manufactories, and a church (1839), besides the old parish church of Crosthwaite, $\frac{3}{4}$ mile north, with Southey's grave. Pop. (1851) 2618; (1891) 3760. See LAKE DISTRICT.

Keszthely, a market town of Hungary, on the western shore of Lake Balaton, 113 miles by rail SW. of Pesth. Pop. 5393.

Ket, ROBERT, a tanner of Wymondham, in Norfolk, who raised the standard of insurrection in that county in July 1549. The cause of the outbreak was a widespread dissatisfaction of the country people against the gentry. Sixteen thousand men gathered round Ket, who raised his mimic throne beneath the 'Oak of Reformation' on Monshold Hill, overlooking Norwich. This city was twice captured by the rebels; on the second occasion they held it until they were driven out by the Earl of Warwick, and compelled to fight a battle, in which Ket was defeated and captured. He was afterwards hanged at Norwich. The insurrection never had more than a local significance. See the Rev. E. W. Russell's *Ket's Rebellion* (1860).

Ketch, a broad, strongly built vessel of two masts, viz. the main and mizzen, formerly much used for carrying mortars, and called a bomb-ketch.

Ketch, JACK. See EXECUTION.

Ketchup, or CATSUP, is a name given to certain sauces much valued for flavouring soups, meats, fish, &c. It may be prepared from a variety of fruits and vegetables; but the ketchups in most ordinary use are those made from common mushrooms (*Agaricus campestris*), unripe walnuts, and ripe tomatoes. The fruit or vegetable is first broken or bruised with salt, and allowed to stand for about twenty-four hours to extract the juice; the juice must then be expressed, put into a pan, and boiled with appropriate seasonings until it is reduced to about half the quantity. It should be allowed to cool before it is bottled, and then, if tightly corked, will keep for years.

Ketones. See ACETONES.

Kettering, a market-town of Northamptonshire, 75 miles NNW. of London by rail. The parish church, dating from about 1450, and restored in 1862, is a fine Perpendicular structure, with tower and spire. A town hall and coin exchange was built in 1863; and Kettering has also a free grammar school, water-works (1872), and manufactures of boots and shoes, stags, brushes,

&c. The charter for the market was given by Henry III. in 1227 to the monks of Peterborough. Pop. of parish (1861) 5845; (1891) 19,454.

Kettledrum. See DRUM.

Keuper, the upper division of the Triassic System (q.v.).

Kew, a village in Surrey, 6 miles W. of Hyde Park Corner, and on the right bank of the Thames, which is here crossed by a fine granite bridge, rebuilt in 1899, and 55 feet wide. Foremost among objects of interest at Kew are the Royal Botanic Gardens and Arboretum, containing magnificent collections of plants and ferns, both native and exotic, and of trees and shrubs. Established in 1760 by the mother of George III., and made a national institution in 1840, the gardens now extend over 70 acres, and the arboretum 178 acres, and the annual cost of keeping them up amounts to about £20,000. In 1882 there were 1,244,167 visitors to the gardens, whilst on Whit-Monday 1890 it was computed that nearly 100,000 persons were admitted. In addition to numerous hot-houses and conservatories, the principal features are a palm-house 362 feet by 100 and 66 feet high; a temperate-house of the same height, occupying three-fourths of an acre; three museums; a laboratory; the North gallery, containing sketches from nature taken in different parts of the world; and the Pagoda, an octagonal ten-storied building 163 feet high. To the south-west of the gardens is an observatory, chiefly used as a meteorological station; here are kept the thermometer and other meteorological and magnetical instruments which serve as standards for the United Kingdom. Close to the northern entrance is Kew Palace, formerly a favourite residence of George III., and of Queen Charlotte, who died there. In the church, built in 1714, and subsequently enlarged, is an organ presented by George IV., and said to have been used by Handel. The late Duke and Duchess of Cambridge are buried in the vaults, and in the churchyard adjoining are the graves of Gainsborough, the painter, and two less-known artists, Meyer (George III.'s miniature-painter) and Zoffany. Sir Peter Lely once lived on the Green. Pop. (1801) 424; (1881) 1670; (1891) 2076.

Kewatin. See KEEWATIN.

Keweenaw Point, a peninsula of Michigan (q.v.), projecting into Lake Superior, and co extensive with Keweenaw county (350 sq. m.; pop. 4270). It is famed for its copper-mines.

Key, in Music, the series of notes, or scale, in which modern music is written. Each note on the staff may form the *tonic* or key-note of a scale, which is called after the name of that note (see MUSIC). A piece is said to be in such and such a key when that key predominates throughout; and the tonic harmony of the key is always to be found at the close of the piece, unless it leads to some further movement. It is held by many that each of the various keys has a character, or colour, as it is termed, of its own. In connection with music, the name key is also given to the levers by which the pianoforte, organ, &c. are played; to the levers on wind-instruments for opening or closing certain of the sound-holes; and to the west used for tuning the pianoforte, drum, &c.

Key, FRANCIS SCOTT, author of 'The Star-spangled Banner,' was born in Maryland, 9th August 1780, practised law at Frederick City and at Washington, and became district attorney for the District of Columbia. It was during the British invasion in 1814, at the attack on Baltimore, which he witnessed from an English man-of-war, that Key, after watching through the gray dawn to see which flag floated over the ramparts of Fort

Melhenry, wrote the words which have kept his name alive. He died 11th January 1843. A collection of his poems appeared in 1857. There is a handsome monument by Story, erected at the expense of James Lick, at San Francisco.

Key. THOMAS HEWITT (1799-1875), headmaster of University College School and professor of Comparative Grammar in University College, London, was eminent as a Latin philologist and author of a *Latin Grammar* and of a *Latin-English Dictionary* (new ed. 1888).

Key, or Kei, Islands, a small group in the East Indies, lying S. of Dutch New Guinea and N.E. of Timor, consists of Great Key, Little Key, and some smaller islets. Total area, 680 sq. m. Pop. about 20,000, Malays and Alfuros; three-fourths on Great Key. This is a long narrow island, stretching north to south, volcanic in origin, and with a rocky, hilly surface that rises to nearly 3000 feet. Little Key, situated to the west of Great Key, is of coral formation, and lies low; it is said to have made its appearance in the middle of the 19th century during an earthquake disturbance. All the islands are covered with dense jungle. Valuable timber is the chief product. Fishing is the chief occupation; and *beche de mer* is gathered. The group has been in the hands of the Dutch since 1645. See G. Laugen in *Pearl, Rom. Geog. Soc.* (1888), and *Seal. Geog. Mag.* (1888 and 1890). The islets of the Bahama group in North America are called generally keys or cays (Span., 'rocks' or 'reefs').

Keyne. St. a holy virgin said to have lived about 300, whose name survives in an old church in Cornwall near Liskeard, and still more so in its famous well. Whoever of a newly-married pair first drinks of its water will bear rule throughout their life together. All the world knows from Southey's ballad the story of the bride who outwitted her husband by taking a bottle to church. The well is mentioned by Fuller and Carew, but the reader will find fuller details in Cyrus Redding's *Illustrated Itinerary of Cornwall* (1842).

Keys, POWER OF THE. See POPE.

Key West, a port of entry and capital of Monroe county, Florida, is situated on the island of Key West (Span. *Cayo Hueso*, 'Bone Reef'), 60 miles SW. of Cape Sable. It is a coral island, 7 miles long, 2 to 3 wide, and nowhere more than 11 feet above the level of the sea. There is a good harbour, defended by a casemated brick fort; and the buildings include a custom-house, barracks, and a marine hospital. The exports are salt, turtle, sponges, fruits and vegetables, and cigars. Dangerous reefs make the business of salvage important. The warm and equable climate attracts consumptives. The place was a great military and naval centre during the war with Spain in 1898. Pop. (1870) 5016; (1880) 9800; (1890) 18,085.

Khabarovka, at the junction of the Ussuri with the Amur, is the capital of the Maritime Province (q.v.) of Siberia. Pop. 30,000.

Khairpur, the chief town of Khairpur state, in Sind, stands among marshes about 15 miles E. of the Indus. It was once a very important city. Pop. 7000. Area of state, 6100 sq. m.; pop. (1891) 131,937, mostly Mohammedans.

Khalid. See MOSAYLIMA, CALIF.

Khalif. See CALIF.

Khama, the reforming chief of the Bamangwato in the Bechuanaland (q.v.) Protectorate, was born in 1846, and on a visit to England in 1895 secured recognition for his stringent regulations for exclusion of alcohol and maintenance of order.

Khamsin, or KHAMASIN. See EGYPT.

Khan, a title of Mongolian or Tartar sovereigns and nobles. A *Khanda* is a principality. Khan is also a name for Caravanseraï (q.v.).

Khandeish, or CANDÉISH, a district on the northern edge of the Deccan, in Bombay Presidency, lies south of the Nerbudda and east of Baroda, and is intersected by the Tapti river. Area, 10,907 sq. m.; pop. 1,460,851.

Khamia. See CANEA.

Kharasim. See KHIVA.

Kharkoff, capital of the Russian government of Kharkoff, and one of the chief towns of the Ukraine, is by rail 312 miles NW. of Taganrog and 465 S. by W. of Moscow. It is the seat of a Greek bishop and of a university, with four faculties and about 900 students. Attached to the university (founded in 1805) are an observatory, a library of 56,000 volumes, a botanical garden, anatomical museum, &c. This university was a centre of the Nihilist movement. The chief industrial products are sugar, soap, candles, felt, brandy, tobacco, and iron; but the place is principally celebrated for its four great fairs, at two of which (in horses and wool) the mited turnover amounts annually to the sum of nearly £3,000,000. Pop. (1873) 87,000; (1895) 196,500.—The *government*, situated in Little Russia, has an area of 21,035 sq. m.; pop. (1893) 2,537,900, principally Little Russians and Cossacks. It forms a plateau of moderate elevation, scamed by the deep-cut river-courses of the affluents of the Don. Nearly one-half of the area is arable land.

Khartoum, or KHARTUM, once the most important town in the eastern Soudan, stands on the low tongue of land between the Blue and the White Nile, just above their junction, 445 miles SW. of Suakin (*via* Berber), and 1625 S. of Cairo, following the windings of the Nile. It was founded under the rule of Mehemet Ali (q.v.) in 1823, and soon became a place of commercial importance, and was made the capital of Egyptian Soudan. As starting-point and terminus of caravans to the interior, it was notorious for its great activity in the slave-trade. Ivory, ostrich feathers, gums, and tamarinds were other articles of commerce. It shared the evil fortune of the Soudan (q.v.); and General Gordon (q.v.) defended it against the forces of the Mahdi (q.v.) in 1884-85. Two days before the rescue army reached it Khartoum fell, and Gordon was amongst the slain (26th January 1885). Pop. then, about 60,000; a half being Turks, Greeks, Syrians, Arabs, and Egyptian craftsmen, the rest representing the varied races of Eastern Africa. But Khartoum was now deserted for Omdurman, just below and on the left bank of the river, which was the capital of the Mahdi and his successor, the Khalifa, till the advance of Kitchener's force in 1898. On 2d September the dervishes were routed and the Khalifa's power broken at Omdurman; and two days after, the British and Egyptian flags were hoisted on the ruined residency where Gordon fell. The population of Omdurman was believed to be 100,000. After the occupation the administration was restored to Khartoum; and in 1899 the Gordon Memorial College was founded at a cost of over £100,000, the design being to give the intelligent natives of the region a good education, without alarming their religious susceptibilities.

Khási, a series of hills or step-like plateaus in Assam, on the watershed between the Brahmaputra and the Surma, and with the connected Jaintia Hills giving name to a district. The rainfall is enormous, reaching in some parts in 1885-95 an annual average of over 500 inches. Lime, oranges, and potatoes are exported; coal and iron ore

exist, but only the latter is extracted. The language of the Khasis, an Indo-Chinese race, 'has no analogy elsewhere in the whole of India; it is described as 'monosyllabic in the agglutinative stage.' The principles of female descent and female authority are the most marked among their social customs. See Dalton's *Ethnology of Bengal* (1872).

Khatmandu, the capital of Nepal, stretches for about a mile north from the confluence of the Bagmati and Vishnumati rivers. It contains a great number of temples, many in pagoda shape, with roofs of brass, and others domed; but the houses are in general mean, their court yards filled with rubbish-heaps, and the streets are narrow and filthy in the extreme. The principal building is the immense ugly palace of the Maharaja; close to its modern *darbar*, or reception room, is the large military council chamber, the Köt, where in 1846 most of the chief men of the state were massacred. The population is about 50,000.

Khaya, a genus of trees of the natural order Urticaceæ. The Kasson-Khaye of Senegal (*K. senegalensis*), one of the most abundant forest-trees in that part of Africa, attains a height of eighty or one hundred feet, and is much valued for its timber, called *caïcedra*, or African mahogany, which is reddish coloured, very hard, durable, and of beautiful grain. In the marshy coast regions of Gambia the bark is administered in the cure of fever, and Caventon has extracted an alkaloid which has been suggested as a cheap substitute for *quinia*, a product of the bark of *Hortia braziliana*.

Khayyam. OMAR. See OMAR.

Khazars. See CHAZARS.

Khedive, a title granted in 1867 by the Sultan to his tributary the Viceroy of Egypt, and since then used by the latter as his official title. The word (pronounced as a dissyllable) is derived from Persian *khâdir*, and means 'sovereign.' It is therefore a more dignified title than *cali*, 'viceroy.'

Khelat. See KELAT.

Kherson, or CHERSON, capital of the Russian government of that name, stands on the Dnieper, 49 miles from its mouth and S. N. E. of Odessa. The town was laid out by Prince Potemkin in 1778 as a port for the construction of ships of war; but in a few years, owing to the unfavourable character of the river, it was supplanted by Odessa and Nikolaiëff, both as a dock-yard and a commercial outlet. It has a large trade in timber, and manufactures soap, tallow, beer, and tobacco. Wool-cleansing is an important industry. At Kherson Potemkin is buried, and John Howard, the prison reformer, died. Pop. (1871) 46,320; (1898) 67,811. The government borders on the Black Sea, having the Dnieper for its eastern boundary and the Dniester for its western, while the interior is watered by the Bug, Ingul, &c., which form shallow, salt lagoons next the sea. The soil towards the south is steppe-land; in the north, where it touches the 'black earth' region, it is more fertile. Area, 27,515 sq. m.; pop. (1897) 2,728,523. There are seventy German (Swabian) colonies, with about 50,000 inhabitants. Agriculture, gardening, and cattle-breeding are the chief occupations; and there are iron foundries, corn mills, machine-factories, tanneries, carriage-works, and brandy-distilleries. The government embraces several large towns, as Kherson, Odessa, Nikolaiëff, Otchakoff, Velisavetgrad, Voznesensk, and Tiraspol.

Khiva, also called KHARASM, KHWARIZM, or URGANDJ (anc. *Chorasnia*), a Khanate of Turkestan in central Asia, lies between 37° 45'–44° 30' N. lat. and 59° 15'–63° E. long., and contains

about 25,000 sq. m., the surface being mostly a sandy desert, with many fertile tracts scattered over it. It is bounded on the N. by the Russian territory and Sea of Aral, E. by the Khanate of Bokhara, S. by Persia, and W. by the Caspian Sea. The chief oasis, in which the capital Khiva is situated, stretches from the mouth of the Oxus or Amu Daria for 200 miles along its banks, and is watered by artificial canals supplied from that river, to which it entirely owes its fertility. The inhabited area is about 5000 sq. m. The population has been estimated to consist of 260,000 settled inhabitants and nearly as many nomads. Amongst them are Uzbeks, Karakalpaks, and Turkomans (all Ural-Altaië), Aryan Sarts and Tajiks, probably the original inhabitants of Khiva, and Kizilbash, mostly liberated Persian slaves.

Khiva in ancient times was nominally subject to the Seleucids; subsequently it formed a part of the kingdoms of Bactria, Parthia, Persia, and the Califate, and became an independent monarchy in 1092 under a lateral branch of the Seljuk dynasty. The Khivans, or, as they were then called, the Chorasmiens, after conquering the greatest part of Persia and north-western Afghanistan, were obliged to succumb to the Moguls, under Genghis Khan, in 1221. In 1370 Khiva came into the hands of Timür. Timür's descendants were supplanted in 1511 by Shady Beg (called Sheibani Mehemmed Khan by western writers), chief of the Uzbeks, a Turkish tribe, and his successors ruled over Khiva till the end of the 18th century, when they were supplanted by Kirghiz and Karakalpak princes, and from the beginning of the 19th century by the Kungrat branch of the Uzbeks. Ever since the Russians entered central Asia they have complained that the Khivans fostered rebellion among their Kirghiz subjects, and plundered their caravans. In 1717 Peter the Great endeavoured to conquer Khiva, but was defeated, and in 1839 the attempt was renewed by the Czar Nicholas, with no better success. War may be said to have recommenced when new Russian forts in 1869 and 1871 were founded on the shores of the Caspian. It was not, however, till 1873 that a great effort was made finally to crush Khiva. To diminish the difficulties of crossing the deserts the Russian force was divided into five columns, each about 3000 strong, to approach Khiva by different routes. After enduring with admirable fortitude great privations and fatigue, the Russians entered Khiva on the 10th of June. The Khan agreed to pay a war indemnity and to cede to Bokhara the Khivan possessions on the right bank of the Amu-Daria. Shortly afterwards, however, these possessions, including the seat of the Karakalpaks near the embouchures of the Oxus, were incorporated with Russian territory, and now Kizil-Kum and the annexed part of Khiva form the Russian government of Amu Daria, with an area of 39,820 sq. m., and an estimated pop. of 109,600. The rest of Khiva is ruled by the Khan, under Russian suzerainty. KHIVA, the capital of the Khanate, is on the Hazreti Pehlivan Canal, in the western portion of the great oasis. It consists almost entirely of earth-huts, not excepting the residence of the Khan, the only brick buildings being three mosques, a school, and a caravansarai. Pop. 20,000. Other towns are Yengli Urgent, the commercial centre of the Khanate, and Kungrat, not far from the Aral. See works by Vambery (1864), Burnaby (1876), Stumm (Eng. trans. 1885), and Lansdell (1885).

Khoi, a town in the Persian province of Azei-bijan, on the highway between Tazeroum and Tabriz, which lies 75 miles to the S. E. Here Selim I. defeated the Persians in a great battle in 1514. The surrounding district, which is a fertile plateau,

yields grain, fruit (especially mulberries), and cotton. Pop. 25,000.

Khoikhoi. See *HOTENTOTS*.

Khojend, a walled town of Russian Turkestan, on the Sir-Daria, 75 miles S. by W. of Khokand, and 150 E. by N. of Samarcand. It stands in the midst of gardens, and manufactures silk. At one time independent, it was alternately in the hands of the emirs of Bokhara and Khokand until the Russians seized it in 1865. Pop. 35,000.

Khokand, once a khanate of Turkestan, extending east of 64 long, over the whole of the upper basin of the Jaxartes or Sir-Daria. But long previous to the commercial treaty between Russia and Khokand, in 1868, the khanate had been confined to an area of some 30,000 sq. m. In 1875 a rebellion against the khan, who was already practically a Russian vassal, led to Russian intervention. After a fierce struggle the immediate result was the annexation to Russia of all the territory of Khokand lying north of the Sir-Daria. Now the whole khanate forms the Russian government of Fergiana (q.v.), a name under which Khokand was famous throughout the East during the middle ages. The town of Khokand has 54,000 inhabitants.

Khonsar, or KHUNSAR, a town of Persia, in the province of Irak-Ajemi, 80 miles NW. of Isfahan, and on the route from that city to Hamadan. Pop. 12,000.

Khorassan, the largest province of Persia, bordering on Afghanistan, contains about 210,000 sq. m., of which nearly one-third is a vast salt waste; of the remainder a large portion consists of plains of shifting sand. The fertile districts are in the north, where the high range of the Elburz crosses the province, throwing out spurs, and forming a mountainous district, abounding with fertile and well-watered valleys. Artificial fertilisation by means of canals was here carried on to a great extent in ancient times, but the incessant disturbances which have unsettled the district for the last thousand years have almost put an end to this system. The chief products are grain, cotton, silk, hemp, tobacco, aromatic and medicinal plants, fruits, wine, salt, gold, silver, and precious stones, especially turquoises, also camels, horses, and asses. The chief towns are Meshed, the capital, Ni-shapur, Kutehan, Shahrud, Khaf, Kain, and Tebbes.

Khorassan means in ancient Persian *eastwards*, and is said to have extended over all central Asia in the north, to the Helmund on the S., to the Panir on the E., and to the Caspian on the W. After the conquest of the Arabs the country beyond the Oxus became a possession of the Samanide dynasty, whilst Khwarizm (the modern Khiva) was taken by the Seljuks. Herat and the adjoining districts remained in the possession of the Timurides, though sometimes retaken by the Persians, until finally it fell under the sway of the Afghans. Khorassan, being situated on the highway of the Turko-Tartar invasions into the west of Asia, had always to bear the brunt of predatory hosts coming from beyond the Oxus, and its chief towns repeatedly suffered destruction. Recently the invasion has come from the west; and the northern slopes of the Kubbet Mountains, together with the oasis of Merv, including the middle course of the Heri-rud, have been annexed by Russia. See MacGregor's *Narrative of a Journey through Khorassan* (1879); and for the 'Veiled Prophet of Khorassan,' see *MOKANNA*.

Khorsabad. See *NINIVALE*.

Khosru. See *CHOSROES*.

Khotan, called locally *Uchi*, a city and district of eastern Turkestan, lying at the northern base of the Kuen-Lun Mountains, and only six miles from the desert. The district is rich in gold and jade, manufactures silk, and exports silk stuff, carpets, and jade ware. Pop. of city, 40,000.

Khurja, a town of British India, lying 50 miles S. of Meerut and 50 SE. of Delhi, is the chief commercial centre in the district of Bulandshahr. There is a large export of raw cotton to Cawnpore and Calcutta. Pop. (1891) 26,349, chiefly Pathans and Banyas. The latter have banking establishments all over India. They are Jains in religion, and own a fine modern temple.

Khuzistan (anc. *Susiana*), a province of Persia, having Fars and the Persian Gulf on the south, is divided into two almost equal portions, the one, the north-east, very hilly, the other, the south-west, so level as to be almost a stagnant sea in the rainy season, and an arid waste in summer. Khuzistan contains extensive pastoral districts, on which vast herds of cattle are reared, and abounds in soil fitted for rice, maize, cotton, sugar-cane, indigo. Under the rule of the califs Khuzistan was one of the richest provinces of the empire, and Ahwaz, the capital, acquired world-wide reputation for its sugar, carpets, and silk manufactures. With the downfall of the califate of Bagdad Khuzistan ceased to be a rich province; the highway of commerce on the Karun was shut up, and has been only recently reopened. See *KARUN*.

Khyber Pass, the great northern military road between the Punjab and Afghanistan, winds in a north-westerly direction for 33 miles between the projecting spurs of two enclosing ranges of hills. The pass is merely the bed of a narrow watercourse, and varies in width from 150 yards to 20, though in one place it is only '10 feet or less.' It is liable at times to be suddenly flooded. The mountains on either side are in many places perpendicular walls of smooth rock, and can be climbed only in a few places; they vary in height from 1104 to 3373 feet. Over the roughest parts of the pass artillery has to be dragged by men. The Khyber Pass has been the key of the adjacent regions in either direction from the days of Alexander the Great. During the Afghan wars of 1839-42 it was twice traversed by a British army, in spite of an obstinate defence by the natives. The first fighting in the Afghan war of 1878-80 was in forcing an entrance into this pass. It was stipulated in the treaty of Gandamak (1879) that the Anglo-Indian authorities were in future to have full control of this pass.

Kiachta, or *KIACHTA*, a town of the Russian province of Transbaikalia in Siberia, stands on a tributary of the Selenga, 165 miles SE. from Irkutsk, and close to the Chinese frontier, being only separated by a piece of neutral ground, 150 or 200 yards broad, from the Chinese town of Maimaitchin. The place stands in a desolate valley, and along with two other settlements, one 10 miles, the other 2½ miles distant, has a population of 3000 inhabitants. Kiachta was appointed by the treaty of Nerchinsk in 1689 the sole trading place between China and Russia; but down to 1727 the general trade did not flourish much, because the imperial crown reserved the fur trade as a monopoly in its own hands. From 1727 celebrated fairs were held here in December, when Russian furs and cotton, cloth, and leather were exchanged for tea, silk goods, &c. But since the treaty of Peking (1860), when the treaty ports of China were thrown open to Russian vessels and trade was declared legitimate all along the Russo-Chinese frontier, the trade at Kiachta has declined. The Russian goods are valued at £500,000 a year, the Chinese at £2,000,000.

Kiangsi, Kiangsu, provinces of China (q.v.).

Kiao-chan, or KIAU-CHOW, a port on the south side of the peninsula of Shan tung in China, leased by Germany in 1898. The harbour is silted with sand, but advantageously situated. In and around the town live 200,000 souls.

Kidd, WILLIAM, pirate, was a native of Scotland, born probably at Greenock, and is supposed to have been the son of a worthy Covenanting minister who was put to the torture of the boot, and who died in 1679. The lad went early to sea, saw much hard service privateering against the French, and gained a high reputation for stubborn courage, and in 1690 a reward of £150 from the council of New York city. At this time the American colonies were supposed to be nests of pirates who infested the Indian Ocean, and Cooze, Earl of Bellamont, was sent out by William III. as governor of New York and Massachusetts with special instructions to suppress the pest. A ship of 30 guns was fitted out by a private company in London and given to Kidd, who was furnished, moreover, not only with the usual letters of marque, but with commissions under the great seal both to act against the French and to seize pirates. In January 1697 he reached Madagascar, the chief rendezvous of the pirates, but ere long disquieting reports reached England that Captain Kidd was playing the game of pirate himself. After a two years' cruise he returned to the West Indies, and a few months later had the temerity to go to Boston without securing himself by a satisfactory safe-conduct. In spite of the half promises that had been made him he was arrested and sent to England, where he was tried for piracy and the murder of one of his men. Of the latter charge he was formally found guilty, and hanged at Execution Dock, London, 24th May 1701, protesting his innocence to the last. He had buried a store of treasure on Gardiner's Island, off Long Island, which was recovered and seized, amounting with what was found elsewhere to £14,000.

Kidderminster, a parliamentary and municipal borough and market-town of Worcestershire, situated on the Stour 4 miles above its junction with the Severn, and 14½ miles by rail N. of Worcester, 121 NW. of London. It is a busy, thriving-looking place, chiefly noteworthy on account of its carpet-manufacture (see CARPETS), which was first established here in 1735. Worsted spinning and dyeing are also carried on. Richard Baxter was for fourteen years vicar of the parish, and there is a statue of him (1875). An illustrious native was Sir Rowland Hill; a marble statue of him was erected in 1881 at a cost of £1700. Among the public buildings are the parish church, Early English to Perpendicular in style, with a noble pinnacled tower; a Renaissance town hall (1877); a corn exchange (1855); a free library, and a free grammar school, founded in 1637. Kidderminster was incorporated as a municipal borough by Charles I., and since 1832 returns one member to parliament. Pop. of the entire parish, which includes Lower Mitton or Stourport, (1801) 9639; (1881) 31,033; (1891) 33,326, of whom 21,803 were within the municipal limits.

Kidnapping, the abduction specially of children; the word being derived from *kid*, slang for 'a child,' and *nap* or *nab*, cant for 'to seize.' The law of the subject is given at ABDUCTION; the charge of kidnapping frequently made against Gypsies is dealt with at GYPSIES.

Kidney-bean. See BEAN.

Kidneys, two glands having for their function the excretion of the urine. The human kidneys are situated in the region of the loins, one on each side of the spine, and are imbedded

in a layer of fatty tissue. Their form is distinctive. They possess a convex outer border and a concave inner border, the extremities are somewhat enlarged, and the organ as a whole is compressed from before backwards. The average length of each kidney is a little more than 4 inches, and its usual weight is from 4 to 6 ounces. The left kidney is longer and narrower than the right, and in the female the weight is slightly less than in the male. The concave inner border presents a longitudinal fissure—the hilum—at which the vessels enter; in front there is the renal vein, behind it the renal artery, and most posterior the ureter, which conveys the urine to the bladder. When the sides of the hilum are held apart a deep indentation is seen—the sinus of the kidney—in which the ureter dilates to form a large sac—the pelvis of the kidney. Investing the kidney there is a fibrous coat—the *tunica albuginea*—which readily

Fig. 1.—Vertical Section of Kidney:

a, suprarenal capsule; *b*, cortical substance of kidney; *c*, medullary substance of kidney; *d*, hilum; *e*, renal vein; *f*, renal artery; *g*, the sinus or pelvis; *h*, the ureter, proceeding to the bladder.

peels off from the substance of the gland to which it adheres by minute processes and fine blood-vessels. At the hilum it turns inwards, and becomes continuous with the sheaths of the vessels. Under cover of this capsule there is an incomplete layer of involuntary muscular fibre. The substance of the kidneys is dense, extremely friable, and of a deep red colour. On making a longitudinal section of the kidney from the convex outer border to the hilum it is seen to consist of two different substances, which are named, from their position, the external or cortical and the internal or medullary substance, arranged in pyramids with their apices towards the hilum.

The *cortical substance* forms by far the greater part of the gland, and sends numerous prolongations inwards between the pyramids of the medullary substance. It is soft, granular, and contains numerous minute red globular bodies diffused throughout it, which are called, from their discoverer, the Malpighian bodies. Its substance is made up of the *uriferous tubes*, capillaries, lymphatics, and nerves, held together by an intermediate parenchymatous substance.

The *medullary substance* consists of pale reddish, conical masses, called the pyramids of Malpighi. They are usually about twelve in number, but vary from eight to eighteen, and their apices (the *papilla*) point towards the hollow space (termed the *sinus* or *pelvis*) which occupies the interior of the gland. The medullary structure is firmer than the cortical, and instead of being granular presents a striated appearance, from its being composed of minute diverging tubes (the uriferous tubes), which run in straight lines through this portion of the kidneys, after having run in a highly convoluted course through the cortical portion. From the base of each pyramid streaks pass through the cortex, named *medullary rays*, and the portions of cortical substance between the rays are called the *interlobular* of the cortex.

The cavity occupying the interior of the kidneys (the *sinus* or *pelvis*) is lined by mucous membrane, which, through the medium of the ureter, is continuous with that of the bladder, and which extends into the tissue of the kidneys, to line the miniferous tubes. The mucous membrane forms a cup-like cavity around the termination of each pyramid, and the cavity, termed the *calyx*, receives the urine from the open terminations of the tubes, and conveys it towards the pelvis, from whence it passes down the ureter into the bladder.

Each kidney is supplied with blood by a renal artery, a large trunk which comes off at right

Fig. 2.—Plan of the Renal Circulation in Man and the Mammalia (from Ludwig):

a, terminal branch of the artery, giving the terminal twig, *at*, to the Malpighian tuft, *at*, from which emerges the efferent vessel, *at*. Other efferent vessels, *at*, *at*, *at*, are seen proceeding from other tufts, and being the equivalent of the numerous tufts, *at*. From this plexus of capillaries, the efferent vein, *at*, springs.

venous radicle, the efferent vessel, emerges from it close to the point at which the artery had entered. The Malpighian body itself, situated in the labyrinth, consists of a rounded bunch or tuft of capillaries, derived from the afferent and terminating in the efferent vessel, and enclosed in a clear and transparent capsule—the capsule of Bowman lined with flattened epithelium. Each capsule is continuous with the uriniferous tube by a narrow neck.

It now remains to consider the respective functions of the Malpighian bodies and the tubes. From the researches of Bowman and others it appears that in animals in which the urinary excretion is passed in an almost solid form (as in birds and reptiles) the tufts are small and simple as compared with those in the kidneys of animals which (like man and most mammals) pass the urinary constituents dissolved in a large quantity of water. On these grounds, as well as from the fact that the anatomical arrangement of the tufts is well calculated to favour the escape of water from the blood, Bowman arrived at the conclusion that the function of the Malpighian bodies is to furnish the fluid portion (the water) of the urine. Recent observations tend to show that the saline ingredients of the urine are also excreted by Bowman's capsule. The arrangement of the convoluted portion of the tubes, with a capillary network on one side of their basement membrane, and secreting epithelial cells on the other, is the exact counterpart of the arrangement in other secreting glands, and there can be no doubt that the functions of the cells in the convoluted portion of the tubes is to separate from the blood the various organic con-

stituents (urea, uric acid, creatinine, &c.) which collectively form the solid constituents of the urine. It does not necessarily follow that these secreting cells undergo rapid decay and renewal; it is more probable that they have the power of selecting certain materials from the blood, and of transmitting them, without the disintegration of their own structure, to the interior of the tube. The physical and chemical characters of the secretion yielded by the kidneys will be considered in the article URINE.

DISEASES OF THE KIDNEYS.

By far the most important are the group included under the general name of Bright's disease, which may be defined as comprising cases where structural changes in the kidneys, usually inflammatory, but without suppuration, lead to the presence of albumen in the urine. Dr Richard Bright published in 1827 researches showing that many cases of dropsy are attended by albuminuria on the one hand, and by marked changes in the kidneys on the other. His observations have been confirmed and extended by many subsequent observers; and it is now agreed that there are three distinct groups of cases, differing much in causation, symptoms, course, and post mortem appearances, to which the above definition applies. These must be considered separately.

(1) *Catarrhal or Parenchymatous Nephritis* (inflammation of the kidneys). In this form the inflammation affects chiefly the secreting structures of the kidney—i.e. the cells lining the tubules. The kidneys are at first much enlarged; in acute cases in the early stage redder than in health; in later stages and in chronic cases paler. If the duration of the disease is long, however, they may ultimately become much diminished in size, so as much to resemble, except in their paler colour, the kidneys in the cirrhotic form of Bright's disease. This disease may often be traced to exposure to cold; frequently complicates pregnancy; and occasionally occurs in connection with most of the eruptive fevers, but particularly scarlet fever, of which it is one of the most common and serious complications. In acute cases it sometimes begins with a rigor and elevation of temperature. Dropsy is almost always one of the earliest symptoms, and often appears first in the skin of the eyelids. Pain in the region of the kidneys, headache, and vomiting are usually present. The urine is scanty, often bloody, and contains albumen and tube casts. Symptoms of *Œremia* (q.v.) often occur. In favourable cases complete recovery takes place in the course of a few weeks, all the symptoms gradually subsiding. Frequently, however, though the severer features of the case disappear, the urine continues to contain albumen, and the disease becomes chronic. Death may result from *Œremia*, from dropsical effusion, especially in the large serous cavities, frequently from the occurrence of some acute inflammation, particularly of lungs, pleura, or pericardium.

Fig. 3.—Diagrammatic View of Tubules (right side, A) and Blood-vessels (left side, B) of Kidney.

(From Macalister.)

(2) *Cirrhosis of the Kidneys, or Interstitial Nephritis*.—In this form the morbid process consists chiefly in chronic inflammation of the connective tissue of the kidney, which leads to destruction of the tubules and glomeruli by cicatricial contraction. In advanced cases the kidneys are much diminished in size, rough and nodular on the surface, and red in colour. This disease is often traceable to gout, either inherited or acquired, or to chronic lead-poisoning. It is rare before the age of thirty, most common after forty or forty five. The chief feature of this affection is its extremely chronic and insidious nature, which is so marked that it is almost always for some secondary result of the disease that the patient seeks medical advice, and not for symptoms directly referable to the kidneys. The earliest symptom is usually an increase in the quantity of urine, which contains albumen only in small quantities, and may sometimes be quite free from it. Hypertrophy of the heart, with a hard pulse, is one of the most constant features of the disease; and in many cases symptoms due to heart affections are the first which excite the patient's alarm. Persistent headache, unaccountable vomiting or diarrhoea, failure of sight owing to albuminuric retinitis, simple debility, symptoms of uræmic poisoning, cerebral hæmorrhage (apoplexy), or the occurrence of acute inflammation of some internal organ—all these are among the occurrences which may lead to the discovery of this singularly insidious disease. It frequently becomes complicated by addition of inflammation of the kidney tubules (above described) to the primary process, and the symptoms are modified accordingly.

(3) *Waxy or Tuberculous Degeneration of the Kidney*.—As when this degenerative process appears in other organs, the smaller arteries and capillaries are first and most affected; later, other portions of the organ partake in the morbid process. But in the great majority of cases some degree of inflammation of the tubules is also present. Like waxy degeneration elsewhere, it can almost always be traced either to syphilis or to prolonged suppuration. The flow of urine is generally increased in the early stage, and contains albumen. Dropsy is usually present, with some others of the symptoms enumerated above as characteristic of the first form of Bright's disease. But in general the symptoms are rather variable, and could hardly lead to the recognition of the condition present apart from the clue given by the previous history of the case and the occurrence of signs of waxy disease in other organs. In acute cases (first form) prompt and active treatment is necessary, and is often signally successful. Confinement to bed between blankets, light diet, mainly or exclusively of milk, and the production of very free action of the skin and bowels are usually the chief points to be attended to. In the most severe cases wet cupping or bleeding from the arm is sometimes required. Extreme care is necessary till perfect recovery has taken place. In chronic cases warm clothing, with attention to the action of the skin, strict regulation of the diet, avoidance of alcohol, and where possible removal to a warm climate during the cold season can do much to keep the disease in check. Experience has shown that under favourable conditions the course of the disease may be much more gradual than was generally believed by physicians thirty years ago.

Albuminuria without Bright's disease may occur in the course of fevers, in heart disease, and many other morbid conditions. It is now believed by most observers, though the subject is still under discussion, that it may also be present without any actual disease. *Hæmoglobinuria* (impregnation of the urine with the colouring matter of the

blood) is a troublesome, but, except in the case of infants, not a dangerous disease. *Hæmatæmia* (blood in the urine) is indicative of disease in some part of the urinary passages; but it is often difficult to be certain what portion is at fault. Besides Bright's disease, the most common condition leading to it is stone in the kidney or bladder. For *Glycosuria* (sugar in the urine) and *Poluria* (increase in the quantity of urine), see DIABETES.

Stone in the Kidney.—The symptoms attending the passage of a stone from the kidney to the bladder have already been described (see CALCULUS); but it not infrequently happens that a stone formed in the kidney remains there, or, though it enters the ureter, fails to escape, blocking it and preventing the discharge of urine from that kidney. In either case the symptoms are often somewhat obscure and difficult to trace to their true cause. When the stone remains in the kidney blood generally appears from time to time in the urine, and there is persistent pain in the loin, often aggravated by such movements as the jolting of a carriage. Medicinal and dietetic treatment may often prevent the formation of fresh stones, where one has been discharged; and sometimes even seems to lead to the removal by solution of a stone from the kidney. Operation has frequently been resorted to during recent years for the removal of a stone from the kidney, and has in some cases relieved the symptoms, even when no stone has been discovered. When a stone becomes impacted in the ureter the kidney is gradually destroyed, and either atrophies or becomes converted into a large sac containing fluid. The remaining kidney generally becomes enlarged, and carries on the function of excretion; but if its ureter subsequently becomes obstructed in the same way death rapidly ensues.

Suppurative inflammation of the kidney may occur in the course of pyæmia, but usually results from disease of the lower urinary passages (bladder or urethra, hence often called surgical kidney), and is a very fatal disease. The kidneys may become the seat of *tubercular disease*, of *maligant tumours*, of *hydatid cysts*. But none of these conditions are of common occurrence.

Fluctuating or Movable Kidney.—One kidney, more rarely both, may have its attachments to the posterior wall of the abdomen so loosened and elongated that it can move about in the abdominal cavity, somewhat as the intestines normally do. This condition is much more common in women than in men, and may either produce no symptoms, or lead to great discomfort and distress. In the latter case it is usually possible so to adapt a bandage and pad as to restrict the movements of the organ and to relieve the symptoms.

Kidney-stones, the name given to small nodules of reddish-brown ironstone veined with calcite, which are common in the Oxford clay in the sea-cliffs and on the shore north of Weymouth, Dorsetshire.

Kidney-vetch (*Achilleis*), a genus of plants of the natural order Leguminosæ, sub-order Papilionaceæ, containing a number of species, some shrubby and some herbaceous, natives chiefly of the Mediterranean. They have the petals nearly equal in length, and an oval 13-seeded pod, enclosed in the permanent inflated and generally downy calyx. The only British species is the Common Kidney vetch (*A. rubicarpa*), also called *Lady's Fingers*, a herbaceous perennial, with pinnated unequal leaves, and crowded heads of yellow (or sometimes scarlet) flowers. It grows on very dry soils, and is eaten with avidity by cattle, but does not yield much produce. *A. Barba-jovis* (Jupiter's Beard), from the south of Europe, is so

called on account of the long, silky hairs which clothe the leaves, and conspicuous bracts that accompany the flower-heads.

Kidron. See **KEDRON**.

Kieff, one of the oldest towns of Russia, and ecclesiastically one of the most important, stands on the Dnieper, by rail 586 miles SW. from Moscow and 381 N. from Odessa. According to tradition it was founded before the Christian era. In 882 it was made the capital of the Russian principality, and remained so until 1169. Here in 988 Christianity was first preached in Russia by St Vladimir; and ever since that date Kieff has been one of the chief ecclesiastical and intellectual centres of Russia. The town was captured and nearly destroyed by the Mongols in 1240, and it remained in their hands for eighty years. From 1320 to 1569 it was in the possession of Lithuania, then of Poland down to 1654, in which year it was annexed to Russia. The town is built on elevated ground (350 feet above the river), trenched by ravines, and is connected with the opposite bank of the Dnieper by a fine suspension bridge, built in 1851. The most notable institution in the town is the celebrated Petchersk monastery, which is visited by more than a quarter of a million pilgrims annually. Underneath the monastery are a number of caves, containing tombs of the chief saints of the Russian Church. The cathedral of St Sophia, erected in 1037 on the spot where Yaroslaf defeated (1036) the Petchenegs, contains the tombs of the grand-dukes of Russia, and a magnificent altar, ornamented with beautiful mosaics; the interior of the cathedral resembles a labyrinth. The cathedral church of the Assumption harbours the bones of seven saints brought from Constantinople, and has a beautiful belfry with a peal of twelve bells. Altogether Kieff has nearly seventy churches, many of them with gilded domes and pinnacles, which, seen from a distance, give the city a striking appearance. The university, removed here from Vilna in 1833, has four faculties and (1883) 1700 students. There are also theological colleges, a military school, and an arsenal. The industry is unimportant, except tanning and the manufacture of wax candles. Considerable trade is done, especially at the fairs, the most celebrated of which is held during the last half of January. Pop. (1874) 79,773; (1895) 194,300. The fortress of Kieff, begun by Peter the Great in 1706, and now fortified in modern style, occupies a commanding site on the right bank of the Dnieper, and serves as a chief depot for war material.—The *government* embraces great part of the Ukraine, and is bounded on the north-east by the river Dnieper, which with its tributaries, the Priepet and others, performs the functions of drainage. Area, 19,685 sq. m., more than one-half of which is arable and one fifth under wood. Pop. (1897) 3,564,433. Agriculture and horticulture are the chief occupations. The staple industry is the manufacture of beet root sugar (23,000 men employed in 70 factories); spirits, tobacco, flour, machinery, and leather rank next. Trade is still very largely in the hands of the Jews. In Peter the Great's time the government of Kieff embraced the eastern part of the Ukraine and a large portion of middle Russia.

Kickie (*Fragaria Banksii*), a scandent shrub of the natural order Pandanaceae, yielding an edible, aggregated fruit, said to be the finest indigenous fruit of New Zealand. The kickie is found in the northern part of New Zealand. The fruit is a mass of fleshy berries, and the jelly made of it tastes like preserved strawberries.

Kiel, chief town of the Prussian province of Sleswick-Holstein, stands 66 miles N. by E. from

Hamburg by rail, at the head of a deep fjord (11 miles long) of the Baltic, which admits large ships to anchor close to the town. It is the headquarters of the German Baltic Sea navy, and has imperial shipbuilding-yards, slips, dry and wet docks, &c., naval marine stores, a naval academy, a naval officers' school, and an observatory (removed from Altona in 1874). It is also an important commercial port, some 1,100,000 tons of merchandise passing in and out annually. The chief part of its trade is carried on with the towns of Denmark and Sweden; corn, coal, timber, and cattle being imported, whilst coal, flour, beer, butter, cheese, and fish are exported. The industrial activity is considerable, and is mostly exercised in iron-foundries, shipbuilding-yards, corn-mills, breweries, and cabinet-makers' works. Kiel is the seat of a university, founded in 1665, with new buildings completed in 1876; in 1889 it had 85 professors and teachers and 463 students. The castle, built in the 13th century and enlarged by Catharine II. of Russia in the 18th, shelters the university library of 200,000 volumes and a museum with sculptures by Thorwaldsen. The Thanlow Museum contains Sleswick-Holstein carved work of the 15th-18th centuries. The bay is defended by a series of forts placed near its sea entrance. For the Baltic Canal to connect the Elbe and the Bay of Kiel, see **BALTIC SEA**; and **CANAL**. Kiel affords good facilities for bathing. The old town, dating from before the 10th century, has been enlarged by the suburbs of Brunswick and Diestbrook; the latter has beautiful promenades. Pop. (1875) 37,270; (1890) 69,172. Here was signed in 1814 the treaty between Denmark, Sweden, and England, by which Sweden exchanged Pomerania for Norway.

Kielce, the smallest of the Polish governments of Russia, on the Austrian frontier. Area, 3897 sq. m.; pop. (1887) 692,328. The capital, Kielce, 85 miles N.E. of Cracow, has 10,650 inhabitants.

Kiepert, HEINRICH, cartographer and geographer, was born at Berlin on 31st July 1818, and first established his reputation as a map-maker by preparing in co-operation with Ritter the *Atlas of Hellas and the Hellenic Colonies* (1840-46; new ed. 1870). Thereafter he gave his time and energy to constructing atlases of the Orient, especially of the Orient in ancient times, his best-known works in this connection being the maps of Asia Minor, the Ottoman empire in Asia, Caucasus, Palestine, and Turkey, and atlases of the Ancient World (historico-geographical) in various forms, of which the English edition (*Atlas Antiquus*) is familiar to nearly everybody. Kiepert, who conducted the Geographical Institute at Weimar from 1845 to 1852, and from 1859 was professor of Geography at Berlin, wrote, amongst other works, *Lehrbuch der alten Geographie* (1879), *Leitfaden der alten Geographie* (1879; Eng. trans. 1881), and numerous papers, mostly dealing with ancient oriental geography, in the *Proceedings* of the Berlin Academy of Sciences. He died in April 1899.

Kierkegaard, SOREN AABY, the greatest thinker of Denmark, was born at Copenhagen, on 5th May 1813, led the simple but busy life of a thinker and writer, and died on 11th November 1855. He was a very voluminous author. His greatest books are *Either-Or* (1843) and *Studia on Life's Way* (1845); these and many others were published under fictitious names. Kierkegaard applied the Socratic method to the examination of the fundamental philosophical principles of Christianity, regarded not as an organised or church religion, but as the religion of the individual soul. Both his thought and style are singularly original. In dialectical skill, eloquence, and imaginative qualities he is scarcely inferior to Plato; and to

these he joined wit and a love of irony and paradox. He has been one of the most potent influences in modern Danio-Norwegian literature. In his last years he made a bitter attack on the official church. See *Life* by Georg Brandes (in Danish, 1877), and biographical studies by Barthold (in German, 1875-86).

Kieselguhr. See DIATOMS, DYNAMITE.

Kilauea, the great volcano of Hawaii (q.v.).

Kilbowie, in Dumbartonshire, 4 miles NW. of Glasgow, is the seat of the huge sewing-machine works of the Singer Company, which cover 46 acres, and employ about 8000 hands. The town is part of the police-borough of Clydebank, whose population increased from 3830 in 1881 to 10,589 in 1891.

Kilburn. See KINBURN.

Kildare, a county of the province of Leinster, Ireland, bounded by Dublin, Wicklow, Queen's and King's counties, Meath, and Carlow. Its chief town is Naas, and the other municipal towns are Kildare, Kilenlen, Maynooth (where is the Roman Catholic College), and Athy, besides which there are quite a number of small towns. The area is 418,836 acres, or 654 sq. m.; the surface is generally flat and the soil very productive. A great portion of the county belongs to the central Carboniferous plain of Ireland. In the northern part there is a large extent of bog, and the great Bog of Allen covers some 40,000 acres, intersected by elevated ridges of dry ground. From this bog rises the Hill of Allen, a conical rock of porphyry and greenstone, 300 feet high. Towards the south-east the surface rises to meet the hills of Dublin, and in the south to meet those of Carlow. There are a few small woollen, paper, and corn mills, breweries and distilleries, but agriculture is the main occupation. The most fertile and best farmed districts are the valleys of the Liffey and the Greese, besides which rivers the county is watered by the Boyne and Blackwater, both having their source in County Kildare, the Barrow and the Lesser Barrow. The Royal Canal, connecting Dublin with the Shannon, traverses the northern portion, and the Grand Canal traverses the valley of the Liffey. To the south of the town of Kildare is the Curragh of Kildare, an undulating plain of bright green grass covering about 8000 acres; a portion of it forms the Newmarket of Ireland, and on another portion is the Curragh Camp. Kildare returns two members to the imperial parliament. Pop. (1841) 114,488; (1891) 79,206, of whom 87 per cent. were Catholics. Kildare is noted for its antiquities. There are old giant stone pillars at Panchestown, Harriestown, Jigginstown, and Mullamast, and remarkable earthworks near Naas and elsewhere. There are numerous sepulchral mounds on the Curragh, and also the remains of a stone circle. There are five round towers in the county, and the ruins of a great many religious houses and castles. See works by Rawson (1807) and O'Byrne (1807).

Kildare, a town in Kildare county, 30 miles SW. of Dublin. St Bridget (q.v.) founded a nunnery here, and the older name *Devin Ceathill* was changed to *Col-lara*, the cell or church of the oak, from an old tree under whose shadow the saint built her cell. There are remains of three other monastic institutions, and a round tower, the finest in the county, 103 feet high. Kildare was one of the first sees founded in Ireland; its first prelate died in 549. The Protestant see (1550) is now united with Dublin, and the Roman Catholic see forms the diocese of Kildare and Leighlin. After the Norman invasion Kildare became a place of considerable importance, and a parliament was held there in 1309. It suffered severely, however, in

the wars of Elizabeth and during the great Civil War, and has never recovered its former standing, although historically one of the most interesting old towns in Ireland. The rebellion of 1798-99 began in Kildare, where, on the night of the 23d May 1798, a number of officers from Duddin were murdered by the insurgents. Prior to the Union it returned two members to the Irish parliament. Pop. (1861) 1426; (1891) 1172.

Kilia, a town in the portion of Bessarabia ceded by Roumania to Russia in 1878, is situated on the northern bank of the Kilia branch of the Danube, 20 miles NE. of Ismail. It has some fishing and trade. Pop. (1884) 9079. The place was captured by the Russians in 1790, and bombarded by the allied fleet in July 1854.

Kilian, ST, the apostle of Franconia, a native of Ireland, who, sent by the pope as a missionary bishop to the heathen, preached at Würzburg about 690, and was slain by his convert Duke Gozbert for denouncing his marriage with Geila, his brother's widow. Würzburg claims him for its first bishop; his day falls on 8th July.

Kilima-Njaro, an isolated mountain mass in East Africa, standing between Victoria Nyanza and the coast, just within the northern limit of the German East African Company's territory, in 3° 20' S. lat. and 37° 50' E. long. The mass consists of two peaks, or rather craters, Kibo and Kimawenzi, connected by a broad saddle (14,000 feet) studded with lava hills. Kibo was climbed by Dr Meyer in October 1889. Its highest point is about 19,680 feet above sea-level; its crater is 650 feet deep, and 6500 feet in diameter. At the same time he climbed the second highest pinnacle of Kimawenzi, and found it to be more than 17,250 feet high. The crater rim of both peaks is covered with a thick crust of ice. See *Pfeiffermann's Mittheilungen*, vol. xxxvi, No. 1; also H. H. Johnston's *Kilimanjaro Expedition* (1886).

Kilkenny, an inland county of Leinster, bordering on Queen's County, Carlow, Wexford, Waterford, and Tipperary. Its area is 599,732 acres, or 796 sq. m. The proportion of bog is small, and owing to this and the slope of the country the climate is dry, salubrious, and temperate. Vegetation is earlier here than in the rest of Ireland, and the soil along the valleys of the Suir, Nore, and Barrow is very rich. In the northern part there are large tracts of moor devoted to sheep and cattle, but almost nothing has been done to improve the pasturage in the hilly districts. Kilkenny forms for the most part a continuation of the Carboniferous-limestone plain, but to the south and south-east the surface rises to a considerable elevation. In the north there is another hilly region forming part of the Castlecomer anthracite coalfield. At present the output is about 80,000 tons per annum, or more than one half the annual coal production of Ireland. In the western district are the Walsh Mountains. The principal rivers are the Suir, the Barrow, and the Nore, which all rise in the Slieve Bloom Mountains, and after widely-divergent courses empty themselves into Waterford Harbour. The chief towns are Kilkenny, Callan, Thomastown, Freshford, Ulingford, and Castle-comer. Pop. (1841) 202,120; (1891) 87,261, of whom 94 per cent. were Catholics. Prior to the Union Kilkenny returned sixteen members to the Irish parliament, but now the county returns two and the city one to the imperial parliament. The linen manufacture was once a prosperous industry, but is now practically extinct, and the woollen manufacture is nearly so. There are a few breweries, distilleries, tanneries, flou mills, and marble-polishing works.

Kilkenny, anciently part of the kingdom of

Ossory, was formed into a county by King John in 1210, and during the Revolution was held by the Irish for James II. It was made an English settlement after the Norman invasion, and was the scene of a long succession of conflicts between the two races. The Norman remains are very numerous, and among other antiquities are circular groups of stones on Slieve Grian and the Hill of Cloghmaunta, several cromlechs and raths, numerous forts and mounds, five round towers, and monastic ruins at Jerpoint, Rosbercon, Thomastown, Knocktopher, and elsewhere. The most notable castle is Graney, in Iverk, supposed to have been founded by the Earls of Ormonde in 1521, and of which three towers are still standing. The cave of Dunmore, between Kilkenny and Castlecomer, which opens with a natural arch 50 feet high, is noted for its beautiful stalactite chambers and its subterranean stream. At Silverwood and Ballygunnion are the remains of very ancient lead-mines. Manganese, marl, pipeclay, marble, and copper are still found. See J. G. Robertson's *Antiquities and Scenery of Kilkenny* (1851).

Kilkenny, the capital of the county of that name, is also a county of a city and parliamentary borough, returning one member to parliament. It is situated on the Nore, 81 miles SW. of Dublin by rail. Pop. (1851) 19,975; (1891) 11,048. At one time it was the seat of busy linen and woollen manufactures, but very little of either now remains. It is still, however, the centre of a considerable industry in marble-polishing. In the neighbourhood are extensive quarries of shelly black marble, which is in extensive request for chimney-pieces, tombstones, and other purposes. The name is Celtic—*Cil Canice* the church of St. Canice or Kenny, a building dating from 1052 and the largest ecclesiastical edifice in Ireland except St. Patrick's at Dublin. It is in the Early English style, 226 feet long by 123 across the transepts. There are many old sepulchral monuments, and quite close to the south transept are the remains of a round tower still 100 feet high. Other ecclesiastical remains are the preceptory of St. John's, founded in 1211; the Dominican abbey, founded in 1225, still used as a Roman Catholic church; and the Franciscan abbey, founded in 1230. In 1857 was erected the Roman Catholic cathedral, at a cost of £30,000, a handsome building with a massive central tower 186 feet high. On a precipitous rock above the Nore is the famous castle of Strongbow and his son and successor, dating from about 1175, and restored during the 19th century as a place of residence for the Marquis of Ormonde. The grammar school, founded in the 16th century, also stands on the banks of the river, fronting the castle, and here Swift, Congreve, and Bishop Berkeley received their education. Near the city is the Roman Catholic college of St. Kieran. Several parliaments were held at Kilkenny in the 11th century, and even down to Henry VIII. it was the residence, occasionally at any rate, of the lieutenant. It was here that in 1397 was passed the stringent 'Statute of Kilkenny,' meant to prevent the Anglo-Irish from becoming more Irish forbidding intermarriage, &c. and here that in 1642 the Assembly of Confederate Catholics gathered. Cromwell laid siege to the city in 1648, and in 1650 it capitulated on honourable terms. The principal trade of the city is now in provisions, through the port of Waterford, by which it is united both by river and rail. The fable of the 'Kilkenny cats,' which fought till nothing but the tails were left, was a satire on the contentions of Kilkenny and Trishtown in the 17th century about boundaries and rights, which went on till both towns were impoverished.

Killarney, a small market-town in the county of Kerry, 18½ miles by rail SW. of Dublin, 47 WNW. of Cork, and 1½ mile from the lower Killarney Lake. Its importance depends on the crowds of tourists who come to visit the famous lakes. The town has been practically rebuilt, and now possesses some spacious streets with a number of good houses and public buildings. Most notable among the latter is the Roman Catholic cathedral, a very imposing structure, which, along with the Bishop's Palace, was designed by Pugin. There is also a large Episcopal church, a lunatic asylum, a courthouse, and a railway hotel. Pop. (1851) 7,127; (1891) 5,510. There is a small trade in making fancy articles to attract the strangers, principally from the wood of the arbutus, which grows on the islands. On the shores of the lakes are marble-quarries, yielding several varieties—green, red, white, and brown—and also some old copper-mines. Near the town is the seat of the Earl of Kenmare, whose estates were the scene of disturbances, in connection with evictions, during the Irish agitation of 1888-89.

Killarney, LAKES OF, are a series of three connected sheets of water, the lowermost of which is within 1½ mile of the town of Killarney. The outflow is by the river Laune north-west to Castlemain Harbour. These famous lakes are situated in a basin in the midst of the mountains of Kerry, some of which rise abruptly from the water's edge densely clothed with trees from base to summit. Arthur Young called those which surround the upper lake 'the most tremendous mountains that can be imagined, and said that the wooded hills along the margins 'form the most magnificent shore in the world.' This is exaggeration, but the scenery of Killarney is very beautiful, and in some of its aspects unique. It presents, as Arthur Young quaintly said, an admirable mixture of the beautiful and sublime. The lower lake, Lough Leane, covers an area of 5001 acres, and is studded with richly-wooded islands. The largest of these is Ross Island, on which is situated Ross Castle, an old stronghold of the O'Donoghues. Another island is the 'sweet Innisfallen' of Moore's song, and on this is the picturesque ruin of an abbey, founded by St. Finian the leper in the 6th century. The upper lake covers some 430 acres, and is also studded with islands. Between the two is Lough Tore, covering 680 acres. Connecting the upper with the lower and middle lakes is the Long Range, a beautifully-wooded and picturesquely-winding stream 2½ miles long. About midway in its course occurs the famous echo, caused by a lofty rock called the Eagle's Nest. Between the lower and the middle lakes is the fine ruin of Muckross Abbey, founded by the Franciscans in 1440. A peculiarity of the scenery is the luxuriant growth of arbutuses on the islands of the lakes, which add such richness and colour to the general effect. See works by Mr and Mrs Hall (1843-78).

Killiecrankie, a beautiful wooded pass in Perthshire, on the Garry River, 15 miles NNW. of Dunkeld. It is traversed by Wade's Great Highland Road (1732), and by the Highland Railway (1863). For the battle, see GRAHAM (JOHN).

Killigrew, THOMAS, born in 1612, served as a page in the household of Charles I., and was afterwards a dissolute companion of Charles II. in exile and his groom of the bedchamber after the Restoration. He published in 1664 nine indifferent plays, which he tells us were written in nine different cities. He was some time manager of the king's company, and in his patent obtained permission to give the female parts to women. He

died in 1683. Sir John Denham's lines form his best epitaph:

Had Cowley ne'er spoke, Killgrew ne'er writ,
Combined in one, they'd made a matchless wit.

—**KILLGREW, SIR WILLIAM**, his brother, was born in 1606, fought in the Civil War, and died in 1695. His works include a comedy, *Pandora*, and three tragicomedies, *Scindru*, *Ornideses*, and *The Siege of Uchin*.

Kilmainham, a township of Dublin county and a western suburb of Dublin city. Pop. 5391. Here is the Royal Hospital for the reception of wounded and pensioned soldiers. It was originally founded by Charles II., is conducted on similar principles to the sister institution, Chelsea Hospital, and provides for 250 inmates. Near it is the government prison of Kilmainham. The phrase, 'the treaty of Kilmainham,' played a prominent rôle in party political warfare in 1882. The phrase pointed to an alleged arrangement between Mr Gladstone and Mr Parnell (then in Kilmainham gaol), whereby the latter promised to use his influence to prevent agrarian crime in Ireland on condition that a legislative measure altering the Land Act of 1881 was introduced into parliament.

Kilmarnock, the largest town in Ayrshire, on Irvine and Kilmarnock waters, 15½ miles by rail NNE. of Ayr, and 24 SSW. of Glasgow. It received its name *Kil-arno-Emin-oc* (Gael., 'church of my little Emin') from the dedication of its church about 1200 to an Irish saint of the 7th century; and in 1591 it was made a burgh of barony under the Boyds, from which date its hose and bonnet making grew into thriving industries. The great carpet manufacture was introduced in 1777, and the printing of calicoes in 1770, of shawls in 1824; tweeds, wineys, boots, &c. are also manufactured; and the Glasgow and South-Western Railway works were transferred hither in 1858. The staple trade, however, is in connection with iron, owing to Kilmarnock's situation in a great mineral district; and the October cheese-fair (established 1855) is second to none in the kingdom. The Boyd's Dean Castle, 1 mile NE., was reduced by fire to ruin in 1735; and the town itself, which has suffered twice from fire (1668 and 1800), and once from flood (1852), has few buildings of interest. The town hall (1805), the courthouse (1852), the corn exchange (1862), with its Albert tower 110 feet high, and the new academy (1876) may be noticed, as also may a statue of Sir James Shaw (1848), and the Kay Park of 41 acres (1879), with its Burns' monument, a tower 80 feet high. Of Burns (q.v.) and of the Covenanters Kilmarnock has memories; and it was the birthplace of Alexander Smith. Since 1832 it has united with Rutherglen, Dumbarton, Port Glasgow, and Renfrew to return one member to parliament, its parliamentary boundary having been extended in 1885. Between 1875 and 1890 its valuation increased from £61,847 to £96,195. Pop. (1841) 19,398; (1881) 25,841; (1891) 28,147. See M'Kay's *History of Kilmarnock* (1848; 4th ed. 1880).

Kilogramme, a thousand grammes. 2.2046 lb. See METRIC SYSTEM. *Kilogramme metre* is the amount of work done in lifting one kilogramme one metre. 7.23398 foot pounds. *Kilowatt*, a thousand metres. 3280.9 feet. 0.96211 mile. *Kilowatt*, unit of activity in Mechanics. one thousand watts = 1.3406 horse power = 1.3591 cheval vapeur.

Kilrush, a small seaport of Ireland, on the northern shore of the Shannon estuary, 36 miles W. of Limerick. It is resorted to for sea-bathing, and exports grain and timber. Pop. 3865.

Kilsyth, a town of Stirlingshire, 13 miles NE. of Glasgow, with quarries and coal and iron mines.

Founded in 1665, it was made a burgh of barony in 1826. Here, on 15th August 1645, Montrose with 4900 followers almost annihilated 7000 Covenanters under Baillie (Gardiner's *Good Civil War*, vol. ii. 1889). A remarkable religious revival took place here in 1839, originating in the preaching of W. C. Burns, afterwards missionary to China. Pop. (1851) 3949; (1881) 5405; (1891) 6073.

Kilt. See HIGHLAND COSTUME.

Kilwa. See QUILWA.

Kilwinning, a town of Ayrshire, on the Garnock, 3½ miles NNW. of Irvine and 26 SW. of Glasgow. The stately Tirrensonian abbey, founded in the 12th and demolished in the 16th century, was dedicated to Winmin, an Irish saint, who is said to have founded a church here about 715. The traditional birthplace of Freemasonry (q.v.) in Scotland, Kilwinning has also been celebrated since 1488 for archery; its July shooting at the popinjay, placed on the steeple (105 feet high), is described in Scott's *Old Mortality*, and continued till 1870. Eglinton Castle (1798), the seat of the Earls of Eglinton (q.v.), is 1½ mile S.E.; and the Eglinton Ironworks (1846) afford employment. Pop. (1861) 3921; (1881) 3469; (1891) 3835. See works by Wylie (1878) and Lee Ker (1883).

Kimberley, capital and chief town of Griqualand West, South Africa, the most important inland town of the Cape Colony, is situated 540 miles NE. of Capetown by rail (30 hours). Pop. (1891) 28,718, more than half natives. The British flag was first hoisted at Kimberley in November 1871; but Griqualand West did not become an integral portion of the Cape Colony till October 1880. The climate is healthy, though hot in summer; the neighbouring country, in all places where water can be obtained, fertile. The wants of the town have been abundantly provided for by water-works carried out at a cost of nearly half a million sterling, for which water is obtained from the Vaal River. On the outbreak of the Transvaal war it was invested by the Boers, but after a siege of over three months it was relieved on 15th February 1900. The rise of Kimberley has been rapid; and its situation is favourable to its further development. It holds the direct road from Capetown and the sea to the Orange Colony, the Transvaal, and the immense territories to the north; and is important to travellers and 'cup-country' traders as the emporium and starting place for the interior. There are a handsome town-hall, post-office, high court, public library, and botanic gardens. Kimberley owes its existence to the diamond-mines, the working of which dates only from July 1871, and of which the most important, known as Du Toit's Pan, Bultfontein, De Beer's, and Kimberley Central, were amalgamated into one huge company, with a share capital of £3,950,000. The number of diamonds found elsewhere in the whole world is comparatively insignificant (see CAPE COLONY, Vol. II, p. 734; also DIAMOND, Vol. III, p. 791). Kimberley is also the name of a fertile district in the Fitzroy basin, in northern West Australia, where gold was found in 1893.

Kimchi, DAVID, the most eminent Jewish grammarian and exegete, was born about 1160, probably at Narbonne, where he spent the greater part of his life, and died about 1235. His father, Joseph Kimchi, was the author of a number of commentaries and other theological works. His brother Moses wrote similar works and a Hebrew Grammar. His own celebrity, however, far exceeds theirs, and even with competitors like Rashi and Ibn Ezra he has preserved his place as the most popular of Jewish commentators. His Grammar, *Mekhalol*, and his Lexicon, *Seder hash arasham*, have to a certain degree been the basis

of all subsequent Hebrew grammars and lexicons. His commentaries include almost all the books of the Old Testament. That on the Psalms was edited by Schiller-Szinessy (Camb. 1885).

Kimmeridge Clay, the lowest series of the Upper Oolite, consists of dark, bluish gray shaly clay, which is sometimes bituminous and occasionally (as at Kimmeridge in the Isle of Purbeck) passes into a shale so rich in bituminous matter as to be used as a fuel. In other places the clay is calcareous, and contains nodules of argillaceous limestone or septaria. Near its base it sometimes shows sandy layers and clay ironstone. The series attains a maximum thickness of 600 to 660 feet.

Kimpolung, a town of Wallachia, stands in a valley at the foot of the Carpathians, 80 miles NW. from Bucharest. Pop. 9090.—Another town of this name exists in the extreme south of Bukowina. Pop. 5534.

Kin, NEXT OF. When a person dies intestate his real property devolves, according to English law, on his Heir (q.v.), and his personal property is distributed among his next of kin. The degrees of kindred are divided into lineal and collateral. The lineal consists of the ascending, such as father, mother, grandfather, grandmother, paternal and maternal, and so on *ad infinitum*; and the descending, such as son, daughter, grandson, grand-daughter, and so on *ad infinitum*. The collateral kindred consists of brothers, sisters, uncles, aunts, &c., and the children of such *ad infinitum*. The mode by which the civil law computed the proximity of degree was this: it allowed one degree for each person in the line of descent exclusive of him from whom the computation begins, and in the direct line counted the degrees from the deceased to his relative; but as regards collaterals it counted the sum of the degrees from the deceased to the common ancestor, and from the common ancestor to the relatives. Thus, a brother was in the second degree, counting one to the father, and one from the father to the brother; a nephew, and also an uncle, a great grandfather and a great-grandson, were all in the third degree; a son and a father were in the first degree; and so on. This mode of computing the degrees of kindred has been adopted in the law of England and Ireland.

When a person dies intestate, leaving personal property, there are two classes of rights to which the next of kin are entitled: one is the right to administer the estate, or to take out letters of administration; the other is the right to a share of the property itself. As regards the right of administration, the court has discretion to appoint a fit person, but a preference is to be given to the widow or widower, and to the next of kin. Among the next of kin those are to be preferred who are nearest in degree according to the above computation: thus, a son or father is preferred to a brother, grandfather, or grandson; and those to a nephew, uncle, great-grandson, or great-grandfather; and so on. In distributing the personalty the widow takes one-third if there be children or other descendants, one-half if there be none. Subject to this claim of the widow, the next of kin take according to the Statute of Distributions, which slightly differs from the order of the civil law as to the degrees of priority: thus, the children exclusively take the whole if children survive; if some of the children are dead, leaving issue, then the issue collectively of each dead child take an equal share with the living children, by what is called the principle of representation. If there are none nearer than grandchildren, each family of grandchildren take the share of the child whom

they represent, and the issue of a deceased grandchild also take the share of their parent. If there are no descendants, the father, if alive, is entitled to the whole. If he also is dead, then the mother and the living brothers and sisters (together with the issue of deceased brothers and sisters collectively) take each one share. After these are dead, then grandfathers and grandmothers, paternal and maternal, and nephews and nieces, if alive, take each a share. The right of representation—i.e. the right of the children of a deceased person being one of a class (and who, if alive, would have been one of the next of kin) to represent him, and take his share—applies as far as the children of brothers and sisters, but no further. The heir-at-law is one of the next of kin, and takes his share of the personalty, though he also gets all the real estate. The half-blood counts among the next of kin equally with the whole blood; males are not preferred to females; and the rule of primogeniture has no application.

In Scotland the rules of priority among the next of kin vary considerably from the above order, which prevails in England and Ireland. The children, being entitled to an absolute legal share called Legitim (q.v.), take the father's property in two characters—one part as legitim, the other as being next of kin—and the result is often different from what obtains in England. Moreover, in Scotland, though the heir-at-law may be one of the next of kin, still he is not entitled to take such share unless he collate the heritable estate (resign it to the executors). The degrees of kindred are not counted in exactly the same way. The father never can take more than one half, nor the mother more than one third, while any of the brothers and sisters, or their issue, are alive. The half-blood does not share equally with, but in an inferior degree to the full blood. See the tabular statement in Paterson's *Compendium of English and Scotch Law*.

Kinabalu. See BORNEO.

Kinburn, or KULEBEN, a former fort of south Russia, situated opposite Otchakoff, on a long narrow sandbank which forms the southern boundary of the estuary of the Dnieper. Paul Jones first suggested to Suvaroff that it should be fortified; it figured prominently in the Russo-Turkish wars of 1771-74 and 1787; and during the Crimean war it fell before the allies, October 17, 1855. The fortifications were razed in 1860.

Kincardineshire, or THE MEARNS, a maritime county of Scotland, with Aberdeenshire and the Dee on the N., Forfarshire and the North Esk on the S. and W., and the North Sea on the E. The rocks are granite, gneiss, sandstone, conglomerate, mica slate, clay slate, limestone, and trap. Area, 383 sq. m., or 245,346 acres, of which 120,050 are in cultivation, and 23,153 in wood. The county may be divided into four sections—viz. the Coast, the 'Howe' of the Mearns, the Grampians, and Deeside. The coast-land and north of the 'Howe' is of superior quality, and rents from £2 to £3, 10s. an acre. The 'Howe' forms a continuation of the Valley of Strathmore (q.v.). The Grampians, running across the country from east to west, parallel to the Dee, with an average breadth of from 7 to 8 miles, cover about 80,000 acres; one of the peaks, Mount Battock, is 2555 feet high. The Deeside portion of the county is a comparatively narrow strip of light, sharp soil. There are few manufactures in the county. The principal towns and villages are Stonehaven (q.v.), the county town; Bervie, a royal burgh; Laurencekirk, a borough of barony; Banchory; and Johnshaven. Of the objects of antiquarian interest the most noted are Dunnottar Castle (q.v.) and Raedyke's Camp, an

entrenchment seemingly on the Roman method, in which it has been supposed that the ancient Caledonians under Galgacus encamped prior to their battle with the Romans under Agricola. Kincairdineshire was the birthplace of George Wishart, Robert Barclay, Dr J. Beattie, and Dr Thomas Reid; and the father of Robert Burns was born in Dumortar parish. Pop. (1801) 26,349; (1871) 34,630; (1881) 34,460; (1891) 34,647.

Kinchinjunga, or KANCHANJANGA, a peak of the Himalayas, between Sikkim and Nepal, 28,176 feet in altitude.

Kindergarten, the name of a kind of school or training-place for young children—name and thing imported from Germany. The principle was first propounded (1826) and the system invented by Friedrich Froebel (q.v.). He was early impressed with the insufficiency of the teaching and training given in the ordinary infant-school, and with the fact that the loving instinct of the mother remained merely an instinct, which required for the training of the child thoughtful guidance and direction. He saw that the teaching in the infant-school was to a large extent traditional; that the selection of subjects and exercises depended on fashion, or upon the likings or prejudices of the teacher, and not upon a genuine knowledge of the nature of children; and that the whole procedure was based upon an induction of facts and phenomena which had been hastily made, and rested upon no firm ground of principle. He therefore set to work to study the ways and doings of infants from their birth, and to note down systematically what kind of mental food and what kind of bodily activity Nature prompted them at each stage of their existence to prefer. He reached the following principles: (*a*) That Education means a harmonious development of all the bodily and mental powers; (*b*) that the *spontaneous* is the raw material and the only element that is valuable in education, and that the teacher must connect all his instruction with these, and graft it upon the spontaneous activity of the child; (*c*) that the work of the teacher is not to give knowledge *ab extra*, but to supply material, means, and opportunities in a rational and harmonious order for the child's mind spontaneously to work upon; and (*d*) that in the presentation of their materials or occupations there must be no break (*in Natura non datur saltus*), because all occupations which train must be developed out of each other. The early materials for instruction are called *gifts*, because they are presented to the child only when his nature and stage of development call for them. The province of the educator is to map out the world of early childhood, and to engineer—i.e. to give each step in—the paths to knowledge or power in each subject; the province of the teacher is to apply this general knowledge to particular cases, and with loving care and delighted patience to provide the right mental food—the most suitable activities for each hour and stage of development. His complete aim is the systematic cultivation of all the powers in complete equilibrium. Hence, while the infant-school goes too much into work and drill, Froebel's system calls for attention to the individual child; he weaves the work into 'play' (spontaneous activity), and he evolves 'drill' out of the free individual desire for society. Hence Froebel's large use of song and dance. He respects freedom and the right order of development so much that he would not give a word to a child until a mental necessity and desire had been created by an ordered set of experiences for that word; and he cultivates the senses and the hand with the utmost care, so that perfectly accurate perception and comparison may produce true and

clear conceptions, which again give rise to true and just judgments. 'All the byways to untruth,' says Miss Shirreff, 'such as exaggeration, confusedness of mind, inaccuracy of speech, are cut off.' The child is not *tought*, but *led* by a set of ordered experiences to the perception of the principles of number (*Arithmetic*) and of space (*Geometry*); and his senses and powers of hand and eye are cultivated by an elaborate series of exercises. The steps in Froebel's system are (1) *Spontaneity* or *Play*, which, however, in a child is always serious and never frivolous; (2) direction of this towards external fact and truth; (3) weaving of spontaneous powers into ordinary occupations; (4) development into self-culture, independent action, a love of knowledge, beauty, and society. The process, like the process of Nature, is slow, tranquil, and organic; but no part of it requires to be undone. The child sees, imitates, or reproduces and invents new forms; these are the three steps in each subject for each pupil. Its most earnest disciples give to it the name of *The New Education*.

The system has made great way in America, and is now making way in England. There is a Froebel Society, which consists of a large number of thinkers and workers in education. The London and Birmingham school boards have introduced the system; and several training colleges are working upon its lines.

The best English books as yet on the subject are Laurie's *Kindergarten Manual*; Miss Shirreff's *Kindergarten* (1876) and *Kindergarten at Home* (2d ed. 1889); Heerwart's *Muse for the Kindergarten* (1877); Kohler's *Praxis* (trans. by Miss Garney, 4th ed. 1889); *The Kindergarten*; *Froebel Society's Papers* (1880); Barnard, *Froebel's Kindergarten*; Karl Froebel, *Explanation of the Kindergarten*.

Kinderscot Grit, name given to the coarse grits and flag-stones which occur towards the base of the Millstone Grit of England (see CARBONIFEROUS SYSTEM). The rock forms the tableland of Kinder-scot in the Peak county. The grit is quarried at Eyam Moor, Derwent Edge, and other places, and is used for engine-beds, foundations, and reservoir work.

Kindly Tenant. See BORTENS.

Kinematics is the science which treats of pure motion. It involves the fundamental conceptions of space and time and takes no direct cognisance of force or mass. Strictly speaking, any kinematical problem dealing with motions that exist in nature is at bottom dynamical, and every dynamical problem is of necessity approached in the first instance on its kinematical side. Thus, to take a familiar example, Kepler's laws of planetary motion were purely geometrical and kinematical statements, from which Newton deduced the dynamical law of universal gravitation. Again, the *Nautical Almanac* is essentially a book of kinematical statistics, giving the positions of the important heavenly bodies at definite successive intervals of time, and not infrequently the rates of change of position; and the calculation of these statistics has a strict dynamic basis.

Kinematics may be regarded as a geometry of position into which the idea of time or duration has been introduced. Thus, change of position, regarded as taking place continuously in time, leads to the idea of velocity, linear and angular. Velocity itself is, of course, subject to change, and this change, regarded as taking place continuously in time, leads to the idea of acceleration, linear and angular. The distinction of linear and angular as applied to velocities and accelerations is very necessary for a clear study of the kinematics of systems of points, such as plane and solid figures, rigid or deformable, or of the kinematics of fluids.

Rotation, strain, twist, vortex are important cases. The kinematics of solid figures is a subject of growing importance to the mechanic and engineer; so much so that in the kinematics of machinery we have a highly-specialised branch of the subject. A glance at any ordinary piece of mechanism, from a steam engine to a sewing machine, shows how various are the relative motions of the wheels, rods, cranks, belts, and other pieces that build it up. The function of a machine is dynamic—viz. to transform energy to a certain end—but this must be effected by suitable kinematical arrangements. In all modern treatises on dynamics and mechanics a section is devoted to a preliminary study of kinematics. Reuleaux's *Kinematics of Machinery* (trans. 1876) deserves particular mention.

Kinetoscope. See EDISON, ZOETROPE.

King (U.S. *king*, from *kin*, 'a kin,' 'a tribe,' and the termination *-ing*, 'belonging to.' Hence *kinging* is 'man of the tribe,' 'chief'). For the origin of the kingly power, see the article GOVERNMENT; for the relation of King to people in Britain, see ENGLAND (HISTORY OF), PARLIAMENT; and for the position of kings in other countries, see the section on the constitutions of these countries.

King, WILLIAM RUFUS, vice-president of the United States, was born in North Carolina, 6th April 1786, and was admitted to the bar in 1806. He was a member of the legislature for three years, was returned to congress as a War-Democrat in 1810, and represented Alabama in the senate from 1820 to 1844. He was then minister to France for two years, and a senator again from 1848 to 1853, when he became vice-president. He died, however, on 18th April of the same year.

King-at-arms. See HERALD.

King Country. See WAKATU.

King-crab (*Limulus*), a curious animal, the last of its race, usually referred to a special group, Xiphosura, within the spider and scorpion class

Fig. 1.—Under-surface of King-crab (*Limulus polyphemus*).

Arachnida. A large convex chitinous buckler covers the head and thorax, a flatter hexagonal shield protects the abdomen, while a long spear runs on from the hind end. There are twelve pairs of appendages on the ventral surface, a pair in front of the mouth, five pairs of legs, the bases of which surround the mouth and are masticatory, and a cover or operculum which overlaps five pairs of flattened abdominal appendages, used in swimming, and bearing peculiar respiratory organs known as gill books. On the top of the large buckler there are two large compound eyes and near the middle line two simple eyes. The internal structures are no less peculiar. The sexes are separate, and the spineless larvae present a curious resemblance to Trilobites.

The king crabs attain a length of over two feet. They live on muddy bottoms at a depth of 2 to 6

fathoms, where they sometimes swim slowly about or more frequently burrow their way in the mud by alternately bending and straightening their

Fig. 2.—Young King-crab, just hatched (greatly enlarged).

spine is used for pointing arrows, and in tropical America the shell sometimes serves as a ladle. See E. Ray Lankester, 'Limulus an Arachnid,' *Quart. Jour. Micr. Sci.*, vol. xxi. 1881; also vols. xxiii. xxiv.

Kingfisher (*Alcedo ispida*), a well-known British and European bird, in the order of pies or Picarie, famous for its brilliant plumage and fish-bone nest. Though it measures only about 7 inches in length from the tip of the beak to the end of the tail, it is rendered conspicuous by the flashing feathers, which are predominantly blue and green. To watch the kingfisher is difficult, for it is shy and wary, and the powerful wings are used in singularly rapid flight. The fish-catching bill is large and strong; the legs are short and weak, but the toes are strengthened by being joined for the greater part of their length. The bird frequents the banks of rivers and lakes throughout Europe; and in Britain is most at home in the south of England. The cry is faint but shrill, like *tee* often repeated. The kingfisher feeds chiefly on small fishes, which are caught by a dexterous dive, carried to the perch, killed by a few blows on a branch, and swallowed whole. The bones are afterwards disgorged, and used in part to form the nest. This is hidden at the end of a hole bored in the bank, and is often anything but clean. The birds generally live in pairs away from their fellows, whose intrusion on the appropriated preserves is jealously resented.

Kingfisher (*Alcedo ispida*).

The seven or eight eggs, which are laid in April, are almost spherical in form and very white, as is often the case in hidden nests. Within the family Alcedinidae, of which the common kingfisher is type, there are numerous genera with representatives in

most parts of the world. The pied kingfisher of India and Africa (*Ceryle rudis*) and the belted kingfisher of North America (*Ceryle alcyon*) are common forms. A sub-family (Daceloninae) includes numerous more omnivorous kingfishers with stouter, flatter bills. Of these the great laughing jackasses of Australia (Dacelo) are notable representatives.

The kingfisher is the old halcyon, 'whose dead body carefully hung by a single thread always turns its beak towards the wind,' a popular and still surviving notion to which Shakespeare makes more than one reference. With the halcyon the imagination of the ancients played lovingly, for to them the bird was Aleyone the daughter of Eolus and wife of the king of Trachis, the son of the morning star, 'who, mourning in her youth for her lost husband, was winged by divine power, and now flies over the sea, seeking him whom she could not find, sought throughout the earth.' 'The bird is not great,' as Socrates continues in Lucian's dialogue, 'The Halcyon,' 'but it has received great honour from the gods because of its lovingness; for while it is making its nest, all the world has the happy days which it calls halcyonidae, excelling all others in their calmness.' So Aristotle, quoting Simonides, says that the halcyon has its young about the turn of the year in winter, 'when Zeus gives the wisdom of calm to fourteen days. Then the people of the land call it the hour of wind-hiding, the sacred nurse of the spotted halcyon.' See R. Bowdler Sharpe's *Monograph of the Alcedinidae or Kingfishers*; Ruskin's *Engle's Nest*; and HALCYON DAYS.

King George's Sound, an inlet 5 miles north and south, and 5 miles broad, at the south-west angle of West Australia, which is an excellent roadstead, and contains two landlocked recesses, Princess Royal and Oyster Harbours. Albany (q.v.), on Princess Royal Harbour, is a port of call for mail-steamers. The fortification of the sound has been recommended by some English military authorities, and an imperial naval depôt has been proposed.

Kinghorn, a royal burgh of Fife, on the Firth of Forth, 3 miles S. of Kirkecaldy by rail. It has shipbuilding-yards, a bleachfield, manufactures of flax and glue, and golf links. Alexander III. was killed (1286) at Kinghorn Ness, and a monument was erected on the spot in 1887. Pop. 2035.

Kinglake, ALEXANDER WILLIAM, historian, was born at Wilton House, near Taunton, in 1809, and was educated at Eton and Trinity College, Cambridge. He was called to the bar at Lincoln's Inn in 1837, and speedily acquired a lucrative practice; but he retired from the profession in 1856, in order to devote himself to literature and politics. He had already published, in 1841, *Eastern*, a work of eastern travel, written in a graphic and poetic vein, yet with great truthfulness to nature, which has always remained one of the most popular books of English travel. He was returned for Bridgwater in the Liberal interest in 1857, took a prominent part against Lord Palmerston's Conspiracy Bill in 1859, and in 1860 warmly denounced the annexation of Savoy and Nice by France. In 1854 he went out with Lord Raglan to the Crimea, where he had every facility for watching the progress of the war. After his return he undertook the defence of the British commander in his *History of the War in the Crimea* (8 vols. 1863-87). As the history was very largely based upon Lord Raglan's papers, it has been regarded by some as a prejudiced narrative of the war; but from the literary point of view opinion is practically unanimous that it is one of the finest historical works of the 19th

century. The criticism of Napoleon III. and the second empire was so searching that the work gave great offence at the Tuileries, and its circulation was prohibited in France during the Empire. Replies have been made to strictures upon other actors in the war, and occasionally with success. But the history remains on the whole a wonderfully accurate, brilliant, and minute record of the great struggle with Russia. In 1868 Kinglake was again returned for Bridgwater, but was unseated on petition. He died 2d January 1891. See *Life* by Innes Shand prefixed to the new edition of *Eastern* (1896).

Kinglet. See GOLDEN-CRESTED WREN.

Kings, THE FIRST AND SECOND BOOKS OF, in the English Authorised Version titled *The First Book of Kings*, commonly called the *Third Book of Kings*, and *The Second Book of Kings*, commonly called the *Fourth Book of Kings*. In the ancient Rabbinical enumeration, implied in Josephus and followed in the Peshito and by Jerome, the Book of Kings (*Melachim*) was reckoned one, ranking fourth and last in the series of the 'earlier prophets' (after Joshua, Judges, and Samuel); the division into two first appears in the Septuagint translation, where they are called the third and fourth 'of the Kingdoms' (*Basilicium*, Heb. *Melachoth*), the books of Samuel forming the first and second. This division was copied by the Vulgate, whence it passed into the 'common' usage of Christendom. The separation between Samuel and Kings is itself not original; for the first two chapters of Kings, concluding the life of David, are consecutive with 2 Sam. ix.-xx. and by the same hand. The books of Kings as we now have them are evidently a compilation, and careful examination shows that they have passed through more than one redaction. In their composition at least four elements can be distinguished: (1) In 1 Kings, xi. 41, reference is made to 'the book of the acts (chronicles) of Solomon, and for the reigns of subsequent kings there is very frequent mention of 'the book of the chronicles of the kings of Judah,' and of a corresponding book of the Kings of Israel. The exact nature of these chronicles cannot now be determined; but the probability is that they were themselves compilations, chiefly digests of a statistical and annalistic character, further epitomised by the writer of the canonical book. (2) The official records of the temple at Jerusalem, though nowhere expressly named, must have been directly or indirectly the source of much of the information given about the worship there, especially under the reigns of Solomon, Joash, Ahaz, and Josiah. (3) The book owes most of its vividness and picturesqueness to materials derived from a series of unofficial narratives, having their origin chiefly in the northern kingdom, and in which the acts of the prophets had special prominence. To this category belong in particular the history of Elijah (1 Kings, xvii. xix., xxi.), and the much more complicated series of passages relating to Elisha, for the northern kingdom; and the story of the man of God from Judah (1 Kings, xiii.), for the southern. (4) The main redactor has contributed the chronological scheme of synchronisms in which the histories of the two kingdoms are brought together under one view, and has given a pragmatical tone to the narrative by undertaking, in the case of each king, an estimate of his religious character and work. This is done in the spirit of the Deuteronomic legislation, and it may be inferred with certainty therefore that the main redaction did not take place till after the reformation of Josiah. The phraseology of such passages as 2 Kings, viii. 22; xiv. 7; xvi. 6 ('unto this day'), implies an earlier date than the fall of the kingdom of Judah; but

evidence of a later pen is found in 2 Kings, xvii. 19, 20; xxiii. 26, 27, while 2 Kings, xxv. 27 *seqq.*, brings us down to a far advanced period of the exile. Important variations (especially in the series of rather disconnected notes which form a large part of the history of Solomon) between the existing Hebrew text and that which must have lain before the LXX. translators show that the book was still in a somewhat fluid state at a very much later date.

For discussion of the critical problems, see Wellhausen in the fourth edition of Bleek's *Einleitung* (1878), reprinted in his *Compendium des Hebräisches*, &c. (1889). Of expositions, those of Thénius (2d ed. Leip. 1873), Keil (2d ed. 1876; Eng. trans. 1872), Bähr (in Lange's *Bibeldwerk*, 1866; Eng. trans. 1877), Rawlinson (in *Speaker's Commentary*), and Reuss (*La Bible*) may be mentioned.

King's Bench. See COMMON LAW.

King's College. London, an institution adjoining Somerset House, Strand, founded by royal charter in 1828, and confirmed by act of parliament in 1882, and on the fundamental principle 'that instruction in the Christian religion ought to form an indispensable part of every system of general education for the youth of a Christian community.' The college being strictly in connection with the Church of England, divinity lectures are a regular part of its routine. The usual university education for young men is provided in theology, literature (ancient and modern), science, engineering and applied science, and medicine. It has also a school of fine art, and a department for the preparation of candidates for the civil service. The instruction is adapted for students above the age of sixteen, but there is a school (1830) for boys in connection with the college, with workshops for mechanical training. There is a branch at Kensington for the higher education of ladies; also evening classes for students occupied during the day. The museum has a collection of models and instruments. For a sketch of the rise and progress of the college, see *The Celebration of the College Jubilee* (1881).

King's or Queen's Counsel are certain barristers at law, in England and Ireland, who have been appointed by letters-patent. The office is entirely honorary, but it gives a right of precedence in all the courts, according to the date of appointment. The appointment practically belongs to the Lord Chancellor. In spite of their title, they are not prevented from being retained and acting for ordinary clients, except that in defending prisoners and acting in suits against the crown they require a special license from the crown, which is, however, never refused. In Scotland there is no such distinction, but the offices of Lord Advocate and Solicitor-general are practically equivalent. The appointment is for life, but in case of disgraceful conduct the letters-patent are revoked, as was done in 1862 to Edwin James, who, in 1873, applied in vain for restitution.

The Queen's Counsels' robes are of silk instead of the ordinary (alpaca) 'stuff' of which the junior's gown is made; and 'taking silk' is thus the common phrase signifying that an 'outer' barrister has become a Queen's Counsel or Q.C. 'Taking silk' is frequently injurious rather than advantageous to a professional career. A Queen's Counsel is prohibited by legal etiquette from taking a good deal of minor business which fell to his share as a junior, and 'silk,' a stepping-stone to the great men, is a stumbling block to the small. When a junior has reached the position in which he feels justified, or is forced by the public opinion of his circuit, to 'apply for silk,' his demand is very rarely refused, or at most postponed, and the honour is little more than a necessary incident in

every successful legal career. Henry Brougham, indeed, was debarred for some years from what was in his case a professional right by the personal antipathy of George IV. and Lord Eldon, and it was not until 1827, on the accession to power of George Canning, that Brougham received a patent of precedence which clothed him in silk and gave him all the professional advantages without the actual title. But this is a striking and almost a solitary exception. Of late years colonial barristers have been gratified with the title of Queen's Counsel conferred by the Lord Chancellor, on representation made by the governor of the colony through the Secretary of State.

King's County, an inland county of Ireland, in Leinster, is bounded on the W. by the Shannon, which separates it from Roscommon and Galway. It is 20 miles long from north to south by 58 wide. Area, 493,985 statute acres, or 772 sq. m. Of this 122,154 acres were under crops in 1889; and of this again nearly one-half was grass, whilst 24½ per cent. was corn and green crops (oats, barley, potatoes, and turnips). Twenty-three per cent. of the total area was covered with bogs, including a large part of the Bog of Allen. The population has steadily decreased—(1841) 146,857; (1861) 90,013; (1881) 72,852; (1891) 65,563, of whom 58,264 were Roman Catholics. The surface is flat, except for the Slieve Bloom Mountains (1733 feet) on the south boundary. The soil, a light loam of medium depth, resting on limestone gravel, is of average fertility. The Grand Canal traverses the northern portion of the county, and joins the Shannon. The river Barrow separates it from Queen's County on the south-east. King's County, constituted a shire in 1557, and named in honour of King Philip, returns two members. In the north-west is Clonmacnois Abbey, founded in 548, one of the most interesting ecclesiastical ruins in Ireland. At Birr Castle Lord Rosse erected his great telescope. The chief towns are Tullamore (5098), Parsonstown or Birr (4955), and Portlaurington (2357).

King's or Queen's Evidence. See AP-PROVER.

King's Evil. See SCROFULA.

Kingsley, CHARLES, born at Holne vicarage, Dartmoor, Devon, 12th June 1819. After education partly at King's College, London, he went up to Magdalen College, Cambridge, and took his degree in 1842—first-class in classics, senior optime in mathematics—and was immediately ordained to the curacy of Eversley in Hampshire, of which parish he became rector in 1844. There he lived for the remainder of his life, having married a daughter of Mr Pascoe Grenfell in the year in which he was presented to his living.

His dramatic poem, *The Saint's Tragedy, or The True Story of Elizabeth of Hungary*, an 'admirable representation of mediæval piety,' appeared in 1848, and was immediately followed by two works of a very different character, *Alton Locke* and *Yeast*, both published in 1849. These brilliant novels are the work of a Radical, a 'Christian Socialist,' and deal with modern social questions in a bold and a strikingly original manner. The hero of *Alton Locke*, 'tailor and poet,' is found in a London workshop. In *Yeast* the condition of the English agricultural labourer is dealt with by one whose sympathy with the people is aristocratic, not democratic, whose radicalism is Christian, and not sceptical, whose enthusiasm never degenerates into unreason, and whose most brilliant invective is always balanced by common sense. The influence of these books at the time was enormous; and if Kingsley wrote nothing more of the same character, it was not so much that time had modified his views as that his

views had modified the times. For two or three years previous to the publication of these novels Kingsley had thrown himself with all the ardour of youth and of his own impetuous nature into various schemes for the improvement of the condition, material, moral, and religious, of the working-classes, a subject of which we all hear a good deal at the present day, but which was somewhat strange in 1844. In this work he was associated with Mr Maurice, the recognised leader of the movement known as 'Christian Socialism'; and he published under the well-known pseudonym of 'Parson Lot' an immense number of articles on current topics, especially in the *Christian Socialist and Politics for the People*. In 1853 appeared *Hypatia*, one of his most fascinating works, a vigorous and brilliant picture of early Christianity in conflict with Greek philosophy at Alexandria in the beginning of the 5th century. *Westward Ho!* followed in 1855, and the presentation of Elizabethan England and the Spanish Main, of Devonshire worthies and their Spanish foemen, is as lifelike as anything to be found in the whole range of romantic literature. The tone of the book is hearty, English, Protestant, free, and, like the author himself, at once strong and tender. In *Two Years Ago* (1857) he sketched with a master hand the North Devon scenery so dear to the west countryman; and *Hereward the Wake* (1866), a novel of the days of the Conqueror, brought the noble series of works of fiction to a close. In 1860 the university of Cambridge had chosen the author of *Hypatia* and *Westward Ho!* to be professor of History, and his inaugural lecture was published at the end of that year under the title of *The Limits of Exact Science as applied to History*. *The Roman and the Teuton* (1864) is also based upon his Cambridge lectures.

In 1869 Kingsley resigned his professorship and was appointed a canon of Chester; and in 1871 he made the voyage that he had so long contemplated, to the tropics, of whose scenery he had already written so enthusiastically; and on his return to Eversley from the West Indies he gave to the world one of its most charming books of travel, *At Last*. In 1873 Kingsley was appointed a canon of Westminster and chaplain to the Queen. He died at Eversley on 25d January 1875. His *Life*, by his widow, in 2 vols., published in 1876, is a biography of deep and sustained interest. Kingsley was by nature hot tempered, enthusiastic, and combative, yet infinitely sympathetic and tender of heart; his 'muscular Christianity' (a phrase he disliked) was cheerful and robust; he had great and varied information, a keen wit, and a mind's eye that ever looked below the surface. His collected works fill 28 volumes (1879-81). Among these, besides those already named, and many volumes of sermons, are *Gleanings* (1854), *The Heroes* (1856), *The Water Babies* (1863), *Town Geography* (1872), *Prize Idylls* (1873), *Health and Education* (1874). Of a sixpenny edition of the chief books (1889-90) millions were sold.

Kingsley, HENRY, brother of the foregoing (born 1830, died 1876), was educated at King's College, London, and Worcester College, Oxford. From 1853 to 1858 he resided in Australia, and on his return commenced his career as a writer of fiction with a vigorous picture of colonial life in *Geoffrey Hamlyn* (1859). To this succeeded *Ravenshoe* (1861), his masterpiece; *Austen Elliot* (1863); *The Milliners and the Barbons*, another novel of Australian life and manners (1865), &c. His ideal of life is a noble and a healthy one; his works, which show little skill in the construction of the plots, contain much that is pathetic, without any tinge of sentimentalism. His style is rather vigorous than highly cultivated. For two years

(1870-71) Kingsley edited the *Edinburgh Daily Courier*.

King's Lynn. See LYNN.

Kingsmill Islands, another name for the Gilbert Islands (q.v.).

King's Mountain. See FERGUSON (PATRICK).

Kingston, chief town of Frontenac county, Ontario, is situated at the head of Lake Ontario and at the mouth of the Cataracti Creek, 161 miles by rail ENE. of Toronto. It has a number of handsome public buildings, and is the seat of the Royal Military College of Canada (1876), of Queen's University (1841), with museums and an observatory, and of the Royal College of Physicians and Surgeons (1854) and the Women's Medical College (1883) affiliated to it. Here also are a business college and a collegiate and training institute for teachers. The city has, besides excellent railway facilities, good water-communication by the lake, the St Lawrence, and the Rideau Canal, which last connects it with Ottawa. It possesses a large, sheltered harbour, with an active trade, and strongly fortified; and, besides busy shipyards, has many factories of locomotives and stationary engines, machinery, leather, boots and shoes, agricultural implements, wooden wares, &c. Grant Allen and George Romanes are both Kingston men. Kingston is the seat of an Anglican bishop and of a Roman Catholic archbishop. Its site was occupied by the old French fort of Frontenac. The town was the capital of Canada from 1841 to 1844. Pop. (1881) 14,091; (1891) 19,264.

Kingston, the commercial and political capital of Jamaica (q.v.), stands on the north side of a landlocked harbour, the best in the island, and, for its size, one of the best in the world. Pop. (1891) 46,542. It was founded in 1693-1703, after the neighbouring town of Port Royal had been destroyed by an earthquake. From this place, afterwards rebuilt, Kingston is distant 6 miles, the breadth of its noble haven; while with Spanish Town, towards the interior, it has since 1846 been connected by railway. In 1758 Spanish Town was made the capital of Jamaica, but in 1872 the seat of government was removed to Kingston. Kingston was visited in 1880 by a violent hurricane, and in December 1882 well-nigh consumed by fire. The city, having a slope to the sea of 1 in 60, is well drained, but the harbour is filthy. With a gravel soil and a dry and temperate climate, maximum 93 in hot season, minimum 56 in cold it is a healthy place. The most interesting public building is the Old Church, where Benbow the 'old sea dog' is buried. There are tram cars, and the water-supply is good. The imports have an annual value of from £1,300,000 to £1,500,000, the exports from £500,000 to £700,000. See the annual *Handbook of Jamaica and Jamaica in 1896*, published by the Institute of Jamaica.

Kingston, capital of Ulster county, New York state, stands on the right bank of the Hudson, 54 miles S. of Albany. It is a railway and canal terminus, and is the centre of extensive transit trade by steamer. Enormous quantities of blue-stone flags are forwarded from Kingston, which is also a principal centre of the hydraulic-cement business, and contains a number of breweries, tanneries, flour mills, foundries, brick yards, and other manufacturing concerns. Pop. (1880) 18,344; (1890) 21,261.

Kingston-on-Hull. See HULL.

Kingston-upon-Thames, a municipal borough and market town of Surrey, 12 miles SW of London, lies on the right bank of the Thames, here crossed by two bridges, one of stone completed 1828 and freed 1870, and the other an

iron railway viaduct. Of late years, with its suburbs of Norbiton, Surliton, and New Malden, it has rapidly increased in size, its easy access to London, coupled with its facilities for boating and the pleasant surroundings of the neighbourhood, notably Hampton Court, Bushy and Richmond Parks, having attracted large numbers of residents. Population of the parish, (1801) 4438; (1831) 7257; (1881) 35,829; (1891) 41,886, of whom 27,059 were within the municipal limits. The parish church, of which William Coxé the historian was once rector, has some fine monuments; the county council buildings, costing £36,000, were undertaken in 1890. In history, however, Kingston has figured somewhat conspicuously: in 838 it was the scene of a great council, convened by Egbert, king of Wessex, and his son Ethelwulf; seven of the Anglo-Saxon kings were crowned here, as recorded on the coronation-stone still standing near the market-place; King John, who granted the town its first charter, was a frequent visitor in 1204-15; in 1264, during the civil war with Simon de Montfort, Kingston Castle (of which no traces now remain) was captured by Henry III.; Fairfax made the town his headquarters in 1647; and a year later took place in the neighbourhood the last fight between the royalists and Roundheads, when Lord Holland and the Duke of Buckingham were defeated. At Ham Common lived Gay's 'Kitty,' Duchess of Queensberry. See Biden's *History of Kingston-upon-Thames* (1832).

Kingston, WILLIAM HENRY GILES, a popular writer of boys' stories, was born in London, 28th February 1814. His father was a merchant in Oporto, and there much of his youth was spent. At first a merchant, he had already published two stories and a book of Portuguese travel, when in 1851 he found the work of his life in the immediate success of *Peter the Whaler*, his first book for boys. During the next thirty years he published more than 120 similar books, all simple, vigorous, and healthy in tone; full of daring adventures, hairbreadth escapes, and all the magic of the sea which he not only loved but knew. His heart never lost its wholesome glow of admiration for any form of human heroism, and the simple and sincere veracity of his style easily generated a corresponding sympathetic enthusiasm in his young readers. And he possessed in no small share the pictorial imagination which enabled him to borrow colour from travellers' accounts of countries he had never seen. Among his most popular books were *The Three Midshipmen*, *The Three Lieutenants*, *The Three Commanders*, and *The Three Admirals*. Kingston took an active interest in many philanthropic schemes, as the mission to seamen, and assisted emigration. He was knighted by the queen of Portugal for his services in helping to bring about a commercial treaty between England and Portugal. He died at Willissen, 5th August 1880.

Kingstown, a populous and important suburb of Dublin, 7 miles SSE. from the G.P.O. Trains run in 15 minutes to Dublin. Previous to 1817, when the harbour works were commenced, it was merely a fishing village known as Dunleavy. On the occasion of the visit of George IV. in September 1821 its name was changed to Kingstown. The situation of the town and the invigorating air have made Kingstown a favourite residence for the well-to-do classes having business in Dublin. The mail packets sail from Kingstown to Holyhead twice a day, morning and evening. There is little general trade, though the harbour, completed by the Admiralty in 1839 at a cost to the imperial treasury of £825,000, is one of the finest in the United Kingdom. The east pier is 3500 feet in

length; the west, 5000 feet, enclosing an area of over 250 acres, with a depth of from 13 to 27 feet. Vessels drawing as much as 24 feet can come alongside the quay at any state of the tide. Kingstown is within the parliamentary division of South Dublin. Pop. (1890) 25,000.

Kingstown, capital of the British island of St Vincent, in the West Indies, stands at the south-west extremity of the island, on a large bay, at the foot of one of the spurs of Mount St Andrew (about 2000 feet). Pop. 5593.

King-te-chin, the principal seat of porcelain manufacture in China, in the province of Chiang-hsi, on a small river which falls into Lake Po-yang from the east. Pop. 500,000.

King Williamstown, capital of a division of the same name on the Buffalo River, in the SE. of Cape Colony, 80 miles ENE. of Grahamstown, and by rail (1877) 42 WNW. of East London, on the coast. It has considerable trade, military barracks and stores, and a college. Pop. about 8000.

Kinkajon (*Cercopithecus caudicolubus*), a quadruped of the group Ateoidea, and allied to the raccoons and coatis. It has six incisors, one canine tooth, and five molars in each jaw, the three hinder molars tuberculous. The kinkajon is larger than a polecat, has a yellowish woolly fur, climbs trees, feeds on fruits, honey, &c., as well as on small animals. It is a native of the warm parts of America, from central Mexico to the Rio Negro of Brazil. It used to be classified with the lemons, to which it bears not a little resemblance, particularly in its habit of sitting on its hindquarters and feeding itself with its hands. Sir R. Owen was one of the first to show that here appearances are deceptive, and that the animal is a true carnivore.

Kinkel, JOHANN GOTTFRIED, a German poet and writer, was born at Oberkassel, near Bonn, 11th August 1815. He studied theology at Bonn and Berlin, and then lectured on theology, afterwards on poetry and the history of art, at the university of Bonn. But, becoming involved in the revolutionary movement of 1848, he was imprisoned in the fortress of Spandau, whence, however, he escaped with the help of his wife and Karl Schurz. Settling in London, he earned his living by teaching German until 1866, when he was appointed professor of Archaeology and Art at Zurich. There he died, 13th November 1882. As a poet Kinkel's fame rests upon the epics *Otto der Schatz* (1846; 56th ed. 1881), a graceful poem of the chivalry of the Rhine; *Der Grobshäutler von Antwerpen* (1872; 4th ed. 1887); *Margret, eine Dorfjüngferliche* (1872); *Tanngrä* (1883; 3d ed. 1886); two volumes of *Gedichte* (1843-68); and a drama, *Nimrod* (1857). He also wrote a history of art (1845); a series of essays on art subjects (1876); and monographs on Rubens (1874), Feiligrath (1867), &c. See Lives by Strodtmann (1859), Am Rhyu (1883), Lübke (1893).—His first wife, JOHANNA (1810-58), a distinguished musician, wrote with her husband, *Erzählungen* (1849). After her death appeared her novel, *Hans Inles in London* (1860).

Kinnaird Head. See FRASERBURGH.

Kino, an astringent substance resembling Catechu (q.v.), the concrete exudation of certain tropical trees, especially of *Pterocarpus marsupium*, a native of the forests of Madras and Ceylon. East Indian kino is the kind which now chiefly occurs in commerce, and is the ordinary kino or *gam kino* of the shops. It is in small angular glistening fragments, the smaller reddish, the larger almost black. Thin pieces are ruby red. It is brittle and easily powdered, has no smell, but has a very astringent taste. Bengal kino is a similar astringent substance, produced by *Bateca frondosa* (see BATEA).

Botany Bay kino is the produce of *Eucalyptus resinifera*. The astringency of kino is due to tannin and pyrocatechin. It is employed in certain forms of diarrhoea as *compound kino powder* (with opium and cinnamon). The *infusion of kino* forms a good gargle for the uvula. Kino serves in India as a yellowish-brown cotton dye.

Kinross-shire, the smallest Scotch county after Clackmannanshire, lies between Perthshire and Fife, and, measuring $9\frac{1}{2}$ by $12\frac{1}{4}$ miles, has an area of 78 sq. m., or 49,812 acres, of which 3327 are water. Most of the drainage belongs to Loch Leven (q.v.), from which the surface rises to encircling hills 734 to 1573 feet high. A separate county since 1252 and earlier, Kinross-shire unites with Clackmannanshire to return one member to parliament. Pop. (1801) 6725; (1851) 8924; (1881) 6697; (1891) after adjustment of areas with Perth and Fife, 6637, of whom 1920 were in the county town, Kinross, 27 miles NNW. of Edinburgh, and near the west end of Loch Leven. See JEANES Mackay's *Fife and Kinross-shire* (1890).

Kinsale, a municipal borough and seaport of County Cork, at the head of Kinsale Harbour, which is formed by the estuary of the river Brandon, 24 miles SSW. of Cork by a railway (1863). Down to the Union Kinsale returned two members; thenceforward one until 1885. The harbour, landlocked, is about 2 miles long, and is capable of containing 300 ships. Its once flourishing trade has passed to its rivals Cork and Queenstown. On the Old Head of Kinsale, a promontory stretching southward into the Atlantic, stands a lighthouse whose light, 236 feet above high water, is visible for 21 miles. Pop. (1851) 5596; (1891) 4605. In 1601, 3000 Spaniards landed at Kinsale in order to fight for the O'Neill confederacy. Here James II. landed on 12th March 1689, and here he re-embarked in July 1690. In the following October the fort was captured by Marlborough.

Kintyre, or CANTIRE (Gael. *ceann tìr*, 'head-land'), a long, narrow peninsula of Argyllshire, between the Atlantic and the Firth of Clyde, extending 42 miles south by westward, and $4\frac{1}{2}$ to $11\frac{1}{2}$ miles broad. At the north end it connects with the mainland by the isthmus of Tarbert, $1\frac{1}{2}$ mile broad, between East Loch Tarbert, a bay of Loch Fyne, and West Loch Tarbert. The surface is diversified by a ridge of low, moorish hills, with many lochs, the highest point being Ben an Tuire (191 feet). Coal is found at Drumblende, 4 miles to the west of Campbelltown (q.v.). Machilish Bay, on the west coast, just beyond, possesses noted golling links. A fair proportion of the soil is in cultivation. A lighthouse (1787), 297 feet above sea level, stands on the Mull of Kintyre (the *Epithema Praemontorium* of Ptolemy), which is overhung by Ben an Lice (1405 feet), and is only 13 miles distant from Ireland. The ancient seat of the kingdom of Dalriada (q.v.), Kintyre ranked till the 17th century as part of the Hebrides, being held successively by Norsemen, by the Macdonalds of the Isles, and by Campbells. Its antiquities include the ruins of the Cistercian abbey of Saddell, of the castles of Dunaverty, Dundonald, Saddell, and Skipness, and of many forts and pre-Reformation chapels. See T. P. White's *Archaeological Sketches in Kintyre* (1873).

Kioto. See KYOTO.

Kipchaks, a Turkic people, who in the 11th century were settled in the steppes of south-east Russia, between the Ural and the Don, north of the river Kuma. After the death of Genghis Khan, one of his four sons, Batu, conquered (1238-43) nearly all the central and southern districts of Russia, and founded the great empire of the Golden Horde on the Kipchaks, fixing his magnificent camp (Turkic, *ardu*,

'camp,' hence the word *Hard*) on the Volga. They gradually acquired the rudiments of civilisation as they came into contact with the cultured peoples of the west and south. The Golden Horde and the eastern branch, the White Horde or eastern Kipchak, were united about 1378; but this joint empire was broken up by Tamerlane in 1390-95. Out of the fragments were formed the small khanates of Astrakhan, Kazan, the Crimea, &c., all of which were eventually absorbed by Russia. The modern descendants of the western Kipchaks are the Tartars of Kazan, Astrakhan, the Crimea, &c. (see TARTARS). The descendants of the eastern Kipchaks are the Kirghiz (q.v.), of whose three hordes the middle one is still called Kipchaks. See Howorth, *History of the Mongols* (1880).

Kipling, RUDYARD, story-teller, was born at Bombay, 30th December 1865, the son of John Lockwood Kipling, C.I.E., principal of the School of Art at Lahore in the Punjab, himself the author of *Boast and Man in India* (1891). Rindyard was educated at Westward Ho and elsewhere in England, but returned in 1880 to India, where he began to contribute verses, tales, and articles to Indian journals, making his literary debut at Lahore in 1884 (in *Echoes*). But it was by his *Departmental Dittos* (1st ed., Calcutta, 1886), *Plain Tales from the Hills* (Calcutta, 1888), and *Soldiers Three* (Allahabad, 1889), that he became well known in England, and sprang at once into the front rank of popular favourites. *The Story of the Gadsbys, In Black and White, Under the Doobars, Woe Willie Winkie*, and *The Phantom Rickshaw*, followed close on the heels of *Soldiers Three*, and like it formed part of an *Indian Railway Library* published at Allahabad. *The City of Dreadful Night* illustrates certain aspects of Calcutta. More ambitious, though hardly so successful, was the longer tale, *The Light that Failed* (1891). *The Barrack-Room Ballads* (1892), in verse more remarkable for vigour of diction and swing of rhythm than for the refinements of poetic form, were amongst his most brilliant successes; and *Naulakha* (1892), a longer tale, was produced in conjunction with Mr Balestier. *Life's Handicap* (1891) and *Maun Inventions* (1893) are other collections of short tales and sketches, not exclusively Indian in subject; and the magazines compete for contributions from his pen. In 1892-96 he lived mainly in the United States.

From the first his sketches of the glories and disgraces and views of Tommy Atkins abroad, and of the more mysterious and unfamiliar life of the natives, were felt equally to 'palpitate with actuality.' He seems from an intimate and first-hand knowledge of the minds and hearts alike of natives and soldiers to render their own ideas in their very words; and he deals directly and simply with the elemental passions of human nature, with love and hate, with shame and fear, with joy and misery. The interlocutors, both high and low, are frequently far from refined, reverent, or sinless; and it has been objected to his tales of Anglo-Indian life that the tone is both flippant and cynical, and that too many of both his men and women seem to be 'playing at tennis with the seventh commandment,' as he himself words it. But unquestionably he commands true realistic power, and in his smallest masterpieces, pathos and humour, the ghastly and the comic, are combined with the *crispezza* of an everyday experience. His inimitable *Jungle Book* (1894) was followed by a *Second Jungle Book* (1895). There were more *Soldier Stories* in 1896, and the poem called *Sera Sera Seas*. *Captain Corcoran's* (1897) was a tale of fishing life on the banks of Newfoundland. *The Day's Work* (1898) was a collection of stories.

Kippis, ANDREW, D.D., F.R.S. (1725-95), born

at Nottingham, studied at Northampton under Dr Doddridge, and from 1753 was minister of a dissenting congregation in Westminster. He wrote much for the magazines, helped to found the *Annual Register*, edited Lardner's works (11 vols.), wrote *Lives* of the four Earls of Shaftesbury and Dr Doddridge, and edited the new edition of the *Biographia Britannica* (5 vols. folio, unfinished, 1778-93).

Kirby, WILLIAM, entomologist, was born at Winesham Hall, Suffolk, 19th September 1759. He was educated at Ipswich grammar-school and Caius College, Cambridge, graduated B.A. in 1781, took orders in the following year, and was first curate, after 1796 rector, of the quiet Suffolk parish of Barham, where he died, July 4, 1850. His principal works are *Monographia Apum Angliæ* (Ipswich, 1802), and *Introduction to Entomology* (4 vols. 1815-26), the latter written conjointly with Mr Spence. The first was very favourably received both at home and abroad, and at once secured for Kirby a distinguished place among European savants. The second work is written in the form of letters (fifty-one in number), giving a familiar account of the habits, instincts, and uses of insects, and remains a classical masterpiece of *vulgarisation* in the best sense of the word. To the seventh edition Spence contributed an appendix giving the history of the book. Kirby also contributed a variety of very important entomological papers to the *Linnæan Transactions*. His greatest discovery in this department of science is that of the genus *Stylops*—the type of a new order of insects, living in the larva state parasitically in the bodies of bees. He also wrote one of the *Bridgewater Treatises*, entitled *Habits and Instincts of Animals* (1835). Kirby was one of the first members of the Linnæan Society (founded in 1788), honorary president of the Entomological Society, and Fellow of the Royal and Geological Societies. See the *Life* by the Rev. John Freeman (1852).

Kircher, ATHANASIUS (1601-80), German Jesuit, philologist, physicist, and inventor of the magic lantern. See HIEROGLYPHICS; and *Life* by Brischlar (Würzh, 1877).

Kirchhoff, GUSTAV ROBERT, physicist (1824-87), became professor in Berlin University in 1874. He distinguished himself in the departments of elasticity, the mechanical theory of heat, optics, and especially of spectrum-analysis. See SPECTRUM; and *Life* by Boltzmann (Leip. 1888).

Kirghiz, or KIRGHIZ-KAZAKS, a people spread over the immense territory bounded by the Volga, the Irtysh, Chinese Turkestan, Ala-tau Mountains, the Syr-Daria, and Aral and Caspian Seas. A few tribes of Kalmucks also live within these boundaries. Over this vast tract reigns a dismal monotony; the country has scarcely any important elevation or depression, excepting the Mogudjar Mountain in the north-west; no river of consequence runs through it, no great forest breaks the uniformity of the scene; it is a vast steppe, containing 850,000 square miles, sterile, stony, and streamless, and covered with rank herbage of five feet high. It abounds in lakes and marshes, the water of which is generally brackish and unfit for use, and in the southern portion lies the Kara-Kum, an extensive salt desert. The Kirghiz are a Turkish race, and speak a separate dialect of the eastern Turkish. They have from time immemorial been divided into the *Great*, *Middle*, and *Little Hordes*. The first of these wanders in the south-west portion of the Russian steppe, partly in the Russian possessions north of the Ala-tau and Khokand, and partly in the territory of China. They are subject to the rulers within

whose bounds they dwell. The Middle Horde possesses the territory (called the country of the Siberian Kirghizes) between the Irtysh, Lake Balkhash, Khokand, and the territory of the Little Horde; and also a great portion of the Russian province of Semipalatinsk. Russia has gradually absorbed them, the result being finally achieved by the victory over Khiva in 1873, and the formation of the new province of Amu-Daria. The Little Horde (now more numerous than the other two together) ranges over the country bounded by the Ural, Tobol, the Siberian Kirghiz, and Turkestan. Like the Middle Horde, they are claimed as subjects of the czar, though partly independent. This horde is partly agricultural, partly nomad. A small offshoot of the Little Horde has, since 1801, wandered between the Volga and the Ural River, and used to be under the rule of the governor of Astrakhan.

The total number of the Kirghiz-Kazaks amounts to 2,500,000—a smaller number than in former times when unchecked and uncontrolled they moved from one end of central Asia to the other. The Kirghiz are noted for their unbounded love of adventure, wit, and poetical disposition. As nomads they have retained most of the characteristics of their race, they still cling to their ancient habits and customs, and Islam has never taken a firm hold on them. Since the suppression of *baranta* ('forays') they have lost their warlike spirit, although they still abhor sedentary life and cannot be persuaded to settle and live by agriculture. Russian schools in the steppes have hitherto vainly striven to transform these inveterate nomads.

KARA-KIRGHIZ, called by the Russians Dikokameni Kirghiz ('Wild rock Kirghiz'), a nomadic people living mostly in the mountains between the Issik-kul and the Kuen-Lun, and extending from the eastern frontier of Fergana to the Muzart, are the oldest Turkish nomads of historical record. They are divided into *Onq* and *Sol* (right and left wings), and into the subdivisions of Sult, Saribagish, and Sujak. Their total number amounts to 324,000 souls, and their cattle is estimated at upwards of 700,000 head. The dialect of the Kara-Kirghiz has retained more of the ancient character than that of the Kirghiz-Kazaks, and their epic poetry is particularly interesting. See M. N. Godekow's finely illustrated Russian work on the Kirghiz and Kara Kirghiz of the Province of the Syr-Daria (Tashkend, 1889 *et seq.*).

Kirin, capital of the province of Kirin, in Manchuria, stands on the river Sungari, 220 miles NE. of Monkden. It has an arsenal and powder-factory. Pop. 75,000 to 100,000.

Kirkcaldy, a seaport and market-town of Fife, on the Firth of Forth, 15 miles N. of Edinburgh. Including the suburbs of Linktown and Newtown of Abbotshall on the west, and Pathhead, Sinclairtown, and Gallatown on the north east, it is nearly 4 miles in length; hence the name 'The Lang Toun.' It was created a royal burgh in 1450, and, with Dysart, Kinghorn, and Burntisland, sends one member to parliament. Its harbour is small and shallow, but there is wet-dock accommodation for ships of considerable burden, and a bill was passed in 1890 for the construction of an entirely new harbour on a large scale. Its manufactures are spinning flax, tow, and jute, and bleaching and weaving linen yarns, which are extensively carried on, the products being the usual varieties of linen cloth; mechanical (including marine) engineering on a large scale; iron-founding; and tanning. There are also several pottery-eries. The manufacture of floorecloth and linoleum has been developed into a great trade, and Kirkcaldy is the chief sent of

this growing and important manufacture. There is also a direct export trade to the United States, which in 1884-90 averaged over £75,000 annually. Pop. of parliamentary burgh (1841) 5704; (1871) 12,422; (1891) 17,324; of royal burgh, as extended in 1876, (1891) 27,155. Kirkecaldy is the birthplace of Adam Smith; and Edward Irving and Thomas Carlyle were teachers here.

Kirkcudbright, STEWARTRY OF, a county of south-west Scotland, washed on the south for 50 miles by the Solway Firth, and elsewhere bounded by Wigton, Ayr, and Dumfries shires. Measuring 41 by 38 miles, it has an area of 954 sq. m.; is watered by the Nith, Urr, Dee, Fleet, and Cree; and in the south-east sends up conspicuous Criffell (1867 feet), on the north-west border Merriek (2764), the loftiest summit in the south of Scotland. The rocks are mainly Silurian, with intrusive granite and carboniferous patches; the soil is variously extremely fertile and extremely barren. Little more than a fourth of the entire area is in cultivation, though great improvements have been effected since the foundation in 1809 of the Stewartry Agricultural Society. Nearly 31 sq. m. are occupied by woods. Towns are Kirkcudbright, New Galloway, Castle Douglas, Dalbeattie, Gatehouse, Creetown, and Maxwelltown; and the antiquities include the Devil's Dyke, Threave Castle, and the ecclesiastical ruins of Dundreman, Lincluden, New Abbey, St Mary's Isle, and Tongue-land. The history of the Stewartry is sketched under GALLOWAY; among its worthies have been Samuel Rutherford, Paul Jones, Thomas Brown, and Alexander Murray. It returns one member to parliament. Pop. (1891) 29,211; (1851) 43,121; (1881) 42,127; (1891) 39,985.

KIRKCUDBRIGHT, the county town, 30 miles SW. of Dumfries by a branch-line (1864), is beautifully situated on the left bank of the Dee, which soon begins to broaden into Kirkcudbright Bay, opening into the Solway Firth six miles below. Its name (pron. *Kirkcudbray*) is derived from the church of St Cuthbert, as old at least as 1164; and it is a royal burgh (1455), uniting with Dumfries, &c. to return one member. Chief buildings are the court-house (1868) and town-hall (1879); and a lattice-bridge (1868), 500 feet long, spans the Dee. The ivy-mantled ruins of the castle built by Maclellan of Bombie in 1582 still dominate the town. Pop. (1841) 2696; (1891) 2533. See Maxwell's *Stewartry of Kirkcudbright* (3d ed. Castle Douglas, 1878), and other works cited at GALLOWAY.

Kirkdale Cave, in the vale of Pickering, Yorkshire, 28 miles W. of Scarborough, is famous for the numerous remains of Tertiary mammals which have been found in it. It was discovered in 1821, in the cutting back of an oolitic limestone rock in which it is situated. It was examined by Buckland, and fully described by him in his *Reliquiæ Diluvianæ*. Its greatest length is 245 feet, and its height is so inconsiderable that there are only two or three places where a man can stand erect. The fossil bones are contained in a deposit of mud that lies on the floor of the cave; this is covered by stalagmite formed by the water, highly charged with carbonate of lime, dropping from the roof. The remains of the following animals have been discovered: hyæna, tiger, bear, wolf, weasel, elephant, rhinoceros, hippopotamus, horse, ox, deer, hare, rabbit, water-rat, raven, pigeon, lark, and duck.

Kirke, COLONEL PERCY (c. 1646-91), served three years as an officer in Tangiers. After the battle at Sedgemoor (1685), his men inflicted fearful atrocities upon the unhappy followers of Monmouth and their suspected sympathisers, as to make their nickname, 'Kirke's Lambs,' a byword for cruelty.

Kirke early deserted to William's side, and helped to raise the siege of Londonderry.

Kirkham, a market-town of Lancashire, 8½ miles W. by N. of Preston. It has a grammar-school (1673), and manufactures of cotton, flax, sail cloth, sacking, and cordage. Pop. (1851) 2777; (1891) 4003.

Kirkintilloch, a town in Dumbartonshire (detached), on the Forth and Clyde Canal, 7 miles NNE. of Glasgow. Its Celtic name *Cairpentia borch* ('fort at the end of the ridge') referred to a strong fort on Antoninus' Wall, which has left some remains; and as early as 1170 it was made a burgh of barony. Chemicals, iron, &c. are manufactured. In the southern suburb, Lenzie, are the large Barony lunatic asylum (1875) and the Glasgow convalescent home (1864). Pop. (1851) 6342; (1881) 8029; (1891) 10,312.

Kirk-Kilissia (the 'forty churches'), a town of Turkey, 104 miles NW. of Constantinople, with which it has a brisk trade in butter and cheese. It is famed for its confections. Pop. 16,000, of whom two-thirds are Bulgarians.

Kirkmaiden. See JOHN O' GROUT'S.

Kirk-session, the lowest court in Presbyterian churches, being the governing body of a particular congregation, and composed of the minister and elders of the congregation. See PRESBYTERIANISM.

Kirkstall Abbey, a Cistercian abbey in Yorkshire, stands 3 miles NW. of Leeds, in the midst of modern manufacturing establishments. Next after Fountains Abbey, it is the best-preserved monastic ruin in the county. First founded at Barnoldswick in the same neighbourhood in 1147, but five years later moved to its present site, the abbey is mainly Transition Norman and Perpendicular in style. The church is, like most Cistercian churches, long and narrow, with little ornamentation, and a low tower. The abbey was presented to the town by Colonel North in 1889.

Kirkwall, the capital of Orkney, on the east coast of Mainland, 49 miles NE. of Thurso, and 225 N. of Leith. St Magnus' Cathedral (1137-1500) is a stately cruciform pile, mixed Norman and Gothic in style. It measures 253 feet by 102 across the transept, and has a central tower 133 feet high. The choir serves as a parish church. The last vestige of the royal castle was demolished in 1865; but the roofless Earl's Palace (1607) remains, and a tower (1550) of the Bishop's Palace, in which King Haaco died in 1263. In 1876-79, £10,500 was expended on drainage, paving, and water-supply; and the harbour, with an iron pier of 1866, has also been much improved. Made a royal burgh in 1486, Kirkwall unites with Wick, &c., to return one member to parliament. Pop. (1841) 3041; (1891) 3926. See Tudor's *Orkneys and Shetlands* (1883).

Kirriemuir, a small town of Forfarshire, 8½ miles NW. of Forfar by rail, with some linen weaving. It is the birthplace of J. M. Barrie, and the 'Thrunis' of his stories. Pop. (1891) 4179.

Kirschwasser (Ger., 'cherry water') is a liqueur made from cherries, and highly esteemed in Germany. The cherries, gathered when quite ripe, and freed from their stalks, are pounded in a wooden vessel, but so that the stones are not broken. They are then left to ferment, and when fermentation has begun the mass is stirred two or three times a day. The stones are afterwards broken, and the kernels bruised and thrown in. By distillation kirschwasser is obtained. For cherry-brandy, see BRANDY.

Kisfaludy, SANDOR (ALEXANDER), a Hungarian poet, was born at Sümeg, in the county of Zala, on 22d September 1772. He served in the Austrian army from 1793 to 1801, and again in

1809. The rest of his life was devoted to literature and farming. He established his fame by a collection of lyrics—his best work—entitled *Himfy's Loves* (1801-7), which created extraordinary enthusiasm; and his fame was further enhanced by *Legends of the Olden Time in Hungary* (1807; 2d ed. 1812). Kisfaludy also attempted the drama, but less successfully; his best dramas are *Johu Hangadi* and *Ladishans the Comedian*. He was one of the founders of the Hungarian Academy of Sciences, which has rendered inestimable service in the advancement of the literary and intellectual life of Hungary. He died at Simeg, 30th October 1844. His *Collected Works* appeared in 6 vols. in 1847, to which 4 vols. of *Posthumous Writings* were added in 1870.

KAROLY (CHARLES) KISFALUDY, younger brother of the preceding, and regenerator of the national drama of Hungary, was born at Tet, in the county of Gyor (Raab), on 6th February 1788. By quitting the army in 1811 he incurred the anger of an austere father, and was obliged to earn a precarious livelihood as an amateur artist, until in 1819 the success of a drama, *The Tartars in Hungary*, made him suddenly famous. This was followed by several others, all dealing with the past history of his country, and by comedies based upon popular life, the best of them *The Student Matthous*. Kisfaludy steadily improved as a dramatist as years went on. He died at Pesth, 21st November 1830. His *Collected Works* were published in 10 volumes in 1831 (5th ed. 8 vols. 1859).—The *Kisfaludy Society*, established in honour of the brothers in 1837, has rendered important services to Hungarian literature.

Kishineff, capital of the Russian government of Bessarabia, stands on a tributary of the Dniester, 162 miles NW. of Odessa by the railway to Jassy. When it came into the possession of Russia in 1812 it was a place of only 7000 inhabitants; since then, however, it has rapidly increased in size and prosperity. The old or lower town abuts upon the river; the new town stands on cliffs between 400 and 500 feet above the river. Pop. (1832) 35,000; (1849) 42,613; (1871) 102,427; (1897) 108,506, composed of nearly all the surrounding nationalities. Fruit, the vine, and tobacco are grown; and tobacco and flour are manufactured. Kishineff is an important trading centre for Bessarabian native products. It is the seat of an archbishop, and has a theological seminary.

Kishm, or **PAWLDAH** (the ancient *Characta*), a parched and barren island of Persia, situated at the entrance to the Persian Gulf. It is 55 miles long, and has an area of 515 sq. m. Salt and sulphur, and the food-products of a few oases, are all that the island yields. Pop. 5000. The island was visited by a severe earthquake in 1881, twelve villages being destroyed and some two hundred lives lost.

Kismet. See FATE, MOHAMMEDANISM.

Kiss, a familiar form of salutation by touching with the lips as an expression of respect or affection, in earlier times and still in many countries used in the common intercourse of man with man, but mostly limited by modern Englishmen to the domestic and dearer relationships of life. The *osculum* was a formal symbol of goodwill among the ancient Romans, and was adopted by the early Christians, whose 'holy kiss' and 'kiss of charity' carried the weight of apostolic sanction. The 'kiss of peace' at the mass, in the Eastern Church and the Mozarabic and Ambrosian liturgies, is given before the offertory and consecration; but in the Roman mass it follows the consecration and is closely connected with the communion. About the end of the 13th century the kiss of peace in the

West gave way to the *osculatorium*, called also the *instrumatum* or *tabella pacis, pacis, pacificale*, or *freda*, a plate with a figure of Christ on the cross stamped on it, kissed first by the priest, then by the clerics and congregation. The kiss of peace was given also at baptism, and is still given by the other bishops to a bishop newly consecrated, and by the bishop to a priest at his ordination; and the Greeks still preserve the rite of giving the kiss of peace to the dead.

The Christians early adopted the practice of kissing the altar as a mark of reverence to the place on which the eucharist is offered, and the officiating priest still does so repeatedly in the Roman mass. It is usual also to kiss the golden cross of the sandal on the pope's right foot on his appointment to office, by newly-created cardinals and by persons on being granted an audience. Even royal persons in former times paid this act of homage to the Vicar of Christ; it is said that Charles V. was the last that did so.

See Kahle, *De Osculo Sancto* (Konigsberg, 1867); Valentini, *De Osculatione Pedum Romanæ Pontificis* (Rome, 1588); and Pougard, *Del Bacio de' Piedi de' Sommi Pontifici* (Rome, 1807).

Kissingen, the most popular watering-place in Bavaria, is situated on the Saale, 60 miles E. by N. from Frankfort-on-Main. Of its three mineral springs (temperature 50.7-51.2° F.), the Rakoczy and the Pandur furnish saline and chalybeate waters, while the Maxbrunnen is acidulous and saline. The Solen-Sprudel is remarkable for the periodical ebb and flow of its waters, caused apparently by the accumulation and discharge of carbonic acid gas. Besides these there are two other springs near the town, and in the same valley the spas of Boeklet and Brückenau. The waters of Kissingen are both drunk and used as baths by the patients, and are considered specially efficacious in cases of dyspepsia, skin diseases, affections of the bowels, eyes, and ears, gout, &c. The population (4024) is increased by an influx of 13,000 to 14,000 visitors annually. Although the existence of mineral (saline) springs at this spot was known as early as the 9th century, it was not until the 16th that their medical properties were recognised, and not until the 19th that the springs came to be in great repute. Between 500,000 and 600,000 bottles of the Kissingen waters are exported annually. At Kissingen an attempt was made to assassinate Prince Bismarck, by Kullmann, on 13th July 1874. See guides, all in German, by Sotier (2d ed. 1883), Werner (3d ed. 1883), Dirri (5th ed. 1884), and Ising (3d ed. 1885).

Kistna, or **KRISHNA**, a river of southern India, rises in the Western Ghats within 40 miles of the Arabian Sea, at a height of 4500 feet, in 18° 4' N. lat., and, flowing eastward across the peninsula, falls into the Bay of Bengal after a course of 800 miles. Area of drainage basin, 97,050 sq. m. The river forms for a considerable distance the boundary between the Nizam's dominions and Madras Presidency, and has a delta extending 100 miles inland. It is only navigable for about 50 miles during six months of the year.

Kistvaen, or **CIST**. See BARROW, BERAL.

Kit-Cat Club, a society formed in London about 1700, consisting of thirty-nine noblemen and gentlemen favourable to the succession of the House of Hanover, and whose ostensible object was the encouragement of literature and the fine arts. Jacob Tonson, an eminent publisher, was founder and secretary; and, not to mention dukes and earls, it included Sir Robert Walpole, Vanbrugh, Congreve, Addison, Steele, and Garth. The club derived its name from having met for some time in the house of Christopher Catt, a pastrycook.

Before its dissolution (about 1720) each of the members gave Tonson his half-length portrait, painted a uniform size, by Kneller. Hence a kit-eat is any portrait of that size—about 36 in. by 28.

Kitchener, HERBERT, LORD, of Khartoum and Aspell in Suffolk, born 22d September 1850 at Gunsborough Villa, near Ballylongford, Kerry, studied at Woolwich Academy, and entered the Engineers in 1871. On the Palestine survey 1874-78, and then on that of Cyprus till 1882, he commanded the Egyptian cavalry 1882-84, served in the Soudan campaign 1883-85, was governor of Suakin 1886-88, and Sirdar of the Egyptian army from 1890. As such, he recovered Dongola (1896), defeated the dervishes at the Atbara (April 1898), and by the final victory of Omdurman, 2d Sept. 1898, routed the Khalifa, and won back the Soudan for Egypt. He was raised to the peerage, having four years before been created a K.C.M.G. In 1899 he went with Lord Roberts to South Africa as chief of the staff in the Transvaal War, and in November 1900 he assumed chief command with the rank of lieutenant-general. See G. W. Steevens's *With Kitchener to Khartoum* (1898).

Kitchen-midden (Dan. *kjøkken-mødding*), mounds in Denmark, N. Scotland, &c., prehistoric refuse-heaps. They are mostly formed of oyster-shells and other shellfish; contain only stone, bone, or wood implements; and bones of the dog and wild animals. See ANTHROPOLOGY, MAN, STONE AGE.

Kite, one of the long-winged, small-footed, short-beaked Falconidae. The typical genus is *Milvus*, confined to the Old World, and represented by half-a-dozen species. Of these the Common or Red Kite (*Milvus tetras*), found throughout Europe, is now very rare in Britain. It feeds on

Common Kite or Glead (*Milvus tetras*).

ollal and small vertebrates of all kinds, and may be destructive to young game and poultry. The Black Kite (*M. nigrescens*) has been recorded in Britain; the Pariah Kite (*M. gangeticus*) of India is a useful scavenger; *M. isurus* inhabits Australia. Under the title kite are also included the Black-winged Kites (*Elanus*) of both hemispheres; the beautiful Swallow-tailed Kite (*Elanoides forficatus*), occurring in the warmer parts of North America; the Hook-billed Kite (*Rostrhamus*) of South America and Florida, feeding, curiously enough, on fresh water snails; and the large Bee-kite or Honey Buzzard (*Percnias apicivorus*), inhabiting Europe and Africa.

Kits Coty House, the best known dolmen in England, stands on a hillside near the road from Rochester to Maidstone, 1½ mile NW. of

Ayleston. Three upright blocks of sandstone 8 feet high support a 'covering stone' 12 feet long so as to form a chamber. The name is supposed to be from old British words for 'the tomb in the wood' (cf. Welsh *coed*, 'wood'). See DOLMEN.

Kittiwake. See GULL.

Kitto, JOHN, an industrious and praiseworthy writer on biblical subjects, was born at Plymouth, December 4, 1804. In his twelfth year he lost his power of hearing in consequence of a fall from a height of 35 feet. His father's circumstances were at this time so wretched that young Kitto was soon after sent to the workhouse, where he learned the trade of shoemaking. In 1824 he went to Exeter to learn dentistry with a Mr Grove, who encouraged him in his literary aspirations; and in 1825 he published *Essays and Letters by John Kitto*. In the same year he was sent to the Missionary College at Islington, where he learned printing. In 1829-33 he accompanied Mr Grove and family on a tour to the East, visiting in the course of his travels St Petersburg, Astrakhan, the Caucasus, Armenia, and Persia. The rest of his life was spent in the service of the publishers, chiefly in that of Charles Knight, whose failure led to less constant employment and pecuniary embarrassments. In 1850 he received a civil list pension of £100 a year. Stricken with paralysis, he died at Cannstadt, in Württemberg, November 25, 1854. His principal works are *The Pictorial Bible* (1838; new ed. 1855), *Pictorial History of Palestine* (1839-40), *History of Palestine* (1843), *The Lost Scenes, Deafness and Blindness* (1845), *Journal of Sacred Literature* (1848-53), and *Daily Bible Illustrations* (1849-53; new ed. by Dr Porter, 8 vols. 1867). He also edited the *Journal of Sacred Literature* (1848-53). In 1844 the university of Giessen conferred on him the title of D.D. Kitto had a working knowledge of Hebrew, Greek, Latin, and the modern tongues. See his Life by Eadie (1857) and Ryland (1856).

Kiu-kiang, or CHIÜ-CHIANG, a Chinese treaty port on the Yang-tze-kiang. Pop. 53,000.

Kiung-chow, chief city of Hainan (q.v.).

Kiwi. See PTERYX.

Kizil-bashes, Persianised Turks. See AFGHANISTAN, KHIVA.

Kizil-Irmak. See ASIA MINOR.

Kizil-Kum (meaning 'Red Sands'), a sandy desert in Russian Turkestan, lying between the lower courses of the Amu-Daria and Syr-Daria. They stretch south-east from the Sea of Aral, and rise from an elevation of 150 feet at the sea to 2000 towards Bokhara. They are partly of shifting nature and partly stationary, and are diversified by numerous undulations or ridges of sand, between which extensive patches of clay occur. North-east of the Caspian stretches the Kara-Kum ('Black Sands') desert, a former bed of the sea.

Kjernf, HALDAN, composer, was born at Christiania, 15th September 1815, and studied law, but devoted himself to music. He wrote much for the piano, but is best known for his charming songs, full of melody and true Norwegian feeling. He died 11th August 1868. There is an English album of his songs, the translations by Mazzioli (1883).

Kjöbenhavn. See COPENHAGEN.

Klagenfurt, the capital (since 1518) of the duchy of Carinthia, in Austria, on the Glan, 262 miles SW. of Vienna by rail. The palace of the Prince-bishop of Gurk possesses a noteworthy chapel; and in the town there are schools of mining, agriculture, technical arts, &c., a library of 35,000 vols., and the Rudolfinum museum. Klagenfurt has

a large white-lead factory, and manufactures leather, cast-iron, tobacco, &c. An active transit trade is carried on. Pop. (1890) 19,756. The fortifications were dismantled by the French in 1809, and now, converted into promenades, separate the town from its four suburbs.

Klapka. GEORGE, one of the most heroic and skilful generals of the Hungarian war, was born at Temesvar on 7th April 1820. He rose to the rank of lieutenant-general in the Austrian army, but on the outbreak of the revolution placed himself at the service of the Hungarian government, and took a prominent part in nearly all the battles against the Austrians between February and August; in more than one the fortune of the day was decided by the troops under his command. But the crowning glory of his career was his defence of Komorn, which he continued to hold for some weeks after all the rest of Hungary had submitted. He lived in exile until the amnesty of 1867 let him return; and he died 17th May 1892. He wrote *The National War in Hungary and Transylvania* (1851), one of the best works on the subject; *The War in the East* (1855); and two series of *Memoirs* (1850 and 1886).

Klaproth. HEINRICH JULIUS VON, orientalist, was born at Berlin, 11th October 1783, the son of Professor Martin Heinrich Klaproth (1743-1817), chemist and mineralogist. At fourteen undertaking the study of Chinese, in 1805 he was appointed interpreter to a Russian embassy to China. It was stopped on the frontier, when Klaproth took the opportunity of exploring Siberia, as afterwards (in 1807-8) the Caucasus and Georgia. Returning to Germany in 1812, he settled three years later in Paris, where in 1816 he was appointed professor of Asiatic Languages, and where he died, 20th August 1835. From 1802 onwards he published innumerable works, in German and later in French, on the subject of his travels, of Asiatic philology and ethnology, of Egyptian hieroglyphics, &c. A blot on their erudition and acuteness is his virulent assaults on other scholars. His *Erfundung des Kompass* was edited by Wittstein in 1885.

Klausenburg (Hungarian *Kolozsvár*), one of the chief cities in Transylvania, is situated 95 miles by rail E. by S. from Grosswardein. It consists of the inner town, formerly fortified, and of five suburbs. Here are a university, with four faculties (founded in 1872), and a Unitarian College, both with libraries, an observatory, a music school, and numerous other educational establishments. The town possesses the national museum, with antiquities, scientific collections, and a library of 45,000 vols. Klausenburg was captured by the Hungarians under Bem on Christmas Day 1848. Machines, oil, and spirits are manufactured. Pop. (1880) 29,921; (1890) 32,729.

Klausthal, the chief mining-town of the northern Harz Mountains, stands on a bleak plateau (1985 feet), 25 miles N.E. of Göttingen. The ores raised are silver, lead, copper, and zinc. There is a good mining academy, with library, museum, and laboratory. Zellerfeld, divided from Klausthal by a brook, is also a mining centre. The mines are the property of the Prussian government. Pop. 8871; but including Zellerfeld, 13,278. The men are almost exclusively employed in the mines and smelting work.

Kleber. JEAN BAPTISTE, a distinguished French soldier, born in March 1753 at Strasburg, where his father was a builder. He was destined for an architect, but his opportune assistance in a Paris tavern brawl to two young German nobles obtained him a nomination to the military school of Munich, and afterwards a commission in the Austrian army. This, however, he resigned after

a few years, and returned to France to become inspector of public buildings at Belfort. In 1792 he enlisted in the Haut-Rhin volunteers, and rapidly rose in rank, becoming general of brigade in 1793. As such he commanded in the Vendean war, but was recalled for advocating more lenient measures. Next year, as general of division in the northern army under Jourdan, he led the left wing at Fleurus, and captured Maestricht; and in June 1796 he gained the brilliant victory of Altenkirchen over the Prince of Würtemberg. He accompanied Bonaparte to Egypt as a general of division, was dangerously wounded at the capture of Alexandria, but recovered so as to take part in the expedition to Syria, and won the battle of Mount Tabor (1799). When Bonaparte left Egypt he entrusted the chief command there to Kleber, who concluded a convention with Commodore Sidney Smith for its evacuation; but on Admiral Keith's refusal to ratify this convention Kleber adopted the bold resolution of reconquering Egypt, and destroyed the Turkish army at Heliopolis. During an attempt to conclude a treaty with the Turks Kleber was assassinated by a Turkish fanatic at Cairo, 14th June 1800. There are Lives by Einouf (1867) and Pajol (1877).

Kleene-bok. See ANTELOPE.

Kleist. EWALD CHRISTIAN VON, German poet, was born at Zeblin, near Köslin in Pomerania, on 7th March 1715. In 1749 Frederick the Great induced him to enter the Prussian army; he was severely wounded whilst leading an attack on a hostile battery at the battle of Kunersdorf, and died twelve days later (24th August 1759) at Frankfort-on-the-Oder. The lyric poet Gleim first taught him how to develop his poetic talents. His name is best known from his *Poems*, especially the one entitled *Frühling*, a sort of descriptive lyric. Besides this he wrote tales (*Die Freundschaft* and *Arist*), idylls (*Irin*, &c.), fables, and hymns. The latest edition of his *Works* was issued by A. Sauer (1884). See Life by Einbeck (1861).

Kleist. HEINRICH VON, German dramatist and poet, was born at Frankfort-on-the-Oder, on 18th October 1777. At first he followed the family profession and entered the army; but left it in 1799 to study, yet science he soon abandoned for literature. As a writer his aims and desires outran his ability to execute, and his works are marred by want of clearness and artistic completeness; in fact, he has some of the worst faults of the Romantic school, to which he belongs. Nevertheless, his best plays, such as *Der Prinz von Homburg*, *Das Käthchen von Heilbrunn*, *Hermanns-schlacht*, and *Der zerbrochene Krug*, possess sufficient vigour and fidelity to life to make them popular even at the present day. The best of his tales is *Michael Kohlhaas*, a story of Brandenburg in the middle ages. The morbid tendencies in his character made him quit before the adversities against which he had to battle, and at last brought him to a suicide's grave. He shot himself, after first shooting a woman whom he loved, and who like him was weary of life, on the bank of Lake Wann near Potsdam, 21st November 1811. His works did not gain recognition until after his death; they were first made known by Tieck, who in 1826 published Kleist's *Gesammelte Schriften* (3 vols.; new ed. 1874). See Life by Brahm (1884).

Klepts. Greek brigands. See BRIGANDS.

Kleptomania (Gr. *klepto*, 'I steal'). Among the phenomena of certain minds that are not regarded as technically insane or criminal are observed inordinate tendencies to acquire, to collect, and to hoard. All young children desire and will at once appropriate whatever they fancy. So long as

property of others, or involve a flagrant breach of law, they are readily admitted as an indication of disease, or as an absurdity and eccentricity which may help to consign the individual to an asylum or to contempt, but concern no one else. But whenever the amount of the object appropriated, or the circumstances under which it is purloined, bring the matter into a court of law, the act is treated as a theft. Such conduct is often the result of disease; it is rarely a disease by itself. The inclination to steal is a premonitory indication of some forms of mental disorder: it is a characteristic symptom of many others, where violence, or delusion, or incoherence leaves no doubt as to the source from which it springs. But there are other cases in which the morbid origin cannot be so clearly demonstrated—where the mind is clear and cogent, the morals pure, and where theft is almost the only proof of insanity. There is evidence in favour of the opinion that the propensity to steal may become so irresistible, and the will so impotent, that the appropriation is involuntary, and the perpetrator irresponsible. It then forms one of the varieties of insanity (see the article INSANITY) characterised by defective inhibition. The gratification of the impulse is commonly found associated with physical changes and conditions which may be regarded as incompatible with the healthy discharge of the functions of the nervous system; but that connection is not invariable, and the best mode of establishing the reality of such a disease is to consider marked cases in relation to the character, interests, and previous deportment of the individual, to the nature of the articles taken, and to the motives. A baronet of large fortune stole, while on the Continent, pieces of old iron and of broken crockery. A clergyman of great usefulness abstracted from book-shops and stalls hundreds of copies of the Bible. The objects are often stolen ostentatiously, or without any adequate precautions to conceal the attempt; they are often of no value; the act is without motive, promptly and spontaneously avowed, and, if overlooked, repeated. The article acquired is restored, or disregarded; and although money is rarely taken, bright and coloured objects most generally excite cupidity.

See Bucknill and Tuke, *Psychological Medicine* (1853); Clouston, *Mental Diseases* (2d ed. 1887).

Klondike, or **KLONDYKE**, a small tributary of the Yukon river in the Canadian district of Yukon, separated from the North-West Territories in 1895. The Klondike (properly *Thron-duick*, 'plenty of fish') gives name to an extraordinarily rich auriferous region, partially known as early as 1873. Gold-mining was being carried on on the Lewis and Stewart rivers in the early eighties, but only in 1896 was gold found on the Klondike in such abundance as to cause the desertion of the adjoining diggings and to create a rush from Europe, renewed in 1897 and 1898. Dawson, where the Klondike enters the Yukon river, is 60 miles east of the Alaskan (U.S.) frontier.

Klopstock, **FRIEDRICH GOTTLIEB**, was born 21 July 1724, at Quedlinburg. Incited by Virgil's *Æneid* and Milton's *Paradise Lost*, he resolved to write a great epic poem whilst a theological student at Jena (1745), selected for his theme *The Messiah*, and while at Leipzig got the first three cantos published in a Bremen magazine (1748). They were received with enthusiasm, except by Gottsched, who denounced his language and verse-structure as heretical innovations. He settled in Hamburg in 1771 with a sinecure appointment, and pensions from the king of Denmark (since 1751) and the margrave of Baden. In 1773 the last cantos of *The Messiah* were published; the poet

died 14th March 1803. His name has (or rather had) a very high place in German literature. For instance, he was taken by the Göttinger Dichterbund as their model and poetic hero, and was greatly admired by young Schiller. Whatever may be thought of the intrinsic value of his poetry, it cannot be denied that he helped to inaugurate the golden age of German literature, and exercised a very beneficial influence on the national taste. When he first began to write, the literature of Germany was dominated by French influences—a cold, correct, unimaginative spirit. Klopstock broke loose from this despotism and breathed the air of freedom into German poetry. Odes, tragedies—in which he introduces Arminius as a national hero—and biblical dramas, with some hymns, constitute the remainder of his poetry. Of these his *Odes* alone possess interest and value now. His works were collected and published in 12 vols. (1798–1817), and in 9 vols. (1839). *The Messiah* has been translated into both English verse and prose. See Life by Muncker (1887–88).

Kluhevskaya. See KAMCHATKA.

Knapweed. See CENTAURIA.

Knaresborough, a market-town in the West Riding of Yorkshire, on the Nidd, 3½ miles N.E. of Harrogate and 17 W.N.W. of York. It has a church (restored 1872), with interesting monuments of the Slingsbys; a grammar-school (1616); remains of a castle (1170), in which Richard II. was imprisoned, and which was dismantled in 1648; a 'dropping well,' with petrifying properties; and St Robert's Cave, in which Eugene Aram buried his victim in 1745. Mother Shipton is claimed as a native, and Jack Metcalf, the blind road-surveyor. Linen and woollen rugs are the staple manufactures. Knaresborough returned two members from 1550 till 1867, and one until 1885. Pop. (1851) 55,6; (1881) 5000; (1891) 4770. See works by Calvert (1844) and Grainge (1871).

Knee, the articulation between the femur or thigh-bone, above, and the tibia or shin-bone, below. A third bone, the patella, or knee-cap, also enters into the structure of this joint anteriorly. The articular surfaces of these bones are covered with cartilage, and connected together by ligaments, some of which invest the joint and lie external to it, while others occupy its interior. The synovial membrane is the largest in the body.

It lines the investing ligament, and is prolonged on the front of the femur above the articular surface, covers certain of the ligaments in the interior of the joint, and forms folds on a large cushion of fat placed between the tibia and patella.

The most important of the external ligaments are the anterior or *Ligamentum Patellæ*, which is in reality that portion of the *Quadriceps Extensor Cruris* which is continued from the knee-cap to the tubercle of the tibia; one internal and two external lateral ligaments; a posterior ligament; and a capsular ligament, which surrounds the joint in the

Vertical Sagittal Section through the inner half of the Left Knee (from Macalister):

a, femur; b, tibia; c, patella; d, tendon of quadriceps muscle; e, ligamentum patellæ; f, subserous bursa; g, prepatellar bursa; h, internal semilunar cartilage; i, ligamentum posticum; k, inner head of gastrocnemius.

intervals left by the preceding ligaments. The positions of these ligaments are sufficiently indicated by their names. Of the internal ligaments the two crucial, so called because they cross one another, are the most important. The external and internal semilunar cartilages are usually placed amongst the internal ligaments; they are two crescentic plates of fibro-cartilage. The convex border of each cartilage is thick; the concave free border is thin. Each cartilage covers nearly the marginal two-thirds of the corresponding articular surface of the tibia, and by its form deepens these surfaces for firmer articulation with the condyles of the femur.

The chief movements of this joint are those of a hinge-joint—namely, flexion and extension; but it is also capable of slight rotatory motion when the knee is half-flexed. During flexion the articular surfaces of the tibia glide backwards upon the condyles of the femur; while in extension they glide forwards. The whole range of motion of this joint, from extreme flexion to extreme extension, is about 135°. Judging from its articular surfaces, which have comparatively little adaptation for each other, it might be inferred that this was a weak and insecure joint; and yet it is very rarely dislocated. Its real strength depends on the large size of the articular ends of the bones, on the number and strength of the ligaments, and on the powerful muscles and fasciæ by which it is invested. See JOINTS, where also the exsion of the knee-joint is discussed.

The KNEE-CAP, or PATELLA, is a Sesamoid Bone (q.v.), developed in the single tendon of the *rectus, curvus, vastus externus, and vastus internus* muscles—the great quadriceps extensor muscle of the leg. It is heart-shaped in form, the broad end being directed upwards, and the apex downwards. The anterior or external surface is convex, perforated by small apertures for the entrance of vessels, and marked by rough longitudinal striae; the posterior or internal surface is smooth and divided into two facets by a vertical ridge, which corresponds and fits into the groove on the lower articulating surface of the femur or thigh-bone, while the two facets (of which the outer is the broader and deeper) correspond to the articular surface of the two condyles.

This bone is liable both to dislocation and fracture. Dislocation may occur either inwards or outwards; but it is most frequent in the outward direction. The displacement may be caused either by mechanical violence, or by too sudden contraction of the extensor muscles in whose conjoined tendon it lies; and is most liable to occur in knock-kneed, halby persons. Except in one rare variety, the dislocation is capable of being reduced without any difficulty. Fracture of the patella may, like dislocation, be caused either by muscular action or by mechanical violence.

Fracture by violent muscular action, as when a person in danger of falling forwards attempts to recover himself by throwing the body backwards, is the more common of the two forms. The treatment consists in relaxing the opposing muscles by raising the trunk, and slightly elevating the limb, which should be kept in a straight position. In consequence of the great difficulty of bringing the broken surfaces into exact apposition it is very difficult to obtain bony reunion of the parts, and the case generally results either in mere ligamentous union or in no true union at all.

Kneeling was probably the general posture of the early Christians in prayer not regulated by public authority, but the early church made no distinction in language between kneeling and prostration. At communion the first prayer was said kneeling, the rest of the liturgy standing. At other times of service the rule was for all to kneel

in prayer except on Sundays and between Easter and Whitsuntide. In the modern Catholic Church kneeling is the usual attitude at prayer, as in the Church of England. In the Roman and Greek churches, and with some Anglicans, the celebrant, after kneeling in adoration, communicates standing. In the Church of England, and in the Lutheran Church, the sacrament is received kneeling; Lutherans stand at prayer. Presbyterians sit when receiving the communion, and were till lately accustomed to stand at prayer; recently kneeling at prayer has become the usual practice, save in the remoter districts of Scotland.

Kneller, SIR GODFREY, a portrait-painter, was born at Lubek on 8th August 1646, and learned painting under Rembrandt and Ferdinand Bol. Whilst studying further in Italy he chose historical subjects, but afterwards gave himself entirely to portrait painting. In 1676 he went to London, and, on the death of Sir Peter Lely in 1680, was appointed court-painter to Charles II. This office he retained during the reign of James II., and continued to fill it after the Revolution. In 1691 William III. knighted him, and in 1715 George I. made him a baronet. He died at Twickenham, 7th November 1723, and a monument was erected to him in Westminster Abbey, with a highly laudatory inscription by Pope. Kneller's best-known productions are the 'Beauties of Hampton Court' (painted by order of William III.), his portraits of the 'Kit-Cat Club,' and of nine sovereigns (Charles II. to George I. of England, Louis XIV., Peter the Great, and the Emperor Charles VI.). He painted avowedly for the love of money, and hence never did justice to the undoubted talent he possessed. His reputation was due to his rapid brush and his quick eye for likeness, and to the fact that there was nobody to dispute supremacy with him. For Kneller Hall, his house at Twickenham, see BAND (MILITARY).

Knickerbocker, HERMAN JANSSEN, of Friesland, Holland, was one of the earliest settlers of New York. A descendant, Johannes (1749-1827), was an intimate friend of Washington Irving, who immortalised the name by his *History of New York* by 'Diedrich Knickerbocker' (1809). It has since been used as a generic term for New York families descended from the original Dutch settlers.

Knight, CHARLES, author and publisher, was born in 1791. The son of a Windsor bookseller, in 1811 with his father he established the *Windsor and Eton Express*, and continued to edit it until 1821, at the same time printing the *Etonian*. The *Plain Englishman* (1820-22), which was the first attempt to produce cheap literature of a high tone, was jointly edited by Charles Knight and Commissioner Locket of Greenwich Hospital. Removing to London in 1822, Knight began to publish important works in various classes of literature, and he also founded *Knight's Quarterly Magazine*, to which Macaulay, Præd, Montrie, and other writers of promise contributed. In 1827 he became connected with the Society for the Diffusion of Useful Knowledge, for which he published many valuable works and serials, including the *Penny Magazine* (1832-45), which attained a circulation of 200,000 copies weekly. Knight began to issue in 1838 the *Penny Cyclopædia*, upon which he expended for contributions alone the sum of £40,000. This was followed by the *English Cyclopædia* (1851-61), the *British Almanac*, and its *Companion*. Knight edited the *Pictorial Shakespeare*, and was the author of *William Shakespeare: a Biography*. He likewise issued *The Land We Live In* and other works. In 1853 Knight published *Once Upon a Time*, which consisted of a collection of papers from the periodicals; and in 1855 *Knowledge is Power*, a work based upon two

smaller volumes—*Results of Machinery* and *Rights of Industry*—which secured a large sale at a time when the improvements in machinery excited a hostile feeling and the relations between capital and labour were considerably strained. In 1862 Knight completed his *Popular History of England*, upon which he had been engaged for seven years. His *Passages of a Working Life during Half a Century*, which appeared in 1863-65, recounted the struggles of his own life as well as gave interesting pictures of the numerous literary and political personages with whom he had been associated. Knight's compilations, *Half-hours with the Best Authors*, *Half-hours of English History*, and *Half-hours with the Best Letter-writers*, have become widely popular. By his appointment in 1860 as publisher of the *London Gazette* £1200 per annum was assured to him. He died at Addlestone, Surrey, 9th March 1873. (See Life by goldingher (1892).)

Knighthood. The word 'knight' is the modern equivalent of the Anglo-Saxon *enicht*, which meant originally a youth, and afterwards a servant or attendant, and soon came to be restricted to the military attendants upon nobles and great officers of state. This personal relation was subsequently strengthened by the feudal relation of tenancy, in virtue of which the knight held land of his superior under condition of rendering him military service in return (see FEE-DALISM). The origin of medieval knighthood, as a solemn investiture and profession of arms, is involved in obscurity. Embryonic forms of the institution can be traced amongst the early Teutonic nations, and especially the Franks. The customs of chivalry associated with King Arthur and Charlemagne's paladins are of course those of a later era, the epoch of the romance writers. The custom and practice of knighthood were established in England, but as an essentially feudal institution, by the Norman kings. The system of knight-service empowered the king, or a superior lord who was a subject, to compel every holder of a certain extent of land, called a knight's fee, to become a member of the knightly order, his investiture being accounted proof that he possessed the requisite knightly arms and was sufficiently trained in their use. After the long war between France and England it became the practice for the sovereign to receive money compensations from subjects who were unwilling to receive knighthood, a system out of which grew a series of grievances, leading eventually to the total abolition of knight-service in the reign of Charles II.

The ceremonies practised in conferring knighthood have varied at different periods; but two broadly marked ceremonial forms may be recognised, the simple dubbing and the formal investiture as a semi-religious ceremony. In general, in the more elaborate ceremony, fasting and bathing were necessary preparatives, and the actual creation was preceded by solemn confession and a midnight vigil in the church, followed by the reception of the eucharist. The new knight offered his sword on the altar, to signify his devotion to the church and determination to lead a holy life. The sword was redeemed by a sum of money, had a benediction pronounced over it, and was girded on by the highest ecclesiastical present. The title was conferred by binding the sword and spurs on the candidate, after which the person who conferred the order dealt him a blow on the cheek or shoulder, saying, 'Be thou a good and faithful knight,' or words to that effect. The new knight then took an oath to protect the distressed, to maintain right against might, and never by word or deed to stain his character as a knight and a Christian. The religious character of the ceremony seems to have become thus prominent in and after the foundation

of the militant monastic orders in Palestine, as the Knights Templars (see TEMPLARS) and Knights of St John (see HOSPITALIERS). A knight might be degraded for the infringement of any part of his oath, in which case his spurs were chopped off with a hatchet, his sword broken, his escutcheon reversed, and some religious observances were added, during which each piece of armour was taken off in succession, and cast from the recipient knight. This ceremony was of very rare occurrence, but was performed in effigy as late as 1814 in the case of Lord Dundonald (q.v.).

'Knights errant' were they who wandered seeking foemen worthy of their steel, and acquiring fame at joust and tourney, by maintaining the pre-eminence in beauty and virtue of the ladies to whom they had vowed service. The (unhistorical) 'Knights of the Round Table' (see ARTHUR) and the paladins of Charlemagne (see ROLAND) are types of those whose mission it was to succour distressed damsels and destroy tyrants; and Amadis (q.v.) may be taken as a representative hero of those romances of chivalry which Cervantes satirised in *Don Quixote*. Sad specimens of the military knights in a degraded condition were the robber knights (*Lombardes*) of Germany, who lived largely by levying blackmail on merchants or by sheer plunder.

Knighthood, originally a military distinction, came, in the 16th century, to be occasionally conferred on civilians, as a reward for valuable services rendered to the crown or community. The first civil knight in England was Sir William Walsworth, lord mayor of London, who won that distinction by slaying the rebel Wat Tyler in presence of the king. Since the abolition of knight-service knighthood has been conferred without any regard to property, as a mark of the sovereign's esteem, or as a reward for services of any kind, civil or military. In recent times it has been bestowed at least as often on administrative officials, scholars, lawyers, physicians, artists, and citizens as on soldiers. Although knighthood could originally be conferred by any person of knightly condition, the right to bestow it was early restricted to persons of rank, and afterwards to the sovereign or his representative, as the commander of an army. In England the sovereign now bestows knighthood by a verbal declaration, accompanied with a simple ceremony of imposition of the sword, and without any patent or written instrument (see ACCOLADE). In some few instances knighthood has been conferred by patent, when the persons knighted could not conveniently come into the presence of royalty, as in the case of governors of colonies, or other persons occupying prominent situations abroad. The lord-lieutenant of Ireland also occasionally, but rarely, exercises a delegated power of conferring knighthood. The monosyllable 'Sir' is prefixed to the Christian names of knights and baronets, and their wives have the legal designation of 'Dame,' which in common intercourse becomes 'Lady.' For the existing orders of knighthood, see ORDERS, BATH, GARTER, THISTLE, GOLDEN FLEECE, &c.

Persons who are simply knights, without belonging to any order, are called in England Knights Bachelors. Knighthood of this kind is now only conferred in Great Britain. A degree of knighthood called Banneret (q.v.) formerly existed in England and France; it was given on the field of battle in reward for the performance of some heroic act. It is noticeable that, whereas the German word for knight is *Ritter*, the word *knecht*, etymologically the same as knight, means the squire or a still humbler attendant of the knight. The French knight (see LÉGITIM OR HONORÉ) is *chevalier*, the Italian *cavaliere*. The form of helmet which the requirements of the later heraldry have appropri-

ated to knights is figured under HERALDRY (fig. xi.). For Knights of the Shire, see PARLIAMENT.

Mills, *History of Chivalry* (1825); Gantier, *La Chevalerie* (1884); Reibisch, *Geschichte des Ritterthums* (1842); Schreckenstem, *Die Ritterorden* (1884); Major Lawrence-Archer's *Orders of Chivalry* (1888).

Knight-service. See TENURE.

Knights of Labour, a national labour organisation in the United States, founded at Philadelphia in 1869. It is to be distinguished from trades-unions as embracing all classes and kinds of labour, even clerks, sempstresses, &c., and extending, through its local assemblies, over the whole country. The professed objects of the body are just and reasonable, and such as appeal strongly to public sympathy. The first general assembly was held in 1878; from this year the numbers rapidly increased, and the oaths of secrecy formerly administered were abolished soon after. In 1883 there were 53,000 members, in 1886 there were 730,000; in 1886 and 1887, however, the system of 'boycotting' having been introduced, the business of the country was greatly disturbed, and since then the strength of the organisation has declined. At the convention of 1888 the total was admitted to have fallen below 500,000; and dissensions further weakened the body. Unavailing opposition to the policy of the leaders led to many withdrawals, and the power of the organisation was weakened. See GRANGERS, INTERNATIONAL, TRADE UNIONS.

Knights Templars. See TEMPLARS.

Knipperdolling, BERNARD, a noted leader (1527-36) of the fanatical Anabaptists (q.v.).

Knitting. See HOSIERY.

Knock, a village in County Mayo, Ireland, 17 miles ESE. of Castlebar, where an alleged luminous apparition of the Virgin appeared on the chapel wall in 1880. For a considerable time afterwards crowds of pilgrims flocked to the scene, and numerous miraculous cures were reported. Pop. of parish, 3241.

Knock-knee. See LEG.

Kuole. See SEVENOAKS.

Knot (*Tringa canutus*), a wading shore-bird of the family Scolopacidae, in the same genus as the dunlin, stints, &c. It is a regular autumn visitor to Britain, especially to the eastern estuaries, but breeds in the far north, and ranges as far south as the West Indies. The general colour, in summer, is reddish brown, finely mingled with black, gray, and white; in winter the plumage becomes mostly ash gray, and on the under parts white. The total length is about 10 inches. Its food consists in great part of small bivalves, but birds and insects are also eaten. The bird used to be caught and fattened for the table.

Knot, the divisions of the log-line on board ship, marked by *knots*, each having the same relation to a geographical mile as twenty eight seconds has to an hour. Hence the number of knots in the log line which run out in twenty eight seconds represents the number of geographical or nautical miles an hour which the ship is going at the time. The geographical mile is $\frac{1}{60}$ th of a mean degree of a meridian on the earth (see DEGREE), and is therefore $\frac{1}{60}$ th of 69.055 English statute miles; hence when a ship is going '13 knots,' it is travelling really at the rate of about 15 English miles an hour. See LOG.

Knots and **Splices** include all the various methods of tying, fastening, and joining ropes or cords. From 150 to 200 different kinds of knots may be enumerated, mostly used on shipboard,

though almost all occupations using ropes or cordage have special kinds of knots adapted to their different requirements. While the great majority of these are purely technical, there are a few so generally useful in the everyday occurrences of life that they may be shortly described. The figures represent the various knots before they are drawn taut, the better to show the method of tying. Generally, the requirements of a useful knot may be stated to be that it should neither 'slip' nor 'jam'—i.e. that, while it holds without danger of slipping while the strain is on it, when slackened it should be easily untied again. The simplest knot is the common one tied on the end of a thread or cord to prevent it slipping. By passing a loop instead of the end of the cord the common slip-knot (fig. 1) is formed; and a useful fixed loop is got by tying a simple knot, or the 'figure of 8 knot' (2), on the loop of a cord. One of the simplest and most useful running-knots for a

small cord is made by means of two simple knots (3). The most secure method of fastening a line to, say, a bucket is the standing bowline (4); and a running bowline is formed by passing the end *a* through the loop *b*, thus making a running-loop. Another good knot to make fast a bucket is the anchor-bend (5). Out of the score or so of methods of fastening a boat's painter the one which will be found most useful is the well-known two half-hitches (6). The timber-hitch (7) is useful for attaching a line to a spar or a stone, and the clove-hitch (8) is invaluable for many purposes. It is very simple and cannot slip.

A simple method of fastening a rope to a hook is the blackwall-hitch (9), where the strain on the main rope jams the end so tightly against the hook that it cannot slip. There are many methods for shortening a rope temporarily, one of them being the sheepshank, the simplest form of which is shown in fig. 10.

Of the methods for uniting the ends of two

cords the simplest and one of the most secure is the common reef-knot (11), which must be carefully distinguished from the 'granny' (12), which will jam if it does not slip; the reef-knot will

do neither. For very small cords or thread the best knot is the weaver's (13). The fisherman's knot is a very useful one for anglers, and is formed by a simple knot in each cord being slipped over the other (14); when drawn taut it is very secure, and it is easily separated by pulling the short ends. A useful method of uniting large ropes is shown in fig. 15: tie a simple knot on the end of one rope and interlace the end of the other, and draw taut. This tie may also be made with the figure of 8 knot. For very large ropes the carrick-bend (16) is the simplest and most secure. The bowline-bend is formed by looping two bowline-knots into each other. For attaching a small line to a thick rope the becket-hitch (17) is very useful.

Splicing is the process employed to join two ropes when it is not advisable to use a knot. The three chief varieties of the splice are the short-splice, the long-splice, and the eye-splice. The short-splice is made by unlaying the ends of two

ropes for a short distance and fitting them closely together; then, by the help of a marlinspike, the ends are laced over and under the strands of the opposite rope, as shown in fig. 18. When each strand has been passed through once, half of it is cut away and the remainder passed

through again; half of the remainder being also cut away, it is passed a third time, and, when all the strands are so treated, they are hauled taut and cut close. This reducing the thickness of the strands tapers off the splice. The long-splice is employed when the rope is used to run through a block, as it does not thicken it. The ends of the two ropes are unlaid for a much longer distance than for the short-splice, and similarly placed together. Then one strand is taken and further unwound for a considerable distance, and its vacant place filled up with the corresponding strand of the other rope, and the ends fastened as in the short-splice. Other two of the strands are similarly spliced in the opposite direction, and the remaining two fastened at the original joining-place. The eye-splice is, as the term implies, used to form an eye, or round a dead-eye, and is shown finished in fig. 19.

To prevent a rope fraying at the ends a variety of methods are employed, the simplest being to serve or whip the end with small cord. Other methods are by interlacing the ends, one of which, the single-wall, is shown at fig. 20, the ends afterwards being drawn taut and cut short.

The theory of knots, from the scientific point of view, was first treated by Listing in his 'Vorstudien zur Topologie' (*Göttinger Studien*, 1817); and the subject is most exhaustively considered by Professor Tait (*Trans. Roy. Soc. Edin.*, 1876-77), in a paper in which the various kinds of knots are analysed according to their number of crossings, and their 'knottiness,' 'beknottedness,' and 'knotfulness' are dealt with.

See Dana, *Seaman's Manual* (9th ed. 1863); Tom Bowling, *Book of Knots* (1866); Captain Alston, *Seamanship* (new ed. 1871); J. Tom Burgess, *Knots, Ties, and Splices* (1884).

Knout, an instrument of punishment introduced into Russia under Ivan III. (1462-1505). It was a whip with a handle 9 inches long and one complex lash, comprising a lash 16 inches long, with a metal ring; a continuation with another ring; and

finally, a flat lash of hard leather, 21 inches long, and ending in a beak-like hook. The offender was tied to two stakes, stripped, and received on the back the specified number of lashes; 100 to 120 were equivalent to sentence of death, but in many cases the victim died under the operation long before this number was completed. The whipping was inflicted by a criminal. For the knout Nicholas substituted the *plet*, a three-thonged lash, and this was disused, save in certain penal settlements, by Alexander II. (Knout is the French spelling of a Russian word spelt by the Germans *knut*, and by Russians, Germans, and French alike pronounced *knuot*; in English, usually but absurdly *nout*).

Knowles, JAMES SHERIDAN, dramatist, was born at Cork, 21st May 1784, the son of a lexicographer and teacher of elocution, who was cousin-german to Richard Brinsley Sheridan. The family removed to London in 1793, and here young Knowles became intimate with Hazlitt and Lamb. He had early shown a strong bent for an actor's life, and after serving a while in the militia, and studying medicine for a time, he made his first appearance at the Crow Street Theatre, Dublin. But he never attained much eminence in this profession, and subsequently he conducted a school for several years in Belfast and Glasgow. It was at this time he laid the foundation of his fame as a dramatist. His *Brian Boroiawc* (1814) and *Caius Gracchus* (1815) were first performed at Belfast. *Vivianus*, his most effective play, had been a success in Glasgow before Maeready in 1820 produced it at Covent Garden. Besides *William Tell*, in which Maeready achieved one of his greatest triumphs, Knowles's best plays are *Love, The Hunchback, The Love Chase, and The Wife*. His works attract by the strong human feeling that beats beneath their antique dress, and several of them are still among standard acting-plays. Knowles appeared with fair success in many of his own pieces; but in his later years he forsook the stage for the pulpit, became a Baptist preacher, and drew large audiences to Exeter Hall. His earnestness and enthusiasm were great, and two controversial works written to combat Roman Catholic doctrines displayed considerable acuteness. From 1849 Knowles had a civil list pension of £200 a year. He died at Torquay, 30th November 1862.

Knowltonia, a genus of South African plants, of the natural order Ranunculaceæ. *K. vesicataria* is remarkable for its acridity and blistering power. The bruised leaves are used at the Cape of Good Hope instead of cantharides.

Know Nothings, the popular name for the Native American party which was formed in the United States shortly before 1855, gained considerable successes in that year, lost its ground hopelessly in 1856, and soon after disappeared from American politics. Its distinctive principle was that the government of America must be in the hands of Americans; naturalisation was to follow only after twenty-one years' probation, and allegiance to any foreign potentate or power—presumably including the pope—was to be a bar to selection for political office. The order was a secret one, and the popular name arose from the members professing always to 'know nothing' when questioned about it. In the state elections of 1855 the party carried most of New England, besides New York, Kentucky, and California, and gained some successes in other states. In 1856 they nominated Mr Fillmore (q.v.) for reelection to the presidency, and polled nearly 875,000 votes; but they gained the electoral votes of Maryland only, and this defeat was the death-blow of the party. Nevertheless, its radical principle, in the form of revolt against the tendency to allow political power to fall into

the hands of a particular body of foreign-born citizens, occasionally reappears in American politics. In Boston, for instance, in 1889 the native-born citizens combined to snatch the city government from Irish hands; and the unsuccessful attempt to defeat the Tammany Hall nominees at New York at the same time exhibits a similar reaction at work.

Knowsley, a village of Lancashire, 5 miles NE. of Liverpool, where—one mile from the village—is Knowsley Hall, the seat of the Earl of Derby, which contains valuable paintings by Rubens, Rembrandt, Teniers, Claude Lorraine, and other great masters.

Knox, JOHN, the great Scottish Reformer, was born at Giffordgate, a suburb of the town of Haddington, in 1505, the year preceding the birth of his famous countryman, George Buchanan. Knox has himself told us in a single sentence all that is definitely known of his family connections. 'My lord,' he represents himself as saying to the notorious Earl of Bothwell, 'my grandfather, grand-sire (maternal grandfather), and father have served under your lordship's predecessors, and some of them have died under their standards.' He received the elements of his education in the grammar-school of his native town, and in 1522 was sent to the university of Glasgow. St Andrews was nearer his home, and possessed the more famous university; but he was probably drawn to Glasgow by the fame of the most distinguished literary Scotsman of his generation—John Major, the schoolman. For this reason, at least, Buchanan was sent to St Andrews, though Glasgow was nearer his native place, when Major had migrated to the former university. At Glasgow, under Major, Knox could have been subjected to none of the influences of the great intellectual revolution which substituted for the studies and methods of medievalism the ideals of the Revival of Letters. Like all his educated contemporaries, he learned to speak and write Latin with perfect fluency; but it was always with an idiom that showed he had none of the humanist's scruples regarding purity of language. What he learned from Major was the art for which that scholar was renowned throughout Europe, the art of logical exercitation; and Knox's writings everywhere show that all through life he had a natural delight in the play of dialectic. He left the university without taking the degree of Master of Arts, thus by the conditions of all the medieval universities precluding himself from the career of an academic teacher.

During the eighteen years that follow his leaving the university Knox passes completely out of sight. All that is known of him during this period is that from 1519 to 1543 he acted as notary in his native town of Haddington. As in the documents that establish this fact his name appears with the addition of 'Sir,' the title of priests who were not Masters of Arts, Knox must have been in orders in the Church of Rome till as late as 1543. In 1544 we find him acting as tutor to the sons of Douglas of Longniddry and Cockburn of Ormiston families, it is to be noted, both favourably disposed to the new opinions in religion now rapidly making their way in Scotland. Through these families he was brought into contact with George Wishart, who had lately returned from travelling in Germany and England with the burning zeal to gain his country to the Lutheran reformation. From this period the future direction of Knox's life was decided, and thenceforward with an intensity and self-devotion never surpassed he is the apostle of the cause with which his name is for ever identified—the establishment in Scotland of what he deemed the only true conception of the primitive church as based on the teaching of Christ

and the apostles. We have reason to believe that even before this date his sympathies were on the side of reform in religion; but the teaching and example of Wishart seems first to have brought to him the clear consciousness of his mission. Knox identified himself with Wishart with all the impetuosity of his character, and was in the habit, he tells us, of carrying a two-handed sword before the preacher. When Wishart was seized by the emissaries of Cardinal Beaton, Knox would willingly have attended him to the last; but Wishart, who knew the fate in store for him, rejected the offer. 'Return to your bairns' (meaning Knox's pupils), he said, 'and God bless you. One is sufficient for one sacrifice.'

Wishart was burned at St Andrews in March 1546, and in May of the same year Cardinal Beaton was murdered. The cardinal's murderers held possession of the castle of St Andrews; and, as Knox was known to be the enemy of Beaton (though he had no share in his assassination), he was forced (1547) for his own safety to join them with his pupils. Here his zeal and theological attainments made him so conspicuous that, at the instance of the leaders of the reforming party (Sir David Lindsay among the rest), he was formally called to the ministry, and preached with much acceptance in the castle and parish church of St Andrews. A few months later the castle surrendered to the French; and in the teeth of the express terms of capitulation, the more prominent of the besieged party were sent as prisoners on board the French galleys. For eighteen months Knox remained a captive, his first winter being spent in a galley on the Loire, the second in prison in Rouen. His constitution was not naturally robust, and his hard experience during these two years seriously impaired his health for the rest of his life. The breach of faith on the part of the French, and the ignominy to which he was subjected, were never forgotten by Knox, and must in part explain and justify his life-long conviction that no good thing could come of French policy or French religion.

In February 1549, on the express intercession of Edward VI., Knox regained his liberty. As it was still unsafe for him to return to Scotland, for the next four years, till the death of Edward VI., he made his home in England. From all that is known of him during these years it is clear that he made himself a person to be reckoned with by those at the centre of authority in the country. By his preaching at Berwick he gave such offence to the Bishop of Durham that he was removed to Newcastle, where it was supposed his influence would be less mischievous. In 1551 he was appointed one of six chaplains to Edward VI., and in 1552, at the suggestion of the Duke of Northumberland, he was offered the bishopric of Rochester. As the duke's object in suggesting the appointment was simply to check, as far as he could, what he deemed the dangerous activity of Knox, the offer was unhesitatingly rejected. Knox's importance in England is still further proved by the fact that along with five others he was consulted by Archbishop Cramer regarding his forty-five (afterwards forty-two) articles of religion; and it has been lately established that largely on Knox's representation the thirty-eighth article was so couched as to commit the Church of England to the Geneva doctrine of the eucharist.

On Mary's accession Knox, like the majority of the Reformed ministers, had to seek refuge on the Continent. That he might be within call should circumstances permit his return either to Scotland or England, he took up his abode at Dieppe till the beginning of the following year (1554), when he proceeded to Geneva. In July of this year he was again in Dieppe, 'to learn the estate of Eng-

land; but with Mary of Lorraine as regent in Scotland, and Mary Tudor as queen of England, he was convinced that for the present both these countries were closed against him. He accordingly accepted a call from the English congregation at Frankfort on-the-Main, where, however, on account of a dispute regarding the use of the Book of Common Prayer, he remained only a few months. At Geneva he found a congregation of his own way of thinking; but, eager to be an apostle in his own country, he once more returned to Dieppe (August 1555), whence he ventured into Scotland in September. He remained in Scotland till July of the next year, residing chiefly in Edinburgh, but making preaching journeys into various parts of the country. The new doctrines were steadily spreading in Scotland, but as yet their supporters were not strong enough to present a confident front against the government. It was at his own risk, therefore, that Knox remained in the country; and at the prayer of the congregation in Geneva he returned to that town in July 1556. It was probably during this visit to Scotland that he married his first wife, Marjory Bowes, to whom he seems to have been engaged during his sojourn in Newcastle. For the next two years he remained in Geneva, ministering to his congregation, and seeing much of Calvin, whose influence on Knox regarding all the great questions of the time was afterwards to bear fruit in the ordering of affairs in Scotland. To this period, also, belong several of his minor writings, and notably his *First Blast of the Trumpet against the monstrous Regiment of Women*, the publication of which he must afterwards have regretted in the interest of the cause he had most at heart.

Meanwhile, in Scotland the ground was being prepared for the great work in store for Knox. Under Mary of Lorraine as regent, the French influence had come to be regarded as a danger to the independence of the country, and a sense of this danger threw many into the party of reform. The unworthy lives of the old clergy, and the cupidity of many of the nobles, worked in the same direction. In 1557 the advocates of reform bound themselves by what is known as the *First Covenant* to do all in their power to effect a religious revolution; and by 1558 they felt themselves strong enough to summon Knox to their aid in the work he deemed the mission of his life.

In May 1559 Knox found himself again in Scotland, which he never again left for a prolonged period. He at once became the life and soul of his party. At the moment of his arrival the Lords of the Congregation, as the Protestant nobility termed themselves, were in open revolt against the regent. By his preaching at Perth and St. Andrews Knox gained these important towns to his cause, and by his labours in Edinburgh, of which he was appointed minister, he also won a strong party against the government. But the Reformers of their own resources could not hold their ground against the regent, subsidised by France with money and soldiers. Mainly, therefore, through the efforts of Knox, who all through his public career was deep in the politics of the time, the assistance of England was obtained against what was now deemed the French invasion. The help of England proved effective; and by the treaty of Leith (1560), and the death of the regent the same year, the insurgent party became masters of the country. The Estates of Parliament having met on August 1st, the ministers were ordered to draw up a Confession of Faith which should embody the new teaching; and on August 17th Protestantism was formally established as the religion of the country. Having gained thus much, the ministers, desirous of practical results from their victory, drew up the first *Book of Discipline*—a document ever memorable in the

history of Scotland, and admirable in itself for its wise and liberal suggestions for the religious and educational organisation of the country. These suggestions, however, were little to the mind of the majority of the Protestant nobles, who, 'perceiving their carnal liberty and worldly commodity to be impaired thereby,' sneeringly spoke of them as 'devote imaginations.' In the revolution that had been accomplished Knox had been the leading spirit; but he saw that the victory was as yet only half gained, and that the deadliest struggle had still to be decided.

The return of the young queen to Scotland (August 1561) revived all the old dissensions, and introduced new elements into the strife of parties. By every opinion she held on religion, on the relations of prince and subject, on the fundamental principles of life, Mary was separated as by an abyss from the party represented by Knox. If we may judge from the language which each held of the other, Knox and she failed to find one point on which genial intercourse was possible. As the minister of St. Giles (then the only Reformed church in Edinburgh), Knox believed that Mary was his special charge. Her personal conduct, therefore, no less than her public policy, was made the subject of his most stringent criticism; and during the six years of her reign his attitude towards her was that of uncompromising antagonism. The celebration of mass in Holywood Chapel in defiance of the late religious settlement first roused his wrath; and a sermon delivered by him in St. Giles led to the first of those famous interviews with Mary, the record of which makes such a remarkable portion of his *History of the Reformation*. The division of ecclesiastical property, by which those in actual possession received two-thirds, the Reformed ministers one-third, was a further ground of quarrel with the new government. The delay of Mary to confirm the late religious settlement also gave rise to the gravest anxiety on the part of Knox and his brother ministers. In view of the precarious interests of the great cause, Knox spoke out with such frankness as to alienate the most powerful noble in the country, and the one whom he respected most—Lord James Stuart, afterwards the Regent Moray. The marriage of Mary with Darnley (1565) again, however, led them to common counsel, as both saw in this marriage the most serious menace against the new religion. In the subsequent revolt, headed by Moray and the other Protestant nobles, Knox nevertheless took no part, and remained at his charge in Edinburgh. But after the murder of Rizzio he deemed it wise, considering Mary's disposition towards him, to withdraw to Kyle in Ayrshire, where he appears to have written the greater part of his *History*.

The events of the next two years—the murder of Darnley, Mary's marriage with Bothwell, and her subsequent flight into England—again threw the management of affairs into the hands of the Protestant party; and under Moray as regent the acts of 1560 in favour of the Reformed religion were duly ratified by the Estates of the Realm. As in the former revolution, Knox was still the same formidable force the nobles had to reckon with; and at Stirling at the coronation of James VI. (1567), and at the opening of parliament the same year, he preached in that strain which gave his sermons the character and importance of public manifestoes. The assassination of Moray in 1570, and the consequent formation of a strong party in favour of Mary, once more endangered the cause to which he had devoted his life, and the possession of the castle of Edinburgh by the queen's supporters forced him to remove to St. Andrews for safety. He had already had a stroke of apoplexy,

and he was now but the wreck of his former self, but his spirit was as indomitable as ever. The description of him at this period by James Melville can never be omitted in any account of Knox. 'Being in St Andrews he was very weak. I saw him every day of his doctrine go hulle and fear, with a furring of martvicks about his neck, a staff in the one hand, and good godly Richart Ballanden, his servant, holding up the other oxtar, from the abbey to the parish church; and he the said Richart and another servant lifted up to the pulpit, where he behaved to lean at his first entry; but or he had done with his sermon, he was so active and vigorous that he was like to ding that pulpit in blades, and fly out of it.'

It was the desire of his congregation of St Giles to bear him once more before he died. Accordingly, by short stages, he made his way to Edinburgh, and on the 9th November 1572, at the induction of his successor in office, he made his last public appearance. He died the same month at the age of sixty-seven, and was buried in the churchyard then attached to St Giles, behind which church a small square stone in the pavement of Parliament Square, marked 'I.K., 1572,' now indicates the spot where he is supposed to lie. The saying of the Regent Morton at his grave, 'Here lyeth a man who in his life never feared the face of man' (Cadderwood), was the most memorable panegyric that could have been pronounced to his memory.

Knox was twice married. His first wife, Marjory Boyes, died in 1560, leaving him two sons. By his second wife, Margaret Stewart, daughter of Lord Ochiltree, whom (little more than a girl) he married in 1564, he had three daughters. His widow and all his family survived him.

In their broader features the character of Knox and of the work he achieved cannot be misread. In himself he stands as the pre-eminent type of the religious Reformer—dominated by his one transcendent idea, indifferent or hostile to every interest of life that did not subserve its realisation. He is sometimes spoken of as a fanatic; but the term is hardly applicable to one who combined in such degree as Knox the shrewdest worldly sense with an ever-ready wit and a native humour that declares itself in his most serious moments and in his treatment of the loftiest subjects. To blame him for intolerance or harshness is but to pass judgment on his age and on the type to which he belongs. It is his unquestionable tribute that the work he accomplished was the fashioning anew of his country's destinies. The revolution he was the main instrument in effecting was not merely the substitution of one set of dogmas for another; it was the transformation of the national ideals, the quickening of the national life, the victory of principles which eventually assured to Scotland the free and natural development of the life of her people. It has to be added that by his *History of the Reformation in Scotland* Knox holds a place of his own in the history of literature. His narrative, as was to be expected, is that of one who saw only a single aspect of the events he chronicles; but the impress of the writer's individuality, stamped on every page, renders his work possibly unique in English literature.

See McOric, *Life of Knox* (1811; 7th ed. 1855); *The Works of John Knox*, edited by David Laing (6 vols. 1846-64); Carlyle, *Heroes and Hero-Worship*; Lorimer, *John Knox and the Church of England* (1875); short works by Mrs MacCunn (1895) and Taylor Innes (1896); and the Life by the present writer (1895).

Knoxville, a city of Tennessee, stands amid picturesque scenery on the Holston River, at the head of steamboat navigation, 165 miles E. of Nashville. It is a railway junction, and has manufactures of iron goods, wooden wares, flour,

&c. Here are the state university and the agricultural college, the state school for deaf-mutes, an industrial school for coloured pupils, and a handsome post-office. Pop. (1880) 10,917; (1890) 22,535.

Knur and Spell (called by Strutt 'Northen Spell'), an old English game played with a ball, which is 'risen' from a trap and hit with a bat made for the purpose. The ball, called the 'knur,' is made of wood, a little bigger than a walnut. The bat, called a 'tripstick,' as it is also used to spring the trap or 'spell,' consists of a piece of hard wood, 6 by 4 inches, and 1 inch thick (the pommel), attached to a supple handle from 3 to 4 feet long, which the player grasps with both hands, giving the full swing of his body with the stroke. The game consists of the cumulative distance of a given number of strokes, the player who has the greatest number of yards being the winner.

Knutsford ('Canute's ford'), a pleasant-looking town of Cheshire, 15 miles SW. of Manchester by rail, the Cranford of Mrs Gaskell's sketches, with manufactures of cotton, worsted, and leather goods, and a pop. of (1851) 3127; (1881) 4290. In 1888 the elder son of Sir Henry Holland (q.v.) was created Baron Knutsford. See H. Green's *History of Knutsford* (1859).

Knysna, a forest track and elephant preserve, extending from the sea to the Outeniqua Mountains in Cape Colony, 150 miles W. of Port Elizabeth.

Koala (*Phascolarctus cinereus*), a marsupial, restricted to eastern Australia, of the family Phalangeridae, and pretty nearly resembling the Phalangers in dentition, but having the molar teeth much larger. The toes of the fore-feet are in two opposable groups, of two or three, a character

Koala (*Phascolarctus cinereus*).

not found in any other quadruped, but well adapted to grasping the branches of trees, on which the koala often hangs with its back undermost, like the sloth. There is scarcely any rudiment of a tail. The general form is not unlike that of a young bear, whence the name of 'Native Bear.' The female carries her young on her back for a long time after it is capable of leaving her pouch.

Kobbe. See DAR-FER.

Kobolds. See GÖBLIN, DEMONOLOGY.

Koch, KARL, botanist, was born at Weimar, 6th June 1809. He studied at the universities of Würzburg and Jena, and in 1836 undertook a scientific journey to southern Russia. In 1843-44 he visited Armenia, Kurdistan, Transcaucasia, and the Crimea. He was appointed extra-ordinary professor of Botany at Jena in 1836, and in 1848 at Berlin, where he died, 25th May 1879. His chief work is his *Dendrologie* (1869-72); but he also published several books of travel, *Beiträge zu einer Flora des Orients* (6 parts, 1848-54), and a map of Transcaucasia and Armenia.

Koch, ROBERT, an eminent bacteriologist, was born at Klausthal, in the Harz, 11th December 1843, studied at Göttingen, and practised medicine at Hanover and elsewhere. His investigations in connection with wounds, septicæmia, and splenic fever gained him a seat on the imperial board of health in 1880; and his further researches in microscopy and bacteriology led to his discovery in 1882 of the *Bacillus tuberculosis*. In 1883 he was made a privy-councillor, and appointed leader of the German expedition sent to Egypt and India in quest of the cholera germ (see BACTERIA, fig. 5; also CHOLERA). In 1885 he was appointed professor at Berlin, and in 1891 director of the new institute for infectious diseases. He made valuable investigations on rinderpest in South Africa, leading to a method of prophylactic inoculation; and in 1898 he began a two years' series of investigations on malarial fever in Italy, Greece, East Africa, India, and New Guinea. For Koch's postulates, see GERM; and for his tuberculin, see TUBERCLE, p. 317. He has written on splenic fever (1876 and 1882), on wound poison (1878), and other subjects.

Kock, CHARLES PAUL DE (1794-1871), born at Passy, near Paris, was the son of a Dutch banker who perished on the scaffold during the French Revolution. He devoted himself to literature against the wishes of his relatives, and produced an endless series of novels, vivacious, piquant, and readable, but hardly reaching the dignity of literature. However, they will retain their value as pictures of lower middle-class life in Paris in the first half of the 19th century, especially in its shadier sides; and they display a marvellous fertility in the invention of incidents, more or less equivocal in character, in the life of the French bourgeoisie, its *cabarets*, and its *quaiettes*. His undeniable gifts are marred by a coarse vulgarity that seems in grain, and an utter absence of style. Yet his stories were for long immensely popular, and we know that for thirty years they were the sole reading of Major Pendennis. Here may merely be named *Georgette; Gustave; Le Barbier de Paris; La Femme; le Mari et l'Amant; Mœurs Parisiennes*. The collected edition of his works fills 56 vols. (1844-45). See his *Memoires written by Himself* (1899). **HENRI DE KOCK**, his son (born 1821; died 17th April 1892), followed his father as closely as he could, with a series of far weaker novels. Another work is his *Souvenirs de Napoleon III. a Wilhelmshöhe* (1871).

Kodiak. See KADIAK.

Kohat, the headquarters of Kohat district, in the Punjab, is pleasantly situated in a mountain-valley, 37 miles S. of Peshawar. It is surrounded by a wall 12 feet high, and has cantonments to the east and a fort to the north. Guns and rifle-barrels are manufactured near by. Pop. (1881) 18,179; (1891) with cantonment, 27,003. The district has an area of 2771 sq. m., and a pop. of 203,175.

Kohleth. See ECCLESIASTES.

Koh-i-nûr. See DIAMOND.

Kohistan, a name given to certain mountainous regions in Persia, Afghanistan, and Turkestan.

Kohl. See ALCOHOL.

Kohl, JOHANN GEORG, traveller and author, was born at Bremen, April 28, 1808, studied at Göttingen, Heidelberg, and Munich, and settled in Dresden in 1838. From this point he made excursions to every important district of Europe, and on his return from each expedition published his experience in a series of works. In 1854 he went to America, where he spent four years, and prepared a series of maps for the government. Returning to Germany he became city librarian at Bremen, and there died on 28th October 1878. His

writings include works on Austria, Britain, the Rhine, the Alps, Russia, Denmark, the Netherlands, Istria, Dalmatia, and Montenegro (all between 1842 and 1851); also books of travel in Canada (1856) and the United States (New York, 1857); and histories of the discovery of America (1861; Eng. trans. 1862), of the north-eastern coast of America ('Maine Historical Collections,' Portland, 1869), and of Magellan Strait (1877).

Köhler, REINHOLD, a learned student of the history of literature, was born at Weimar, 24th June 1830, studied philology at Jena, Leipzig, and Bonn, and accepted in 1857 the post of a librarian in the ducal library at Weimar, of which he became the chief in 1881. Besides numerous contributions to the learned journals, such as his admirable notes on J. F. Campbell's tales in Benfey's *Orient und Occident* (vol. ii. 1864), he published works on the *Donquixote* of Nomms (1853), on Kleist's Works (1862), on Herder's *Civil* and its sources (1867); and edited *Alte Bergmannslieder* (1858), four dialogues of Hans Sachs (1858), *Kunst über alle Künste* (a 1672 translation of Shakespeare's *Titus of the Shrew*), Dante and the German translations (1865), Wieland's *Oberon* (1868), and Schiller's *Ästhetische Schriften* (1871). His admirable notes to Krenzwald's *Estnische Märchen* (1869) and Laura Gontzenbach's *Schwedische Märchen* (1870) are known to all folklorists. He died 15th August 1892.

Kohl-rabi (Ger. *Kohl-rübe*, 'Kale-turnip;') so French *Chou Rave*), a cultivated variety of the Kale or Cabbage (*Brassica oleracea*), distinguished by the swelling of the stem just above the ground, in a globular form, like that of the turnip, but with the leaf-stalks springing from the swollen part, and adding to the peculiarity of its appearance. This is the part which is used, and its uses are similar to those of the turnip. It is a common field-crop in Sweden.

Koïl. See ALIGARH.

Koko-nor, or KUKU-NOR, a lake of Tibet, near the frontier of the Chinese province of Kan-su, fills a depression surrounded by mountains, and lies, according to Prjevalsky, 12,097 feet above the level of the sea. Its very salt waters, exquisitely blue in colour, cover 66 miles by 40. It contains five islands, one with a Buddhist monastery.

Kok-ra Wood, or COCTS WOOD, the wood of an Indian tree, *Lepidostachys Roeburghii*, which belongs to a very small natural order, Scapaceæ. It is imported into Britain in logs of 6 or 8 inches in diameter, having the heart-wood of a rich deep brown colour and very hard; and is much used in the manufacture of flutes and other musical instruments.

Kokstadt. See GRIQUALAND EAST.

Kola, a place of only 770 inhabitants, but worthy of notice as the most northern town of European Russia. It is situated on the peninsula of Kola, is the capital of Russian Lapland, and has a spacious harbour. The peninsula of Kola is a dreary expanse of forests and lakes, but has several ranges of mountains, one of which, the Umbalek Mountains, on the east side of Lake Inandra, rising to 3300 feet, is the second highest (after the Caucasus) in Russia. See Rae's *White Sea Peninsula* (1882).

Kola Nuts, or GURU NUTS, the seeds of *Sterculia acuminata*, a tree native to the regions of Africa south of 7° 30' lat. From the 17th century traders brought home marvellous stories of these nuts; but it was in 1865 that Dr Daniell discovered that they contained an alkaloid identical with that found in tea, coffee, mate, and guarana, and from that time they have received more attention. In the Soudan they are valued so highly that no greater honour can be given than the presentation

of some of the nuts. In times of drought a single nut has bought a slave, while a bride of the highest family has often been sold for a handful. This excessive value is due to the possession of remarkable virtues, the explanation of which is still wanting. The natives chew the nuts, extracting the juice and spitting out the fibrous matter. By means of it they profess to withstand hunger, thirst, sleep, and exhaustion. Analysis reveals only about 2 per cent. of theine, tea and coffee containing from $\frac{1}{2}$ to 3 per cent., while there is also a small amount of volatile oil; but this does not account for all its virtues, and the explanation given is that it is used in the fresh state, and, like coca, loses its powers on drying. In Africa the seeds are only transported when carefully wrapped in leaves resembling lotus, and are frequently moistened. As imported into Europe they undoubtedly, like tea and coffee, possess a stimulant value, but beyond that their virtues are doubtful. In Africa they possess a reputation for purifying and clarifying muddy water, but it does not appear that they are superior to other mucilaginous seeds for this purpose. In certain forms of diarrhoea they are useful, and may be taken, like tea, as a decoction. They have been recommended for dipsomania, but their utility in this respect is small. The rotten nuts and those which had become dry began to be exported in 1877 to Germany and France, for the purpose of mixing with chocolate; and in recent years various preparations—kola paste, chocolate, aerated water, &c. have been introduced, the value of which is doubtful. Dilute alcohol extracts most colouring and extractive matter from the seeds, and this tincture or a decoction may be used for administering them; but the best and simplest way is to chew the seed by itself, or take the powder mixed with some sweetening material.

Sterculia acuminata:
a, the nut.

Kolapur (*Kolhapur*), the capital of a tributary state in Bombay, 141 miles S. by E. of Poona, with many handsome modern buildings and an active trade. Pop. (1891) 45,815.—*Kolapur state* has an area of 2816 sq. m., and a pop. of 913,131, nine-tenths Hindu.

Kolarians. See INDIA, Vol. VI. p. 103.

Kolguef, or KALGUEF, an island of Russia, in the Arctic Ocean, belonging to the government of Archangel. Area, 1350 sq. m. It is visited in summer by fur-hunters, walrus-hunters, and fowling, who capture eider-ducks, swans, and other seabirds that yield down. The only permanent inhabitants are a few Samoyedes.

Kolin, or KOLLIN, a town of Bohemia, on the Elbe, 38 miles by rail E. by S. from Prague, is a centre of the sugar industry of the country, and manufactures chemicals, oil, metal wares, &c. Pop. 11,636. A great battle was fought, June 18, 1757, in its vicinity between 54,000 Austrians under Marshal Daun and 31,000 Prussians under

Frederick II. The latter were defeated with a total loss of 14,000 men; the Austrians lost 8000.

Kollar, JAN, Slavonic poet and scholar, was born 29th July 1793 at Mossoez, in the north-west of Hungary, studied at Presburg and Jena, and in 1819 became pastor of a Protestant congregation at Pesth. His first work was a volume of *Poems* (1821); this was followed by an enlarged edition of the same entitled *The Daughter of Glory* (1824), his greatest work. He also published a collection of Slavonic *Folk-songs* (2d ed. 1832-33), and some books on the Slavonic peoples and languages. He was made professor of Archaeology at Vienna in 1849, and died there, January 24, 1852. See the Autobiography included in his *Collected Works* (2d ed. 4 vols. Prague, 1868).

Kölliker, ALBERT VON, anatomist and embryologist, was born at Zurich on 6th July 1817, studied natural sciences at Zurich, Bonn, and Berlin, was appointed professor of Physiology and Comparative Anatomy at Zurich in 1845, and in 1847 exchanged this for the chair of Anatomy at Wurzburg. He is principally distinguished by his labours in the department of microscopic anatomy and on the development of the embryo. Among his principal works must be named his *Handbuch der Gewebelehre des Menschen* (translated for the Sydenham Society by Bask and Huxley as *A Manual of Human Histology*), *Die Siphonophora oder Schwammthiere von Messina*, the *Challenger Report on Penmatulida* (vol. i. 1880), and *Entwickelungsgeschichte des Menschen u. d. höheren Thiere*. In association with Von Siebold he started the important *Zeitschrift für wissenschaftliche Zoologie*.

Köln. See COLOGNE.

Kolouca, a town of Austrian Galicia, on the Pruth, 43 miles by rail NW. of Czernowitz. Situated not far from a rich petroleum region, it has works for refining petroleum and for making paraffin candles. Pottery is, however, the staple manufacture. Pop. 30,160 (nearly half are Jews).

Kolonna, a town of Russia, on the Moskva, 68 miles by rail SE. of Moscow. It manufactures silk, linen, leather, soap, and machines. Pop. (1894) 28,323. Here the Mongols under Batu defeated the Russians in 1237.

Kolosvár. See KLAUSENBURG.

Koltzoff, ALEXEI VASSILIEVICH (1809-42), a Russian poet of the people, left but few songs, yet those among the choicest lyrics of Russian poetry.

Kolyta, a river of eastern Siberia, flowing from the Stanovoi Mountains 995 miles north east to the Arctic Ocean. It is only free from ice during eleven weeks in the year. Its waters are full of fish.

Kouorn, a town and fortress in Hungary, situated on the island of Schutt, in the Danube, which is here crossed by a bridge of boats, 48 miles NW. of Pesth. The town, which is irregularly built, with narrow, gloomy streets, contains (1891) 13,072 inhabitants, who trade in corn and timber, cultivate the vine, and carry on fishing. The fortress, one of the strongest in Europe, commenced in the end of the 13th century, was greatly enlarged and strengthened by Matthias Corvinus; the fortifications were again restored and improved in 1805-9. It requires for its defence at least 15,000 men and 400 pieces of artillery. Although taken by Ferdinand I. in 1527, it successfully withstood the Turks in 1543, 1591, and 1663. Klapka held it for the Hungarians against the Austrians from October 1848 to September 1849.

Kong, a district of West Africa, stretching from 8° 30' to 12° N. lat. along the upper course of the Comoé (mouth at Grand Bassam on the Ivory Coast), and measuring some three degrees of longitude. The district is a plateau, whose average

elevation is 2300 feet above sea-level, rising in a few groups of peaks up to 6000 feet. The Kong Mountains of the geographers are affirmed by Binger to be merely isolated granitic peaks only 300 feet above the plateau. The people, Mandingoes by race and Mohammedans by religion, manufacture cotton stuffs and carry on indigo-dyeing. The capital of the state is the town of Kong, with from 12,000 to 15,000 inhabitants. This district was declared a protectorate of France in 1889. See *Bull. Soc. Geog. de Paris* (1889) for a paper by Captain Binger.

Konich, or KONIYA. See KONIUM.

König, FRIEDRICH, the inventor of the steam-press, was born at Eisleben, 17th April 1774. He became a printer, and at the same time eagerly prosecuted scientific studies. Having devoted himself to the invention of means of printing by machinery, he applied in vain for the necessary pecuniary assistance in various quarters, his schemes being rejected as impracticable; but at last Thomas Bensley, a printer in London, came forward to his support, and a patent was obtained in 1810 for a press which printed like the hand-press by two flat plates. A second patent was obtained in 1811 for a cylinder-press, and others in 1813 and 1814 for improvements upon it. This improved machine was adopted in 1814 by the proprietors of the *Times*. In the later part of his life König was a partner in a company for making steam printing-presses at Oberzell, near Würzburg, in Bavaria. He died 17th January 1833. See PRINTING, and Gobel's monograph (Stutt. 1883; Fr. trans. Paris, 1885).

Königgrätz, a town of Bohemia, on the Elbe, 73 miles by rail E. by N. from Prague. It is the seat of a bishop, and has a Gothic cathedral. The fortifications erected in 1780-89 have been recently razed. Here Ziska was buried in 1424. Pop. (1890) 7815; with its four suburbs, 16,500. A signal victory was gained here by 240,000 Prussians over 220,000 Austrians on 3d July 1866. The Prussian loss was 9000 men, the Austrian 21,000, with 22,000 prisoners. The Austrians name the battle *Sadowa* from an adjoining village nearer the centre of the battlefield.

Königsberg, a town and fortress in East Prussia, situated on the river Pregel, 4½ miles from the Frisches Haff and 366 by rail NE. from Berlin. The original nucleus of the place was the block-house built in 1255 by the Knights of the Teutonic Order, but, although founded so long ago, Königsberg is a modern town; scarce any of its old buildings now exist. The castle, which grew out of the block-house, belongs chiefly to the 16th and 18th centuries. It was the headquarters of the grandmaster of the Teutonic Order, and from 1525 to 1618 was the residence of the Dukes of Prussia. In the castle chapel (built in 1592) Frederick I. crowned himself first king of Prussia in 1701, and William I. was crowned in 1861. The cathedral, now the Knopfdorf parish church, is a Gothic structure, erected in 1333 and thoroughly restored in 1856; in an adjoining building Kant (q.v.) lies buried. The university was founded as a Lutheran institution in 1544, and rebuilt in 1844-65. Connected with it are an observatory (1811), a zoological museum (1819), a botanical garden (1809), a library of 200,000 volumes, together with the usual laboratories and collections. The number of official teachers was 96 and the number of students 760 in 1889. One of the most imposing edifices in the town is the new exchange (1875). The academy of painting, a music school, and a commercial school may be mentioned. Of the industries the foremost place belongs to the iron-works, casting and machinery-making; next come

the manufacture of pianos, thread, tobacco, beer, the confection marchpane, &c. Printing and the preparation of meerschaum (175 tons annually) are also prosecuted. Königsberg is one of the chief continental centres for the tea trade, and ships immense quantities of corn. The exports average in value £8,118,670 annually, and consist mostly of grain, flax, and hemp, with smaller quantities of timber, wool, spirits, sugar, and rags; the imports average £10,117,800, and embrace, besides grain, flax, and hemp for transport, tea, woven goods, metal wares, herrings, timber, chemicals, and coals. Large merchant-vessels which cannot approach the town unload and load at Pillau, 28½ miles by rail to the west, at the entrance from the Baltic to the Frisches Haff. It is proposed to construct a channel through the lagoon (*haff*), with a depth of 20 feet, from Pillau to Königsberg. Pop. (1875) 122,636; (1890) 161,666. The town was first fortified in 1626; but was converted into a modern fortress of the first class in 1843 and since. Königsberg was occupied by the Russians in 1758 and by the French in 1807. See works by Faber (1849) and Schubert (1855).

Königshütte, a rapidly growing centre of great coal, iron, zinc, and copper works in Prussian Silesia, 110 miles SE. of Breslau by rail. It was constituted a town in 1869, out of several mining villages. Pop. (1885) 32,072; (1891) 36,502.

Königsmark, COUNT PHILIPP CHRISTOPH VON, a Swede by birth, born about 1662, who, having entered the service of the Elector of Hanover, was accused of carrying on a love intrigue with Sophia Dorothea, wife of the Elector George, afterwards George I. of England, and suddenly disappeared on 1st July 1694. It is believed that he was murdered. Sophia was confined in the castle of Ahlden until her death in 1726. See a *Quarterly* article (1885); Vizetelly, *Count Königsmark* (1890); and Wilkin's *Love of an Unconquered Queen* (1900). —MARIE AURORA, Countess of Königsmark, sister of Count Philipp, born at Stade in 1670, became in 1694 the mistress of Augustus II., Elector of Saxony, and by him mother of the celebrated Marshal Saxe (q.v.). When Augustus grew tired of her she entered Quedlinburg nunnery, and died prioress of it, 16th February 1728.

Königstein, a fortress of Saxony, once regarded as impregnable, but now of no military importance, stands on a rock 800 feet above the Elbe, 24 miles SE. of Dresden by rail. Here the Saxon army yielded to Frederick the Great in 1756.

Königswart, a town of Bohemia, 14 miles by rail SE. from Eger, is situated in a romantic valley, has a fine castle belonging to Prince Metternich, chalybeate and acidulated springs, and a bathing establishment. Pop. 2112.

Konkan, the name given to the strip of coast-districts in Bombay Presidency. The breadth varies from 1 to 50 miles, as the Western Ghats approach or recede from the sea. Konkan is rather a geographical than an administrative division, and includes, besides North Kanara, the British districts of Ratnagiri, Kolaba, and Thana, Bombay Island, three native states, and Goa, with a total area of 17,000 square miles, and a population of 5,000,000. The annual rainfall is over 100 inches.

Konrad. See CONRAD.

Koodoo. See ANTELOPE, ELAND.

Kootenay, a river of British Columbia which rises in Canada, passes through corners of Montana and Idaho, but returns to Canada again, and, after a course of 150 miles (during which it forms a lake), falls into the Columbia River. Gold is largely found in its basin, especially since 1894, and several mining towns have sprung up.

Kopeck, a Russian bronze coin, the hundredth part of a Rouble (q.v.), and equivalent to $\frac{1}{2}$ farthing of sterling money.

Kopparberg. See FALUN.

Korais. See CORAIS.

Korán (Arab., from *karua*, 'to read'), *The Reading*, by way of eminence; a term first applied to every single portion of Mohammed's 'Revelations,' used at a later period for a greater number of these, and finally for their whole body, gathered together into the one book which forms the religious, social, civil, commercial, military, and legal code of Islam. The Korán is also known under the name of Furgán ('discrimination,' 'test'); further, of *Al Moshaf* (*The Volume*), or *Al-Kitáb* (*The Book*, in the sense of 'Bible'), or *Al Dhikr* ('the Reminder,' or 'the Admonition'). The Korán is, according to the Moslem creed, coeval with God, uncreated, eternal. Its first transcript was written from the beginning in rays of light upon a gigantic tablet resting by the throne of the Almighty; and upon this tablet are also found the divine decrees relating to things past and future. A copy of it, in a book bound in white silk, jewels, and gold, was brought down to the lowest heaven by the angel Gabriel, in the blissful and mysterious 'night of power or destiny,' in the month of Ramadan. Portions of it were, during a space of twenty-three years, communicated to Mohammed, both at Mecca and Medina, either by Gabriel in human shape, 'with the sound of bells,' or through inspirations from the Holy Ghost 'in the Prophet's breast,' or by God himself, 'veiled and unveiled, in waking or in the dreams of night.' Traditions vary with respect to the length of the individual portions revealed at a time, between single letters, verses, and entire chapters or Surahs (Arab., 'courses,' as of bricks in a wall). The first revelation forms, in the present arrangement of the book, verses 1-5 of surah xvi., and begins with the words: 'Read [preach], in the name of thy Lord, who has created all things!'

Mohammed dictated many of his inspirations to a scribe, in broken verses or in finished chapters, and from this copy the followers of the Prophet procured other copies—unless they preferred learning the oracles by heart from the master's own mouth. The original fragments were without any attempt at a chronological or other arrangement, promiscuously thrown into a box, and a certain number were entirely lost. A year after the death of Mohammed the scattered portions were, at the instance of Abu bekir, collected by Zaid Ibn Thábit of Medina, the Prophet's amanuensis, 'from palm leaves, skins, blade-bones, and the breasts of men,' and faithfully copied, without the slightest attempt at moulding them into shape or sequence, together with all the variants, the repetitions, and the gaps. This volume was entrusted to the keeping of Hafsa, one of the Prophet's wives, the daughter of Omar. A second redaction was instituted in the thirtieth year of the Hegira, by Calif Othman, to fix the text and the reading according to the Qoráish idiom; many different readings being current among the believers. He ordered new copies to be made from the original fragments, in which all the variants were to be expunged, but without any further alteration being introduced; and the old copies were all consigned to the flames. With respect to the succession of the single chapters, 114 in number, no attempt was made at establishing continuity, but they were placed side by side according to their respective lengths; so that immediately after the introductory fátah or exordium follows the longest chapter, and the others are ranged after it in decreasing size. They are not numbered in the

manuscripts, but bear distinctive, often strange-sounding headings, as the Cow, Congealed Blood, the Fig, the Star, the Towers, Saba, the Poets, &c., taken from a particular matter or person treated of in the respective chapters. Every chapter or surah but one begins with the introductory formula: 'In the name of God, the Merciful, the Compassionate.' It is generally stated at the beginning whether the surah was revealed at Mecca or at Medina. Every chapter is subdivided into smaller portions (*Ajál*, 'verses,' lit. 'signs'), varying in the ancient 'seven editions' or primitive copies (of Medina [two], Mecca, Kufa, Basra, Syria, and the 'Vulgar Edition' reduced by Noldeke to four editions) between 6000 and 6036. The number of words in the whole book is 77,639, and an enumeration of the letters shows 323,015 of these. Other—encyclical—divisions of the book are into thirty *ajzâ* and into sixty *ahzâb*, for the use of devotional readings in and out of the mosque. Twenty-nine surahs commence with certain letters of the alphabet, 'of which God alone knows the meaning.'

The contents of the Korán as the basis of Mohammedanism will be considered under that head, while for other questions of authorship and chronology we must refer to MOHAMMED. But the chief doctrines laid down in the book are that there is one God, one true religion, and a day of judgment. When mankind turned at different times from truth, God sent prophets to lead them back to it, Moses, Christ, and Mohammed being the most distinguished. Both punishments for the sinner and rewards for the pious are depicted with great diffuseness, and exemplified chiefly by stories taken from the Bible, the Apocryphal writings, and the Midrash. Special laws and directions, admonitions to moral and divine virtues, more particularly to a complete and unconditional resignation to God's will ('Islam'), legends, principally relating to the patriarchs, and, almost without exception, borrowed from the Jewish writings, form the bulk of the book, which throughout bears the most palpable traces of Jewish influence. The Hebrew scriptures were known to Mohammed by oral communication only; hence frequently odd confusion in stories taken from that source.

The general tendency and aim of the Korán is found pretty clearly indicated in the beginning of the second chapter: 'This is the book in which there is no doubt; a guidance for the pious, who believe in the *mysteries of faith*, who perform their *prayers*, give *alms* from what we have bestowed upon them, who believe in the *revelation* which we made unto thee, which was sent down to the *prophets before thee*, and who believe in the *future life*,' &c. To unite into one the three principal religions which he found in his country—Judaism, Christianity, and Heathenism—was Mohammed's ideal; and the Korán, properly read, discloses constantly the alternate flatteries and threats aimed at each of the three parties. Certain abrogations made by the Prophet himself of special passages in the Korán are due to the vacillating relation in which he at first stood to the different creeds, to concessions first made and then revoked. Witness the 'Kiblah,' or the place where the believer was to turn in his prayer, being at first Jerusalem; and also forbearance to idolaters forming one of the original precepts.

The Korán expresses the thoughts and ideas of a Bedawi Arab in Bedawi language and metaphor. In the matter there is endless repetition, little order or coherence, and not a little inconsistency. The style is very unequal; often noble and forcible, often familiar or dull. Accepted as the miraculous utterance of the Almighty, the Korán stands above criticism, and is not proved but assumed to be the

unapproachable standard of grammatical and every other merit. It is written in prose wherein the links of each sentence rhyme with one another, and generally the same rhyme is maintained through the whole chapter. This is and was a common literary form, and to it the Arabic language by its symmetrical formation of words lends itself very readily. Refrains are introduced in some surahs; and plays upon words are not disclaimed.

The outward reverence in which the Koran is held throughout Islam is exceedingly great. It is never held below the girdle, never touched without previous purification; and an injunction to that effect is generally found on the cover which, in the eastern binding, overlaps the boards. It is consulted on weighty matters; sentences from it are inscribed on banners, doors, and the like. Great lavishness is displayed upon the material and the binding of the sacred volume; the copies for the wealthy are sometimes written in gold, and the covers blaze with gold and precious stones. Nor is anything more hateful in the eyes of a Moslem than to see the book in the hands of an unbeliever.

The Koran has been commented upon so often that the names of the commentators alone would fill volumes. Thus, the library of Tripoli, in Syria, is reported to have once contained no less than 20,000 different commentaries. The most renowned are those of Samachshari (died 539 H.), Baidhawi (died 685 or 716 H.), Mahalli (died 870 H.), and Soyuti (died 911 H.). The principal editions are those of Hinckelmann (Hamburg, 1694), Marracci (Padua, 1698), Fingel (1834), besides many editions of small critical value printed in St. Petersburg, Kasan, Teheran, Calcutta, Cawnpore, Serampore, &c. The first, but very imperfect, Latin version of the Koran was made by Robertus Retensis, an Englishman, in 1143 (ed. Basel, 1545). The principal translations are: into Latin, that of Marracci (1698); into English, Sale (1734; ed. by Rev. E. M. Wherry, 4 vols. 1882-86), who explains somewhat while he translates, and whose notes are voluminous and invaluable, Rodwell (1861; 2d ed. 1878), and Palmer (1880), whose rendering is the best; into French, Savary (1783), Garcin de Passy (1829), Kazimirski (1849; new ed. 1884); into German, Megerlin (1772), Waid (1828), Ulbrann (1840); besides Persian, Turkish, Malay, Hindustani, and other eastern translations. Of concordances to the Koran may be mentioned those of Fluzel (1842) and Kazem-Bek (St. Petersburg, 1859), and that published at Calcutta in 1811. Among authorities whose works may be consulted on the Koran are Marracci, Sale, Savary, Waid, Geiger, Amiri, Sprenger, Lane, Muir, Weil, Noldeke, and Lane Poole.

Kordofan, or the White Land, lately a province of the Egyptian Soudan (q.v.), is separated from Senaar on the E. by the White Nile, and from Dar Fur on the W. by a strip of desert. It extends from 12 to 16° N. lat. and from 29° 30' to 32° 30' E. long.; its area, including Takalla on the S., has been estimated at 41,500 sq. m., and its population at 280,000, of whom three-fourths are slaves. The province is traversed by no rivers; but water is found almost everywhere at a comparatively short depth. The surface is undulating. The chief produce of the soil is millet, the principal food of the inhabitants. Gum trees, mimosa, thorny plants, and prickly grass are common, but there is no forest timber. Gums, hides, ivory, ostrich-feathers, and gold are exported. Cattle and camels are bred in great numbers. Three-fifths of the population are settled; the rest are nomadic. The aborigines belong mainly to the Nuba stock, but use a negro tongue and are mostly pagans. There is a large element of nomad and slave-hunting Arabs, Moslems in faith. The capital is El Obeid, with about 30,000 inhabitants, situated in the centre of the country. In the end of the 18th century Kordofan was conquered by the ruler of Senaar, then by the sultan of Dar Fur; in 1821 it was annexed by Mehemet Ali of Egypt, but was

lost to the Egyptians by the Mahdi's revolt in 1883. Since 1899 it has been part of the reconstituted Egyptian Soudan (see SOUDAN).

Korea. See COREA.

Körner, KARL THEODOR, a patriotic German poet, the son of Schiller's friend, Christian G. Körner, was born at Dresden, 23d September 1791. After irregular studies at Freiberg, Leipzig, and Berlin, young Körner, through Kotzebue's influence, was appointed dramatist to a Vienna theatre; for it he wrote some light comedies, such as *Der Grane Domino* and *Der Nachtwächter*, and some tragedies, of which *Zring*, a work full of noble enthusiasm, was the most successful. The uprising of the German nation against Napoleon inspired Körner with patriotic ardour. He joined Lutzow's celebrated corps, and not only displayed heroic personal courage in many encounters, but encouraged his comrades by fiery patriotic songs. These, published in 1814 under the title of *Lyre und Schwert* (Eng. trans. *Lyre and Sword*, 1839), are regarded by the Germans with a kind of sacred admiration, and have gone through a great number of editions. The most famous of these pieces is the *Schwert-Lied*, composed in a pause of battle, and only a few hours before the author fell in a skirmish, between Schwerin and Gadebusch, on 26th August 1813. He was buried near Wobelin; there his father and mother and sister were also interred. A collected edition of his works in one volume (Berlin, 1834; new ed. 1879) was published by Streeckfuss. A biography of the poet, written by his father, has been translated into English, 'with selections from his poems, tales, and dramas,' by G. F. Richardson (Lond. 2 vols. 1845). A museum of Körneriana was formed at Dresden in 1873. See LIVES by Lehmann (1819), Eichard (1821), and Bauer (1883); also Jonas' life of his father (1881).

Körös, NAGY ('Great Körös'), a town of Hungary, 55 miles SE. of Budapest by rail. Pop. (1891) 25,484. KISS KÖROS ('Little Körös'), a small town, 66 miles by rail S. by E. of Budapest, is the birthplace of Petöfi. Pop. 6734. Both places grow wine. See CSOMA DE KÖROS.

Korosko, a small village of Lower Nubia, with a few wretched huts straggling along the right bank of the Nile, about midway between the first and second cataracts. Here the Nile boats land the goods that are conveyed by caravan to the Soudan.

Korveii. See CORVEL.

Kosciusko (KOSCIUSZKO), TADEUSZ, a Polish general and patriot, was born on 12th February 1746 in Lithuania. He chose the career of arms, and was trained in France. In 1777 an unhappy love affair drove him to the United States, where he fought for the colonists and advanced to the rank of brigadier general. He returned to Poland in 1786. When Russia attacked his country in 1792, Kosciusko held a position at Dubienka for five days with only 4000 men against 18,000 Russians. In spite of this the pusillanimous King Stanislaus submitted to the Empress Catharine, whereupon Kosciusko resigned his command and retired to Leipzig. After the second partition of Poland he put himself at the head of the national movement in Cracow, and was appointed dictator and commander-in-chief (1794). His defeat of a greatly superior force of Russians at Racławice was followed by a rising of the Poles in Warsaw. He established a provisional government, and took the field against the Prussians, but, defeated, fell back upon Warsaw and maintained himself there valiantly, until the approach of two new Russian armies induced him to march to meet them. He was overpowered by superior numbers in the battle

of Maciejowice, 10th October 1794; and, covered with wounds, he himself fell into the hands of his enemies—it is then that De Ségur falsely makes him exclaim, 'Finis Polonia!' Two years later the Emperor Paul restored him to liberty. He spent the remainder of his life chiefly in France, prosecuting agricultural pursuits. When Napoleon, in 1806, formed a plan for the restoration of Poland, Kosciusko refused to lend himself to the French monarch's designs. The address to the Poles, which Napoleon published in Kosciusko's name in the *Mondeur*, was a fabrication. In 1814 he besought the Emperor Alexander to grant an amnesty to the Poles in foreign countries, and to make himself constitutional king of Poland. He settled at Solothurn in Switzerland in 1816, and died on 15th October 1817, by the fall of his horse over a precipice. His remains were removed to Cracow (q.v.) by the Emperor Alexander, and were laid side by side with those of John Sobieski. See the biographies by Falkenstein (2d ed. 1834), Chodzko (1837), and Michelet (in *La Pologne Martyr*, 1863).

Kosher (Heb., 'right,' from *gashar*, 'to be right'), pure, according to the Jewish ordinances. Thus 'Kosher meat' is meat killed and prepared by Jews after the Jewish manner, and so fit to be eaten by Jews.

Köslin, a town of Prussia, 5 miles from the Baltic Sea and 85 N.E. from Stettin. There are iron-foundries and manufactures of paper, soap, bricks, &c. It formerly had a mint. Pop. (1885) 17,277.

Kosovo, the 'Field of Blackbirds,' a plain in Turkey, near the Servian frontier, west of the Prishtina, on which two sanguinary battles were fought—(1) between Sultan Murad I. and the Servians under their Tsar Lazar on 15th June 1389; both sovereigns fell, and the Servians lost their independence in consequence of their defeat; (2) between the great Hungarian general Hunyady and Sultan Murad II., on 17th to 19th October 1448, when the former was defeated. See Madame Mijatovich, *Serbian National Songs about Kossora* (Lond. 1881).

Kossuth, LOUIS, the leader of the Hungarian revolution, was born in 1802 at Monok, in the county of Zemplin, in Hungary. His family was of noble rank, but his parents were poor. He studied law at the Protestant college of Szarospatak, and practised for a time. In 1832 he commenced his political career at the diet of Presburg as the deputy of absent magnates, and as editor of a journal which, owing to the state of the law, was not printed, but transcribed and circulated. The subsequent publication of a lithographed paper led, in May 1837, to Kossuth's imprisonment. He was liberated in 1840, and became the editor of the *Pesti Hirlop*, a newspaper in the modern sense of the word, in which he advocated views too extreme for many of the liberals amongst the nobles, but which took strong hold of the youth of the country. In 1847 he was sent by the county of Pesth as deputy to the diet, and soon became the leader of the opposition. He advocated the emancipation of the peasants, the abolition of all feudal rights and privileges, the freedom of the press, &c., and, after the French revolution of 1848, openly demanded an independent government for Hungary and constitutional government in the Austrian hereditary territories. To his speeches must in great part be ascribed not only the Hungarian revolution, but the insurrection in Vienna in March 1848. On the resignation of the ministry in September 1848 he found himself at the head of the Committee of National Defence, and pro-

secuted with extraordinary energy the measures necessary for carrying on the war. As a reply to an imperial decree, dated 4th March, abolishing the Hungarian constitution, he induced the National Assembly at Debreczin, in April 1849, to declare that the Hapsburg dynasty had forfeited the throne. He was now appointed provisional governor of Hungary; but being disappointed in his hopes for the intervention of the Western Powers, and finding the national cause jeopardised by the interference of Russia, he endeavoured to arouse the people to a more desperate effort. The attempt was vain. Finding that the discussions between himself and Gorgei (q.v.) were damaging the national cause, he resigned his dictatorship in favour of the latter. After the defeat at Temesvar on 9th August 1849 he found himself compelled to flee into Turkey, where he was made a prisoner; but, though his extradition was demanded both by Austria and Russia, the Porte resisted their claims. In September 1851 he was liberated by the influence of England and the United States, and, the Republican government of France refusing him a passage through their territory, he sailed in an American frigate to England, where he was received with every demonstration of public respect and sympathy. In December of the same year he landed in the United States, where he met with a most enthusiastic reception. He returned in June 1852 to England, and there he chiefly resided, until Sardinia and France prepared for war with Austria; when, on condition of something definite being done for Hungarian independence, he proposed to Napoleon to arrange a Hungarian rising against Austria. He secured England's neutrality in the event of the war extending to Hungary. The peace of Villafranca bitterly disappointed Kossuth, but did not dishearten him. He made two other attempts (in 1860-61, in conjunction with Cavour and with the help of Napoleon; in 1866, with the aid of Victor Emmanuel) to bring about a rising against Austrian rule in his native country, but without final success. When in 1867 Deak effected the reconciliation of Hungary with the dynasty, and initiated a *modus vivendi* between the two parts of the Austro-Hungarian monarchy, Kossuth retired from active political life. He afterwards lived mostly in Turin, and, although never tired of denouncing the political and economical alliance between Hungary and Austria, abstained from conspiring or agitating against it; but he refused to avail himself of the general amnesty (1867), and to return to his native land to take the oath of fealty to the dynasty he had once dethroned. In 1880-82 he published three volumes of *Memories of my Exile* (Eng. ed. vol. i. 1880); others followed in 1890. He died in Turin, 20th March 1894, and on 1st April was buried amidst national solemnities in the Protestant church at Budapest. See his letters (1862 and 1872), and works on him (in German) by Houm (1851), Frei (1849), and Somogyi (1891).

Kostendil, or KÜSTENDIL, a town of Bulgaria, near the Struma or Strymon, 43 miles SW. of Sofia, has gold and silver mining, warm baths, numerous ruins, and a Greek archbishop. Pop. 11,383.

Kostroma, capital of a Russian government, stands near the junction of the Kostroma with the Volga, 216 miles by rail N.N.E. from Moscow. Of late years the industry of the town has shown great advances. The spinning and weaving of cotton and linen, the manufacture of brandy, dyeing, corn-grinding, and tanning are the chief industries. Pop. (1891) 28,143. The government of Kostroma has on the west the government of Yaroslaff and on the east that of Vyatka. Area, 32,490 sq. m.; pop. (1897) 1,428,893.

Kotah, the chief town of a native state of the same name in Rajputana, standing on the right bank of the Chambal, is a hot, unhealthy city, with a pop. of 40,270. The area of the state is 3803 sq. m.; pop. (1891) 526,267.

Köthen, a town in the German duchy of Anhalt, down to 1853 capital of the principality of Anhalt-Köthen, stands by rail 22 miles N. from Halle and 31 SSE. from Magdeburg. The castle of the former dukes (the line became extinct in 1847) was rebuilt in 1597-1606 after a fire. In the cathedral of St James there are some antique glass windows. The industries embrace iron-foundries, sugar-factories, &c. Pop. (1875) 14,403; (1885) 17,473.

Kotow, the ceremony of prostration, with striking of the forehead on the ground nine times, performed before the emperor of China. The British envoy, Lord Amherst, in 1816 refused to perform the degrading ceremony, and the point was finally conceded by the Chinese in the treaty of 1857. Kotowing is unknown outside of China.

Kotzebue, AUGUST FRIEDRICH FERDINAND VON, a German dramatist, was born at Weimar on 3d May 1761, filled various offices in the public service of Russia, and from an early age was a facile writer of plays, tales, satires, historical works, &c.; he was stabbed to death at Mannheim, 23d March 1819, by Sand, a Jena student, because he had ridiculed the *Burschenschaft* movement. Besides quarrelling with Goethe, Kotzebue satirised the leaders of the Romantic school. Among his dramatic performances, the chief merit of which consists in their knowledge of stage-effect, their lively dialogue, and clever but superficial character drawing, may be mentioned *Menschenhass und Renc* (known on the English stage as *The Stranger*), *Die Hussiten vor Nannburg*, *Die beiden Klingsberge*, *Der arme Poet*, *Armut und Edelstein*, *Die Kreuzfahrer*, *Ostaria*, &c. Kotzebue wrote no fewer than two hundred dramatic pieces, which have been collected in editions of 28 (1797-1823) and of 44 vols. (1827-29).—His son, OTTO VON KOTZEBUE, born on 30th December 1787 at Revel, accompanied Krusenstern round the world in 1803-6, and afterwards made two long voyages of exploration in the Pacific, discovering amongst others the Krusenstern Islands, Kotzebue Sound, and the Suwaroff Islands during his first voyage (1815-17); during the second expedition (1823-26) he visited the Samoa group, the Philippines, the Sandwich Islands, &c. He died at Revel on 15th February 1846. His two books, descriptive of his voyages, were both translated into English (1821 and 1830).

Koumiss is an intoxicating beverage made by the Kalmecks from fermented mares' milk; and artificial koumiss made of ass's and cow's milk has been used in cases of consumption.

Kowalevsky, ALEXANDER, embryologist, was born 19th November 1840, and became professor at St Petersburg. He is known for his researches on the embryology of invertebrates which led to Haeckel's Gastræa theory; for his discovery of the life-history and true position of the Ascidiæ; and for investigations of the development of the Amphioxus, Balanoglossus, Sagitta, and Brachiopods. See ASCIDIANS, EMBRYOLOGY. His brother, WOLDEMAR (1843-83), professor of Palæontology at Moscow, became bankrupt, and died by his own hand.—Woldemar's wife, SONJA or SOPHIE (1850-91), daughter of a Moscow artillery officer, made a brilliant name for herself throughout Europe as a mathematician, was professor of Mathematics at Stockholm, and left a brilliant series of novels, of which *Tora Borevitzova* was translated in 1895. See Löffler's monograph on her (trans. 1895).

Kovno, capital of the Russian government of Kovno, stands near the confluence of the Vilia and the Niemen, 523 miles by rail SW. of St Petersburg and 94 ENE. of Königsberg. The town, founded in the 11th century, was made a stronghold of the Teutonic knights. Long the chief commercial town of Lithuania, it had lost nearly all its trade when it was annexed by Russia in 1795; but since the construction of the railway it has recovered its commercial importance. Grain, flax, linseed, rags, and timber are exported. Pop. 73,543, about one-half Jews.—The government of Kovno touches Prussia and Poland. Area, 15,600 sq. m.; pop. (1897) 1,549,972, of whom three-fourths are Lithuanians and 14 per cent. Jews.

Kowloon, the Chinese peninsula opposite Hong-kong (q.v.), of which 2½ miles were ceded to Britain in 1861, and nearly 200 square miles additional were granted by China to Britain on lease for ninety-nine years from 1898.

Koyumjik. See ASSYRIA, NINEVEH.

Kozlof, a town in the Russian government of Tamboff, is the meeting-place of the railways from the Caspian, the Sea of Azov, and Moscow (123 miles NW.). Pop. 28,350.

Kra, or KRAO, the isthmus connecting Siam with the Malay Peninsula, whose minimum breadth is 44 miles. Most of the schemes for a ship-canal propose to utilise the estuary of the Pakshau, which separates British from Siamese territory, and penetrates 17 miles inland. A ridge of land 7½ miles wide and 250 feet high is all that then separates the Pakshau from the headwaters of the Chumpon, which flows eastwards to the Gulf of Siam. A canal here would shorten the journey from Ceylon to Hong-Kong by 300 miles, and that from Calcutta to Hong-Kong by 540 miles. A railway across the same narrow belt of land has also been suggested. See Loftus, *Journey across the Isthmus of Kra* (1883).

Kragujevatz, a town of Servia, 61 miles S. of Belgrade, has an arsenal, a cannon-foundry, and a small-arms factory. Till 1842 it was the residence of the Servian princes. Pop. (1895) 13,500.

Krain. See CARNIOLA.

Krajova, a town of Roumania, 154 miles by rail W. of Bucharest. In the neighbourhood are productive salt-mines. Pop. 33,000, mostly engaged in commerce. Here the woiwode of Wallachia defeated Sultan Bajazet in 1397.

Krakatoa, or KRAKATAU, a volcanic island in the Strait of Sunda, between Java and Sumatra, was in 1883 the scene of one of the most tremendous volcanic disturbances on record. From May the volcano on the island had been ejecting its contents in showers of ashes; during 26th, 27th, and 28th August the crater walls fell in, together with a part of the ocean bed, carrying with it two-thirds of the island (total area before the eruption 13 sq. m.), and creating two small islands, which subsequently disappeared. At the same time a gigantic ocean wave inundated the adjoining coasts of Java and Sumatra, causing a loss of 36,500 lives, and the destruction of 300 villages, and then curved round the entire globe. The noise of the eruption was heard for a distance of 2000 and even 3000 miles. The occurrence likewise set up a series of concentric atmospheric waves, which travelled at least three times round the earth. The dust and other finely-comminuted debris cast up by the explosion gave rise during three years or more to weird sun-glowings of wondrous beauty, these seen in Great Britain in November 1883 being especially grand. See E. Metzger in *Petersmann's Mittheilungen* (1886); *Report of the Krakatoa Committee of the*

Round Society (Lond. 1888); and G. J. Symons, *The Eruption of Krakatoa* (1888).

Kraken, a fabulous animal, first described by the Norwegian bishop Pontoppidan in 1750, and from time to time said to have been seen in the Norwegian seas. Its back is described as about a mile and a half in circumference; it rises from the sea like an island, stretches out mast-like arms, capable of dragging down the largest ships, and when it sinks again into the deep causes a whirlpool in which large vessels are involved to their destruction. It makes the waters round it thick and turbid, and thus is able to devour the shoals of fishes that swim to the place attracted by the musky scent. This fact, together with its numerous arms, point to one or other of the large class of cuttle-fishes as the true original of the Scandinavian kraken. The fable of the kraken has considerable analogy to the more recent stories of the great sea-serpent. See John Gibson's *Monsters of the Sea* (1887).

Krameria. See RATTANY ROOT.

Kranach. See CRANACH.

Krangannur. See CRANGANORE.

Krapotkin. See KROPOTKINE.

Krasnovodsk, a Russian military station and harbour, on the east side of the Caspian Sea, in the Transcaspian territory. Pop. 427.

Krasnoyarsk, the chief town of the Siberian government of Yeniseisk, on the Upper Yenisei, 370 miles E. from Tomsk, is the centre of the gold-washings of the province. Pop. (1871) 12,974; (1894) 17,154.

Kraszewski, Krazinski. See POLAND (LITERATURE OF).

Krause, KARL CHRISTIAN FRIEDRICH, a German philosopher, born 6th May 1781 at Eisenberg, studied philosophy at Jena under Fichte and Schelling, qualified as a *privat-docent* in that university in 1802, but removed in 1805 to Dresden, where he lived till 1813. His learned work on the doctrines of Freemasonry (1810), advocating their rational reform, drew upon him the resentment of the German Freemasons. After residing for a time in Berlin, lecturing in the university, he settled in Göttingen, where he lectured on all the branches of philosophy (1823-30), and drew around him a number of enthusiastic disciples, including the philosophical jurist, H. Ahrens. He never obtained a professorship, notwithstanding his success and popularity as a *docent*, his incessant industry, and the versatility and fertility of his genius. In 1831, after an amelioration in his circumstances, he removed to Munich, where Baader befriended him, but Schelling treated him with coldness, and in the midst of further disappointments and struggles, he suddenly died there of apoplexy, 27th September 1832. Krause is deservedly ranked with Fichte, Schelling, Hegel, Herbart, and Schopenhauer, as one of the masters of the German philosophical movement inaugurated by Kant. His earlier works (1803-11) are written in an elegant and flowing style, but he limited the circulation and popularity of his later writings by the excessive purism of his German terminology, which eschewed all foreign terms and revelled in the most elaborate native compounds. This literary idiosyncrasy has made Krause for the novice (the most unreadable of all philosophical writers, and even Zeller declares his German to be at times 'as unintelligible to Germans as it were Sanskrit.' The most popular of his writings is his sketch of the Ideal of Humanity (*Das Verbild der Menschheit*, 1812). His system of philosophy is expounded in various sketches and outlines of the philosophical sciences (*Logie*, 1803, 1828; *Ethics*, 1811; *Philosophy of*

Right, 1803, 1828; *Sketch of the System of Philosophy*, 1828), and most fully and definitely in his 'Lectures on the System of Philosophy' (1828) and his 'Lectures on the Fundamental Truths of Science' (1829). Since his death many of his works have been edited by Leonhardi, Ahrens, Roder, Wünsche, and Hohlfeld. The *Ideal of Humanity* has been summarily rendered into Spanish (by Del Rio, 1860) and Italian, and an English translation by Hastic appeared in 1890. Professor Tiberghien of Brussels has ably summarised and illustrated Krause's philosophy in French. Professor Flint has given an admirable summary of Krause's philosophy of history in his *Philosophy of History*, and Professor Lorimer shows appreciation of Krause's philosophy of law in his *Institutes of Law*. The translation of Pleiderer's *Philosophy of Religion* contains a sketch of Krause's Absolute Philosophy of Religion. But Krause's system of philosophy, as a whole, which, as regards his view of the relation of the world to God, he called *Pantheism* ('all-in-God'), in contradistinction to the Pantheism of the other schools and the Dualism of the deistic tradition, has not yet obtained adequate expression in English. Froebel, the founder of the Kindergarten system, followed Krause's doctrines. There are monographs in German by Hohlfeld (1879), Procksch (1880), and Martiu (1881).

Kreasote. See CREASOTE.

Kreatine. See CREATIN.

Krefeld, one of the most important manufacturing towns of Germany, stands about 4 miles from the left bank of the Rhine and 12 NW. of Düsseldorf. It owes its importance to the settlement here, in the 17th and 18th centuries, of refugees from Juliers and Berg, and the neighbouring countries, compelled to leave their homes by religious persecution; they established the silk and velvet manufactures for which Krefeld is now noted. In 1885 the number of looms engaged in these manufactures was 29,837, and the value of the fabrics exported was upwards of £2,975,000. Here are large railway repair shops, iron-foundries, and works for making machinery, and manufactures of chemicals, soap, spirits, &c. The town possesses a technical school of weaving, &c. Pop. (1875) 62,840; (1890) 105,376.

Krementschug, a town of Russia on the Dnieper, 74 miles by rail SW. of Pultowa. From 1765 to 1789 it was the chief town of New Russia; it is now the seat of great industrial activity, especially in wool, timber, and tobacco, and of factories for agricultural machines, leather, tobacco, candles, &c. Pop. (1871) 30,472; (1897) 57,879.

Kremlin. See MOSCOW.

Kremnitz, one of the oldest towns of Hungary, in the county of Bars, lies in a deep, gloomy valley, 83 miles N. from Budapest. It is famous for its gold and silver mines, which, however, are less productive now than formerly, and its mint. Pop. 8,550, almost entirely of German origin.

Krems, a town of Lower Austria, at the confluence of the river Krems with the Danube, 47 miles by rail W. by N. of Vienna. Pop. 11,042.

Kremsier, one of the prettiest towns of Moravia, on the March, 35 miles E. by N. of Brunn. It is the summer residence of the Arch-bishop of Olmutz, whose fine palace contains a picture-gallery, a numismatic collection, and a library of 37,000 volumes. From 22d November 1818 to 7th March 1819 this town was the seat of the Austrian Constitutional Diet. Pop. 12,816.

Kreuzer from the cross (*Kreuz*); formerly conspicuous upon it is a small copper coin still in use in Austria, 100 making a florin or gulden (nominal

value, 2s.). Till 1876 it was current also in southern Germany as the 60th part of a guilder (see FLORIN). The kreuzer was first coined in the 13th century, in Tyrol, and was originally of silver.

Kreuznach, a town of Rhenish Prussia, dating from the 9th century, on the Nahe, 35 miles by rail SSE. of Coblenz. Its chief manufacture is champagne, its principal trade in wine and corn; but it is most notable for its salt springs. These were discovered in 1478, and, being serviceable in serofinous and other affections, attract over 5000 visitors annually. Their temperature ranges from about 50° to 90° F. Pop. (1895) 19,344. See Engelmann's *Waters of Kreuznach* (Lond. 1880).

Kriegsspiel ('war-game') was introduced in 1824 by Lieutenant von Reiszwitz of the Prussian army, after several years spent in perfecting the game as originally designed by his father. It aims at giving interesting representations of military manoeuvres on a contoured map of sufficiently large scale to show all the features of the ground, and enable their effect for cover, command, or concealment to be duly allowed for. The troops are represented by metal blocks coloured red for one player and blue for the other, and made to the same scale as the map. One officer takes command of each side, assisted, if necessary, by subordinate officers. An umpire, with generally two assistants, superintends the game. A 'general idea' of the military situation is issued to each side, and contains whatever information it is considered probable that each would have under the circumstances. A 'special idea' follows, giving such details as the strength and composition of each force, its distribution at the commencement of the game, the immediate object in view, the date and hour of the imaginary time at which operations commence, and any information as to the enemy which may be in the possession of the commander-in-chief, represented by the framer of the scheme. The 'special idea' for one player will differ from that for the other, and must not be seen by him. The wind, weather, state of the country, &c. are usually assumed to be as on the day of playing.

Each player then frames his orders, and is strictly held to them. Three copies of the map are generally used, though one is enough if the players are only allowed access to it in turn when the other's troops are covered up. On 'red's' map, if three are available, only his own troops are shown, until, as the game progresses, it is decided by the umpire that he could see some of 'blue's' men, when pieces representing those only which are so seen are placed on it. 'Blue's' map is similarly treated, but on the third, or umpire's map, both sides are completely represented. The game proceeds by moves, each of two minutes' imaginary time, the space the different arms would cover in that time at ordinary marching rate being laid down on a scale, and thereby transferred to the map. The player points out the direction in which he wishes each body of men moved, and the assistant umpire then measures off the distance and places them. The same number of moves is given simultaneously to both players, and the number of moves given at a time grow less as they come nearer, until perhaps only half a move can be given, or the question arises whether any advance can be made on one side or the other. This and all similar points must either be decided by the umpire from a consideration of the situation, or by a throw of the die. Rules are laid down for the guidance of umpires; thus, 'repulsed' troops cannot come into action again for ten minutes (five moves), 'defeated' troops cannot do so for twenty minutes, and if 'totally defeated' are removed from the map. The victorious side loses half as many as the 're-

pulsed' or 'defeated,' and one-third as many as the 'totally defeated' troops. If the die is used a table of possibility decides such questions as 'can guns come into action under infantry fire,' the odds being 3:2 in favour of the infantry at 500 yards; 2:1 at 400, and so on. These odds also determine the loss per battalion or squadron by means of another table, which allots certain faces of the die to either colour, and regulates the loss in proportion to the number of dots on the face which turns up. Thus, in a question where the odds were 5:4 against 'red,' if the single dot turned up, 'blue' would be 'repulsed' with a loss of six per battalion; if two, three, or four dots turned up, 'red' would be 'defeated' with losses of eight, nine, or eleven per battalion; and if five or six dots turned up, 'totally defeated' with losses of fifteen and eighteen per battalion. Tables of losses from artillery fire and infantry fire at various ranges, and under different conditions are also used, and the time required for destroying or constructing bridges, &c. laid down.

Intelligence of the enemy, if seen by a scout, is obtained from the umpire, who allows himself to be questioned, but frames his answers in accordance with what the scout would be likely to know. Orders sent to detached bodies of troops cannot take effect until sufficient time has elapsed for an orderly to reach them; and, if directed to go across country, at each fence the die must be thrown to decide whether he gets over without a fall. Everything is done to make the conditions of the game similar to those of actual warfare, with the result that the players cannot fail to realise the value of time in military operations, the difficulty of ascertaining the enemy's movements, and the necessity for clear and definite orders. The umpire decides when the game shall cease, which is generally when one side has clearly obtained the mastery or gained his object. See Vernois, *The Tactical War Game* (trans. by Macdonnell, 1884).

Krilof, IVAN ANDREYEVICH, the La Fontaine of Russia, was born at Moscow, February 14, 1768, the son of a penniless infantry captain. At fourteen he lost his father, next filled for some time a post in a public office at St Petersburg, but gave it up after his mother's death in 1788, to try in turn writing dramas, and the joint editing and publishing of literary magazines. For some years he found shelter at the country seats of Prince Sergius Galitzin, acted till 1804 as his secretary when military governor of Livonia, and next wandered aimlessly about the towns of Russia, finding his amusement in card-playing. About the close of the year 1805 at Moscow he showed some of his fables to the poet Dmitrieff, who printed them in the *Moscow Spectator*. They were at once successful, and thus Krilof, at forty, found in what his strength really lay. The first collection of his fables (twenty three in number) appeared in 1809; the second, containing twenty one more, in 1811. He returned to St Petersburg in 1806, and soon after obtained a government appointment which in 1821 he exchanged for a congenial post in the Imperial Public Library under his friend Olenine. Honours were now showered upon his head; his years glided peacefully away; he was comfortably off, and much beloved by all ranks of society, no less for his kindness and good nature than for his carelessness in dress, his laziness, his excessive smoking, and a thousand amiable eccentricities. He died November 21, 1844, and the vast spontaneous concourse at his funeral in the Nevsky Prospect showed how closely he had touched the popular heart of Russia. A fine bronze statue of him was erected in the Summer Garden.

Krilof was careless of time, but could not help being a consummate artist, and the Horatian *curiosa felicitas* is one of the most characteristic

marks of his versification. His shrewd humour and keen though genial satire are all his own, no less than that insight born of sympathy which has given such reality and truth to his glimpses of Russian men and manners. His slightest fables, however light and merely humorous they seem, are stamped throughout by broad humanity and intense although enlightened patriotism. Yet he is never dull or tedious, and his moral never lacks the saving grace of spontaneity. Withal he is a genuine fabulist, with rich measure of that shrewdness wrapped in simplicity, that sense of the varied individuality veiled in the dumbness of the brute-world, and that mastery of the art of compressing the essentials of a story into a few concise and straightforward lines, which mark only the greatest masters of the art.

For Krilof's life may be read the memoirs in Russian by Pletnet and by Grot, the admirable sketch prefixed by the late W. R. S. Ralston to his *Krilof and his Fables*, a prose translation; in its first edition (1868), of ninety-three fables; in its fourth (1883), of fifty-five more. There are good translations into French verse by Charles Parfait (1867); into German by Ferdinand Tornay (1842), and an anonymous lady (1863). See also chap. vi. vol. I of Sutherland Edwards, *The Russians at Home* (1879).

Krimmitschau, a town of Saxony, 45 miles S. of Leipzig by rail, manufactures buckskin and vicuña wool, machinery, &c. Pop. (1875) 17,705; (1885) 19,755; (1895) 23,553.

Kris, a dagger or poniard, the universal weapon of the inhabitants of the Malayan Archipelago.

Malay Kris.

It is made of many different forms, short or long, straight or crooked. The hilt and scabbard are often much ornamented. Men of all ranks wear this weapon, and those of high rank when in full-dress sometimes carry three or four. In Java women sometimes wear it.

Krishna. See VISHNU.

Kronenberg, an iron-manufacturing town of Rhenish Prussia, 4 miles S. of Elberfeld. Pop. 8858.

Kronos. See SATURN.

Kronstadt (Magyar *Beassó*), an important trading and iron-manufacturing town, and capital of a Hungarian county in the extreme south-east of Transylvania; it is 261 miles SE. of Pesth by rail, near the Carpathians, and 1850 feet above the sea. The pop. (30,739 in 1890) includes Saxons, Székler, Magyars, Romanians, Greeks, Armenians, and Gypsies.—For the Russian Kronstadt, see CRONSTADT.

Kroonem, or KROOBOYS (also spelt *Kroonem* and *Krooboy*), a Negro people inhabiting for the most part the Pepper Coast of Guinea, West Africa. They belong to two divisions, the Grebo or Gedeha and the Kroonem proper. The Grebo are agriculturists and traders; the Kroonem are bold and skilful boatmen, and are employed for the sari boats all along the coast of that part of Africa. Their language is closely related to the Mandingo tongue.

Kropotkin, PRINCE PETER, Russian Nihilist, was born at Moscow in 1842, of one of the noblest houses in the empire. At fifteen he entered the Corps of Pages at St. Petersburg, whither, after five years' service and exploration in Siberia, he returned

in 1867 to study mathematics for four years at the university, whilst acting as secretary to the Geographical Society. In 1871 he explored the glacial deposits of Finland and Sweden; in 1872, whilst on a visit to Belgium and Switzerland, he associated himself with the extreme section of the International. Two years after his return to Russia he was arrested (March 1874), but in July 1876 escaped to England. From Switzerland he was expelled in 1881; and at Lyons he was condemned in 1883 to five years' imprisonment. Released in 1886, he returned to England. He is author of *Paroles d'un Révolté* (1885) *In Russian and French Prisons* (1887), *Memoirs of a Revolutionist* (1899), and articles in the *Even. Britannica*, the present work, &c.

Krüdener, BARBARA JULIANA VON (1766-1824), daughter of Baron von Vietinghoff, was born at Riga. Married to Baron von Krüdener, a Livonian nobleman who was Russian ambassador at Venice, she for years lived apart from him in Riga, St. Petersburg, and Paris. In 1803 she published a novel, *Falerie*, edited by Sainte-Beuve in 1855, supposed to be partly autobiographical. Next her thoughts turned to religion. She came in contact with Jung-Stilling, and ultimately gave herself up to exaggerated religious mysticism. She appeared as the herald of a new religious era, and impressed the Emperor Alexander of Russia. Obligated to withdraw from France, she retired to her paternal estates near Riga. See Krug's *Conversations with Madame von Krüdener* (1818), and Lives by Eynard (1819), Lacroix (1880), and Clarence Ford (1893).

Kruger, STEPHANUS JOHANNES PAULUS, born 10th Oct. 1825 at Rastenburg in Cape Colony, with his fellow-Boers 'trekked' to Natal, the Orange River Free State, and the Transvaal, and in the war against England (1881) was appointed head of the government. In 1883 he was elected president of the Transvaal Republic, and again in 1888, 1893, and 1898. On the failure of negotiations to remedy the Outlanders' grievances he, with Mr Steyn, president of the Orange Free State, on 9th Oct. 1899 presented an ultimatum which was virtually a declaration of war, and for which his government had been preparing for years. This was followed by the invasion of Natal and Cape Colony; and the war, which lasted till the end of 1900, resulted in the annexation of the Transvaal and Orange Free State as British colonies. In Nov. 1900 Mr Kruger sought refuge in Europe. See JAMESON (L. S.); and Statham, *Paul Kruger and his Times* (1898).

Krummacher, FRIEDRICH WILHELM (1796-1868), anti-rationalist theologian, born at Mors-on-Rhine, was latterly chaplain to the Prussian court. Translations of his books on *Solomon* and *Elijah the Tishbite* were popular. See his *Autobiography* (1869), and the *Lebenserinnerungen* (1889) of his brother, Emil Wilhelm. His father, Fr. Adolf Krummacher (1768-1845), wrote the well-known *Parabeln*.

Krupp, ALFRED, head of the gigantic iron and steel works at Essen in Prussia, was born in humble circumstances there in 1812. He succeeded his father, who had founded a small iron forge there in 1810, and took control of the works in 1848, when he found 'three workmen and more debts than fortune.' Almost simultaneously with the introduction of the Bessemer steel process in 1857 and the use of the steam-hammer came the demands from artillerists for larger guns, and from railway companies and shipbuilders for more durable materials of construction. Krupp established at Essen the first Bessemer steel works erected in Germany, and the first forging hammer as well. The first steel gun manufactured at Essen (1847) was a 3 pounder muzzle-loader. Krupp showed in

the International Exhibition of 1851 a 6-pounder steel gun. To Krupp undoubtedly belongs the credit of introducing steel as a material for gun construction, and of pioneering that material for many years when it was disregarded by the governments. In 1862 he exhibited a cast-steel block weighing 20 tons, which was designed to show what the Essen works were capable of doing in the manufacture of ordnance. He showed a similar block at Paris of 50 tons (1867), and a block of 52 tons at Vienna in 1873. At the Dusseldorf Exhibition of 1880 he showed a steel gun of 100 tons weight, being the first to demonstrate the possibility of producing a piece of ordnance of such enormous size. The manufacture of cast-steel axles was begun in 1852, and of tires from solid forged pieces in 1853. The subsequent history of the Essen works is an epitome of the records of the German iron and steel industry. In all matters of technical and industrial development Krupp took a leading part. He acquired large mines and collieries, and every year saw additions made to his establishment at Essen (q.v.). The works cover about 1000 acres, and about 20,000 persons find employment there in all departments. Krupp was a man of much decision of character, and great penetration. Naturally Germany owed him much, and was not slow to acknowledge her obligations. The late Emperor William frequently visited him, and it was probably to this circumstance that the popular rumour of his partnership in the works was due. Krupp supplied artillery to almost every government in Europe, and was the recipient of many foreign orders and decorations. He died 14th July 1887, and sixty thousand people attended his funeral.—His son, Alfred, succeeded as head of the great house at Essen; and under him was manufactured in 1888 the 135-ton gun for the fortifications of Cronstadt. See CANNON; and *Alfred Krupp*, by Budeker (Essen, 1888).

Krusenstern, ADAM JOHN, BARON VON, a Russian voyager, was born 8th November 1770 at Haggud in Esthonia. After serving for some time in the British navy he was commissioned by Alexander I. of Russia to command a naval expedition for exploring purposes in the North Pacific. In the course of a three years' voyage (1803-6), the first made round the world by a Russian navigator, he discovered the Orloff Islands, and explored the Marquesas and Washington groups, the west coast of Yezo, the coast of Saghalien, and the northern Kurile Islands. But he failed in the second object for which he was sent out—the opening of Russian trade with Japan. He published an account of his voyage (3 vols. Petersb. 1810-12), which was soon translated into the principal languages of Europe (Eng. ed. 1813); and to this he subsequently added *Contributions to the Hydrography of the Pacific Ocean* (1819), *Atlas of the Pacific Ocean*, with *Recueil des Mémoires Hydrographiques* (1824-27), and other works on the same subject. Krusenstern died on 12th August 1846 at his estate in Esthonia. See *Memoir by Bernhardt* (Eng. trans. by Sir John Ross, 1856).

Krylov. See KRILOF.

Kshatriya. See CASTE.

Kuban, a river of the Caucasus (q.v.), and the name of a province.

Kublai Khan (called by the Chinese CHI-TSU), more properly KHUHLAI KHAN, the Grand Khan of the Mongols and emperor of China, was the grandson of Genghis Khan through his fourth son Tuli. During the reign of his brother Mangu (1251-59) Kublai completed the conquest of the northern Chinese (Kin) empire (begun by Genghis) and took possession of north China. On the death of Mangu, Kublai was proclaimed khakhan or

Great Khan, but had a formidable rival in his own brother Arikhuka, and after he had suppressed him, in Kaidu, a descendant of Genghis Khan's third son Oghotai, who struggled against Kublai throughout the whole of his reign. Kublai, who was an able and energetic prince, adopted the Chinese mode of civilisation, greatly encouraged men of letters, made Buddhism the state religion, creating the office of Great Lama in Tibet, and manifested an enlightened care for the welfare of his subjects. But he was also an ambitious sovereign and a prince who loved magnificence. He overthrew the Sung dynasty of southern China, compelled Corea, Cochinchina (Champa), Burma (Mien), Java, and some Malabar states in India to acknowledge his supremacy. An attempt to invade Japan ended in disaster. He established himself at Tatu or Khan-baligh (Cambaluc, the modern Peking), and there founded a new dynasty—that of Yuen—the first foreign race of kings that ever ruled in China. Including the western Mongol states of the Golden Horde on the Volga and the Ilkhans in Persia, Kublai's dominions extended from the Arctic Ocean to the Strait of Malacca, and from Corea to Asia Minor and the confines of Hungary—an extent of territory the like of which had never before, and has never since, been governed by any one monarch in Asia. The splendour and pomp of his court inspired the graphic pages of Marco Polo (q.v.)—who spent some time at the residence of the Mongol emperor of China—and at a later date the imagination of Coleridge. See Yule's *Marco Polo* (1875), and Howorth's *History of the Mongols* (part i. 1876).

Kuch Behar. See BEHAR.

Kuenen, ABRAHAM, an eminent Dutch theologian, was born at Haarlem, 16th September 1828, studied at Leyden, and became at the close of 1852 an extraordinary, in 1855 an ordinary professor there. He was vector of the university, 1861-62. His first important work was his *Historisch-Critisch Onderzoek naar het Oudsteen en de Verzameling van de Boeken des Ouden Testaments* (3 vols. 1861-65; trans. in part by Colenso, 1865), which had a great influence on Old Testament scholars both in England and Germany. The result of the critical movement which he inaugurated, although it was first suggested by Graf, has been to entirely reconstruct the history of Israel, the priestly code and the historical portions connected with it being made the latest element in the Pentateuch. This view of Old Testament criticism has since been made familiar to Englishmen through the work of Wellhausen and his disciple Robertson Smith, and was developed further by Kuenen in his best-known book, *De Godsdiens van Israel tot den Oudeerping van den Joodschen Staat* (1869-70; Eng. trans. 3 vols. 1873-75), and in the carefully revised and considerably fuller second edition of his *Onderzoek* (the Hexateuch, 1885; the Prophetic books, 1889). In the preface to the latter he says: 'In setting forth, for the first time, the complete and systematic critical justification of the Graham hypothesis, I am no longer advocating a heresy, but am expounding the received view of European critical scholarship.' Other works of Kuenen, only less important than these, are *De Profeten en de Profetie onder Israel* (1875; Eng. trans. 1877) and *National Religions and Universal Religions*, the Hibbert Lectures for 1882. Besides these Kuenen has made countless contributions on biblical questions to the learned journals, especially the well-known *Theologisch Tijdschrift*, established in 1867. He died at Leyden, 10th December 1891. In critical insight and constructive ability, he stood at the head of the Old Testament critics of his time; Ewald's mantle had fallen on him. His firm grasp of historical

method has given an unusual lucidity and force to his argument, and enabled him to bring almost for the first time the history of Israel into line with the history of other peoples of the ancient world. For, leaving the special supernatural question aside, its development must otherwise have been organic and normal, and this Kuenen was the first historian conclusively to demonstrate.

Kuen-Lun, a great mountain-chain of central Asia, which forms the northern wall of the Tibetan plateau, as the Himalayas do the southern. Starting from the Pamir plateau (82° E. long.), the Kuen-Lun extends eastward as far as 94° E. long., forming an arc to the north. The entire region, which varies from 100 to 150 miles in width, is covered with snow, and in many places with gigantic glaciers. Between the chains lie narrow valleys of a very steep inclination. Storms of sand and of snow, often of both commingled, rage violently in winter. The peaks of this region measure from 18,000 to 25,000 feet in altitude, and the passes from 13,000 to 18,000 feet. These mountains were almost unknown until the explorations of the Russian General Prjevalski, 1876-88.

Kufic Coins are the early Mohammedan coins engraved with inscriptions in the Kufic or epigraphic Arabic character, as distinguished from the Neskhi or cursive writing (see ARABIA, Vol. I, p. 367); but the term is often applied erroneously to Arabic coins in general. In the early years of the califate the gold and copper coinage of the Byzantine emperors and the silver coinage of the Sassanians were used and imitated. The Arabic historians refer to several attempts to introduce a distinctive Mohammedan coinage prior to 76 A.H.; but, with the exception of two or three isolated specimens in the Paris Bibliothèque Nationale, on which numismatists are not agreed, there is no numismatic evidence for any such experiments. In 76 and 77 A.H. (695-96 A.D.) the Calif 'Abd el-Melik issued gold coins with his own image instead of that of the Byzantine emperor; but, the representation of living creatures being opposed to the law of Mohammed, this coinage was discontinued, and a reformed gold currency, engraved solely with Kufic inscriptions, was inaugurated in 77 A.H. This was supplemented with a silver currency on similar lines in 79 A.H., and the earliest dated copper coin appeared in 80 A.H. The gold coin was called a *dirham* (from the denarius), the silver a *dirhem* (drachma), and the copper a *folis* (follis). The first weighed on the average 65 grains troy, .979 fine, or rather more than our half-sovereign; the dirhem weighed about 45 grains, .970 fine, or rather more than our sixpence, but was much larger and thinner; the weight of the fels was irregular. The earliest coins present chiefly religious formulas and the year of issue, to which the silver and some of the copper added the name of the mint-city. The names of the califs first appear on gold and silver under the 'Abbāsids; but with this addition, and sometimes the names of governors and viziers, the gold and silver currency of the Moslem empire remained practically unchanged until the 4th century of the Hegira (q.v.; the 10th A.D.), and even then the break-up of the empire of the califs into numerous minor dynasties did not bring with it any more serious modifications in the coinage than the introduction of the names of princes and sultans and some variation in the style of the inscriptions. During the whole of this period the Arabic character on the coins is still almost universally Kufic; but in the 4th century local peculiarities begin to appear, and various styles are developed, which may be termed *transitional Kufic*. Examples of these are seen in the coinage of the Ghaznavids of North-west India, and still more marked in the

issues of North Africa and Spain, such as those of the Fatimi califs. Occasional idiosyncrasies, in the introduction of Roman and Byzantine images, and even of the figures of Christ and the Virgin, are seen on the coins of the Mesopotamian dynasties of Turcoman race in the 6th century of the Hegira (12th A.D.), which also present beautiful examples of highly-decorative transitional Kufic. In the 7th century (13th A.D.) the Kufic was generally superseded by the Neskhi character throughout the coinage of the Mohammedan world, and attained its greatest perfection on the currency of the dynasts of Granada and Fez, the shahs of Persia, and the rulers of Delhi. Mongol and Sanskrit inscriptions are incorporated with Arabic in the legends of coins struck by the descendants of Genghis Khan in Persia and the Indian kings. Kufic coins are of inestimable value to the historian, for they supply him generally with the names of kings, governors, and califs, and those of their liege-lords, heirs-apparent, and viziers, and often a short pedigree of their ancestry, together with the city where they struck the coins, and the year, and sometimes even the month, of issue. A complete list of Mohammedan coins is a skeleton history of the Moslem empire in all its ramifications, and not seldom a prince or dynasty unknown to history is revealed by the coins alone.

The principal modern authorities on the subject are *Soret, Éléments de la Numismatique Musulmane* (1868); *Sauvage, Matériau pour servir à l'histoire de la Numismatique Musulmane* (1885, &c.); *Tieszenhausen, Monnaies des Khalifes Orontours* (1873); *Lavoix, Catalogue des Monnaies Musulmanes de la Bibliothèque Nationale* (vol. i, 1887); *Stieckel, Handbuch zur morgenländischen Münzkunde* (1870); *S. Lane-Poole, Catalogue of the Oriental and Indian Coins in the British Museum* (12 vols, 1875-90); *Catalogue of the Mohammedan Coins in the Bodleian* (1888); *Essays in Oriental Numismatics* (1874 and 1877); *Coins and Medals, their Place in History and Art* (1885); *R. S. Poole, Catalogue of Persian Coins in the British Museum* (1888); and among older works, *Marsden, Numismata Orientalia* (1825; and new ed. 1874, &c.), *Fraehn, Recensio* (1825).

Kugler, FRANZ, a German historian of art, was born at Stettin, January 19, 1808, studied at Berlin and Heidelberg, and in 1833 became a professor in the Academy of Art and a *docent* at the university of Berlin. He died March 18, 1858. His most valuable work is a *Handbuch der Geschichte der Malerei, von Konstantin d. Gr. bis auf die neuere Zeit* (2 vols, 1837). Of this the part relating to Italian art was translated by the Eastlakes (5th ed. 1887), and that relating to the German, Spanish, French, and Dutch schools by Head. Kugler's other principal works are a *Handbuch der Kunstgeschichte* (1841-42), an unfinished *Geschichte der Baukunst* (1855-60), and a *Life of Frederick the Great* (with ill. by Menzel, 1840; new ed. 1887; Eng. trans. 1843 and 1877). He is also favourably known as a poet and as the author of several dramas.

Kuh-horn, ALPENHORN, or ALPHORN, a simple musical instrument made of wood or bark with a cupped mouthpiece, formerly employed by the mountaineers of Switzerland and other countries to convey signals or alarms in war-time, but now only used by cowherds—hence the name. It is variously made from 3 feet to about 8 feet long, nearly straight, curving at the end, and widening into a bell, and has the peculiarly tender sound produced by the cupped mouthpiece in conjunction with the wooden tube. It has the open harmonics of the tube; and its melodies, which among the mountaineers have a charm all their own, are played on the notes C, G, C', E, G'. A similar instrument, called *Lure*, is used in Sweden, and kindred ones in the Himalayas and among the Indians in South America.

Kullenburg. See CULENBORG.

Kuka, or KUKAWA. See BORNÜ.

Ku-Klux Klan, a secret organisation which, said to have been founded in 1866 at Pulaski, Tennessee, originally for purposes of amusement only, soon developed into an association of 'regulators,' and became notorious for the lawless deeds of violence performed in its name. The proceedings of the Ku-Klux in the southern states are only one feature of the determined struggle to withhold from the emancipated slaves the right of voting. The outrages and murders which convulsed the country in 1868-69 ended in the calling out of troops and the formal disbandment of the society in March of the latter year; but its name and often its disguises were used for years after to cover the violence of political desperadoes.

Kulja, a town of Zungaria, central Asia, stands on one of the great highways leading from China to west Turkestan, and on the Ili. This river rises on the northern slope of the Tian-Shan Mountains, and flows north and north-west into Lake Balkhash, after a course of about 750 miles. Kulja is the chief town of a fertile district that produces excellent corn, rice, cotton, tobacco, wine, and fruits, whilst its pastures support large herds of horses, camels, cattle, and sheep. This district (Kulja or Ili) revolted against China in 1865, was occupied by Russia in 1871, but ten years later restored to the Chinese. Russia, however, retained 4357 sq. m. of the western part, now incorporated in the province of Semiryetchensk. The Chinese province has an area of 23,130 sq. m. and a population of 70,000. In 1876 the population of the entire province whilst in Russian hands was 132,000. The town of Kulja has about 12,500, mostly Chinese inhabitants. New Kulja, 25 miles to the west, was destroyed by the rebels in 1866; previous to that date it had 75,000 inhabitants. See *Proc. Roy. Geog. Soc.*, August 1880.

Kulm, a village of Bohemia, 3 miles NE. of Teplitz, was the scene of a bloody conflict between the French and the allied Prussians and Russians on 29th and 30th August 1813. The French, numbering 40,000 men, were commanded by General Vandamme; the Russians, during the first day's conflict, were 15,000 strong, and were commanded by General Ostermann. During the night the latter were heavily reinforced, and on the second day Barclay de Tolly assumed the command. The result was the complete wreck of the French army, which lost in these two days little short of 20,000 men; Vandamme capitulated with 10,000 men.

Kultur-kampf. See GERMANY.

Kum, next to Meshed the most sacred city of Persia, is a straggling, half-ruined, uninviting town on the commercial road between Ispahan and Teheran. Its many shrines and tombs dedicated to Mohammedan (Shiite) saints, especially the reputed tomb of Fatima, the daughter or sister of the great imam Riza, annually attract several thousands of pilgrims. Pop. 20,000.

Kumamoto', a town on the west coast of the island of Kiu sin, Japan. Pop. (1895) 69,828.

Kumania. See CUMANIA.

Kumann, a district in the North-west Provinces of India, with an area of 7000 sq. m. It lies chiefly on the south slope of the Himalayas, and comprises a number of summits rising to over 20,000 feet. At their foot a great waterless forest, 10 to 15 miles in breadth, fills the country with wild jungle, except where clearings have been made by the hill tribes. Mines of iron, copper, and lead exist, but few have yet been worked at all. There are numerous important tea-gardens in the district.

Almora (q.v.) is the administrative headquarters. Pop. (1891) 563,181, nearly all Hindus.

Kumiss. See KOUMISS.

Kümmel. See LIQUEUR.

Kum-quat. See ORANGE.

Kunduz, a river and state of Afghan Turkestan. See AFGHANISTAN.

Kunersdorf, a village in Prussia, 4 miles E. of Frankfort-on-the-Oder, was the scene of one of the most remarkable battles of the Seven Years' War, fought on 12th August 1759, in which Frederick the Great with 48,000 men, after gaining a half victory, was completely defeated by the allied Russians and Austrians, 78,000 men strong. The Prussian loss was 18,500 men, with almost all their artillery and baggage, while their opponents lost 16,000 men.

Kungur, a town in Russia, 50 miles SSE. from Perm, carries on tanning, boot-making, and tallow-boiling. Pop. (1885) 11,882.

Kunigunde, ST. daughter of Count Siegfried of Luxemburg, and wife of Duke Henry of Bavaria, who was crowned king of the Germans in 1002, and emperor in 1014. According to legend, she vindicated her chastity by walking barefoot over hot ploughshares. After her husband's death in 1024 she retired into the convent of Kaufungen, near Cassel, which she had founded, and here she died, 3d March 1030. Pope Innocent III. canonised her in 1200.

Kupferschiefer, one of the series of strata which make up the 'Dyas' type of the Permian System (q.v.) as it is developed in Germany. The bed consists of black bituminous shale, about 2 feet thick, abundantly charged with well-preserved remains of various fish, coniferous leaves, fruits, &c. The organic remains are abundantly coated and even replaced by copper ore (hence the name of the bed), which has been extensively worked along the flanks of the Harz.

Kura, a river of the Caucasus (q.v.).

Kuram, a river rising in Afghanistan near the northern end of the western Suliman range, and flowing through British territory into the Indus near Isakhel. Its valley affords a famous pass into Afghanistan.

Kurdistan ('the Country of the Kurds'), an extensive geographical, though not political, region of Asia, for the most part included within a line drawn from Sivas in Asia Minor by way of Diarbekr, Sulimanieh, Kernanshah and Urmia (in Persia), Mount Ararat, and Erzerüm, back to Sivas. Kurdistan thus belongs to both the Turkish and Persian monarchies, chiefly to the former, and contains about 50,000 sq. m., with a population estimated at more than 2½ millions, thus distributed - nearly 1½ millions in Turkey, 700,000 in Persia, 45,000 in Russian Transcaucasia, and about 5000 on the Afghano-Persian frontier (transplanted thither by Nadir Shah). The country embraces the mountain-chains that alut upon the Armenian plateau on the south, and upon the Iranian plateau on the east. Thus its surface ranges from 5000 up to 15,000 feet in altitude. Between the mountain-chains, the summits of which are generally densely wooded, lie grassy plateaus. Numerous rivers force their way through the mountains at right angles to the directions of their main axes, and go to feed the Tigris and the Euphrates; chief of these tributaries are the two Zabs, the Batman-su, and the two branches of the Euphrates. The principal products of the soil and of native industry are wool, butter, sheep, gum, gall-nuts, hides, raisins, and tobacco, which are sold out of Kurdish districts to the annual value of £110,000. The bulk of the

inhabitants are Kurds (the ancient *Carduchi*), a race partly nomad and pastoral, and partly settled and agricultural. The Kurds, who speak a language called Kermanji, derived from an old Persian dialect, have from time immemorial stood on the same level of civilisation. They are predatory and impatient of political subjection, but recognise a code of rude chivalrous honour, and are hospitable and brave. They live under chiefs of their own, but are nominally subject to the Porte and the Shah of Persia respectively. Their origin is traced back to the Turanian Ginnu or Kurdu, who were a powerful people in Assyrian times. After the fall of Nineveh they gradually became merged in the Medes and were Aryanised. Kurdistan, having been ruled successively by the Persians, Macedonians, Parthians, Sassanians, and Romans, is exceedingly rich in antiquarian remains, most of which are still unexamined. The great Saladin was of Kurdish descent. In 1880 an extensive Kurdish rising against Persia took place, apparently in the hope of securing independence. The inhabitants, with the exception of certain peculiar and esoteric sects, and the Nestorians (q.v.), profess Mohammedanism. They have cruelly plundered and slaughtered their Armenian neighbours. The chief towns are Bitlis, Van, Urmia, Diabekr, and Kermanshah.

See Milligen, *Wild Life among the Kurds* (1870); Lerch, *Forschungen über die Kurden* (St Petersburg, 1857-58); Jaba, *Recueil de Notices et Révélés Kurdes* (1860); and Jaba's *Dictionnaire Kurdo-Français*, with Just's valuable preface (1879).

Kurfürst. See ELECTOR.

Kuria-Muria Islands, a group of five islands, situated 21 miles from the south-east coast of Arabia, in 17° 30' N. lat. and 56° 10' E. long.; area, 21 miles; pop. 34. The ancient *Insula Zenobii*, they were ceded to England in 1854 by the Imam of Muscat. On one of them is a signalling station of the Eastern Telegraphs Company. Guano of an inferior quality is obtained from them.

Kuriles, a sparsely-populated group of islands, numbering twenty-six in all, and extending like a chain from the southern cape of Kamchatka to the eastern extremity of Yezo in Japan, to which empire they belong. By a treaty made with Russia in 1875 the Japanese surrendered claims on the southern part of Saghalien, and received in exchange the more northerly portion of the Kuriles. The largest islands of the group are Iturup and Kunashiri, frequently visited by seal-hunters. A migratory race of pit dwellers, calling themselves Kurilsky Ainos, and numbering about sixty souls, is found on the islands, the remnant of a people which formerly inhabited Yezo (see *Transactions of the Asiatic Society of Japan*, vol. x, p. 190). With the exception of these pit dwellers and a few Japanese and Aino families on the southern isles, the population remains in this misty and inhospitable region only during the summer, as long as the fishing season lasts.

Kurisches Haff, a fresh-water lagoon of East Prussia, extending 61 miles south from Memel; width in the south, 28 miles; average width, 14 miles. It is connected with the Baltic by the 'Memel Deep,' a channel about 500 yards wide and 20 feet deep. The spit of sand dunes, one to two miles wide, that separates it from the Baltic, is encroaching on the haff at the rate of eighteen feet annually.

Kurland. See COURLAND.

Kurrachee (*Karachi*), the capital of Sind and of Kurrachee district, and the chief port of entry for the Punjab, stands at the northern end of the great Indus delta, and close to the frontier of Beluchistan. It is a terminus of the Sind, Punjab, and Delhi Railway, and is 1169 miles by rail (about

half that distance direct) SW. of Delhi. Kurrachee has an extensive harbour, sheltered by a break-water and a long reef, at the extremity of which is a fixed light 120 feet above the sea. The landing-place is on Kiamari Island, which is connected with the town by the Napier mole, 3 miles long. The entire cost of the great harbour improvements, completed in 1873, was £450,000; and there is now a lowest depth over the bar of 20 feet. Kurrachee is a modern town, and its public buildings and churches are generally uninteresting, the most attractive being the Frere municipal hall (with a library and museum), named after Sir Bartle Frere (q.v.), of whom there is also a statue here. To the east and north are the cantonments, and, close by, a public garden of 40 acres. The place is generally healthy, and not so hot as the inland districts of Sind; and there is now a good water-supply. There are ironworks and several large cotton presses in the town, the cotton of Sind and the Punjab forming an important article of export. The principal exports, however, are wheat and oil-seeds. The annual trade of the port has risen to above £7,000,000; the inland trade extends to Afghanistan and Beluchistan. Pop. (1881) 73,560; (1891) 105,109, with the cantonments.—Kurrachee district has an area of 14,115 sq. m.; pop. 560,880, mostly Mohammedans. See Baillie, *Kurrachee, Past, Present, and Future* (1890).

Kursk, the chief town of the Russian government of Kursk, 312 miles by rail S. by W. of Moscow and 274 NNE. of Kieff. The chief industry is tanning; but soap, tobacco, candles, and spirits are also manufactured. Kursk is celebrated for its orchards, and has an observatory. Pop. (1871) 31,751; (1897) 52,908. Near the town a fair is held after Easter, when more than £1,250,000 worth of commodities are disposed of, the chief being cotton, silk, and woollen fabrics, sugar, tea, leather, horses, &c. The government of Kursk, in the middle of south Russia, contains 17,931 sq. m., three-fourths fertile arable land (black earth). Pop. (1897) 2,394,893. The province is watered by numerous feeders of the Dnieper and the Don.

Kurtz, JOHANN HEINRICH, theologian, was born at Montjoie, near Aix-la-Chapelle, 15th December 1809, and was first destined for a commercial career, but early devoted himself to the study of theology at Halle and Bonn, and became in 1835 religious instructor at the gymnasium of Mitau, in 1850 ordinary professor of Church History (in 1859 of Exegesis) at Dorpat. He retired in 1870, and lived at Marburg till his death, 26th April 1890.

His writings are numerous, and some, owing to their usefulness, have been exceedingly popular, as the *Lehrbuch der heiligen Geschichte* (1843; 16th ed. 1884), *Christl. Religionslehre* (1844; 13th ed. 1883), *Biblische Geschichte mit Erläuterungen* (1847; 34th ed. 1882), and *Abriss der Kirchengeschichte* (1852; 11th ed. 1886). His works in the department of biblical criticism include *Das Mosaische Opfer* (1842), *Bibel und Astronomie* (1842), *Die Einheit der Genesis* (1846), *Zur Theologie der Paulina* (1865), and especially *Geschichte des Alten Bundes* (1848-55) and *Erklärung des Briefs an die Hebräer* (1869).

His most important books, however, are those devoted to church history, his *Handbuch der allgemeinen Kirchengeschichte* (1855-56), and the invaluable manual, *Lehrbuch der Kirchengeschichte für Studierende* (1849; 9th ed. 1885). Of the last there are three English translations.

Kuruman, a mission-station of the London Missionary Society in Bechuanaland, about 130 miles NW. from Kimberley. It was for many years the scene of the labours of Dr Moffat, and there Livingstone also laboured.

Kusi, a considerable tributary of the Ganges, rises in the Nepal Himalayas, to the north-west of Mount Everest, and flows generally south, in a rapid stream, with a great body of water, to the

main river. Its length is about 325 miles, and it is navigable, although with difficulty, by boats of ten tons, to the Nepal frontier. Its bed is constantly shifting to the westward, and its floods have turned wide tracts into sand and jungle.

Kuskoquim. See ALASKA.

Kustendji, or more properly since 1878 COXSTANZA, a seaport in the Dobrudja, Roumania, stands on the Black Sea, at the end of Trajan's wall and of the railway to Tchernavoda on the Danube. The harbour is exposed; but corn, wool, cattle, and hides are exported. Pop. 5000. Not far distant from the town was Tomi, the place of Ovid's banishment.

Küstenland. See GORZ.

Küstrin, a town of Prussia and a fortress of the first rank, is situated in the midst of extensive marshes at the confluence of the Warthe with the Oder, 51 miles E. of Berlin by rail. It was first fortified in 1535-43, and was held by the French from 1806 to 1814. Küstrin is also an important railway centre. Pop. (1885) 15,105.

Kutahia, or KUTAYA (the ancient *Coturum*), a town of Asiatic Turkey, in Anatolia, stands 70 miles SE. of Bursa, at a point where great commercial highways cross. Its inhabitants, variously estimated at 30,000 to 60,000, cultivate opium, tobacco, corn, and vegetables, and export wool, mohair, and opium.

Kutais. See TRANSCAUCASIA.

Kuttenberg, a mining-town of Bohemia, 185 miles by rail NNW. of Vienna. Its silver-mines were worked at least as early as the 13th century, and the first silver *grosschen* were struck here about 1300. The town contains a number of fine old buildings, and has miscellaneous manufactures. Close by is an imperial tobacco factory, with 2000 hands. Pop. (1890) 13,563.

Kutusoff, MICHAEL ILARIONOVICH, Prince of Smolensk, a Russian field-marshal, was born 16th September 1745, entered the Russian army at the age of sixteen, and in 1784 became major-general. He distinguished himself in the Turkish war, and was appointed in 1805 to the command of the first army corps against the French. In 1812, notwithstanding his advanced age, as commander-in-chief, he fought Napoleon obstinately at Borodino (q.v.), and obtained a great victory over Davout and Ney at Smolensk. Tolstoi calls him 'the genius of Russia and of the war.' He died 28th April 1813.

Kwilm. See GABOON.

Kyanising, a method of preserving ships from Dry Rot (q.v.), by injecting into the pores of the wood a solution of corrosive sublimate, was invented by John H. Kyan (born at Dublin, 1774; died in New York, 1850).

Kyanite. See CYANITE.

Kyd, THOMAS, dramatist, born in the autumn of 1558, seems to have been educated at Merchant Taylors' School, and was most likely brought up as a scrivener under his father. His bloody and bombastic tragedies of the *Titus Andronicus* order early brought him reputation. These were the two plays having for their hero Jeronimo, marshal of Spain. The first, dealing with the hero's earlier history, was not published till 1605; the second was licensed in 1592 as *The Spanish Tragedy*, but the earliest extant copy is dated 1594. The production of both may perhaps be dated between 1584 and 1589. Kyd published, in 1594, a tedious tragedy on Pompey's daughter Cornelia, translated

from the French, almost certainly produced *The Rare Triumphs of Love and Fortune* (1582) and *Solymann and Perseda* (1592), and has been credited with a greater or less share in other plays. He was a close friend of Marlowe, shared the odium of his irreligious opinions, and is supposed to have died in poverty in 1595. His name now survives only in Jonson's 'sporting Kyd and Marlowe's mighty line.' F. S. Boas edited him in 1901.

Kyle, the central district of Ayrshire (q.v.).

Kyōto, or MIAKO, for over a thousand years the capital of Japan (q.v.), is situated on a flat plain about 26 miles inland from Osaka. A high range of hills to the east separates this plain from Lake Biwa, and on these some of the finest temples connected with the city are built. The city is rectangular in form, the longer streets running north and south, parallel to the Kamo River, which flows along the base of the ridge. At the northern end are situated, in an enclosure, the plain wooden buildings where the emperors of Japan dwelt so long in seclusion. The Honganji temples of the Monto sect of Buddhists, fine structures of their kind and the centre of the Buddhist faith in Japan, rise at the southern end of the city. The streets, though narrow, are clean and attractive, and the whole city has an air of refinement. The singing-girls of Kyōto are noted for their graceful dances. The pottery, porcelain, crapes, velvets, and brocades of Kyōto are highly esteemed; its embroideries, enamels, and inlaid bronze-work, are marvels of skilful handicraft. Pop. (1895) 318,280.

Kyrie Eleison (Gr. *Kyrie eleison*, 'Lord, have mercy'), a form of prayer which occurs in all the ancient Greek liturgies, and is retained in the Roman Catholic mass. It follows immediately after the introit, the priest and the server saying alternately 'Kyrie eleison' thrice, 'Christe eleison' thrice, and again 'Kyrie eleison' thrice; the triplets are understood to be addressed to the three Persons of the Trinity. The Greek words have always been left untranslated in the Latin liturgy. In their translated form they are known to Anglican churchmen as the 'lesser litany,' and occur in the order for morning and evening prayer, and also in the Litany; processional litanies in the early church began with the phrase, and sometimes included as many as a hundred repetitions. The First Prayer-book of Edward VI. (1549) retained the 'lesser litany' after the introit; but in 1552 it was embodied in the short petition that follows each of the commandments, which were then inserted in the communion office.

Kyrie, JOHN (1637-1724), philanthropist, was styled the Man of Ross by Pope, having resided for the greater part of his life in the small town of Ross, Herefordshire. He spent his time and fortune in building churches and hospitals, on an income amounting to £600 a year. Pope celebrated his praises in his third *Moral Epistle*, and Warton said that he deserved to be celebrated beyond any of the heroes of Pindar. The Kyrie Society is a modern association named after him, and was started by Misses Miranda and Octavia Hill in 1875, and founded in 1877 by Prince Leopold and others. The society seeks to bring the influences of natural and artistic beauty home to the lives of the people by means of the decoration of workmen's clubs, of hospital wards, and of dwelling-houses; by the encouragement of window-gardening; providing concerts for the people; and by securing open spaces, both in town and country, to be laid out as public gardens. See an article in *Good Words*, 1881.

Kythul. See KATHRAL.

L

the twelfth letter in our alphabet, is descended from the Phœnician character called the 'ox-goad,' *lamed*, whence the Greek name *lambda* was derived. The letter *lamed* was probably a degraded form of the Hieroglyphic picture of a recumbent lioness, from which the hind-quarters have disappeared, leaving two straight lines, one of which represented the out-stretched fore-paws and the other the chest (see ALPHABET). The early Greek form λ passed over to Italy, where it became **L**. From λ , through the intermediate stage L , the Greeks got the form L (which was transmitted to the Runes), and this finally became Λ in the Greek capitals and λ in the minuscules. Our own minuscule form *l*, in which the horizontal bar is evanescent, was derived from the old Roman cursive. The Roman numeral for 50 was **L**, but this is not the letter of the same form, but was obtained from the western form of the Greek letter *chi*, the successive stages being \times , γ , \downarrow , L , and finally **L**.

The letter *l* is usually termed a 'liquid,' but is more correctly designated as a 'front palatal.' It has a great affinity with *r*, the positions of the vocal organs for forming *l* and *r* being nearly the same. In sounding *r* the breath escapes over the tip of the tongue, while for *l* the tip of the tongue touches the front palate or the base of the gums, the breath escaping over the two sides of the tongue, and the vibrations of the soft lateral edges producing slight oscillations in the force of the breath, whereas in the case of *r* a stronger trill is caused by the vibration of the tip of the tongue. In the Spanish *ll*, the Italian *gli*, and in the English word *glora*, the contact with the palate is made by the middle of the tongue instead of by the tip.

Owing to the affinity between *l* and *r* they are frequently interchanged. In some languages the same sign was used for both sounds, in others either *l* or *r* is wanting. The old Egyptians seem to have made no distinction between the two; in old Pali the signs were interchanged; the Japanese sign for *r* was borrowed from a character which represented *l* in Chinese; while the Polynesians substitute *l* for *r* in foreign words. In English a Latin *r* has become *l* in such words as *plum* (*prunus*), *turtle* (*turtur*), *purple* (*purpura*), *marble* (*marmor*), and *pilgrim* (*peregrinus*). We have the converse change in *chapter* from *capitulum*, and *colonel* from *herodula*, while *colonel* is now pronounced *coronel*.

The letters *d* and *n* have also an affinity with *l*. We have the change of *d* to *l* in *lacrima* for *lacryma*, *lingua* for *lingua*, *lupulus* from *lupulatus*, *sella* from *selula*, *alloguar* from *alloguar*. In the numerals *decem* and *twelve* the *l* is also believed to represent a primitive *d*. We find the change of *n* to *l* in *asellus* for *asinulus*, *collegium* for *conlegium*, and *Bologna* from *Bononia*.

In the spelling of several English words the letter *l* has fallen out, as in *such* and *each*, from the old English *sude* and *ate*. Though preserved

in the spelling, it is not heard in the words *alms*, *palms*, *calms*, *polls*, *hulfs*, *woulds*, and *shoulds*. A final *l* is often mute in the Scotch dialect, as in *a'* for *all*, *fa'* for *fall*, *fu'* for *full*. In modern French it sometimes fades to *u*, as in *aur* for *à les*, *du* for *de le*, *chevane* for *chevals*. In Italian it may become *i*, as in *piano* from *planus*. On the other hand, *l* is intrusive in *windlass* from O.E. *windlæss*, and in *myrtle* from *myrtus*, *principle* from *principium*, and *participle* from *participium*. From a false analogy with *would* and *should*, where the *l*, derived from *will* and *shall*, is radical, it has crept into the spelling, though not into the pronunciation, of *could*, which is the past tense of *can*. The M.E. form *coude* has no *l*, while the Dutch *konde* and the German *konnte* have preserved the *n* which belongs to the root.

Laager, in South African campaigning, is a camp made by a ring of ox-wagons set close together, the spaces beneath being filled up with the baggage of the company.

Laaland, or LOLLAND, a Danish island in the Baltic, at the southern entrance to the Great Belt, 36 miles long by 9 to 15 broad, with an area of 445 sq. m., and a pop. (1890) of 67,913. The surface is remarkably flat, and the soil exceedingly fruitful. Forests of beech and oak cover upwards of 50 sq. m. The capital is Maribo (pop. 2303); the largest town, Nakskov (pop. 5278), with a good harbour and considerable trade.

Lab'arum, the famous standard of the Roman emperor Constantine, designed to commemorate the miraculous vision of the cross in the sky, which is said to have appeared to him on his way to attack Maxentius, and to have been the moving cause of his conversion to Christianity. It was a long pike or lance, with a short transverse bar of wood attached near its extremity, so as to form something like a cross. On the point of the lance was a golden crown sparkling with gems, and in its centre the mysterious monogram of the cross and the initial letters of the name of Christ, the letters χ and ρ —Greek for χ and ρ —being combined (see Cross, Vol. III. p. 582). From the cross-beam depended a square purple banner, and surrounded by a rich border of gold embroidery. The cross was substituted for the eagle, formerly perched on the Roman standards, and there were sometimes other emblems of the Saviour. Between the crown and the cross were heads of the emperor and his family, and sometimes a figure of Christ woven in gold. The origin of the word is still uncertain, 'in spite,' says Gibbon, 'of the efforts of the critics, who have ineffectually tortured the Latin, Greek, Spanish, Celtic, Teutonic, Illyric, Armenian, &c. [and, he might have added, Basque] in search of an etymology.'

Label. See HERALDRY, and CADENCY.

Labiatae (*Lamiacea* of Lindley), a natural order of exogenous plants, containing almost 2500 known species, mostly natives of temperate climates. They are herbaceous, or more rarely half-shrubby, and have 4-cornered stems and opposite branches; also opposite leaves, without stipules, abounding

in receptacles of volatile oil. The flowers are often in cymes or heads, or in whorls, or sometimes solitary. A general characteristic of this order is an aromatic fragrance, which in many species is very agreeable, and makes them favourites in our gardens; but some are weeds with an unpleasant odour. Many are natives of Britain. Some are used in medicine, and others in cookery for flavouring. Mint, Marjoram, Rosemary, Lavender, Sage, Basil, Savory, Thyme, Horehound, Balm, Patchouli, Germander, and Dead Nettle are examples of this order.

Labiche. EUGENE MARIN, a French dramatist, was born at Paris, 5th May 1815, studied at the Collège Bourbon, and next travelled in Italy. His first dramatic piece was the popular farce *M. de Coillien* (1838), which was followed during the next forty years by a long series of over a hundred comedies, farces, and vaudevilles. These were all marked by rare mastery of stage technique despite the usual droll improbability of the plots, intimate knowledge of human nature, crisp and sparkling dialogue, and a lambent humour that is often caustic but never unkindly. He collaborated at one time or another with Gondinet, Delacour, Legouvé, Augier, and other dramatists. His *Fressette* (1846) was the original of Morton's 'Box and Cox.' Among the most important of his pieces are *Le Chapeau de Paille d'Italie* (1851); *L'Affaire de la Rue de Louvain* (1857); *Le Voyage de M. Perrichon* (1860); *Les Petites Déeses* (1863); *Célimaire le Bien-Aimé* (1863); *La Cagoulle* (1864); *Le plus Heureux des Trois* (1870); *Est-on le duc* (1873); *Les Trente Millions de Gladiateur* (1875); *Le Prie Martin* (1876); *La Cigale* (1877). A successful collection of his pieces appeared under the title *Théâtre de Labiche* (10 vols. 1879), with an introduction by Augier. Labiche was elected to the Academy in November 1880, and died 23d January 1888.

Lablache. LUIGI, operatic singer, was born in Naples on 6th December 1794; his father was a Frenchman, who had fled from Paris during the horrors of the Revolution, his mother an Irishwoman. His first engagement as a singer was at the San Carlino Theatre at Naples, in 1812. He afterwards sang with much success at Palermo (until 1820), at Milan, Rome, Turin, and Vienna; in the last-named city a medal was struck in his honour. From 1830 to 1852 he sang nearly every winter at Paris, and annually made visits to London, St Petersburg, and various cities in Germany. In London he was perhaps a greater favourite than even the wonderful Grisi. Lablache died at Naples on 23d January 1858. His voice, a deep bass, has hardly ever been equalled either in volume or quality; and his acting, particularly in the characters of Figaro, Don Bartolo, Don Pasquale, Leporello, &c., was almost as remarkable as his singing. He gave instruction in singing to Queen Victoria.

Laboulaye. EDOUARD RENE DE, a distinguished French jurist, was born in Paris 18th January 1811, became an advocate, and in 1849 was appointed professor of Comparative Jurisprudence in the Collège de France. His most important works are on French law, and a *Histoire Politique des États-Unis, 1620-1789* (3 vols. 1855-65; 6th ed. 1876). He also edited the *Recueil Historique* (1855-69), and its successors, the *Recueil de Législation* (1870-76) and *Nouvelle Revue Historique* (from 1877). Laboulaye attained some distinction as an essayist and story writer; some of his tales, including the humorous *Paris in Amérique*, have been translated into English. He took up a consistently moderate position in politics, and in consequence gained the enmity of extremists

on both sides. He was elected to the National Assembly in 1871, and in 1876 became a life senator. He died 25th May 1883.

Labour, in Political Economy, may be defined as effort for the satisfying of human needs. It is one of the three leading factors in production, the other two being land (or natural objects) and capital; and it is more fundamental than capital, which originally is the result of labour. In the vast circle of industry labour has a great variety of functions, which may be thus classified: (1) Producing of raw materials, as in mining and agriculture; (2) manufacturing in the widest sense of the word, or transformation of raw materials into objects serviceable to man; (3) distribution, or transference of useful objects from one place to another, as determined by human needs; (4) personal services rendered by physicians, teachers, &c.

A distinction insisted on by many economists is that into productive and unproductive labour. The former consists of those kinds of exertion which produce utilities embodied in natural objects. Unproductive labour, like that of the musician, while both useful and honourable, does not add to the material wealth of the community. Though it has the appearance of undervaluing some of the highest services that can be rendered to the community, the distinction has a general validity. Labour directly employed in rendering natural objects serviceable to man may in the language of political economy be distinctively called productive. But in order to obviate a too narrow and abstract view of the subject it is hardly necessary to point out that the labour of the physician or teacher may be indirectly most productive, inasmuch as it increases the efficiency of the workman by promoting his health and intelligence. And apart from the special services rendered by great teachers and artists, and which cannot be measured in material wealth, they raise the general level of production, and even of material civilisation, by inspiring men with finer tastes and higher needs. For the wants to which productive labour ministers vary at different stages of social development, and grow more refined as the human race advances.

The social and legal forms in which labour has appeared have also varied with the progress of civilisation. In the early stages the labour of the chase, fishing, &c. was performed by the men, while the drudgery devolved on the women and slaves. But at that stage few slaves existed. It was not till the agricultural stage was reached that conquering tribes spared the conquered in order to utilise their services as workers. Ancient civilisation was based almost entirely on compulsory labour. The pyramids and other great works of Egypt and Babylonia were possible only because governments could command forced labour on a colossal scale. The more highly developed societies of Greece and Rome rested on the same basis.

It is a disputed question how far free labour existed in the early Teutonic settlements of England and other countries. The question is evidently one of degree, for the Germans possessed slaves long before the great emigrations began, and even in England they did not entirely exterminate the natives. The medieval organisation of society, where definitely constituted, rested on serfdom, i.e. the mass of the workers were attached to the soil, and rendered fixed services in labour, in kind, and latterly in money. While the condition of serfdom greatly varied, there can be no doubt that its tendency was to depress the free and raise the servile cultivators to something like a common level. The free workers of the towns organised themselves in Guilds (q.v.). In the course of the 14th century serfdom began to pass away in England. Its disappearance was followed by enact-

ments for the regulation of labour in the interest of the ruling classes. The first, and one of the greatest, examples of this was the *Statute of Labourers* occasioned by the scarcity of labour consequent on the Black Death. The main object of this statute, which was passed in 1349 and was repealed only in the early years of Elizabeth, was to fix the amount of wages; and it was superseded by a statute of Elizabeth which, besides ordaining an apprenticeship of seven years, empowered the justices in quarter sessions to fix the rate of wages both in husbandry and handicrafts. This act of Elizabeth was not repealed till 1814. The poor law enacted at the close of her reign in 1601 may be described as a method of supplementing the low wages fixed by the justices (see *POOR LAW*).

Towards the close of the 18th century the effect of the industrial revolution was to organise labour in large factories and similar undertakings; and in the early decades of the 19th the growing ideas of freedom had begun to make other great changes in the condition of the workers. The right of combination received in 1824 was utilised in the formation of trades-unions and co-operative societies, and the admission of the working men to the franchise has given them a share in the political life of the country. Changes similar to those in England have taken place, only much later, in the countries of the European continent. The emancipation of agricultural labour from serfdom, which was effected in France at the Revolution of 1789, was not completed in central Europe till 1848, and in Russia not till 1861. Laws for the regulation of labour are now intended not to fix wages as formerly, but to protect the weaker class of workers. Such are the Factory Acts in England, which also have been followed by a corresponding development abroad. Efforts for the international organisation of labour proceeding from socialism have been followed by the international conference for the regulation of labour, which met at Berlin in 1890.

Another great result of social evolution in the most advanced countries of the world has been the more or less conscious and definite constituting of the labouring class as a separate class, with interests at variance with those of the possessors of land and capital. The solution of the questions connected therewith is now universally regarded as the most pressing duty of statesmen and economists (see *SOCIALISM*). In this connection it is maintained on the basis of the old political economy that labour, thus narrowly defined as the attribute of a special class, is the source and measure of value. For treatment of this fallacy, see *VALUE*. See also *DIVISION OF LABOUR*.

See Professor Thorold Rogers' *Six Centuries of Work and Wages*; also popular edition, *Work and Wages*; and the chapters on labour in the various systematic works on political economy.

Labour Day is a legal holiday in some parts of the United States, as in New York (the first Monday in September). The banks and government offices are closed, labour is suspended, and the labour organisations parade the streets and hold meetings. In Europe, as a result of the Labour Conference at Berlin in 1890, in many parts of the Continent the 1st of May was to some extent observed as a labour holiday.

Labourdonnais, BERTRAND FRANÇOIS MAHÉ DE, a famous French naval officer, was born February 11, 1699, at St Malo, and already in 1723 was captain in the naval service of the French Indies. Next year he distinguished himself so greatly at the capture of Mahé on the Calabar coast that he was permitted to add its name to his own. In 1734 he was appointed governor of the islands Ile de France and Bourbon, and his wise measures ere long made

them flourishing colonies. In 1740 he was given command of a squadron in East Indian waters, and during the next five years he inflicted great loss upon England. In September 1746 he compelled Madras to capitulate, but failed to push his success in consideration of a contribution of nine million livres. Accused by Dupleix of betraying the interests of the company, he returned to Paris in 1748, where he languished three years in the Bastille, but was set free and declared guiltless in 1752. He died September 9, 1753. Like most Frenchmen he wrote *Memoires* (1750), but his name best survives from its mention in *Paul et Virginie*. A monument was erected in 1859 at Port Louis on the Ile de France.—His grandson, Bertrand François Mahé de Labourdonnais (1795–1840), was a famous chess-player, and wrote a *Life of his grandfather* (1827).

Labourers. The only peculiar laws affecting labourers are where they come within the description of 'workmen' given in the Employers and Workmen Act, 1875. The act defines 'workman' as 'any person who, being a labourer, servant in husbandry, journeyman, artificer, handicraftsman, miner, or otherwise engaged in manual labour, whether under the age of twenty-one years or above that age, has entered into or works under a contract with an employer.' The act provides such labourers a speedy, easy, and cheap mode of recovering their wages when the amount is small, and affords masters an easy method of correcting misdemeanours and ill-behaviour on the part of the workmen. Labourers' wages are prohibited from being paid in kind or with goods by the Truck Act (q.v.). Other measures affecting labourers are the Factory Acts (q.v.), the extension of the franchise (see *PARLIAMENT*), the establishment of national Education (q.v.); the Workmen's Compensation Act, 1897 (see *LIABILITY OF EMPLOYERS*); see also the articles *ALLOTMENTS*, *GANGS*, *TRADES-UNIONS*, *MASTER AND SERVANT*. Numbers of Irish labourers still come over to England and Scotland at harvest time, returning again when harvest is ended. Italians to the number of 87,000 annually leave their homes for unskilled labour (as on railway laying) in Austria, Germany, and France. A prominent feature in the social economy of several Russian provinces (Samara, Saratoff, Yaroslav, Vyatka) is the large annual migration of their male population to work in more populous centres of Russia as smiths, masons, plasterers, carpenters, boatmen, gardeners, &c. For description of the condition of English agricultural labourers, see books by Jelferies (q.v.), Heath's *English Peasantry* (1874) and *Peasant Life in the West of England* (1880), and Jessopp's *Arday* (1887).

Labrador is the north eastern peninsula of the North American continent, lying between Hudson Bay and the Gulf of St Lawrence. The coasts were probably visited by the Norsemen about the year 1000; they were again sighted by Cabot in 1498. In 1500 a Portuguese navigator, Cortereal, seems to have visited it and to have given it its name, which means 'labourers' land.' Labrador extends from 49° to 63° N. lat., and from 55° to about 79° W. long. The greatest length from the Strait of Belle Isle to its northern cape, Wolstenholme, is 1100 miles; its area, 420,000 sq. m., or nearly five times the area of Great Britain. The Atlantic coast is stern and precipitous (1000 to 4000 feet high), entirely destitute of vegetation, deeply indented with narrow fjords, and fringed with chains of rocky islands. The inner parts of Labrador have been but very imperfectly explored; the greater part consists of a plateau, some 2000 feet above sea-level, and mostly covered with fine forest trees, firs, birches, &c. Numerous lakes,

including Mistassini (q.v.), also exist inland, and, connecting with the rivers, afford in summer continuous waterways for great distances. The only inhabitants of this interior plateau are Cree Indians, nomads. There are numerous rivers, 200 to 300 miles long and 2 and 3 miles wide at their mouths, flowing towards the Atlantic and Hudson Bay. The Grand Falls are 316 feet in perpendicular height, but from 4 miles above this, to the sea, there is a magnificent, almost continuous fall of 2000 feet. These rivers abound in fish, especially salmon and white-fish. The principal fur-bearing animals are bears, wolves, foxes, martens, otters, beavers, lynxes, &c. Of the mineral resources little is known; but iron and Labradorite (q.v.) are certainly abundant. The climate on the coast is very rigorous, owing mainly to the ice-laden Arctic current which washes the shores. The short three-months' summer is marred by the swarms of mosquitoes and black flies. The mean annual temperature at the missionary stations varies from 22 to 28°. The winter is dry, bracing, and frosty. The part draining to the St. Lawrence belongs to Quebec, and forms indeed the larger part of Quebec province; that draining to Atlantic belongs (since 1809) to Newfoundland; the rest is, since 1895, the territory of Ungava. The great wealth of Labrador is its fish—cod, salmon, herrings, and trout. As many as 30,000 fishermen from Newfoundland, Canada, and the United States visit its fishing-grounds in the season. The annual catch is valued at more than £1,000,000. There are some 6000 permanent settlers, Eskimo and French Acadians, in the coast region, collected chiefly at the Moravian missionary stations—Nain (founded 1770), Okkak, Hebron, Hopedale, &c.

See A. S. Packard in *Bulletin of the American Geographical Society* (1887 and 1888), and his *Labrador Coast* (1892); Hand, *Explorations of the Labrador Peninsula* (1863); and R. F. Holme in *Proc. Roy. Geog. Soc.* (1888).

Labradorite is one of the group of the Feldspars (q.v.), and a very important rock-forming mineral. Thus, it is a principal ingredient in many diorites, basalts, gabbros, and andesites. It is met with also in certain volcanic tuffs (Etna). As a rule it is colourless or gray, and seldom transparent. Here and there it occurs in large masses associated with schistose rocks, as on the coast of Labrador. This massive kind (Labrador stone) often shows a beautiful play of rich colours, takes a fine polish, and is cut into snuff-boxes.

Labridæ. See WRASSE.

La Bruyère. JEAN DE, was born at Paris in 1645. He belonged to a middle-class family, and was educated by the Oratorians, the rivals of the Jesuits. After leaving the Oratory he was chosen to aid Bossuet in educating the dauphin, and in 1673 was appointed treasurer of France for the city of Caen, a post which he resigned through disgust at the rapacity of his fellow officials. He became tutor to the Duc de Bourbon, the grandson of the Great Condé, and spent much of his time at Paris and Chantilly with the Comtes, from whom he received a pension until the date of his death. His *Caractères* appeared in 1688, ran through eight editions in seven years, and gained for its author a host of implacable enemies as well as an immense reputation. The book consisted of two parts, the one being a translation of Theophrastus, the other a collection of maxims, reflections, and character-portraits of the men and women of the time. To these portraits has been mainly due the wide and lasting popularity of the *Caractères*. La Bruyère, his editor Walekenær has truly said, 'made mirrors on which by some magic property the reflected faces of a whole generation of men and women have become indelibly impressed.' Bitterly assailed

for his personal satires, La Bruyère found a powerful protectress in the Duchesse de Bourbon, a daughter of Louis XIV., who is said, with what truth cannot be determined, to have aided him in the composition of the later sketches which he embodied in his work. His enemies, headed by Fontenelle and Thomas Corneille, were twice able to secure his rejection when he tried for a chair in the Academy. In 1693, however, he was elected, his success being greatly due to the energetic efforts made on his behalf by his patroness, who is said to have resorted to a stratagem by which certain Academicians were prevented from voting against him. La Bruyère—who never married—died on May 11, 1696, his death being caused by a decoction of tobacco administered to him by the king's physician with the view of relieving him from an attack of apoplexy. Reports that he had been poisoned by his enemies were at one time current, but have since been thoroughly disproved. His *Dialogues sur le Quichisme* were issued in 1699. They were directed against Fenelon, and show none of the literary power so conspicuous in the *Caractères*.

Though he cannot rank with Montaigne or Pascal, La Bruyère is a moralist of high standing and a writer of the highest excellence. Sainte-Beuve affirmed that his book should be at the hand of every author, and that to read parts of it daily would be no less helpful to every critic than the study of the *Imitatio* to every one of a tender and devotional spirit. In his style the clearness, precision, and classic elegance of the Louis XIV. men are united with a pathos, a freshness of phrase, and a richness of colour suggestive of the prose of a later epoch. Like most workers in apothegm and epigram, he falls at times into triteness and exaggeration; but he has singularly few dull pages. His book is built on no regular plan, and to this its peculiar charm is in no small measure due. The writer perpetually varies his subject and his manner. You have here a pregnant maxim, a clear-cut epigram, a piquant anecdote, an old truth reset with novel felicity of phrase—here a page of acute literary criticism—here a bit of dialogue as crisp and bright as the talk in a sparkling comedy—here a character-sketch, racy with ironic malice, and humour, and wit—there a passage glowing with a sombre repressed indignation which proves how deeply the author resented his countrymen's wrongs. A great writer rather than a great thinker, his insight into character is shrewd rather than profound. It has been truly remarked by Suard that, while Montaigne has painted man as he is in all times and in all places, La Bruyère has only painted the courtier, lawyer, financier, and *bourgeois* of the days of Louis XIV.

The best edition of La Bruyère is that included in the series *Les Grands Écrivains de la France*, edited by G. Seryois (3 vols. 1864-82); a recent English translation of the *Caractères* is that by Helen Stott (1890). See the notice by Suard prefixed to the edition of 1838, and Life by Seryois in the 'Grands Écrivains' series (1882).

Labuan, an island 30 sq. m. in area, lying 6 miles from the north-west coast of Borneo. Besides possessing a good harbour (Victoria), it has an extensive bed of excellent coal, which has been worked, though not with commercial success. Labuan is an active market for the products of the neighbouring islands (Borneo and the Sulu Archipelago)—sago, edible birds' nests, camphor, gutta percha, india rubber, rattans, pearls, tortoise-shell, and beeswax. Sago flour is manufactured. Average value of exports, £83,800; of imports, £81,000. The island became British in 1846, and since 1891 is administered by the British North Borneo Company. Pop. 6000, mostly Malays and Chinese. See BROOKE (SIR JAMES).

Laburnum (*Cytisus Laburnum*), a small tree, a native of the Alps and other mountains of the south of Europe, much planted in shrubberies and pleasure-grounds in Britain, on account of its glossy foliage and its large pendulous racemes of yellow flowers, which are produced in great abundance in May and June. It is often mixed with filix, and when the latter preponderates the combination has a fine effect. In favourable circumstances laburnum sometimes attains a height of twenty or even forty feet. It is very hardy, and nowhere flourishes better than in the north of Scotland. It is of rapid growth, yet its wood is hard, fine grained, and very heavy, of a dark-brown or dark-green colour, and much valued for cabinet-work, inlaying, and turnery, and for making knife-handles, musical instruments, &c. The leaves, bark, and particularly the seeds, are nauseous and poisonous, containing *Cytisine*, an emetic, purgative, and narcotic principle. Accidents to children from eating laburnum seeds are not unfrequent; but to hares and rabbits laburnum is wholesome food. A fine variety of laburnum, called Scotch Laburnum, by some botanists regarded as a distinct species (*C. alpinus*), is distinguished by broader

Laburnum (*Cytisus alpinus*).

leaves and darker yellow flowers, which are produced later in the season than those of the common or *English* laburnum. The form known as Adam's Laburnum (*C. L. adami*), now occasionally seen in British gardens, originated in the Jardin des Plantes at Paris, about 1810, and is peculiar in producing the ordinary flowers of the common laburnum and those of another species (*C. purpureus*) in an irregular and indiscriminate way over its branches. The peculiarity is considered to be the result of grafting or budding the one species on the other.

Labyrinth, the name of some celebrated buildings of antiquity, consisting of a series of intricate chambers or passages. Of these the most celebrated were the Egyptian, the Cretan, and the Samian. The Egyptian was visited by Herodotus and Strabo, and was reckoned one of the wonders of the world, containing 3000 chambers. It was built on the shore of Lake Moeris, and its foundations were discovered by Lepsius (see FAYYUM). The Cretan labyrinth was supposed to have been built by Dædalus for King Minos, to contain the Minotaur. The only mode of finding the way out of it was by means of a hank or skein of linen thread, which gave the clue to the dwelling of the Minotaur. The Samian labyrinth was constructed in the age

of Polycrates (540 B.C.). Other inferior labyrinths existed at Nauplia, at Sipontum in Italy, at Val d'Ispeia in Sicily, and elsewhere; and the name of labyrinth was applied to the subterraneous chambers of the tomb of Porsena, supposed to be that now existing as the Poggio Gazella, near Chiusi. Labyrinths called mazes were at one time fashionable in gardening, being imitations, by hedges or borders, of the Cretan; the best known in modern times is the Maze at Hampton Court.

Maze at Hampton Court.

An ancient story told in Fabian's *Chronicle*, also in Higden and other early historians, and blindly followed by their successors, makes a maze at Woodstock the scene of Queen Eleanor's apocryphal vengeance upon Fair Rosamond.

Labyrinthodonts, or STEGOCEPHALL, a race of extinct Amphibians, the remains of which are found in the Permian, Carboniferous, and Triassic strata. Many of them were giants compared with our modern amphibians, from which they also differed markedly in possessing an armature of bony plates in various degrees of completeness. The order includes numerous genera, some of the salamander type, others limbless-like

Transverse section of a Tooth of snakes, and leading on to the modern Cecilians.

The name Labyrinthodont refers to the mazy pattern exhibited on a transverse section of the teeth of some genera. Some of these ancient forms were probably responsible for footprints in the rocks which used to be placed to the credit of a more or less mythical animal, *Cheirotherium*. See *Textbook of Palæontology* by Nicholson and Lydekker (Edin. 1890).

Lac, best known in the form of shell-lac, is a coloured resinous substance of great importance in the arts. It is produced by a small insect from $\frac{1}{4}$ th to $\frac{1}{3}$ th of an inch in length—called *Coccus lacca* (*Carteria lacca* of Signoret), belonging to the sub-order Homoptera of the Hemiptera, or Bugs. Lac is found in India, Burma, Siam, China, and in some of the islands of the Eastern Archipelago. The lac-insect lives upon the young branches of many different species of trees, but the best lac is collected from two or three species of fig, *Zizyphus* and *Butea frondosa*.

As soon as the young are hatched they crawl about in search of sappy twigs. To these they fix themselves by their proboscides, and immediately begin to form their lac cells or cocoons. These have one anal aperture and two others for the admission of air, and in their cocoons the insects remain in a lethargic state for two and a half months. The females, which greatly outnumber

the males, never leave the spot to which they attach themselves, but the males escape by a ventral opening in the cocoon. After impregnation the female feeds voraciously on the juice of the twig to which it is fixed, increases in size, and continues to form lac. The lac surrounds all parts of the insect except the mouth and the three apertures already mentioned. When the young are perfectly formed they issue by the anal opening in the lac incrustation. Naturalists are divided in opinion as to whether the lac is secreted by the insect itself, or whether it is not merely the resinous juice of the trees altered in character by the insect while making its puncture, or just after it is made.

The appearance of the incrustation varies. It often takes the form of coalesced rounded prominences, at some places surrounding, at others scattered over, the branches; but in other instances it looks, superficially, more like a thick, irregular outer layer of bark roughened on the surface. The incrustation is cellular, each cell indicating the position of the insect which formed it. *Stick-lac* is the name given to it when the incrustation is still attached to the twigs, which are usually cut into pieces from three to six inches long. The next step is to remove the lac by a roller moving on a platform, the detached fragments being afterwards placed in tubs of water, and beaten by pestles or trodden by men. It is now in the state of *seed-lac*. The water left in the tubs is coloured red by the bodies of the insects, and, after this water is evaporated, the red substance is made into cakes, forming the lac-dye of commerce (see **DYEING**). After drying the seed-lac is melted in cylindrical cotton bags before charcoal fires, and, by twisting the bags, forced through the pores of the cloth. It drops into troughs, and is either allowed to spread out itself, or is spread by a strip of leaf upon a roller, into a thin sheet. After the impurities are broken out, the flakes are packed in bags, forming the *shell-lac* of commerce. Another form is *button-lac*, which is made by letting the melted lac drop into rounded pieces from 1-1½ inches in diameter.

In India a good deal has been done in the cultivation of lac by transporting the encrusted branches to suitable forests about a fortnight before the young insects begin to move about. The twigs with the insects in the larval state are tied on branches of trees which have been selected for the rearing of future broods. The inland trade for the year 1889 was valued at 101 lakhs of rupees.

Lac has many industrial applications. Shell-lac varnish is more extensively employed than any other spirit varnish. One variety of it is French Polish (q.v.) for furniture (see also **LACQUER**). Lac applied as an alcoholic solution is used to stiffen the calico frame of silk hats (see **HAT**). In fine sealing wax it is the most important ingredient, and either alone or mixed with other bodies it forms a good Cement (q.v.). Personal ornaments, such as chains and bracelets, are largely made of lac in India, and, when mixed with sulphur and some colouring matter, it is used there for coating wooden toys. Another mixture of lac with vermilion, closely resembling red sealing-wax in appearance, is applied by the Chinese to the surface decoration of boxes, trays, vases, and other small articles.

Lac, or **LAKH**, from a Sanskrit word meaning 'one hundred thousand,' is generally employed in India to indicate 100,000 rupees, the nominal value of which is £10,000 or \$48,600; but in consequence of the depreciation in the value of silver the real value is only £8333 or \$40,500.

Laccadives (Sansk. *Laksha Dvipa*, 'the Hundred Thousand Islands'), a group of fourteen coral islands in the Arabian Sea, between 10 and

14 N. lat., and about 200 miles W. of the Malabar coast. Area, 744 sq. m.; pop. (1891) 14,440. They are low and flat, and all but two are comparatively barren. The cocoa-nut is the chief plant, and *coar* (cocoa-nut fibre) the staple product. This and jaggery, cocoa-nuts, copra, tortoise-shell, and cowries are carried over to the mainland by the men, who are brave and skilful sailors. The number of large boats owned in the islands is 184, of small craft 719; the annual exports average about £17,000. The group was discovered by Vasco da Gama in 1499. The northern islands are attached to the Madras district of South Kanara; the rest belong to the rajah of Cannanore, but since 1877 have been administered by the collector of Malabar. The people are Mohammedans of Hindu descent, their language Malayalam, except in Minikoi, which properly belongs to the Maldivic group and retains its language.

Lace is an ornamental fabric of linen, cotton, silk, or gold and silver threads, made by looping, knotting, plaiting, or twisting the thread into definite patterns, of contrasted open and close structure. Three distinct varieties of lace are made, two by handwork, known respectively as *needle or point lace* and *pillow-lace*, and one by machinery. To hand-made lace the term real lace is sometimes applied, and, although it may be made in all or any of the varieties of thread above enumerated, in general it is composed of white linen thread of exceedingly great delicacy and tenacity. Machine-made lace on the other hand usually consists of cotton thread of high counts, but it cannot be used of such fineness as linen; while with machines it is quite impossible to rival the combined grace, delicacy, and strength of ornamental structure obtainable by the skill and patience of the hand worker. Nevertheless machine-made lace is a marvellous triumph of mechanical ingenuity, and more inventive genius has been devoted to its production than has been bestowed on any other branch of textile industry.

Lace on one side, as needle or point lace, is closely allied to embroidery; pillow-lace is derived from and merely an elaboration of plaited fringe-work; and machine-lace is a development of fancy weaving. Although we have these three distinct methods of lace-making, combinations of the whole may be found in one piece of modern lace, and frequently the products are so similar that it requires both experience and close observation to distinguish what is made by the needle from the plaited product of the pillow, or even the twisted lace of the machine. Technically, lace consists of two elements, the pattern, flower, or gimp which forms the closer-worked and more solid portion of the fabric, and the ground or filling which serves to hold the pattern together and in its proper place. In some varieties of lace, however, the ground is almost entirely wanting, and the pattern holds together by joining at the edges where two portions of the design meet and touch. In other cases the ground consists of ties or brides, thin loops or plaits passing from the edge of one portion of the pattern to another contiguous, and thus tying them together. More frequently the ground consists of a delicate filmy honeycomb called a *resseau*, of which the simplest form is the bobbin-net, now made by machinery. On the *resseau* the pattern is sometimes stitched down after being separately made, such lace being known as *appliqué* or applied; in other cases pattern and *resseau* are formed together by needle or bobbin or by both. Other technical terms are met with in the description of lace—as *cardonnet*, a stout thread or several threads together employed to outline the pattern; *pecol*, a minute loop worked on the edge of ties or flowers for their enrichment; and *nodes*, which are ornamental

fillings, variations of the *resseau*, which is always a plain honeycomb mesh.

Point-lace is a fabric which appears to have been arrived at through the efforts to produce light, graceful, and airy effects in embroidery. It is not

known to have been made earlier than the first half of the 16th century; and its original production, as well as its most varied triumphs, are associated with Venice. The stages by which it developed from embroidery-work can be traced from the illus-

Fig. 1.—Part of Liturgical Veil or Cover, in *punto a maglia* or *laeis* work.

Fig. 3.—Rose-point, Venetian, 18th century.

trated pattern-books for embroiderers which were issued early in the 16th century. In these books we find two styles of work intermediate between embroidery and lace-making, one of which consists of patterns cut out of stuff, and having the cut edges sewn over with a button-hole stitch, such work being known to the Venetians as *punto tagliato*. The second method of producing a lace-like effect was by cutting the individual threads in any texture in accordance with a definite pattern, and drawing out the cut portions, the resulting design, partly open work and partly close, being known as *punto tirato*. The converse of this consisted in darning in patterns on a gauze or other

Fig. 2.—Reticella Needle-point Lace, Italian, 16th century.

open woven texture, a class of work termed by the Italians *punto a maglia* (see fig. 1), and by the French *laeis* or *bassis*—whence our 'lace,' which has taken the place of the earlier name *passement* or *passement*. The earliest true needle-lace of Venice, known as *punto in aria* or *reticella*, was in its design similar to the cut work of the pattern books, showing only rectilinear and geometrical forms, as in fig. 2. A gradual development can be traced from such simple forms into rich floral ornaments and scrolls, till early in the 18th century, in the

very delicate needle-point with meshed ground known as *point de l'aise à resseau*, we come to the richest and most elaborate products of the north Italian needlewomen. The most characteristic and valuable of the laces of Venice is that known in Britain as *rose-point* (French *gros-point*) (fig. 3), which consists of patterns worked in relief like sculptured work, forming strong and solid flowers and scrolls, held in position by ties or brides enriched with picots. With such lace the robes of great ecclesiastics and wealthy nobles were adorned, and it was also employed for the ornamentation of altar covers and other church textures. In the making

Fig. 4.

of point-lace the design is first drawn on a piece of parchment, which is then stitched down to a backing of stout linen. Over the lines of the design one or more threads of linen are stitched lightly down, and the slow work of filling up the pattern with button-hole stitches proceeds on the thread outline so obtained. The methods of working are numerous, and some of the stitches indeed have been lost, but commonly the pattern or cloth is obtained by laying down a series of threads parallel to each other, as in fig. 4, and over-stitching them as shown. For the brides or *resseau* a single thread may form the foundation, it also being closely stitched over, as seen in fig. 5. When pattern and fillings are finished, it remains only to cut the

Fig. 5.

stitches which hold the outlining threads to the parchment and the linen backing, thus liberating the lace. From Venice the art of making point-lace travelled out to other Italian towns, and westward to France and Flanders. Principally owing to the efforts of the minister Colbert, who in 1665 chartered a company with exclusive privileges for ten years and a subsidy of 36,000 livres, the art was firmly established in France, ateliers being established in several of the principal towns. Among these places was Alençon, where Venice lace of very fine quality was being made by a lady named Laperriere prior to the establishment of Colbert's company. Alençon lace and the closely-allied fabric made at the neighboring town of Argentan attained great perfection during the 18th century. The designs employed were distinctively French in character, and the réseau and modes which formed the filling showed a minute and filmy delicacy unapproached by the products of any other district (fig. 6).

Fig. 6.—Portion of Alençon Lappet; French, late 17th or early 18th century.

From a picture by Quentin Matsys, painted in 1495, we have evidence that the making of pillow-lace was known in Flanders at that early date; but about the same time it was also being worked in Venice under the name of *Merlotti o piombini*. While point-lace making has always been the distinguishing character of Italy and the south, the making of pillow-lace became and remains distinctively associated with the Flemish towns and with England. For the production of pillow-lace the pattern is first drawn in mill size on a piece of parchment, which is then fastened to a pillow or cushion made to rest in the lap of the worker, and into which pins may be easily and firmly stuck at any required point. The pattern is then pricked over with pin-holes at every point where pins require to be inserted in the subsequent work of twisting and plaiting. The lace maker is also provided with a series of small bobbins, round the upper part of which the thread to be used is wound, and even for the production of a half-inch band of lace of simple pattern a vast number of pins and as many as fifty bobbins may be required, while for elaborate patterns twelve hundred bobbins may be brought into requisition on a single pillow. The whole work in pillow-lace is the result of twisting and plaiting, and the pattern is often outlined and sometimes filled up with thread of a stouter character than that used on the mesh and fillings. The

simplest ground in the pillow-lace consists of the twisted net or hobbin-net, originally made on the pillow, but now entirely made by machinery (see fig. 7). More commonly the net is partly twisted and partly plaited; and the variations in the mesh so formed are characteristic of the different classes of pillow-lace. Thus, the mesh of Mechlin lace consists of four twisted and two

Fig. 7.

plaited sides, as seen in fig. 8. The mesh of Brussels pillow-lace is similar to that of Mechlin, but the plaited sides are longer (fig. 9), while the Valenciennes mesh is plaited throughout. These differences in the form of the ground of pillow-laces give a different

Fig. 8.

Fig. 9.

appearance to the reticulations. The flower or pattern of the lace is worked so as to give it the appearance of plain woven cloth (see fig. 10). The Valenciennes mesh renders that variety more solid and durable than any of the others. Much of the modern Brussels lace has now a machine-made ground instead of the ancient pillow meshes, on which the separately-made flowers are applied or sewed by the imperceptible fine joining stitch. The making of pillow-lace in Honiton and other localities in the south-west of England was begun towards the end of the 16th century by refugees from the Low Countries. In 1662 parliament, desirous of encouraging native lace-making,

Fig. 10.

Fig. 11.
Border of Mechlin Pillow-lace, early 18th century.

prohibited the importation of all laces of foreign manufacture. Lace-workers were thereupon encouraged to settle in England; but as the fine

Fig. 12. Valenciennes Pillow-lace, with réseau ground, late 18th century.

thread necessary for their work was not forthcoming they were forced to return to their native

land. A vigorous smuggling trade between Brussels and England ensued, and the lace so introduced was freely sold as English point, whence Brussels lace came to be generally known as *Point d'Angleterre*. Honiton lace from the 17th century downwards has continued to be made in the same style as the Flemish laces, but at no time has it attained the celebrity acquired by the products of the great centres of the pillow-lace making in Belgium

Fig. 13.—Portion of Honiton Lappet, 18th century.

and the north of France. Fig. 13 is a fine example of Honiton lace-work.

The successful imitation of hand-made lace by machine-work, and the consequent enormous cheapening of material which bears a superficial resemblance to the costly product, has proved almost fatal to the arts of needle and pillow-lace making. Of late years an attempt has been made to re-establish the manufacture of fine point-laces on the island of Burano, near

Venice. Similarly, efforts have been made to revive the industry in Honiton, and at the present time much is being done to encourage the development of the art in various directions in conventual and other establishments in Ireland. The stimulus in all these cases is, however, obviously artificial, and it cannot be said that there is at present any really healthy indication of revived demand for these supreme products of patience and ingenuity.

Machine-lace.—The ground and simplest element of pillow-lace being a network of meshes, the earliest efforts of inventors were directed towards the producing of machinery for fabricating similar netting. The hosiery frame, which had been invented by William Lee towards the end of the 16th century, was the first apparatus with which it was attempted to make a lace net, and about 1764 a modification of the frame was devised by which an open loop-net was produced. By the various devices familiar to hand-knitters fancy patterns could be produced on this machine. The loop fabric, however, had the great disadvantage of unravelling freely at any point where it was broken, as it was constructed of a continuous single thread. At a subsequent period what was known as the warp-lace machine was introduced, in the use of which a separate thread is supplied to each hooked needle employed in the production of the web. On these warp-threads loops are formed by mechanical means, and as they can be moved by the machine either to the right or to the left, neighbouring warps and loops are joined together, and in this way a solid web, which can be cut without unravelling, is obtained. Towards the end of the 18th century a great variety of figured lace began to be made on the warp-machine, and in a greatly improved form it still continues in use.

A new era, however, in machine lace making was inaugurated when, in 1809, John Heathcoat patented his second bobbin-net machine, by which

it was made possible to twist or wrap round each other an indefinite number of threads, and to cause any one thread to traverse, mesh by mesh, every other thread in the width of the fabric being netted. The bobbin-net machine of Heathcoat became the foundation of an enormous industry, and the inventor reaped both honour and ample pecuniary reward for his remarkable ingenuity. His frame has been modified by many inventors, but the most important improvements were effected by John Levers in 1813. The lace-making machine now principally used is known as the Levers machine, but of its complicated structure it would be quite impossible to convey any clear conception within moderate limits. The structure of the simplest fabric produced by it is shown as it appears on the frame in fig. 14; and when dressed and finished this fabric has the appearance indicated in fig. 7, which is common bobbin net. It will be seen that the texture is formed of a series of vertical parallel threads which may be taken to represent

Fig. 14.

the warp of a common web, these being diagonally crossed and intertwined with others which may be looked on as weft-threads. The frame or loom holds the warp-threads vertically, a space being left between each sufficiently wide to admit of a shilling being passed edge-ways between them. Behind these threads, and corresponding to the interspaces, is a row of ingeniously constructed flat bobbins or reels resting in an arrangement called a *comb-bar* or *bolt bar*. These are so placed that with the first movement of the machine each bobbin, which carries its thread with it, passes through two of the parallel and perpendicular threads of the warp, and is lodged in another and similar bolt-bar in front of the warp. But this front bolt-bar, besides an advancing and reeling motion, has another movement, called *shooing*—from right to left. When it receives a bobbin by its forward motion it draws back, bringing the bobbin and thread through two of the upright threads; then it *shoos* or moves to one side, and goes forward again, taking the thread through the next two warp-threads, and lodging the bobbin on the back bolt-bar again, one distance beyond its last space; this it recovers by the next movement, and it again passes through the first space, to be again received by the front bolt bar. By these movements the bobbin thread is twisted quite round one upright thread of the warp; another movement then shifts the bobbin, so that it will pass through the next pair of upright threads, and so carry on its work, the warp-threads moving at the same time, unwinding from the lower beam, and being rolled on the upper one. There being twice as many bobbins as there are threads in the warp, each bolt bar having a set which it exchanges with the other, and all being regulated with great nicety, a width of lace is made in far less time than has been required to write this short description. The additions to and variations upon these operations (which only apply to bobbin-net), for the production of patterns, are numerous and complicated—each pattern requiring new combinations; but they all depend upon the variations which can be given to the movements of the flat disc-like bobbins.

Gold Lace and Silver Lace.—The so-called gold thread which is used in textiles consists of silver-gilt wire, or for commoner purposes copper-gilt wire, either round or flattened into a fine ribbon.

These wires may be so used for weaving and embroidery purposes, but generally what is called gold thread consists of a yellow thread of cotton or linen round which the flattened gold wire is spirally wound so as to completely encase it. Silver wire is similarly prepared and used, being wound on a white instead of a yellow basis. Gold and silver threads may be used in ordinary lace-making, but what is generally termed gold and silver lace consists of braids, ribbons, and bands of these materials employed for embroidery and braiding, and for the ornamentation of uniforms and official robes, badges, &c. The use of gold and silver wire in textiles is of great antiquity, and sumptuous garments enriched with precious metals must have been used in Egypt for royal and priestly personages in the time of Moses; for we find (Exod. xxxix. 2, 3) directions for making gold-embroidered robes for Aaron in the wilderness. The making of gold and silver lace is associated with the ribbon industry, and it is usually prosecuted in districts where that trade is located. Lefebvre, *Embroidery and Lace, their Manufacture and History* (Eng. trans. 1888).

Lace-bark Tree (*Loxetta tinctoria*), a tree of the natural order Thymelæaceæ, a native of the West Indies. It is a lofty tree, the inner bark of which has all the appearance of coarse lace. A governor of Jamaica is said to have presented to Charles II. a cravat, hilt, and ruffles made of it.

Lacedæmon. See SPARTA.

Lace-leaf. See LATTICE LEAF.

Lacépède. BERNARD DE LA VILLE, COUNT DE, French naturalist, was born on 26th December 1756, at Agen, and was appointed curator of Natural History in the Royal Gardens at Paris in 1785. At the Revolution he became professor of Natural History in the Jardin des Plantes and at the university. He was made a senator in 1799, a minister of state in 1809, and in 1814 a peer of France. He died of smallpox at Epinay, near St Denis, 6th October 1825. Besides continuing Buffon's *Natural History* at Buffon's own request—in *Histoire des Reptiles* (2 vols. 1788-89)—Lacépède wrote *Histoire Naturelle des Poissons* (6 vols. 1798-1803), which, in spite of numerous errors, was long held in high esteem, and works on the Cetacea, the *Natural History of Man*, *Les Aps de la Nature*, and a *General History of Europe* (18 vols. 1826). Lacépède was likewise a highly accomplished musician, and published *La Poétique de la Musique* (2 vols. 1785). An edition of his works appeared at Paris in 3 vols. in 1876.

Lacertidæ. See LIZARD.

Lachaise. FRANÇOIS D'AIX DE, a Jesuit, born of a noble family, 25th August 1624, in the castle of Aix, now in the department of Loire, made his studies at Rohan, and was already a provincial of his order when Louis XIV. selected him for his confessor on the death of Father Ferrier in 1675. His position was one of great difficulty, owing to the different parties of the court, and the strife between Jansenists and Jesuits. In the most important questions of his time Father Lachaise avoided extreme courses. A zealous Jesuit, and of moderate abilities, he yet sustained among his contemporaries the reputation of a man of mild, simple, honourable character. Madame Maintenon could never forgive him the little zeal with

which he opposed the reasons urged against the publication of her marriage with the king; but during the thirty-three years that he filled his office of confessor he never lost the favour of the king. He died 20th January 1709.—Louis XIV. built him a country-house to the east of Paris, the large garden of which was in 1804 converted into a burial-place, and is known as the *Pantheon-Lachaise*, the resting-place of many famous men. See PARIS.

Laches. In English law, is a word used (from Fr. *lâcher*, 'to loosen') to denote negligence or undue delay, such as to disentitle a party to a particular remedy, or to relief. According to the common law this principle has no application as regards the crown; but various statutes, chiefly the so-called *Nullum Tempus Act* (9 Geo. III. chap. 16), have restricted the rights in this respect.

Lachine. a town of Quebec, Canada, 8 miles SW. of Montreal by rail, a favourite summer residence. There is a canal hence to Montreal to avoid the Lachine Rapids of the St. Lawrence.

Lachlan. a river of Australia, a tributary of the Murrumbidgee, which itself, a little farther down, enters the Murray (q.v.).

Lachmann. KARL KONRAD FRIEDRICH WILHELM, a celebrated German critic and philologist, was born, 4th March 1793, at Brunswick, studied at Leipzig and Göttingen, became an extra ordinary professor at Königsberg in 1818, at Berlin in 1825, and an ordinary professor there in 1827. He was admitted a member of the Academy of Sciences in 1830, and died 13th March 1851. Lachmann's scholarship was extraordinary alike in profundity and range. He was equally devoted to classical and German philology, and illustrated both by a singularly subtle and sagacious criticism evolved in strictly scientific method. Among his most important productions are his editions of the *Nibelungenlied*, the works of Walter von der Vogelweide, Propertius, Catullus, Tibullus, Babrius, Avianus, Gains, and the *Agrimensores Romani*. In his *Betrachtung über die Hiios* (supplemented by Haupt, 1847) he maintained that the *Iliad* consisted of sixteen independent *lays* enlarged and interpolated in various ways. The smaller edition of his New Testament appeared in 1831 (3d ed. 1846); the larger, in 2 vols., in 1842-50. The design of the last of these works was to restore the Greek text as it existed in the Eastern Church in the 3d and 4th centuries; and Lachmann attached the greatest value to the readings found in the old Latin and Greek western mss., where he found differences in his oldest eastern texts. His latest undertaking was his edition of Lucretius (1850), which Monro styles 'a work which will be a landmark for scholars as long as the Latin language continues to be studied.' See the Life by Hertz (Berlin, 1851), and also J. Grimm in vol. i. of his *Kleinere Schriften*.

Lachrymal Organs. See EYE.

Lackawanna River. Pennsylvania, is a tributary of the Susquehanna, and its valley nearly coincides with the Wyoming and Lackawanna coal basin (55 miles long), which produces half the anthracite mined in the United States.

La Condamine. CHARLES MARIE DE, French geographer (1701-74), served in the army, travelled extensively, and was sent with others to Peru (1735-43) to measure a degree of the meridian there. On his return he explored the Amazon, and brought the first definite information as to india-rubber. He also brought Curate (q.v.) to Europe, and wrote in favour of inoculation.

Laconic. The Spartans, or Lacedæmonians (whose country was called Laconia), systematically endeavoured to confine themselves to a sen-

tentious brevity in speaking and writing; hence the term *laconic* has been applied to this style.

Lacordaire, JEAN BAPTISTE HENRI, was born at Reçy-sur-Orce, in the department Côte-d'Or, March 12, 1802. He was educated at Dijon, and there began to study law. In 1822 he went to Paris, and practised successfully for two years as a barrister. His religious views were quite unsettled at this time. 'He was a deist, like all the youth of his day, and a liberal, like almost every Frenchman, but without any extreme views.' The spiritual change in him came suddenly, and then his true life began. He gave up his profession, entered the college of St Sulpice in 1824, and was ordained priest in 1827. In 1828 he became chaplain of the convent of the Visitation and in 1829 chaplain of the Collège Henri IV. Marked out by his Liberalism, he was asked to help the Abbe Lamennais and Montalembert in the establishment of the *Avenir*, the well-known High Church and Radical newspaper. In 1831 Lacordaire and Lamennais were summoned by Government, but acquitted, for writing in the *Avenir* against the appointment of three bishops by Louis-Philippe. Soon after this Lacordaire and Montalembert opened a free school in Paris, claiming as a right the liberty of teaching promised in the charter of 1830. The school was closed by the police, and Lacordaire and Montalembert were tried and fined one hundred francs. Thirteen months after its first appearance the publication of the *Avenir* was suspended, and, being condemned by the pope, was then finally given up. In 1834 Lacordaire gave a series of Conferences to the students of the College Stanislas which attracted great attention, and led the way to his famous Conferences in Notre Dame, delivered in 1835 and 1836. His audiences were immense, his success as a preacher was at its height, when he suddenly withdrew and went to Rome, feeling the need for himself of silence and solitude. In 1839 he entered the novitiate of the Dominican order, and in 1840 reappeared in the pulpit of Notre Dame, clothed in the habit of a Dominican monk. The next three years of his life were spent partly in France and partly in Italy. In 1843 he resumed his Conferences in Notre Dame, and continued them till 1851. In the revolution of 1848 Lacordaire accepted the republic, and was elected to the Constituent Assembly, but resigned his seat ten days after his election, as he found he was unsuited for the storms of parliamentary life. His last Conferences, delivered at Toulouse in 1854, are the most eloquent of all. After finishing these Conferences he undertook the direction of the military school of Sorrze, and at this post he remained till his death, which took place in 1861, a year after his election as Academician. Lacordaire was one of the greatest of modern preachers and orators. He laid hold of the thoughts of the day, he understood the difficulties he had to deal with, and he won men to the truth by his eloquent reasoning and by his love for their souls. A collected edition of his works appeared in Paris (9 vols. 1872). See Lives by Montalembert (1862; Eng. trans. 1863), Dora Greenwell (1867), and Lear (1882).

Lacquer. Ornamental or useful articles of brass, such as gas fittings and some kinds of furniture, are usually lacquered to preserve the surface from discoloration or corrosion. Iron, tinplate, and other metals and alloys are also sometimes lacquered. The lacquer used is composed essentially of shell lac or seed-lac, or both, dissolved in spirits of wine. But its composition varies considerably. One kind consists of 2 parts of shell lac dissolved in 20 parts by weight of alcohol, less than 1 part of turpentine being mixed with

it. It is customary, however, to add small quantities of one or more gum-resins, such as sandarach, amber, and anime, to the lacquer, which is coloured with gamboge, dragon's blood, and other substances. The brass, which is first heated till the hand can just safely touch it, generally receives two coats of lacquer; but sometimes the first coat is put on when the metal is cold. In the case of dark lacquering the brass is first bronzed and coated with black lead. Coal and tobacco smoke, as well as the vapour or fumes of some chemical substances, injure lacquered surfaces.

Lacquer-ware.—The lacquer used for the celebrated lacquer-ware of Japan differs entirely from the lacquer used for brass. The body of this ware is of wood, and the lacquer or varnish with which it is coated is the juice of the lacquer-tree (*Rhus vernicifera*), sometimes also called the varnish-tree. This remarkable lacquer not only forms a very hard surface, but, unlike other varnishes, it stands a considerable heat without injury, so that in Japan lacquered vessels are used for hot soups and hot alcoholic drinks. There are numerous kinds of Japanese lacquer-ware, the simplest kind being perhaps that with the grain of the wood seen, for which a fine transparent lacquer is used. For black lacquer ware the juice or varnish is darkened with galls and a salt of iron, and for red it is mixed with about 20 per cent. of cinnabar; orpiment, oxide of iron, and Prussian blue being also used as colours. In the case of gold and silver lacquer-ware, the varnish is mixed with about 30 per cent. of the powder of these metals in a fine state of division, so that when the surface is polished it shows a metallic lustre. Tin is used to imitate gold, the yellow hue being given by colour in the varnish.

The lacquered surface of the best ware is prepared by a very tedious process, owing to the number of coatings it receives. For the several preliminary ones crude lacquer is used, together with a single coating of powdered bismit earthenware and water, the surface being rubbed with a whetstone after each. Two or three more coatings of lacquer are next applied, each being rubbed with charcoal and water. For the finishing coat the best lacquer is employed, and this is polished with calcined deer-horn, finely powdered, the finger and a little oil bringing up the final gloss. The various articles made, such as boxes, vessels, trays, cabinets, &c., are decorated either by inlaying with metal, ivory, or mother-of-pearl, by speckling and gilding with gold or silver, by designs in colour, by relief paintings, or by carving. The art of lacquering is a very ancient one in Japan, and fine specimens of old work bring very high prices.

Lacretelle, JEAN CHARLES DOMINIQUE DE, journalist and historian, was born at Metz on 3d September 1766. He was attracted to Paris on the outbreak of the Revolution; but there, instead of following his profession, that of an advocate, he turned his abilities to journalism, and helped to edit *Le Journal des Debats* and *Le Journal de Paris*. He managed to escape the Reign of Terror by enlisting in the army; but soon procured his release and returned to journalistic work in the capital. In 1810 he was nominated censor of the press, having the year previous been appointed professor of History in the university of Paris. This post he held down to 1853. From 1811 a member of the French Academy, he became its president in 1816. Lacretelle died near Mâcon on 26th March 1855. He wrote a series of works, respectable, but of no very outstanding merit, dealing with the history of France from the time of the religious wars down to the middle of the 19th century. Of these the most useful are *Histoire du Dix-huitième Siècle* (6 vols. 1808),

Précis Historique de la Révolution (3 vols. 1801-6), and *Histoire de France pendant les Guerres de Religion* (4 vols. 1814-16).—His elder brother, PIERRE LOUIS (1751-1824), distinguished himself as an advocate and journalist, and by his writings on law subjects.

Lacroix, PAUL, French miscellaneous writer, better known by his pen-name of P. L. JACOB, BIBLIOPHILE, was born at Paris, on 27th February 1806. Whilst still at school he began to edit editions of the old French classics, as Marot, Rabelais, &c. But it was in the field of the historical romance that he won his spurs as a writer. His industry was prodigious, and the number of works that issued from his pen immense. Besides actively assisting in more than one journalistic enterprise, he wrote romances, plays, books on history, on manners and customs, and on bibliography, and edited memoirs, biographies, &c. His most valuable productions were a series of works on the habits, manners, customs, costumes, arts, sciences, and intellectual condition of France from the middle ages down to the 19th century. His bibliographical works are also valuable, especially those in connection with Molière. He wrote two elaborate works on the *History of Prostitution*, published under the name of Pierre Dufour. From 1855 onwards Lacroix was custodian of the Arsenal library of Paris, and died in that city on 16th October 1884.

Lacroix, SYLVESTRE FRANCOIS, a French mathematician, was born in Paris in 1765, taught mathematics from 1787 in different educational establishments connected with the army, then in the Normal School, the Polytechnic, the University of France, and the Collège de France successively. He died on 25th May 1843. He is not remarkable for original discovery in mathematical science, but deserves to be remembered for his *Traité du Calcul Différentiel et Intégral* (Paris, 1797; 7th ed. 1867), and its continuation, *Traité des Différences et des Séries* (1800), which are complete compilations of the results of all previous research.

La Crosse, a Canadian field game played with a ball and a long stick (5 or 6 feet) of light hickory, bent at the top like a bishop's crozier (Fr. *crosse*). Strings of deer-skin are stretched diagonally across the hooked portion of the crosse in different directions, forming a network—not so tightly as in a battledore or tennis racquet, nor so loosely as to form a bag. Only one ball is employed, made of india-rubber, and 8 or 9 inches in circumference.

The Crosse and Ball.

Posts or poles about 6 feet high, with a small flag at the top of each, complete the equipment. The players are usually twelve on each side, but their number, as well as the distance of the goals apart, is nearly optional. The object of the game is for one side to drive the ball through their opponents' goal. The ball must not be touched with the hand or foot, but is scooped up from the ground with the bent end of the crosse, on which it is carried horizontally, while the player runs towards one of the goals, trying to dodge his antagonists. If it seems prudent, he pitches the ball off his crosse towards one of his own side who may be in a better position to carry it towards the goal. The players must not strike, trip up, or grasp one another, nor must any

one lay hold of the crosse of another; a player may strike the ball off an opponent's crosse with his own crosse, and not by any other means.

The National La Crosse Association of Canada was founded in 1867, and in the same year an Indian team visited Great Britain. Afterwards other Canadian teams played in England and Scotland, and several local clubs were formed; in a few places the game is very popular.

La Crosse, capital of La Crosse county, Wisconsin, stands on the Mississippi, at the mouth of La Crosse River, and at the junction of six railways, 195 miles by rail WNW. of Milwaukee. It contains a Roman Catholic cathedral and over a score of other churches, a convent, an orphanage, two hospitals, excellent schools, and a public library. The city has a large trade in lumber and grain. The manufactures include farming implements, engines and boilers, sashes and blinds, &c., and there are several large lumber-mills, iron-foundries, and breweries. Pop. (1870) 7785; (1890) 25,090.

Lacryma Christi, a wine of a sweet but piquant taste, and a most agreeable bouquet, which is produced from grapes grown on Mount Vesuvius. The kind most esteemed is the light red, the dark amber-coloured coming next. But the genuine wine is very expensive, as only a small quantity is produced; and the name (derived from a monastery on the mountain) is commonly given in Naples to Capuan and other second-class wines. See WINE.

Lactantius, LUCIUS CÆLIUS (or CÆCILIUS) FIRMIANUS, an eminent Christian apologist who flourished in the early part of the 4th century. His Italian descent is more than dubious, but it is certain that he was brought up in Africa, although it is very unlikely that he was a pupil of Arnobius. He seems to have settled as a teacher of rhetoric in Nicomedia in Bithynia, and most likely he was converted there by witnessing the marvellous constancy of the Christian martyrs under the tenth and most savage persecution of Diocletian. About the year 313 he was invited to Gaul by Constantine the Great, to act as tutor to his son Crispus, and is supposed to have died about 325. His principal work is his *Divinarum Institutionum libri vii.*, a production both of a polemical and apologetic character. His theology is somewhat crude, and he has been accused of error in his treatment of the doctrine of the Holy Spirit, his Chiliasm and his eschatology were not peculiar to himself. Among his other writings are treatises *De Ira Dei* and *De Mortibus Persecutorum*, both inscribed to his dear friend, the famous Donatus. His style is remarkably pure, justifying his title of the 'Christian Cicero.' His character appears to have been elevated but austere, perhaps somewhat soured by the poverty and trials of his life.

Lactantius was remarkably popular in the middle ages, and MSS. and printed editions of his works are numerous. Dufresnoy in his edition (2 vols. 1748) enumerates as many as 86 editions of his entire works, besides separate editions of his different treatises, from 1461 to 1739 A.D. The best editions are those in vols. x, xi, of the *Bibl. Pat. Eccl. Lat.* by Gersdorf (Leip. 1812-41), and Migne's *Patrologia* (vol. vi. 1844). There is a translation in Clark's Ante-Nicene Library.

Lactation. See MILK, BREAST.

Lacticals. See DIGESTION, Vol. III, p. 815.

Lactic Acid, $\text{CH}_3\text{CH}(\text{OH})\text{CO}_2\text{H}$, the acid contained in sour milk. In the pure state it is a colorless, transparent, syrupy liquid, of specific gravity 1.215. It is without smell, has a sharp acid taste, and is miscible with water, alcohol, and ether. It is formed in milk by the fermentation of the milk-sugar under the influence of an organised ferment. On a large scale it is usually prepared from

cane-sugar in the following manner: 7 lb. of cane-sugar and $\frac{1}{2}$ oz. tartaric acid are dissolved in 4 gal. of water and allowed to stand for a few days; then 4 oz. of rotten cheese rubbed up in a gallon of sour milk, and $2\frac{1}{2}$ lb. of zinc oxide (zinc white) are added, and the mixture is thoroughly stirred and kept at a temperature of about 105° F. for eight or ten days. The liquid is boiled to stop the fermentation, filtered, and evaporated till the zinc lactate which it contains crystallises; this is then re-dissolved in water, decomposed with sulphuretted hydrogen, the mixture filtered to free it from zinc sulphide, and evaporated on a water-bath.

Lactic acid occurs very widely distributed as a product of the natural fermentation of sour vegetable materials, such as sauerkraut; it is also found in the stomach and intestines. An isomeric acid of the same composition but slightly different properties, called sarco- or para-lactic acid, occurs as a product of waste of animal tissues, and is found in muscle of all kinds, especially after violent exertion or artificial tetanus. Sarco-lactic acid has been frequently detected in blood soon after its removal from the body, in quantities usually below 1 part per 1000, but it apparently does not occur in normal healthy blood while in the body.

The tests for lactic acid are not very satisfactory. On addition of lead acetate and alcoholic ammonia to a solution containing lactic acid an insoluble lead lactate, $3PbO \cdot 2C_3H_5O_2$, is precipitated as a white powder. The properties and amount of water of crystallisation of the zinc lactates are also characteristic. Most of the lactates are crystalline and soluble in water.

Lactometer, or GALACTOMETER, a very simple instrument for testing the richness of milk; it consists of a glass tube graduated to 100 parts. New milk is poured in up to the top of the graduated part and allowed to stand; and when the cream has completely separated the value of its quantity is shown by the number of parts in the 100 which it occupies. Another form of instrument was invented by Doeffel, consisting of a small hydrometer with a scale 2 inches long divided into 20 degrees, the zero being placed at the point to which the instrument sinks in water, and the 20th degree corresponding with the density 1.0383. This instrument is preferred by the continental chemists; and 14 is held to show milk undiluted with water.

Lactucarium. See LETTUCE.

Ladakh, one of the outlying governorships of Cashmere, in the valley of the Upper Indus, and behind the great central range of the Himalayas. The Ladakhis, some 20,000, are of Turanian stock and Buddhists in religion. The capital is Leh (q.v.). See CASHMERE.

Lad'amm (Arab. *lādun*; Gr. *lādanon*), a curious, delicately-scented, resinous gum which exudes from certain kinds of Cistus, chiefly *C. orientis*, *C. ladan*, and *C. laurifolius*, growing in Crete, Cyprus, and parts of Asia Minor. *C. ladaniferus*, strange to say, does not produce the gum. Ladannum, under the name of Labdamm, is alluded to by Browning in *Paracelsus*; and there are interesting articles under *Ladannum* and *Lade* in the French *Encyclopédie*, ix. 172 and 336, in which the gum is said to be collected on fringes of leather attached to long poles, and drawn over the shrubs in the heat of the day. In Cyprus at the present time the gum is actually collected from the beards of the goats that browse among the bushes, a system mentioned by Herodotus, iii. 112. At one time ladannum was used in medicine and as a perfume; it is now, in the form of small black balls, a costly toy fingered by soft handed idlers in the Levant.

Ladiu. See ENGADINE.

Lading. BILL OF. See BILL OF LADING.

Lado. See GONDOKORO.

Lad'oga, LAKE, the largest lake of Europe, is situated a short distance N. of St Petersburg, in Russia, being crossed by the frontier-line between that country and Finland. It is 129 miles in length, 78 in breadth, and 6998 sq. m. in area. The southern and eastern shores are low and marshy; but on the north-west the coast is broken, and rises into cliffs. There, too, are numerous islands. The lake receives the waters of Lake Omega and Lake Ilmen in Russia and of Lake Saima and other lakes in Finland; and its own waters are carried off to the Gulf of Finland by the Neva (q.v.). The average depth of Lake Ladoga does not exceed 300 feet, except in the north-west, where over a limited area the depth is about 730 feet. The navigation is exceedingly dangerous owing to the shallows, sand-banks, and sunken rocks with which the lake abounds, and to the winds and gales which prevail during the months it is free from ice (May-October). In order to obviate the difficulties of navigation, canals have been constructed to connect the mouths of the rivers that reach it along the south and south-east shores. The principal is the Ladoga Canal (70 miles long and 60 feet wide). This canal system forms the thoroughfare for a very extensive traffic (some 20,000 vessels annually, carrying merchandise valued at £6,000,000) between the Volga and the Baltic, so extensive, in fact, that the government have recently seen fit to construct a new canal parallel to the old Ladoga Canal. Communication by water subsists between Lake Ladoga and the White Sea as well as the Caspian. The fauna of the lake is arctic in character. Two of the islands in the north-west, Valaam and Konevets, are each the seat of a monastery, founded in 960 and 1393 respectively, which are visited by thousands of pilgrims every year.

Ladrones, or MARIANA ISLANDS, a group of fifteen islands in the western Pacific, north of the Carolines, in 13° 21' N. lat. and 144° 146' E. long., disposed in a row almost due north and south; their united area is about 420 sq. m. They were discovered by Magellan (1521), whose sailors called them the 'Thieves' (*Ladrones*) Islands, from the thievish propensity displayed by the natives; in 1668 they received the name of Mariana Islands. In 1899 they were sold by Spain to the United States. A channel divides the islands into two groups. The five to the south are low and flat, those to the north mountainous; most are thickly wooded, and all are well watered, fruitful in coconuts, rice, maize, cotton, sugar, tobacco, and indigo. The area cultivated, however, is small, and the trade is of little consequence. The people are mostly indigenous Chamorros and Tagals from Luzon, besides a mixed race of partly Spanish descent. At the time when the islands were discovered the inhabitants were reckoned at 60,000, but the present population is only about 8700. Under the Spanish rule their former gaiety and cheerful industry have changed to dull, apathetic indifference and laziness, and their heathenism to an outward Christianity which places no check on license and immorality. The largest island is Guam, with an area of 198 sq. m., and a pop. of nearly 7000; on it is the only town, Agaña.

Lady, a woman of distinction correlatively to *Lord* (q.v.), used in a more extensive sense in common parlance correlatively to *gentleman*. As a title it belongs to peeresses, the wives of peers and of lords by courtesy, the word *lady* being in all these cases prefixed to the peerage title. The daughters of dukes, marquises, and earls are by courtesy designated by the title *lady* prefixed to

their Christian name and surname; a title not lost by marriage with a commoner. 'Lady,' prefixed to their husband's surname, is the usual title of wives of Baronets (q.v.) and knights. See COURTSEY TITLES, ADDRESS (FORMS OF).

Ladybird (*Coccinella*), a genus of pretty little beetles, generally of a brilliant red or yellow colour, with black, red, white, or yellow spots. The form is nearly hemispherical, the under-surface flat, the thorax and head small, the antennae and legs short.

Ladybird (*Coccinella octulata*), magnified.

When handled they emit a yellowish fluid, with a disagreeable smell. Adults and larvæ feed chiefly on aphides, and are thus most useful to hop-growers and other agriculturists. The eggs are laid under the leaves of plants, on which the larvæ afterwards run about in pursuit of aphides. In late autumn the surviving adults find safe corners, and hiber-

nate till spring. Ladybirds occasionally occur in immense numbers, and from ignorance of their usefulness have sometimes been regarded with superstitious dread. The family of which the genus is type, Coccinellidae, includes about 1500 species, of which forty or so are British. One of the commonest forms (*C. septem-punctata*) is found over all Europe, and in parts of Asia and Africa. The name is apparently a modification of *Ladybug*, lady referring to the Virgin Mary, as the German name *Marienkäfer* suggests.

Lady Chapel, a chapel dedicated to the Virgin Mary ('Our Lady'), and usually, but not always, placed eastwards from the altar when attached to cathedrals. Henry VII.'s Chapel at Westminster is the lady chapel of that church.

Lady-day, one of the regular quarter-days in England and Ireland, on which rent is generally made payable. It is the 25th of March in each year; but in some districts Old Lady Day (April 6) is still observed as the term day. See ANXICATION.

Lady Fern (*Athyrium filix-femina*, or *Asplenium filix-femina*), a beautiful fern, common in moist woods in Britain, with bipinnate fronds sometimes two feet long. The whole plant has an extremely graceful appearance. It is said to possess the same anthelmintic properties as the male fern.

Lady's Mantle (*Alchemilla*), a genus of herb-

Alpine Lady's Mantle (*Alchemilla alpina*); a, a flower.

aceous plants, chiefly natives of temperate and

cold climates, of the natural order Rosaceæ, sub-order Sanguisorbeæ; having small and numerous flowers, an 8-cleft calyx, no corolla, and the fruit surrounded by the persistent calyx. The name lady's mantle, signifying *Mantle of Our Lady*, i.e. of the Virgin Mary—is derived from the form of the leaves.—The Common Lady's Mantle (*A. vulgaris*) is abundant on banks and in pastures throughout Britain. Its root-leaves are large, plaited, many-lobed, and serrated; its flowers, in corymbose terminal clusters, are usually of a yellowish-green colour.—The Alpine Lady's Mantle (*A. alpina*) grows on Scotch mountains, and has digitate serrated leaves, white and satiny beneath.—A common British plant is the Field Lady's Mantle, or Parsley Piert (*A.*—or *Aphanes—arvensis*), found in pastures, an astringent and diuretic, said to be useful in cases of stone in the bladder, by producing a large secretion of lithic acid.

Lady's Slipper (*Cypripedium*), a genus of plants of the natural order Orchidææ, of which one species, *C. Calceolus*, is a native of Britain, being found in a few places in the north of England, and is reckoned one of the most beautiful of the British orchids. The genus is remarkable for the large

a, *Cypripedium spectabilis*; b, flower and leaf of *C. barbatum*.

inflated lip of the corolla. Several very beautiful species are natives of the colder parts of North America. *C. spectabilis* is a North American species; *C. barbatum*, a native of Java. Both are in cultivation, the former in hardy collections, the latter in hothouses.

Ladysmith, a small town in Natal (named from a colonial governor's wife), 140 miles N.W. of Durban by rail. On the outbreak of the Transvaal War in 1899 it, including the army of Sir George White, was invested by the Boer forces, and after a siege of one hundred and twenty days, was finally relieved by Sir Redvers Buller on 28th February 1900. Pop. about 2000.

Laeken, a northern suburb of Brussels, with (1891) 25,211 inhabitants. In it is the crypt of the Belgian royal family in the new Gothic church of the Virgin, and a royal palace (built in 1782), which previous to its destruction by fire on 1st January 1890 contained valuable works of art and historical documents. The palace has been rebuilt in the same style as the one destroyed.

Laennec, RENE, THEODORE HYACINTHE, a distinguished physician, was born at Quimper, in Lower Brittany, 17th February 1781. He studied medicine under his uncle at Nantes, and at Paris

under Corvisart, to whom the medical profession is mainly indebted for the introduction of percussion in the investigation of diseases of the chest (although the original discovery is due to Auenbrugger). In 1799 Laennec was an army-doctor in the field; in 1814 he became the chief editor of the *Journal de Médecine*; in 1816 he was appointed chief physician to the Hôpital Necker, and it was there that he soon after made the discovery of 'mediate' auscultation, or, in other words, of the use of the Stethoscope (q.v.). In 1819 he published his *Traité de l'Auscultation Médiate*, which has undoubtedly produced a greater effect, in so far as the advance of diagnosis is concerned, than any other single book. His treatise had not long appeared when indications of consumption were discovered in his own chest by means of the art of his own invention, and after a few years of delicate health, during which he continued to practise in Paris, he retired to die in his native province, 13th August 1826. See his *Life* by Lallour (Quimper, 1868).

Lafare Sunday. See GOLDEN ROSE.

Lævulose. See SUGAR.

Lafayette, capital of Tippecanoe county, Indiana, on the Wabash River, and on the Wabash and Erie Canal, 63 miles NW. of Indianapolis, at the intersection of five railways. It is a flourishing city, in the midst of a rich prairie country. Laid out in 1825, it contains numerous churches, the Purdue state university, and manufactories of farming-implements, machinery, cars and wagons, &c. Pop. (1880) 14,860; (1890) 16,243.

La Fayette. MADAME DE, the reformer of French romance-writing, was born in 1634, her father being a marshal and governor of Havre. She married the Comte de La Fayette in 1655, and was a member in her youth of the literary circle which met in the Hôtel de Rambouillet. She was the intimate friend of Mme de Sévigné, and in her thirty-third year formed a liaison with La Rochefoucauld, which lasted until his death in 1680. She died in 1693. Her novels *Zuile* and the *Princesse de Cleves* led to a reaction in taste against the fantastic and long-winded romances of such writers as La Calprenède and Mlle de Scudéry. She had a genuine command of passion and knowledge of character, and in her *Princesse de Cleves* gave a vivid and faithful picture of the court life of her day. She committed, however, a curious anachronism in transferring the men and women of Louis XIV.'s age to the court of Henry II.; for example, her Duchesse de Valentinois is Mme de Montespan, the Prince de Cleves is the Comte de La Fayette, and the Duc de Nemours is La Rochefoucauld. Her novels, says Geruzez, were more than a novelty, they were almost a revolution. Her *Œuvres Complètes* till 5 vols. (1812; new ed. 1882); of her *Mémoires* the best ed. is by Assé (1890). See Haussouville's monograph (1891), and Ste-Benve's *Portraits de Femmes*.

Lafayette, MARIE JEAN PAUL ROCH YVES GILBERT MÔTIER, MARQUIS DE, was born in the castle of Chavagnac, in Auvergne, September 6, 1757. He belonged to an ancient family; came to his estates at thirteen; married three years later; entered the army, and sailed, in spite of the at least professed opposition of the court, for America in 1777, to offer his sword to the colonists in their struggle for independence. He became an intimate and admiring friend of Washington, who gave him the command of a division after his conduct at the battle of Brandywine. The treaty between the insurgents and France at once led to war between France and England, and Lafayette returned to his country early in 1779. Six months later he again crossed the Atlantic, was charged with the defence of Virginia, and had his share in the battle of Yorktown, which practically closed the war. On

a third visit to North America in 1784, after the conclusion of peace, he was received in such a manner that his tour was a continual triumph.

Lafayette had imbibed liberal principles in the freer air of America, and was eager for reforms in his native country. He was called to the Assembly of Notables in 1787, and sat in its successor, the Assembly of the States General, and in that which grew out of it, the famous National Assembly of 1789. He took a prominent part in its proceedings, and laid on its table, on the 9th July 1789, a declaration of rights based on Jefferson's Declaration of Independence. He was soon appointed to the chief command of the armed citizens, whereupon he formed the National Guard, and gave it the tricolor cockade. Indeed, in the first stages of the Revolution, it seemed as if the 'Grandison-Cromwell-Lafayette' had the destinies of France in his hands. But the fever of revolution soon surged too hotly for the constitutional channels in which he would have had it flow. He struggled incessantly for order and humanity, yet was mortified to the heart by the furious violence of the mob which butchered Foulon and brandished the reeking heart of the commandant Berthier before his eyes. The Jacobins hated his moderation, while the court abhorred his reforming zeal, and both combined to defeat him in his canvass against Pétion for the mayoralty of Paris. Along with Bailly he founded the club of the Feuillants, and he supported the abolition of title as well as of all class privileges. After the adoption of the constitution of 1790 he retired to his estate of Lagrange till he received the command of the army of Ardennes, with which he won the first victories at Philippeville, Maudenge, and Florennes. But the hatred of the Jacobins increased, and at length Lafayette, who had come from the army to Paris publicly to denounce the Jacobin Club, finding on his return to the camp that he could not persuade his soldiers to march to Paris to save the constitution, rode over into the neutral territory of Liège. He was seized by the Austrians and imprisoned at Olmütz till Bonaparte obtained his liberation in 1797; but he took no part in public affairs during the ascendancy of Bonaparte. He sat in the Chamber of Deputies from 1818 to 1824 as one of the extreme Left, and from 1825 to 1830 he was again a leader of the opposition. In 1830 he took an active part in the revolution, and commanded the National Guards. In 1824 he revisited America, by invitation of Congress, who voted him a grant of 200,000 dollars and a township of land. He died at Paris, 20th May 1834.

See his *Mémoires et Correspondance* (8 vols. 1837-40); studies by Regnault Warn (1824) and Sarrane (1832); *Life* by B. Tuckerman (New York, 1889); two books by Bardoux (1892); the *Diary and Letters of Gouverneur Morris* (1888); and Domiel's *Participation de la France à l'Établissement des États Unis* (1889-91).

Laffitte, JACQUES, a French banker and statesman, born at Bayonne, 24th October 1767, began life as a banker's clerk in Paris, and in 1805 began business on his own account. He soon acquired great wealth and in 1814 was made governor of the Bank of France. After the second restoration he joined the opposition in the Chamber of Deputies, and enjoyed the highest popularity in Paris; he was elected by all twenty sections in the city in 1817. In 1830 he made his house the headquarters of the friends of the revolution, and out of his private means supplied great part of the funds for carrying through the movement. In November he was entrusted with the formation of a cabinet, but he only held power until 12th March following. Meanwhile he was obliged to sell his property to pay his debts. A national subscription preserved him his hotel in Paris; and from the

ruins of his fortune he founded a new Discount Bank in 1837. As the government receded from the principles of the revolution of 1830, Laffitte became more and more active in opposition. In 1843, to the great displeasure of the court, he was elected president of the Chamber of Deputies. He died at Paris, 26th May 1844. The *Souvenirs de J. Laffitte, racontés par lui-même* (3 vols. Paris, 1844), were written by Marchal.

Lafite. See BORDEAUX.

Lafontaine. JEAN DE, was born on July 8, 1621, at Chateau-Thierry, in Champagne. His early education was neglected. He was placed in a clerical seminary, which he soon quitted to undertake his father's duties as master of woods and forests. Early in life he devoted himself to the study of Rabelais, Marot, and other old writers, and set himself to the composition of verses—all of them more or less worthless. In 1654 he published a verse translation of the *Eunuchus* of Terence, and then went up to Paris, where he won the favour of Fouquet, who awarded him a pension of 1000 francs on condition that he furnished a piece of verse quarterly. The verses thus produced showed considerable originality, and their author became the darling of the ladies of highest distinction in Paris. During six years he wrote little, abandoning himself to a life of gallantry and to social meetings with Molière, Boileau, and Racine. His *Contes et Nouvelles en Vers* appeared in 1665; his *Fables Choisies mises en Vers* in 1668; and his *Amours de Psyche et de Cupidon* in 1669. Among his chief patronesses were Marguerite of Lorraine and the Duchess of Bonillon, and for nearly twenty years he was maintained in the household of Mme de la Sablière. In 1684 he read an admirable *Discours en Vers* on his reception by the Academy, to which he was admitted much against the wish of the king. In her later years Mme de la Sablière became devout, but Lafontaine attached himself to the dissolute Prince de Conti, pursuing in his old age the follies and dissipations of his youth. She died in 1693, and for his two remaining years he was cared for by Mme d'Hervart, who maintained him until his death, which occurred at Paris on April 13, 1695. During an illness about two years before he had allowed himself to be converted in so far at least as to acknowledge the impropriety of the *Contes* and, it is said, destroy a new play. He was one of the idlest, the most reckless, the most frivolous and dissipated of men, but he was likewise one of the most lovable and charming, as he was assuredly one of the most gifted.

The subjects of the *Contes* are taken from Boccaccio, Ariosto, Machiavelli, Rabelais, the *Heptameron*, the *Cent Nouvelles nouvelles*, Apuleius, Athenæus, and other writers. The stories are retold with inimitable skill, Lafontaine surpassing in wit and in narrative dexterity the authors with whom he challenged comparison. Nothing could be easier, more sparkling, more ingeniously and gracefully turned than his verse. The language has a racy archaic flavour, the style combining the elegance of the 17th century writers with something of the Rabelaisian richness. The subjects are nearly all of the grossest description, and their grossness is in most cases artfully heightened by Lafontaine. His story of Alaciel, for example, is a deeply degraded version of the sombre though voluptuous tale told by Boccaccio. As for the *Fables*, their charm is undying, and they are free from the impropriety of the *Contes*. It has been truly said of them by Silvestre de Saey that they supply three several delights to three several ages. 'The child rejoices in the freshness and vividness of the story; the eager student of literature in the consummate art with which it is told; the experienced man of the

world in the subtle reflections on character and life which it conveys.' Nevertheless the general verdict of French critics on Lafontaine can hardly fail to seem unduly high to his English readers. Theodore de Banville, for example, maintains that he is not merely an artist supreme in lyric comedy, but a great romantic poet, in whose work there is always a 'window open to heaven.' Such praise is hardly judicious. Lafontaine was a sparkling satirist, a brilliant versifier, a well-nigh incomparable master of the difficult art of telling a story in rhyme. He combined, as another critic has said, the flower of the *esprit Gaulois* with a perfume of antiquity. He was a great—not merely an amusing—writer, but he was not a great poet. With all its graces, his verse has not the melody, the passion, the power of suggesting a beauty and mystery beyond the exact meaning of the words, which distinguish all high lyric work. But on the other hand it would be hard to name a French poet, saving Molière, who has given such delight to others than his countrymen as has been given by Lafontaine.

See Sainte-Beuve's *Portraits Littéraires*, vol. i.; Banville's *Petit Traité de Poésie Française*; Taine's *Essai sur les Fables de La Fontaine*; and Lucas Collins' *La Fontaine and other French Fabulists* (1882). The best editions are by Marty-Laveaux in the *Bibliothèque Elzévirienne*; A. Pauly in Lemerre's *Collection des Classiques Françaises*; L. Moland in the *Librairie des Bibliophiles*; and Girard and Destenilles in the *Grands Écrivains*.

Lago Maggiore. See MAGGIORE.

Lagomys, a genus of rodents, much resembling hares or rabbits, but with limbs of more equal length, more perfect clavicles, longer claws, longer head, shorter ears, and no tail. There are about a dozen species, one in south-east Europe, one on the Rocky Mountains, and the rest on the mountains of northern Asia. They are about the size of guinea-pigs, and make burrows, but are particularly interesting for their habit of stacking choice herbage for winter use. The stacks of the Siberian species, the Alpine Lagomys or Pika (*L. alpinus*), are said to be utilised by the sable-hunters for fodder.

Lagoon (Lat. *lacuna*, 'a hollow,' 'a pool') is a species of lake formed by the overflowing either of the sea or of rivers, or by the infiltration of water from these; and hence lagoons are sometimes divided into fluvial and marine. They are found only in low-lying lands, such as the coasts of Holland, Italy, the Baltic, and the east coast of South America; are generally shallow, and do not always present the same aspect. In some cases they are completely dried up in summer; in others, after being once formed, they preserve throughout the whole year the character of stagnant marshy pools; and in others again the sea, which reunites them to itself in winter, is separated from them in summer by a bar of sand or shingle.

Lagos, a seaport on the south coast of Portugal, 30 miles ENE. from the extremity of Cape St Vincent. Pop. 7900, who fish for tunny and sardines. In the bay of Lagos Admiral Boscawen defeated the French Toulon fleet, August 18, 1759.

Lagos, a British colony, an island, and a town on the Guinea coast of Africa. The colony extends from 2 to 6 E. long., and comprises the islands of Lagos and Iddo (annexed in 1851), the districts of Palma and Lockie (1862), district of Badagry (1863), Katamu (1879), Appa (1883), and Malim, Ogho, and Jakri (1885). Area of colony, 1971 sq. m. The inhabitants (85,607 in 1891) are mostly Negroes and two thirds pagans, though Mohammedanism is making great headway. Average annual value of exports (palm oil, palm kernels, ivory, gum copal, cotton, and Guinea grains), £582,040; of imports (spirits, tobacco, cotton goods, and hardware), £466,370. Trade is carried on principally with

England and Germany, to a less extent with the United States, France, and Brazil. The island has an area of 3½ sq. m.; and at its western end stands the town, the principal commercial place on this part of the coast, and the only safe harbour for a distance of 1000 miles. Pop. 40,000. The bishop of the Niger territory resides here; but Lagos itself belongs to the diocese of Sierra Leone. Previous to the interference of the British Lagos was one of the chief entrepôts for the export of slaves. Created a separate government in 1863, the colony formed part of the West African Settlements (from 1866) and of the Gold Coast (from 1874) successively. In 1886 the present colony was constituted.

Lagostomus. See CHUNCHILLA.

Lagrange, JOSEPH LOUIS, COMTE, the great algebraist, was born at Turin, 25th January 1736. His father, who, as well as his mother, was of French descent, was war-treasurer to the Piedmontese government. In later life Lagrange explained his first application to the study of mathematics by the fact that the family property had been lost in speculations. At the age of seventeen a paper of Halley's in the *Philosophical Transactions* turned him towards algebra and analytical geometry, and then his powers developed with striking precocity. In 1751 he was appointed mathematical professor in the Royal School of Artillery; at the same time he discovered a series for differential expansion analogous to the binomial theorem of Newton, and attracted Euler's attention by a letter on the general solution of certain isoperimetric problems which had been proposed to the best mathematicians in Europe. He also corresponded with D'Alembert, then the leader of French scientific society. At Euler's suggestion Frederick the Great appointed Lagrange to succeed him as director of the Academy of Berlin. Before leaving Piedmont he did much original work in integration and partial differences, applying mathematical methods to physics and astronomy, and assisted, in 1758, to found the Turin Academy of Sciences. In 1762, by his completion of the Calculus of Variations, the main theory of which had been foreshadowed in his discussion of isoperimetricals, and his investigations of sound, harmonies, &c. by new analytical methods, Lagrange gained a European reputation, though at the expense of his health, which was never afterwards robust. His memoir on the moon's libration, which in 1764 obtained the prize of the French Academy, brought into prominence his great principle of virtual velocities, which was presently to be so largely utilised in dynamical problems. Lagrange gave the first complete proof of Laplace's generalisation, that, so far as the laws of motion are concerned, our solar system is necessarily stable and permanent, because all the changes of the planetary orbits, caused by their reciprocal gravitation, are periodic. While in Prussia, from 1766 to 1787, Lagrange read before the Berlin Academy about sixty dissertations on the application of the higher analysis to mechanics and dynamics. From the leading results of these memoirs and of his previous work, duly marshalled and systematised, arose Lagrange's principal work, the *Mécanique Analytique*, which was published (1788) in Paris under the supervision of Legendre. The central theory, unifying the science of dynamics in all its developments, was the principle of virtual velocities which he had established in 1764.

Just before the issue of the *Mécanique Analytique*, Lagrange arrived in Paris, to be welcomed by the court and lodged in the Louvre with a pension of 6000 francs. In 1791 he was elected foreign member of the Royal Society of London.

He commanded universal respect even in the crisis of the Revolution, and was appointed professor in the Normal and Polytechnic Schools, one of the first members of the Bureau des Longitudes, and was enthusiastically in favour of the new decimal and metrical system. He was appointed member of the senate under Bonaparte, who also bestowed on him the title of Count and the Grand Cross of the Legion of Honour. He did more than any other, except Euler, to develop the applications of the infinitesimal calculus.

Partly owing to his weak constitution, Lagrange was extremely regular in his habits, abstemious in food, with his work ever most systematically distributed. His various treatises, read to the Academies of Turin, Berlin, and Paris, now fill seven quarto volumes. Other important works are *Théorie des Fonctions* (2d ed. 1813), *Leçons sur le Calcul des Fonctions, Résolution des Équations Numériques*. Lagrange died at Paris, 10th April 1813, and was buried in the Panthéon. A new edition of his works, in 16 vols., was undertaken in 1867.

La Guaira. See GUADRA.

La Hague, the north-west extremity of the peninsula of Cotentin, in the north of France, over against Alderney of the Channel Islands. It is crowned by a lighthouse, 158 feet high. This must not be confounded with La Hogue (q.v.).

La Harpe, JEAN FRANÇOIS DE, French writer, born at Paris, November 20, 1739, first attracted attention in 1763 by a successful tragedy, *Warwick*. His fame was further enhanced by a series of eloquent *Eloges*. But his other plays on the classic model, such as *Timoleon*, *Pharamond*, and *Gustave Wasa*, entirely failed. *Mélanie*, *Philotele*, and *Coriolan* were more successful. His best-known works are, however, his critical lectures, published in 12 vols. (1799-1805) as *Lycée, ou Cours de Littérature*, which long remained a standard of literary criticism. That portion which relates to ancient literature is of little value, and that which treats of contemporary writers is entirely worthless, owing to the bitterness and pride of the critic; but the intervening portion gives a fairly complete critical history of French literature. His *Correspondance Littéraire*, published in 1801, by the bitterness of its criticisms rekindled fierce controversies. The Revolution, at its commencement, found no more ardent admirer than La Harpe; but after five months' imprisonment for refusing to countenance the extremes to which the immoderate zealots of the movement pushed matters his views entirely changed, and he became a firm supporter of church and crown. A posthumous work, *La Vision de Cazotte*, must be ranked amongst the best achievements of his pen. His graceful style and keenness of observation are perhaps more than counterbalanced by his partiality, vehemence of judgment, and superficiality. La Harpe died February 11, 1803. See Sainte-Beuve, *Causeries du Lundi*, vol. v.

Lahn, an important affluent of the Rhine (q.v.) in its middle course.

La Hogue, a roadstead on the east side of the peninsula of Cotentin, in the north of France (not to be confounded with Cape La Hague, q.v.). On May 19, 1692, the French fleet of forty-four sail under Tourville, which Louis XIV. had collected for the purpose of invading England in support of James II., was defeated here by the combined English and Dutch fleets of ninety vessels under the Jacobite Admiral Russell. Twelve large French line of battle ships which took refuge in the shallow roadstead of La Hogue were destroyed, under the eyes of King James, by boats' crews led by Admiral Rooke. See Macaulay's *History*.

Lahore, capital of the Punjab, stands in 31° 34' N. lat. and 74° 21' E. long., near the left bank of the Ravi. Pop. (1868) 125,413; (1891) 176,854, of whom 86,413 were Mussulmans. Lahore covers 640 acres of ground, and is surrounded by a brick wall 16 feet high. The city is entered by metalled roads through thirteen gates. The fort occupies a commanding position to the north-east, and near it are the mosque of Aungzeb and Runjeet Singh's tomb. The English civil station, some 3 miles long, is called Anarkalli, and a broad road, the Mall, connects this with the government house and the Lawrence Gardens. Three miles farther is the military station or cantonment of Mian Mir, one of the dreariest and most unhealthy in India. The Punjab University, largely endowed by native chiefs and gentlemen—Moslem, Sikh, and Hindu—is one of the most flourishing educational establishments in India. There are also the Oriental College, the Government College, Government Medical School, Mayo Hospital, the Roberts Institute, and a good museum containing many fine specimens of Greco-Bactrian sculpture.

The origin of Lahore is uncertain, but is certainly not later than the 7th century A.D. Under the Mogul empire the city reached its greatest size and magnificence, and is said to have had a population of over 1,000,000 souls. Akbar and Jahangir lived at Lahore, and the remains of the beautiful and magnificent buildings erected by them and other great Mogul emperors are still considerable, as well as Jahangir's wonderful gardens at Shadra and Shalimar. Since the time of Aungzeb nothing of importance has been constructed. In 1799 Ranjeet Singh, the Sikh ruler of the country, removed the seat of government to Amritsar, about 30 miles to the south; but in 1846 a British Council of Regency (of the Punjab) was established in Lahore, in 1849 the young Maharaja Dhuleep Singh transferred the government of the state to the East India Company, and Lahore became the capital of the new British province of the Punjab. Lahore is an important railway centre; lines from Kurrahee and Peshawar are connected there with the south road leading to Delhi and Rajputana, to Calcutta, and to Bombay.

The Lahore district is one of the most important of the Punjab, with an area of 3648 sq. m., and a population of above a million. The Bari Doab Canal is an important government irrigation work, and no less than 500,000 acres in the district are cultivated by means of artificial irrigation of some sort.

Lahr, a town of Baden, on a small affluent of the Rhine, 20 miles SSE. of Strasburg by rail, with manufactures of cottons, pottery, &c., and printing establishments. Pop. 9937.

Laibach, capital of the Austrian crown-land of Carniola, and formerly of the Kingdom of Illyria, lies in an extensive plain on the river Laibach, 7 miles above its junction with the Save, and 92 by rail NE. of Trieste. The streets of the old town, which goes back originally to Roman times, are narrow and irregular, those of the new suburbs wide and handsome. The town was fortified from 1416 down to the beginning of the 19th century. The castle is now used as a prison. Laibach has been a bishop's see since 1461, and has a cathedral, national museum, &c. It is likewise a place of some commercial and industrial importance, having cotton factories, bell and iron foundries, cloth and woollen goods manufactories, and an imperial tobacco-factory. To the south-west of the town is the Laibach Morass upwards of 89 sq. m. in extent, three fourths of which have been brought under cultivation; the remainder affords a supply of turf. Interesting lake-dwellings have been discovered in the morass. Pop. (1890) 30,565. A

congress met here in 1821 to regulate the affairs of Italy.

Laidlaw, WILLIAM, the friend and latterly amanuensis of Sir Walter Scott, was born at Blackhouse in Selkirkshire in November 1780. After farming with but little success at Traquair and Libberton, he settled in 1817 as a kind of factor and manager on the estate of Abbotford and was Scott's trusted counsellor in all his schemes of improvement. Here, with the exception of but three years after the disaster in Scott's affairs, he lived till Scott's death in 1832, his constant companion and household friend, honoured by an affection that his loyalty deserved. Laidlaw's acquaintance with Scott began in the autumn of 1802, and he supplied some of the materials for the third volume of the *Minstrelsy of the Scottish Border*. The sweet and simple pathos of his own ballad, 'Lucy's Flittin', would alone have kept the name of 'Willie' Laidlaw from being forgotten even were that name not safely enshrined in a hundred pages of Lockhart's *Life of Scott*. After his great master's death Laidlaw was factor successively on two Ross-shire estates, and died at his brother's farm at Contin in that county, 18th May 1845. See two papers in *Chamber's Edinburgh Journal* for July 26 and August 2, 1845.

Laing, DAVID, a learned antiquary, was the son of an Edinburgh bookseller, and was born in 1795. For thirty years he followed his father's trade, earning the esteem of all the antiquaries and scholars of his time by his remarkable knowledge and his readiness to communicate it. In 1837 he became librarian of the Signet Library, a post which he held till his death, October 18, 1878. Laing was honorary secretary of the Bannatyne Club throughout, and himself edited many of its issues; while his contributions to the *Transactions of the Society of Antiquaries of Scotland* were innumerable, yet all stamped with characteristic thoroughness. He received the degree of LL.D. from Edinburgh in 1864, and left behind him a private library of unusual value even for his exceptional opportunities; many books at the sale in London realised unheard-of prices. A valuable collection of MSS. was bequeathed to Edinburgh University.

David Laing's knowledge of the ecclesiastical and literary history of Scotland was profound, and his more important works will long retain their value. These were his edition of Robert Baillie's *Letters and Journals* (3 vols. 1841-42), the works of John Knox (6 vols. 1846-64), and of the Scottish poets, Sir David Lyndsay, Dunbar, and Henryson. His literary life covered the long period of more than sixty years, and death surprised him busy on Wynton and a new edition of Lyndsay.

Laing, MALCOLM, a meritorious Scottish historian, was born on the mainland of Orkney in 1762. He was educated at Kirkwall and Edinburgh University, and was called to the bar in 1785, but never became a successful advocate. He died in November 1818. He wrote in 1793 the last volume of Henry's *History of Great Britain*, and in 1800 published his own *History of Scotland from James VI. to Anne*. In the 1801 edition occurs his attack on Queen Mary for participation in Darnley's murder. His *Poems of Ossian* is a fierce onslaught on Macpherson.

Laing's Nek. See COLLEY.

Lairesse, GERARD (1640-1711), a Dutch painter with classical sympathies, exercised an influence on art schools through his *Art of Painting* (Eng. trans. 1738). This work was compiled from notes of his conversations with friends and pupils after he had become blind (in 1690).

Lais, the name of one or, more probably, two Greek courtesans, celebrated for extraordinary

beauty. The elder is believed to have been born at Corinth, and flourished during the Peloponnesian war. She was supposed to be the most graceful woman of her time in Greece, but in character she was capricious, and greedy of money, and in her old age she gave way to intemperance.—The younger appears to have been born in Sicily, but came to Corinth when still a child. She sat as a model to the painter Apelles, and is said to have been stoned to death by some Thessalian women whom she had made jealous.

Laissez Faire is a phrase which expresses the attitude towards the State of the school of political economists founded by Adam Smith. The phrase is usually traced to Gournay, merchant and economist of the Physiocratic school. But it is said first of all to have been the remonstrance of French merchants against the system of the great statesman Colbert, who established a minute regulation of industry by the State. They believed that the best thing the State could do for industry was to leave it alone. The phrase therefore embodied the protest of private industrial enterprise against minute vexations, and oppressive regulation by a French state, which at that time represented only the court and a narrow privileged class, which was often incapable, and always engrossed in war, intrigue, and other pursuits alien to industry. But in England more than any other country it has been accepted as a watchword of free trade and free industry, as contrasted with the protective system and state regulation generally.

Laké, GERARD, Viscount, born 27th July 1744, served in Germany (1760), America, and at Vinegar Hill (1798). He defeated the forces of Gwalior at Alighah and Delhi (1803), Sindia at Leswarree (1803), and Holkar near Furruckabad (1804). Created a baron (1805) and viscount (1807), he died in London, 20th February 1808.

Lake (Lat. *lacus*) is a portion of water surrounded by land. Lakes are of two kinds—fresh water and saline—and have been formed in various ways. Taking first the *freshwater lakes*, these may be grouped as follows: (1) *Obstruction Lakes*.—Some of these are more or less temporary sheets of water, such as the lake-like expansions of certain rivers, and the deserted loops of river-channels. Other temporary lakes are due to the operations of the beaver; to the choking of the narrower passages of a river channel by drifted vegetable debris or river-ice; or to the advance of a glacier across the mouth of a lateral valley. Now and again rock-falls and landslips obstruct the drainage of valleys and give rise to lakes; and similar results have been brought about by the advance of lava across a valley. (2) *Crater Lakes*.—These occupy the craters of extinct or quiescent volcanoes. (3) *Sink Lakes*.—These lie in hollows caused by subsidence of the surface consequent upon the removal of underlying soluble rocks, such as rock-salt, and calcareous and gypsiferous rocks. (4) *Earth-movement Lakes*.—Unequal movements or warping of the earth's crust have occasionally originated hollows by direct subsidence. It is possible also that local elevation by affecting the lower ends of valleys may sometimes have obstructed the flow of rivers, and thus given rise to lakes. (5) *Glacial Lakes*.—These consist of (a) hollows of erosion or *rock-basins*, which have been excavated by glacier-ice, and (b) hollows caused by the unequal distribution or accumulation of glacial detritus during the glacial period. (6) *Subterranean Lakes*.—These are found chiefly in calcareous regions, where they occupy the underground channels which have been excavated by the chemical and mechanical action of water (see CAVES). They are met with also in volcanic regions, filling, or partially filling, the

cavities which are sometimes seen in lava-flows (see LAVA).

Fresh-water lakes are very unequally distributed. They are most numerous in those regions which were overflowed by land-ice during the glacial period, as in the British Islands, Scandinavia, Finland, &c., Canada, and the adjoining United States. Lakes occur at all heights above the sea; the most elevated being Lake Tsuna in Abyssinia (7500 feet), Lake Titicaca in the Bolivian Andes (12,500 feet), and Askal Chin in Tibet (16,600 feet). The largest lake in the world is Lake Superior, which covers an area of 31,200 sq. m., and has a mean depth of about 475 feet. Lake Baikal, in central Asia, is the largest and deepest mountain-lake, its area being 13,500 sq. m., and its mean depth 850 feet, but in places it reaches a depth of more than 4000 feet. Some of the mountain-lakes of Europe also attain great depths; thus, Lake Geneva is 1000 feet, Lago Maggiore 1158 feet, and Como 1358 feet.

Salt Lakes.—Two kinds are recognised: (a) portions of the sea cut off from the general oceanic area by epigene or hypogene agencies; (b) lakes, originally fresh-water, which have been rendered saline by evaporation and concentration. Those of the first group range in size from mere pools and lagoons up to inland seas, such as those of the great Aralo-Caspian depression. The Dead Sea and the Great Salt Lake of Utah are good examples of the second group of saline lakes, which might be defined shortly as lakes which have no outlet to the ocean. The Caspian Sea is 97 feet below the level of the Black Sea, has an area of about 170,000 sq. m., and is from 2500 to 3000 feet deep in the deepest parts. A still more depressed area is that of the Dead Sea, the surface of which is 1292 feet below the level of the Mediterranean Sea.

Lake District, the name applied to the picturesque and mountainous region comprised within the counties of Cumberland, Westmorland, and a small portion of Lancashire, within which are grouped as many as sixteen lakes or *meres*, besides innumerable mountain *tarns* and streams, and a series of mountains rising in four points to a height of over 3000 feet. The district extends about 30 miles from north to south by about 25 from east to west, and contains within its compass the utmost variety and wealth of natural scenery, soft and graceful beauty ever alternating closely with grandeur and sublimity. Indeed nowhere else in the world perhaps is so much varied beauty to be found within so narrow a space. The district is visited every year by thousands of tourists, who are able, from Keswick or Ambleside as a centre, to explore the whole region, and climb all its chief mountains within a week. But it must not be forgotten that many of the most lovely spots lie out of the ordinary routes, and that for those travellers who can afford the time there is ample occupation for a much longer period. The Lake District is fringed by such considerable towns as Penrith, Kendal, Lancaster, Barrow, Cocker-mouth, and Whitehaven; and already railways bring the traveller, from different points of the compass, to Keswick, to Windermere, to Coniston, and to Boot. The principal lakes are Windermere, Esthwaite Water, and Coniston in the south; Ulswater and Hawes Water in the east; Bassenthwaite in the north; West Water, Emmerdale Water, Buttermere, and Crummock Water in the west; and Derwentwater, Thirlmere, Grasmere, and Rydal Water in the heart of the district. The highest mountain-summits are Seafell Pike (3210 feet), Seafell (3161 feet), Helvellyn (3118 feet), and Skiddaw (3060 feet), all easily accessible, in great part even on pony-back. Besides these there are hundreds of mountains and *pikes* , many clothed with

the richest greenery. The lakes are fed and emptied by beautiful mountain-streams and *becks*, often forming noble waterfalls and *fores*, like Lodore Falls, near Derwentwater; Dungeon Gill Falls, near Grasmere; Stockgill Foree, near Ambleside; Seale Foree, near Crummoek Water; Aira Foree,

observation as a memorial of Wordsworth. His lifelong friend and brother poet, Southey, lived for forty years at Greta Hall, near Keswick, and rests in Crosthwaite churchyard hard by. Here also at Greta Hall Coleridge lived awhile, often visiting the Wordsworths; and here his children were brought up by Southey. The hapless Hartley Coleridge lived long at Nab Cottage, near Rydal Water, and is buried beside Wordsworth in Grasmere. Christopher North lived at Elleray, near Windermere; Shelley lived some time at Keswick after his marriage, and Mrs Hemans at Dove Nest on Windermere. Harriet Martineau had her home at the Knoll, near Ambleside; and not far off is Fox How, where Dr Arnold found rest from the strain of Rugby, and where he died. James Spedding was born at Bassenthwaite, and here was visited by Edward Fitzgerald and Tennyson; and the latter lived some time at Tent House on the east bank of Coniston Lake. At Brantwood, near Coniston Lake, Ruskin resided during the later years of his life. The poet Gray spent a fortnight of 1769 in traversing the Lake District, and his *Journal* shows that he looked before his time at nature with 'distinctness and unaffected simplicity,' in Wordsworth's phrase. Hither came in the summer of 1802 Charles Lamb, with his sister Mary, to spend three weeks with Coleridge at Keswick. He appears to have thoroughly enjoyed the new experiences, yet in a letter to his friend Manning (24th September 1802) he writes with a spirit worthy of Dr Johnson: 'After all, Fleet Street and the Strand are better places to live in for good and all than amidst Skiddaw.'

near Patterdale; and Dalegarth Foree, near Boot. Among the places most visited, besides these, are the towns or villages of Keswick, Coniston, Bowness, Hawkeshead, Ambleside, Ulverston, Rosthwaite, Grasmere, Patterdale, and Borrowdale; the Langdale Pikes; the Duddon Valley, celebrated in Wordsworth's series of sonnets; Honister Pass, and Kirkstone Pass; the Castle Rock of St John, celebrated in Scott's *Bride of Tricrain*; and such minor but imposing mountain-peaks as Bleneathara or Saddleback (2847 feet), near Keswick; Coniston Old Man (2633), near Coniston; and the Great Gable (2950), near Wastdale Head.

But far more even than its romantic natural beauty is the rare interest that has been added to this district by the group of illustrious poets who made it their home about the beginning of the 19th century, and who were somewhat unintelligently grouped together by unsympathetic critics as forming the 'Lake School' of poetry. Of these the most illustrious was Wordsworth, who has interpreted for us with marvellous fidelity and force the life—animate and inanimate alike—of the country which he knew and loved. His *Excursion* is the best of all guide-books to the Lakes—*Wordsworthshire*, as Lowell aptly terms the district; and students of English poetry will never lose an interest in those hallowed scenes in which the modern High-priest of Nature first expounded the co-operative spiritual harmony between man and nature herself, and taught how the mute life in nature ever leads upwards to the conscious life in man and the creative force in God. He was born at Cockermouth; he had his education at Hawkeshead school; he lived thirteen years in three houses at Grasmere, and thirty-seven at Rydal Mount; and he lies fittingly, with his wife, his children, and his gifted sister Dorothy, in Grasmere churchyard, in the midst of the scenery he has made enchanted. His first house at Grasmere, Dove Cottage or Town End, his home from December 1799 to May 1808, and of De Quincey for more than twenty years thereafter, was bought in 1890 by public subscription for permanent pro-

tection as a memorial of Wordsworth. His lifelong friend and brother poet, Southey, lived for forty years at Greta Hall, near Keswick, and rests in Crosthwaite churchyard hard by. Here also at Greta Hall Coleridge lived awhile, often visiting the Wordsworths; and here his children were brought up by Southey. The hapless Hartley Coleridge lived long at Nab Cottage, near Rydal Water, and is buried beside Wordsworth in Grasmere. Christopher North lived at Elleray, near Windermere; Shelley lived some time at Keswick after his marriage, and Mrs Hemans at Dove Nest on Windermere. Harriet Martineau had her home at the Knoll, near Ambleside; and not far off is Fox How, where Dr Arnold found rest from the strain of Rugby, and where he died. James Spedding was born at Bassenthwaite, and here was visited by Edward Fitzgerald and Tennyson; and the latter lived some time at Tent House on the east bank of Coniston Lake. At Brantwood, near Coniston Lake, Ruskin resided during the later years of his life. The poet Gray spent a fortnight of 1769 in traversing the Lake District, and his *Journal* shows that he looked before his time at nature with 'distinctness and unaffected simplicity,' in Wordsworth's phrase. Hither came in the summer of 1802 Charles Lamb, with his sister Mary, to spend three weeks with Coleridge at Keswick. He appears to have thoroughly enjoyed the new experiences, yet in a letter

to his friend Manning (24th September 1802) he writes with a spirit worthy of Dr Johnson: 'After all, Fleet Street and the Strand are better places to live in for good and all than amidst Skiddaw.'

Wordsworth himself wrote a *Description of the Scenery of the Lakes in the North of England* (1822), in which it is interesting to see how the descriptions glow with recollections of love, and how hot is his indignation against all wanton attempts to artificialise the face of nature. He would have denounced the Manchester scheme for bringing water from Thirlmere, and actively supported the aims of the 'Lake District Defence Society' (established in 1883).

See Professor Knight's *English Lake District, as interpreted in the Poems of Wordsworth* (1878), and his *Through the Wordsworth Country*, with 56 engravings by Harry Goodwin (1887); also Harriet Martineau's *English Lakes*, with illustrations by W. J. Linton (1858), T. G. Bonney's *English Lake Scenery* (1876), and Edwin Waugh's *Rambles in the Lake Country* (1861) and *In the Lake Country* (1880). Of the innumerable guides may be mentioned those of W. Hutchinson (1776), T. West (1789), J. Hudson (1843), Miss Martineau (1855), James Payn (1859 and 1867), H. I. Jenkinson's *Practical Guide* and his *Tourist Guide* (1879), Raddeley's *Thorough Guide* (1880), and G. R. Mill, *The English Lakes* (1896).

Lake-dwellings (Ger. *Pfahlbauten*, 'pile-dwellings'), habitations placed on platforms supported by piles, or other substructures, in the shallows around the margins of lakes, have only recently become known to archaeologists, although the first notice of a lake-dwelling community was written by Herodotus in the 4th century B.C. He describes certain tribes on Lake Prasias in Macedonia as living in huts on platforms supported on piles which were approached from the land by a single narrow bridge. It now appears that from the very earliest times down to the commencement of the historic period there were lake-dwellings of various descriptions in the lakes of central Europe, and that a similar custom continued in Scotland and Ireland to much later times. Owing to an extraordinary subsidence of the waters of the Swiss lakes in 1854 the remains of a lake-dwelling were discovered at Meilen in the lake of Zurich, and it was speedily found that similar

remains of pile-dwellings, each indicating the site of a relic-bed in the mud of the lake-bottom, existed in proximity to the shores of most of the lakes in Switzerland. Since their first discovery the sites of these ancient settlements have been thoroughly explored and systematically described by Dr Keller, F. Troyon, and others. The relics of this singular phase of early civilisation, which have been carefully gathered into the museums of Switzerland, disclose the condition of the industrial arts among the lake-dwellers, as manifested in the successive stages of the stone, bronze, and iron periods of their culture and civilisation. There is nothing known of the origin of the lake-dwelling phase of social life. It has been suggested that a desire for greater security from attack than could be afforded by a cluster of dwellings situated on the mainland first led to the selection of natural islets as the sites of habitations, and when this had become an established custom the transition was easy from the selection of natural islands to the construction of artificial islands where natural sites for habitations isolated by water did not exist. As a matter of fact there are several varieties of artificial lake-

dwellings of which the sequence is not certainly known. The substructure is usually all that remains. It has been found in some instances to be a mass of stones, and in others a mass of brush-wood, built up from the bottom of the lake. The more common form in Switzerland, however, is a substructure of piles, driven into the lake-bottom, and the heads brought level to support the platform for the huts. Where the water is deep and the bottom soft, the piles are driven only for a short distance, and stones accumulated around and among them to keep them in position. In some cases the lower ends of the piles have been mortised into a kind of horizontal framework of logs, to give greater stability to the superstructure. The piles are usually tree-trunks with the bark on, and the platforms were frequently the same, though sometimes the trunks were split or roughly boarded. On this platform the huts were erected. Nothing usually remains of them, but in some instances the remains of the lower tiers of boarding have been detected. In all cases in which the form of the huts could be determined it has been rectangular. But it seems deducible from the curvature of some

Fig. 1.—Lake-dwelling restored.

pieces of hardened clay, with the marks of interwoven branches upon them, that circular huts of wattles and daub were also constructed. They were doubtless thatched with straw and reeds. There were many huts on one platform, and a narrow gangway was generally carried on piles from the platform to the shore. Sometimes a dug-out canoe seems to have been used instead of a gangway, but as they seem often to have had horses, sheep, goats, and cattle on the platform, the gangway would be in such cases a necessary adjunct to a settlement, the piles of which have been occasionally found to indicate a superficial area of 100,000 square feet, and which was therefore practically a village on piles. The number of lake-dwellings discovered in the lakes of Switzerland exceeds one hundred and forty. The best known of these are Meilen in the lake of Zurich, Wangen in the lake of Constance, Robenhansen in the small and partially dried up lake of Pfaffikon, and Moosseedorf in the small lake of that name, all stations of the stone age; Moringen in the lake of Biemle, Estavayer in the lake of Neuchatel, and Morges in the lake of Geneva, all stations of the bronze age; and Marin, otherwise known as La Tene, in the north end of the lake of Neuchatel, a station of the iron age.

In the settlements of the stone age the cutting

implements, such as axes, knives, saws, are made only of stone. As flint is not abundant in Switzerland, the larger implements, such as axes, are generally made of diorite, serpentine, and other hard and tough stones, and sometimes even of nephrite and jadeite. The smaller implements, such as knives, saws, arrow-points, and spear-heads, are usually made of chipped flint, but the axes are cut out of the block by a sawing process, the cuts being made to some depth on opposite sides, and the parts separated by a blow. Those axes or axe-hammers that were perforated by a hole for the haft were bored by a drill of soft wood worked with sand. The stone axes were, however, for the most part mere wedges not perforated for the haft, but fixed in a socket in the end of a short piece of stag's horn, through which the perforation for the handle was made. Sometimes the handle itself was perforated, and one end of the stag's horn mounting, which carried the stone axe socketed into its other end, was mortised into the handle. Bitumen was used as a cement to fix the stone tools of all kinds in their handles of horn or wood. Arrow-points, notched or barbed, and harpoon-points for spearing fish were made of bone. The pottery of the stone age settlements was coarse but plentiful, and the cooking vessels were occasionally of large size. The lake-dwellers of the stone age were agriculturists,

cultivating on the adjacent mainland their crops of wheat, barley, millet, and flax, and rearing flocks and herds, the cattle being sometimes stalled upon the platforms. They were hunters and fishers, and their food seems in consequence to have been both varied and plentiful. Amongst the animals they hunted, and whose remains have been found in the relic-beds underneath the dwellings, are the urus and bison, the elk, the ibex, and chamois, the wild-boar and stag; and they kept the domestic ox, the horse, swine, sheep, goats, and dogs. They stored nuts and dried apples cut in halves; and among the charred remnants of their food fragments of their cakes of bread have been discovered. To the same charring action of the fire which seems in several cases to have consumed the huts we owe the preservation of many specimens of their textile fabrics, woven of well-spun flaxen threads, and of their fishing-nets, and mats made of bast or fibre of the lime-tree, and ropes and lines of plaited twigs, or cords of flaxen thread.

The pile-dwellings of the bronze age appear to have been placed farther from the shore than those of the stone age. The settlements of the bronze age also exhibit an increase in the number of domestic animals, and a corresponding decrease in the number of wild animals used for food. The pottery, though not thrown upon the wheel, is finer in form and much more highly ornamented, often with patterns of great elegance, painted in black or red, and sometimes inlaid with strips of tin. In settlements founded in the bronze age, such as that at Morges in the lake of Geneva, bronze is almost the only material used in the manufacture of their implements and weapons; and consequently stone and bone implements are as rare in them as bronze implements are in the earlier settlements. But there are a number of settlements which seem to have existed during the transition period, in the relic-beds of which the implements of stone and bronze are found mingled together. The forms of the bronze objects found in the lake-dwellings do not materially differ from those generally found diffused over central Europe. One feature of the lake-dwellings is the abundance and variety of the bronze ornaments, and the extraordinary development of the pins with ornamental heads, which are found of all sizes up to 15 inches in length. The bracelets are penannular, often hollow, or C-shaped in section, and decorated on the convex surface with a variety of sunk patterns composed of combinations of straight lines and circles. The principal varieties of the implements and weapons of bronze are axes, chisels, gouges, saws, sickles, knives, daggers, spear-heads, swords, hammers, and anvils. The knives are very abundant, and there is one large variety, with a curved and almost scythe-shaped blade, having a thick back, which is characteristic of the lake-dwellings. There is a smaller knife with an oval or crescent-shaped blade, so thin and sharp that it has been taken for a razor. The swords are mostly of the broad-bladed and slightly tapering form found in central Europe, and often have their handles also of bronze. Moulds of stone for casting the different varieties of bronze implements, weapons, and ornaments have been found in the relic-beds, showing that the articles were manufactured in the settlements in which they were used. In the principal settlement of the bronze age at Morges the number of bronze articles found exceeds 500.

The settlement of Marin in the lake of Neu-

châtel is the best known of the lake-dwellings of the iron age. As the area occupied by the piles is about 1200 feet long by 250 feet wide, the settlement was undoubtedly a large one. Several caldrons of thin bronze with iron ring handles attached to the rim were found here; and a number of small articles of bronze were also found, none of which were of bronze age types. The weapons were all of iron. They consist of short double-edged swords, the edges straight to within a short distance of the point, and large, broad, and thin-bladed spear-heads, sometimes oval or leaf-shaped, but usually with wavy or indented edges. Several of the sword-blades are damascened, after the ancient method of damascening by welding together strips of metal differently prepared, and some have makers' marks. The sheaths are of iron, beaten very thin, and are remarkable both for their elegance of form and the peculiar nature of their decoration. This has been sometimes supposed to be Etruscan, but it much more closely resembles the style of ornamentation which is now known in France as Gaulish, and is common to a series of

Fig 2.—Ground-plan of Crannog in Drumaleague Lough.

grave-mounds occurring both in France and Switzerland. The other articles found at Marin are shield-mountings, fibulae, buckles, bridle-bits, and hatchets, all of iron, a number of rings or bracelets, beads, &c. of coloured glass, playing dice and other small objects of bone, pieces of Roman pottery, and Roman and Gaulish coins. The latest of the coins is of the reign of the Roman Emperor Claudius, 41 to 54 A.D.

There is no means of computing the antiquity of the earlier lake-dwellings of Switzerland, but Dr Keller remarks on this point that, 'although the actual determination of the age of the lake-dwellings is doubtful, yet we may say with perfect certainty that they are more than 2000 years old, and with a considerable amount of probability that they reach back from 1000 to 2000 years before Christ.' Lake-dwellings have also been found on the Italian side of the Alps in the lake of Garda and the Lago Maggiore; in Savoy in the lakes of Bourget and Paladru; in Austria in the bed of a dried-up lake at Laibach, and in several small lakes near Salzburg, and in Bavaria and Pomerania. In Scotland and Ireland, where

they are numerous, they are known as Crannogs (q.v.), from the Celtic word *crann*, 'a tree.' The crannogs, however, are not constructed like the Swiss pile-villages. They are either palisaded refuges on small islets of natural formation, or artificial islets formed of brushwood, stones, and earth, and steadily and protected by piles driven through and around the mass. The problem presented to the crannog-builders was to construct, in a maximum depth of 10 or 12 feet of water, a solid, compact, and generally circular island, with a radius of 50 feet or thereby, capable of providing a permanent means of refuge and shelter for a considerable number of men and animals. The process is thus described by Dr Munro: 'Over the site chosen a circular raft of tree-trunks laid above branches and brushwood was formed, and above it additional layers of logs, together with stones, gravel, &c., were heaped up till the mass grounded. As this process went on, poles of oak were inserted here and there, the rough logs forming the horizontal layers were pinned together, and at various levels oak-beams mortised into one another were stretched across the substance of the island and joined to the surrounding piles. When a sufficient height above the water-line was attained, a prepared pavement of oak-beams was constructed, and mortised beams were laid over the tops of the encircling piles which bound them firmly together. The margin of the island was also slantingly shaped by an intricate arrangement of beams and stones, constituting a breakwater.' Frequently a wooden gangway stretched to the shore; in other cases the only means of access was by canoes, hollowed out of oak-tree trunks. Much the same system of construction appears to have been followed in Ireland. The plan (fig. 2, p. 487) of one of two crannogs in Drumaleague Lough, in the county of Leitrim, given on a scale of 1 inch to 20 feet, shows a circle of piles enclosing a space of 60 feet in diameter, with remains of supplementary circles at several points in the interior of the main or outer circle. In the centre is the log-pavement, A, about 35 feet by 25 feet, probably the floor of the log-house, which was the principal building on the crannog. In the centre of this pavement is a hearth-place, B, covered with flat stones, still showing traces of fire. On the outside of the pavement is another hearth-place, C, on a bed of stiff clay, while around a large tree root, D, the top of which has been dressed with a hatchet, and which may have served as a table, were found the refuse of the daily food in the shape of the broken and split bones of deer and swine. The crannogs are generally very much smaller than the Swiss lake-settlements, and from the nature of their construction there is no relic-bed. Those of Ayrshire and Galloway in Scotland have yielded objects dating from the time of the Roman occupation of Scotland to quite recent times. The most characteristic objects recovered from the Irish crannogs belong to the period of the Norse incursions, ranging from the 8th to the 10th and 11th centuries. There have been a few exceptional instances of the discovery of implements of stone and bronze age types in apparent association with the crannog structures, but so far as is yet known there is no crannog in Scotland or Ireland that can with any degree of certainty be assigned to the age of stone, or to the age of bronze. They seem to belong exclusively to the iron age and the historic period. There are frequent references to the use of crannogs as refuges and strongholds in the early Irish annals, and in Scottish and Irish historical documents of the 16th and 17th centuries. The first traces found in North America of anything resembling the lake-dwellings of Europe are at the mouth of Na man's Creek, a tributary of the Delaware.

The custom of living in wooden houses erected on piles over the waters of a lake, river, or inlet of the sea is still practised by barbarous tribes, and has been described by many travellers in the Malayan Archipelago, New Guinea, Venezuela, and in central Africa. When Ojeda, Vesputi, and the other discoverers entered the lake of Maracaibo in 1499, they found an Indian village constructed on piles above the water, and thence called it Venezuela ('little Venice'). The dwellings of the Papuans along the coasts and river-banks of New Guinea are built of bamboo and raised on stakes, and are grouped together. Cameron saw regular villages of pile-dwellings on Lake Mohrya in central Africa, each separate, and accessible only by jealously-guarded canoes.

See Munro, *The Lake-dwellings of Europe* (1890); Keller, *The Lake-dwellings of Switzerland* (trans. by Lee, 2d ed. 1878); Munro, *Ancient Scottish Lake-dwellings, or Crannogs* (1882); Wood-Martin, *The Lake-dwellings of Ireland* (1886).

Lake of the Thousand Islands, an expansion of the St Lawrence (q.v.) extending about 40 miles below Lake Ontario. It contains some 1500 rocky islets, the largest, Wolfe Island (48 sq. m.; pop. 2383), measuring 2½ miles by 7.

Lake of the Woods, a large lake of North America, studded with numerous wooded islands, mostly in Ontario, but touching also Manitoba and Minnesota. Gold was found about it in 1897. The lake is nearly 100 miles long, and about 300 in circuit. It is fed by the Rainy River, and drained by the Winnipeg.

Lakes (originally prepared from *lac*, whence the name) are pigments or colours formed by precipitating animal or vegetable colouring matters from their solutions chiefly with alumina or oxide of tin. Cochineal and madder lakes are the only ones used by artists. The former are prepared with Cochineal (q.v.) and alumina, and according to their shade of red, or purple red, are known as carmine, crimson lake, scarlet lake, purple lake, and Florentine lake. These were formerly much employed for landscape-work by water-colour painters, and are still in request for flower painting, but they have not much stability. The madder pigments of this kind, called rose madder or madder lake and madder carmine, are on the other hand quite permanent, both as water-colours and oil colours, and are much prized by artists. There are several yellow lakes made, but they are fugitive, and consequently but little used.

Paper-stainers and decorators use several pink lakes prepared by saturating a strong decoction of Brazil-wood and other dye-woods with chalk, starch, and a little alum. To these such names as Venetian, Florence, and Berlin lakes are applied. The two best lakes used by decorators are crimson and morone lakes.

Lakh. See *LAC*.

Lakshmi, in Hindu Mythology, the name of the consort of the god Vishnu (q.v.), and considered also to be his female or creative energy.

Lalande, JOSEPH JÉRÔME LE-FRANÇOIS DE, a French astronomer, was born at Bourg, 11th July 1732. Sent to Paris to qualify for an advocate, he was attracted to astronomy, which he studied under Delisle and Lemoigner. The latter persuaded the Academy of Paris to send Lalande to Berlin in 1751, to determine the moon's parallax, whilst Lacaille was sent to the Cape of Good Hope. On his return he was appointed one of the astronomers-royal, and in 1762 succeeded Lemoigner in the professorship of Astronomy in the College de France, a post which he held down to his death on 11th April 1807. He lectured with great success, and published several astronomical works of a

popular kind, as well as works of greater scientific value. In 1795 he was appointed Director of the Paris Observatory. His character was marked by extreme vanity; nevertheless he contributed greatly to the general progress of astronomical science. His principal work is *Traité d'Astronomie* (2 vols. 1764; 3d ed. 3 vols. 1792). In 1802 he instituted the Lalande prize for the most notable astronomical book or observation of the year.

Lalita-Vistara is the name of one of the most celebrated works of Buddhist literature. It belongs to the northern Buddhists, but is of unknown origin and antiquity, existing only in a debased Sanskrit version. It contains a narrative of the life and doctrine of the Buddha Sakya-muni, and is considered by the Buddhists as one of their nine chief works, treating of *Dharma*, or religious law.

Lally-Tollendal, THOMAS ARTHUR, COUNT DE LALLY and BARON DE TOLLENDAL, a French general, was born at Romans, in Dauphiné, in January 1702. His father, Sir Gerard Lally, was an Irish Jacobite refugee, and commander of an Irish regiment in the French service. Lally distinguished himself as a soldier in Flanders, especially at the battle of Fontenoy; accompanied Prince Charles Edward to Scotland in 1745; and in 1756 was appointed commander-in-chief in the French East Indian settlements. He commenced vigorous hostilities against the British, took many towns, and besieged Madras itself; but, having sustained a severe defeat, he was compelled to retreat to Pondicherry, which was attacked in March 1760 by land and sea by a greatly superior British force. Lally, however, held out for ten months; then, capitulating on 16th January 1761, he was conveyed as a prisoner of war to England. But, hearing that he had been accused of treachery and cowardice in India, he obtained leave to proceed to France for the vindication of his character. There he was thrown into the Bastille, and kept two years before his trial took place. The parliament of Paris at last condemned him to death for betraying the interests of the king and the Indian Company, and the sentence was executed on 9th May 1766. But his son, supported by the powerful assistance of Voltaire, procured a royal decree on 21st May 1778, declaring the condemnation unjust, and restoring all the forfeited honours. See Malleon's *French in India* (new ed. 1884), and Hamont's *Fin d'un Empire Français aux Indes* (1887).

That son, TROPHIMUS GERARD, MARQUIS DE LALLY-TOLLENDAL, born in Paris, 5th March 1751, was one of those nobles who in the States General of 1789 united with the Third Estate; but, alarmed at the democratic tendencies of the National Assembly, he afterwards allied himself with the court. He laboured to procure for France a constitution with two chambers and a privileged aristocracy; and earnestly sought to protect the king, but was himself obliged to flee to England. After the Revolution of 18th Brumaire, he returned to France. Louis XVIII. made him a peer. He died at Paris on 11th March 1830. He was the author of a famous *Defence of the French Emigrants* (1794); and a *Life of Wentworth, Earl of Strafford* (2d ed. 1814).

Lama. See LLAMA.

Lamaism (from the Tibetan *bla-ma*, 'spiritual teacher or lord') is the name of the religion prevailing in Tibet and Mongolia. It is Buddhism corrupted by Sivaism, and by Shamanism or spirit-worship. As ancient Buddhism knows of no worship of God, but merely of an adoration of saints, the latter is also the main feature of Lamaism. The essence of all that is sacred is comprised by this religion under the 'three most precious jewels'

—viz. the 'Buddha-jewel,' the 'doctrine-jewel,' and the 'priesthood-jewel.' The first person of this trinity is the Buddha; but he is not the creator, or the origin of the universe; as in Buddhism, he is merely the founder of the doctrine, the highest saint, though endowed with all the qualities of supreme wisdom, power, virtue, and beauty, which raise him beyond the pale of ordinary existence. The second jewel, or the doctrine, is the law or religion—that which is, as it were, the incarnation of the Buddha, his actual existence after he had disappeared in the Nirvāna. The third jewel, or the priesthood, is the congregation of the saints, comprising the whole clergy, the incarnate as well as the non-incarnate representatives of the various Buddhistic saints. The latter comprise the five Dhyāni-Buddhas, or the Buddhas of contemplation, and, besides, all those myriads of Bodhisattvas, Pratyeka-Buddhas, and pious men, who became canonised after their death. Inferior in rank to these saints are the gods and spirits, the former chiefly taken from the Pantheon of the Sivaïtes. The highest position amongst these is occupied by the four spirit-kings—*Indra*, the god of the firmament; *Yama*, the god of death and the infernal regions; *Yamādakka*, or Siva, as the avenger in his most formidable shape; and *Vaisravana*, or the god of wealth. The worship of these saints and gods consists chiefly in the reciting of prayers and sacred texts, and the intonation of hymns, accompanied by a kind of music which is a chaos of the most unharmonious and deafening sounds of horns, trumpets, and drums of various descriptions. During this worship, which takes place three times a day, the clergy, summoned by the tolling of a little bell, are seated in two or more rows, according to their rank; and on special holidays the temples and altars are decorated with symbolical figures, while offerings of tea, flour, milk, butter, and others of a similar nature, are made by the worshippers; animal sacrifices or offerings entailing injury to life being forbidden, as in the Buddhistic faith. Lamaism has three great annual festivals. According to Huc, there are rites corresponding to baptism and confirmation; and the principal religious ceremony closely resembles high mass. Lamaism does not allow the interment of the dead. Persons distinguished by rank, learning, or piety, are burned after their death; but the general mode of disposing of dead bodies in Tibet, as in Mongolia, is that of exposing them in the open air, to be devoured by birds and beasts of prey. The Lama must be present at the moment of death, in order to superintend the proper separation of body and soul, to calm the departed spirit, and to enable him to be reborn in a happy existence.

One of the most interesting features of Lamaism is the organisation of its hierarchy. Its summit is occupied by two Lama popes, the one called *Dalai-lama*, i.e. Ocean priest, or priest as wide as the ocean—the 'Grand Lama,' residing at Potala, near Lhasa—and the other bearing the titles of *Tesho-lama*, *Bogdo-lama*, or *Pan-chhen*. In theory, both popes have the same rank and authority, in spiritual as well as in temporal matters; but, as the Dalai-lama possesses a much larger territory than the other, he is in reality much more powerful. Next in rank are the *Khontakts*, who may be compared to the Roman Catholic cardinals and archbishops. The third degree is that of the *Khulbilghans* or *Hobilghans*. Their number is very great. These three degrees represent the clergy that claims to be the incarnation of the Buddhistic saints. The Dalai-lama and the Pan-chhen were in their former lives the two chief disciples of the great Lamaist reformer, M'tsong kha pa, who is reputed to have founded in the 14th century of

the Christian era the present system of the Lama hierarchy. The Khutukts were in their prior existences other Buddhistic saints of very great renown; and the Khubilghans are those reborn hosts of saintly patrons whom the temples and convents of Lamaism possess in boundless numbers.

In order to ascertain the re-incarnation of a departed Lama, various means are relied upon. Sometimes the deceased had, before his death, confidentially mentioned to his friends where and in which family he would reappear, or his will contained intimations to this effect. In most instances, however, the sacred books and the official astrologers are consulted on the subject; and if the Dalai-lama dies it is the duty of the Panchhen to interpret the traditions and oracles. It is understood that the imperial court at Peking has more to do with the selection than is admitted by the priests. Down to 1880 there had been no fewer than 103 Dalai lamas.

Besides these three classes of the higher clergy Lamaism possesses a lower clergy, which, having no claim to incarnate holiness, recruits its ranks on the principle of merit and theological proficiency. It has four orders: the pupil or novice, who enters the order generally in his seventh or ninth year; the assistant priest; the religious mendicant; and the teacher or abbot. All the members of these orders must make the vow of celibacy, and by far the greatest number of them live in convents, the number of monks, in proportion to the population, being enormous. A Lamaist convent consists of a temple, which forms its centre, and of a number of buildings connected with the temple, and appropriated to the meeting-rooms, the library, refectory, dwellings, and other spiritual and worldly wants of the monks. At the head of the convent is a Khubilghan, or an abbot, the latter being elected by the chapter and appointed by the Dalai-lama, or the provincial Khubilghan. In addition to these orders of monks and convents, Lamaism has likewise its nuns and nunneries. The Lamaist bible bears the name of *bKa'gyur* (or *Kandjur*), 'translation of the words,' namely of the Buddha. It contains not less than 1083 works, which in some editions fill 102 to 108 volumes in folio.

Lamantin. See MANATEE.

Lamarck. JEAN BAPTISTE PIERRE ANTOINE DE MONNET, CHEVALIER DE, evolutionist, born at Bazentin in Picardy, 1st August 1744, was educated for the church at the Jesuit College of Amiens, which he left at the age of seventeen to join the French army then warring in Germany. Having gained rapid promotion to officer's rank, he was sent in 1763 to the garrisons at Toulon and Monaco, where he became impressed with the Mediterranean flora. Accidental injuries led him to resign his position, and brought him to Paris, where he was forced to work in a banker's office, while his spare energies were devoted to the study of plants. In 1773, thanks in part to Buffon, he published a *Flore Française*, in which he applied a new analytical method of classification. As tutor to Buffon's son, he had the opportunity of visiting Holland, Germany, and Hungary. In 1774 he became a member of the French Academy and Garde de l'Herbier du Jardin du Roi—the nucleus of the famous post-revolutionary *Jardin des Plantes*. In one of the twelve chairs associated with this 'Jardin' Lamarck remained for twenty-five years as professor of what we would now call Invertebrate

Zoology. In 1801 or earlier he had begun to think actively about the relations and origin of species, expressing his conclusions in 1809 in his famous *Philosophie Zoologique*. Of his other great work, *Histoire des Animaux sans Vertèbres*, he published seven volumes between 1815 and 1822. Hard work and illness enfeebled his sight and left him for the last ten years of his life not only blind but poor. To one of his two daughters he dictated the last volume of his Invertebrate Zoology, while to keep himself alive he was forced to part with some of his treasured collections. Greater than his contemporaries and immediate successors dreamed, Lamarck died in comparative obscurity, 18th December 1829, aged eighty-five.

Apart from his contributions to classification and descriptive zoology, Lamarck had a twofold importance, as an expositor of the now accepted theory of descent, and as an inquirer into the still debated factors in evolution. It is easy to find in his *Philosophie Zoologique* passages which foreshadow many modern suggestions in regard to evolution, including the theory of natural selection; but the gist of his thinking is fairly expressed in the following propositions: (1) Every considerable and sustained change in the conditions of life produces a real change in the needs of the animals involved; (2) change of needs involves new habits; (3) altered function evokes change of structure, for parts formerly less used become with increased exercise more highly developed, other organs in default of use deteriorate and finally disappear, while new parts gradually arise in the organism by its own efforts from within (*efforts de son sentiment intérieur*); (4) gains or losses due to use or disuse are transmitted from parents to offspring.

There can be no doubt that Lamarck, though beyond doubt an independent thinker, was influenced by Buffon, and also perhaps by Erasmus Darwin, whose *Loves of the Plants* had been translated into French in 1799. On his contemporaries he exercised little influence—in fact it was not till the Darwinian revival of etiology that the worth of Lamarck began to be justly appreciated. To those who deny the transmissibility of all characters individually acquired in direct response to changed functions and surroundings, the theory of evolution according to Lamarck seems to be based on an undemonstrated if not erroneous hypothesis; to those, on the other hand, who believe that individually acquired characters are transmissible from parents to offspring, Lamarck's theory is part of the solution of the evolutionist's puzzle. Thus, while the majority of naturalists in Britain and Germany side with Darwin and Weismann against Lamarck, there is in France a distinctly Lamarckian school, and a *Banquet* of his admirers has been instituted; while in America what are called 'Neo-Lamarckian' views are vigorously upheld by many naturalists of eminence, such as Cope, Hyatt, and Packard, who seek to explain evolution according to fundamental 'laws of growth,' plus the inherited effects of use and disuse and of environmental influence.

by Ch. Martins (1873); *Lamarek, par un Groupe de Transformistes, ses Disciples* (1887); A. S. Packard, Introduction to *Standard Natural History* (1885); and E. Perrier, *La Philosophie Zoologique avant Darwin* (1884).

La Marmora. ALFONSO FERRERO, MARQUIS DE, Italian general and statesman, born at Turin, 17th November 1804, who, entering the army, became known as a zealous reformer. He was decorated for distinguished conduct in the national war of 1848, and promoted to general of brigade. In 1849 he entered the cabinet as Minister of War. In 1855 he withdrew from the ministry to assume the command of the Sardinian troops in the Crimea, and at the close of the war was invested with the Order of the Bath and the Grand Cross of the Legion of Honour, and re-entered the ministry in his former capacity. He took part in the war of 1859, by which Lombardy was acquired by Italy; and was appointed commander-in-chief of the Italian army in 1861, and in 1864 prime-minister. In the campaign against Austria in 1866 he lost the battle of Custoza, and had to sustain unpleasant controversy as to his management of the campaign. Latterly he was entrusted with several diplomatic missions; he preferred the French to the Prussian alliance; and his publication (1873) of the secret negotiations between Prussia and Italy incurred the censure of Prince Bismarck. La Marmora died 5th January 1878. See a monograph by Massari (1880).

Lamartine. ALPHONSE MARIE LOUIS DE, French statesman and author, was born at Mâcon, 21st October 1790. He came of an ultra-royalist stock, and was educated in royalist principles. Up to 1815 a considerable portion of his time was spent in Italy, a country for which he had a deep affection. On the fall of Napoleon and the establishment of the Bourbons, Lamartine proceeded to Paris and entered the ranks of the Garde Royale. He soon returned to Italy, however, which he traversed on foot; and here, as his *Elvire* and *Julie* testify, he experienced a passion that kindled into energy those poetic gifts which ultimately made him one of the great singers of France. His first *Meditations* were published in 1820, and at this period he was appointed First Secretary of Legation at Naples. He subsequently became *charge d'affaires* at Florence, where he remained for five years, acquiring a wide knowledge of international politics. Lamartine married an English wife, Marianne Birch, who shared in her husband's labours and aspirations. In 1829 Lamartine, foreseeing impending difficulties, declined the post of Secretary of State for Foreign Affairs in the Polignac ministry. He accepted a mission to the new king of Greece, Leopold of Belgium (elected 11th February 1830; resigned 15th May). At the same time he published his *Harmonies Poétiques et Religieuses*, which excited such enthusiasm that he was unanimously elected to the Academy. Lamartine, still a royalist in principle, disapproved of the revolution of July 1830. His friends nominated him at Dunkerque and Toulon for election to the Chamber of Deputies, but he was defeated at both places, and went on a tour to the East. He wrote an account of his travels, entitled *Souvenirs d'Orient*. Recalled to France in 1833, he was returned for both Mâcon and Bergues, and elected to sit for the latter place. But Mâcon being his native place, his fellow-townsmen would not be denied, and re-elected him almost unanimously in 1837. Between 1834 and 1848 Lamartine wrote and published his *Journaux*, *La Chute d'un Ange*, and the celebrated work, the *Histoire des Girondins*, which the Conservatives erroneously alleged was the cause of the revolution of 1848. The historian merely saw further into the future than most of his con-

temporaries. The Orleanist régime was repugnant to him because of its duplicity, and when the monarchy fell he accepted the inevitable. It was he who insisted upon an appeal to the people. He was a member of the Provisional Government which formally proclaimed the Republic at the Hôtel de Ville. The new order having been established on the basis of liberty, equality, and fraternity, the ministry was constituted with Lamartine as Minister of Foreign Affairs. Lamartine, who was the presiding genius of the government, endeavoured to rule the country according to the principles of constitutional liberty, but there was an extreme party, headed by Louis Blanc and Ledru Rollin, which sought to establish national workshops and to effect social changes of a sweeping character. A formidable outbreak on the 15th of May, resulting from the refusal of the Assembly to appoint a Minister of Labour, and which eventually led to the expulsion of Louis Blanc, was suppressed by the vigorous efforts of Lamartine. In June, however, a more serious rising occurred, upon which the executive committee resigned their functions, and conferred the command of the forces on General Cavaignac. After a terrible conflict the insurrection was suppressed, Lamartine had already stepped down from power, and from the time when Louis Napoleon acquired the ascendancy through unscrupulous means his political career practically closed. He now devoted himself to literature, publishing in the order named the two series of the *Confidences*, his *Raphael*, *Geneviève*, the *Tailleur de Pierres de St-Point*, and that valuable contribution to the study of continental politics, the *Histoire de la Restauration*. He likewise edited several *Collections* of his former writings, *Discours divers*, and issued monthly his *Entretiens Familiaux*. Lamartine continued to take an interest in public affairs, discussing them eloquently with his friends, but his patriotic spirit revolted against the iron rule of Napoleon III. In consequence of his straitened circumstances, parliament voted Lamartine a moderate pension, and the Paris town-council presented him with a chalet in the Bois de Boulogne. He died on February 28, 1869. See the Life by Lady M. Dumville (1888), and by Deschanel (2 vols. Par. 1893).

Lamb. CHARLES, essayist, critic, and humorist, was born on the 10th of February 1775, in Crown Office Row, in the Temple, London, where his father was clerk and confidential servant to Samuel Salt, a wealthy bencher of the Inner Temple. For this, as for many other details of Lamb's private and domestic life, we are indebted to his essays, which form the best of all commentaries on his biography. (His father, John Lamb, is the Lovel of the essay on the 'Old Benchers of the Inner Temple.') There were seven children born to John Lamb and his wife in the Temple, of whom three only survived their early childhood—Charles Lamb, his sister Mary, ten years older than himself, and a yet older brother, John. Charles received his first schooling at a humble academy, out of Fetter Lane, but at seven years of age he obtained, through Samuel Salt, a presentation to Christ's Hospital, where he remained for the next seven years. His school experiences, and the friendships he formed, notably that with Samuel Taylor Coleridge, three years his senior, are again familiar to all readers of the *Essays of Elia*. At the age of fourteen he left school with a fair amount of scholarship, and an intensified love of reading. He might have stayed and become a *Grecian*—as the highest class boys were denominated—and so proceeded to the university. But the exhibitions were given on the understanding that the holder was to take holy orders, and Lamb's unmountable stammer barred him from that profession.

Lamb left Christ's Hospital in November 1789.

At that time his brother John held a post in the South Sea House, of which Samuel Salt was a deputy-governor, and Charles was soon presented through the kind offices of this friend to a humble situation in the same company; but early in 1792 he obtained promotion in the shape of a clerkship in the accountant's office of the India House, where he remained for more than thirty years. In this same year Samuel Salt died. The occupation of his old clerk and servant was at an end; and with his legacies from his employer, Charles's salary, and whatever Mary Lamb could earn by needle-work, in which she was proficient, the family of four (for John Lamb was living a comfortable bachelor life elsewhere) retired to humble lodgings. In 1796 we find them in Little Queen Street, Holborn, and it was there that the terrible disaster occurred, destined to mould the career and character of Charles Lamb for the whole of his future life. There was a strain of insanity in the children inherited from the mother. The father, who had married late in life, was growing old and childish; the mother was an invalid, and the stress and anxiety of the many duties devolving on Mary Lamb began to tell upon her reason. In an attack of mania, induced by a slight altercation with a little apprentice girl at work in the room, Mary Lamb snatched up a knife from the dinner-table, and stabbed her mother, who had interposed in the girl's behalf. Charles was himself present, and wrested the knife from his sister's hand. It was a critical moment in the young man's history. The father was all but imbecile; the mother was no more; and the whole direction of affairs for the sister's future remained with Charles. The inquest resulted in a verdict of temporary insanity. Mary would in the natural course have been transferred for life to a public asylum; but, by the intervention of friends, the brother's guardianship was accepted by the authorities as an alternative. To carry out this trust Charles Lamb from that moment devoted his life, sacrificing to it all other ties and ambitions, and never flagging in duty and tenderness for thirty-eight years. It was inevitable that the family should leave the scene of this 'day of horrors;' the old father with his son Charles removed to Pentonville, where at successive lodgings they remained until the father's death. The house in Little Queen Street no longer stands. With two or three other houses adjoining, it has been pulled down, and a church now stands upon its site—a not unfitting memorial of the spot where Lamb consecrated his future life by an act of devotion as remarkable as any recorded in the annals of literature. Mary Lamb remained subject to attacks of temporary aberration for the rest of her life. The attacks were usually foreseen, and at such seasons she was removed to some suitable asylum. The length and frequency of these periods of absence increased, until the closing years of her brother's life, when she was exiled from him during the greater part of each year. In the meantime Charles Lamb had fallen in love, but renounced all hope of marriage when the duty of tending his otherwise homeless sister had appeared to him paramount. The history of his brief attachment, to which there is frequent pathetic allusion in his writings, is obscure. The girl, who appears in his earliest sonnets as Anna, and in his essays as Alice W., was in fact named Anne Simmons, and resided with her mother in the village of Wilford, in Hertfordshire—the scene of Lamb's early romance of *Rosalind Gray*. Lamb's grandmother, Mrs. Field, was house-keeper at Blakesware, a dower-house of the Plumer family, closely adjoining Wilford; and during Lamb's frequent visits to Blakesware (immortalised in one of the loveliest

of his essays as 'Blakesmoor, in Hertfordshire') he had made the girl's acquaintance. She afterwards married a Mr. Bartum, a London silversmith, and is referred to under that name in the essay *Dream Children*.

Lamb's earliest poems, written in 1795, were prompted by this deep attachment. Two sonnets on this theme, with two others on different topics, were included in S. T. Coleridge's earliest volume of poems, issued at Bristol in 1796. In the following year a second edition of Coleridge's poems appeared, 'to which are now added poems by Charles Lamb and Charles Lloyd.' The latter was a young man of kindred poetic tastes, whose acquaintance Lamb had made through Coleridge. Here, as before, the poetic influence under which Lamb wrote was the same that had so strangely moved Coleridge, while still at Christ's Hospital—the graceful and melancholy sonnets of W. L. Bowles. In the following year Lamb and Lloyd made a second venture in a slight volume of their own (*Blank Verse*, by Charles Lloyd and Charles Lamb, 1798); and here for the first time Lamb's individuality made itself felt in the touching and now famous verses on the 'Old Familiar Faces'—like so many of his memorable utterances in prose and verse, full of autobiographical allusion, and yet gaining rather than losing in permanence of charm through the circumstance. It was, however, in prose, not in verse, that he was to find his true strength.

In the same year as the *Blank Verse* just mentioned he published his little prose romance, *The Tale of Rosalind Gray and Old Blind Margaret*; and four years later his *John Woodvil*—the fruit of that study of the dramatic poetry of the Elizabethan period, in the revived study of which he was to bear so large a part. Lamb had little or no dramatic faculty. The little play was crude and valueless as a drama, but with detached passages reflecting much of the music and quaintness of Fletcher and Jonson. Meantime, Lamb and his sister were wandering from lodging to lodging, too often forced to leave through the rumour of Mary Lamb's malady which followed them wherever they went. They had lived at more than one house in Pentonville—they were in Southampton Buildings in 1800 and 1801—and then removed to Lamb's old familiar neighbourhood, where they continued for sixteen years. The early years of their residence in the Temple were among the hardest and saddest of their lives. They were very poor; Charles's experiments in literature had as yet brought him neither money nor reputation; and the gradual accession of new friends that might have brightened their path had the drawback of bringing Charles face to face with social temptations which he could not resist. A very moderate indulgence in wine or spirits seems to have speedily affected him, and his shyness and his impediment of speech made him eagerly resort to what for the moment made him forget both. 'We are very poor,' writes Mary Lamb in 1804; and again in 1805, 'It has been sad and heavy times with us lately.' In Lamb's anxiety to raise a few pounds, rather than from any confidence in his dramatic faculty, he began to write a farce, which the proprietors of Drury Lane accepted, and produced in December 1806. It was the now famous farce *Mr H.*—famous, however, not for its success, but for its failure. His love for things dramatic soon found a more profitable outlet in a commission from William Godwin to contribute to his 'Juvenile Library,' then in course of publication. For this series Charles and Mary wrote in 1807 their well-known *Tales from Shakespeare*—Mary Lamb making the version of the comedies, Charles that of the tragedies. This was Lamb's

first success. It brought him sixty guineas, and what was more valuable, hope for the future, and the increased confidence and recognition of his growing circle of friends. As one consequence of the success, the brother and sister composed jointly two other children's books—*Mrs Leicester's School* (1807) and the *Poetry for Children* (1809). Charles also made, single-handed, a prose version of the *Adventures of Ulysses*. Another more important consequence was a commission from the Longmans to edit a volume of selections from the Elizabethan dramatists. The volume at once exhibited Lamb, to those who had eyes to see, as one of the most profound, subtle, and original of English poetical critics. Three years later a conviction of the same fact would be deepened in those who knew that the unsigned articles in Leigh Hunt's *Reflector*, on Hogarth and the tragedies of Shakespeare, were from the same hand, and that a prose writer of new and unique quality was showing above the dull level of the conventional essayist.

In 1817 Lamb and his sister left the Temple for rooms in Great Russell Street, Covent Garden. Next year an enterprising young publisher induced him to collect his scattered verse and prose in two neat volumes, as the *Works of Charles Lamb*, and this publication naturally paved the way for his being invited to join the staff of the *London Magazine*, then newly started. Lamb was required to contribute light prose essays, and was wisely allowed a free hand. His first essay appeared in August 1820, 'Recollections of the old South Sea House,' the public office in which his first small salary was earned, and where his elder brother had remained a high-placed and prosperous clerk. Lamb signed his first paper *Elia*, borrowing for a joke the name of a foreigner who had been fellow-clerk with him in the office. The signature was continued through Lamb's successive contributions to the magazine; and as he placed it on the title-page (without his own) of the first collected edition of the essays in 1823, it became indissolubly connected with the work. The series came to an end, as far as the *London Magazine* was concerned, in 1825. *The Last Essays of Elia* were collected in a second volume in 1833.

In August 1823 Charles and Mary quitted their rooms over the brazier's in Russell Street, and made their first experiment as householders in a cottage in Colebrooke Row, Islington, with the New River (into which George Dyer walked in broad daylight) flowing within a few feet of their front door. Moreover, they were now on the eye of making a pleasant addition to their household in the form of a young friend, the orphan daughter of an Italian teacher of languages at Cambridge. Charles and Mary Lamb virtually adopted Emma Isola, and she was treated as a member of their family until her marriage with Edward Moxon the publisher, in 1833.

Early in 1825 Lamb, who had been for some time failing in health, was allowed to resign his post in the India House, the directors liberally granting him as pension two-thirds of his then salary. Having now no tie to any particular neighbourhood, the brother and sister were free to wander. They took lodgings—and subsequently a house—at Enfield; but Mary Lamb's health becoming gradually worse and necessitating constant supervision, they parted with their furniture and gave up house-keeping. They finally removed to the neighbouring village of Edmonton, where in a small cottage, hard by the church, they spent the last year of their joint lives. It was a melancholy year. Lamb's own health was suffering. They had lost their young friend Emma Isola. The absence of settled occupation had not brought Lamb all the comfort he had looked for: the

separation from his London friends, and the now almost continuous mental alienation of his sister, left him companionless, and with the death of Coleridge in the summer of 1834 the chief attractions of his life were gone. In December of the same year, while taking one day his usual walk on the London Road, he stumbled and fell, slightly injuring his face. The wound was in itself trifling, but erysipelas ensued, under which he rapidly sank, and he passed quietly away, without pain, on the 29th of December. He was buried in Edmonton churchyard. His sister survived him nearly thirteen years, and was buried by his side in May 1847.

Lamb's place in literature is unique and unchallengeable. As a personality he is more intimately known to us than any other figure in literature, unless it be Samuel Johnson. He is familiar to us through his works, which throughout are composed in the form of personal confidences; through his many friends who have loved to make known his every mood and trait; and through his letters, the most fascinating body of correspondence in our language. It is a dangerous thing to say, but it may be doubted whether, outside a necessarily limited circle, his works are read so much for their own sakes as for the light they throw upon the character of their author. It is the harmonious concord of dissonances in Lamb that is the secret of his attraction. The profound and imaginative character of his criticism, which at its best is unerring, and with it the reckless humour of the Bohemian and the *farceur*; the presence of one lamentable weakness serving to throw into stronger relief the patient strength of his life's struggle; his loyalty and generosity to his friends, even when they abused it most; and all this flowing from one of the most beautiful acts of devotion in the records of self-sacrifice; the wild fun of Trimenlo and Stephano, alternating with the tenderness of Miranda and Ferdinand, or the profound philosophic musings of Prospero—and all these, like Ariel, now 'flaming distinctly,' now 'meeting and joining'—it is this wondrous blending of opposites that has made Lamb, save to the 'sour-complexioned' and matter of fact, one of the most dearly loved among English men of letters, and with every sign that this love is one which no changes of taste are likely to diminish.

Our chief authorities for Lamb are his own writings, and the *Life and Letters*, and *Final Memorials*, by the late Mr Justice Talbot. Later editions of these works have appeared, enlarged by Percy Fitzgerald and W. C. Hazlitt. There is a quite separate memoir of Lamb, of considerable interest, by the late B. W. Prater ('Barry Cornwall'). Another memoir, and a complete edition of Lamb's works and correspondence, by the writer of the present article, are published by Messrs Macmillan. E. V. Lucas's *Lamb and the Lloyd's* (1898) should also be cited as an interesting work.

Lamb, WILLIAM. See MELBOURNE.

Lamballe, MARIE THÉRÈSE LOUISE OF SAVOY-CARIGNAN, PRINCESS DE, was born at Turin, 8th September 1749, the daughter of the prince of Carignan. Beautiful and charming, she was made by Marie Antoinette superintendent of the royal household, and her own intimate friend and companion. Princess Lamballe proved her devotion to her royal mistress by returning to France (whence she had escaped to England) after the unsuccessful flight from Versailles, by sharing the queen's imprisonment for a week in the Temple, and finally by refusing to take the oath expressing detestation of the king, queen, and monarchy (3d September 1792). As she stepped out of the courtroom on that fatal day she was cut to the ground; her body was given up to the fury of the populace, who paraded her head and heart on pikes in front

of the queen's windows. See *Lives by Lescaur* (1865), *Bertin* (2d ed. 1894), and *Sir F. Montefiore* (1896).

Lambayeque, a province of Peru, with a pop. of 86,000, is mostly a rainless, barren region, with some fertile valleys. The capital, Lambayeque, situated 7 miles from the mouth of the river Lambayeque, lies 128 miles NW. of Trujillo, and has manufactures of woollen and cotton fabrics. Pop. 6300.

Lambert, DANIEL. See OBESITY.

Lambert, JOHANN HEINRICH, a philosopher and mathematician, was born 29th August 1728, at Mülhausen in Upper Alsace. He was successively clerk, secretary, and private tutor, studied assiduously all the time, and at last lived the life of a private gentleman. In 1764 Frederick the Great made him a member both of the Council of Architecture and of the Academy of Sciences. He died at Berlin, 25th September 1777. Lambert was the first to lay a scientific basis for the measurement of the intensity of light, in his *Photometria* (1760); and he was especially skilful in applying the analytical methods of mathematics. A work on analytical logic from his pen, *Neues Organon* (2 vols. 1764), was greatly valued by Kant, with whom Lambert kept up a correspondence. Of his other works we may mention *Kosmologische Briefe* (1761) and *Anlage zur Architectonik* (1771). See *Huber's Life of him* (1829) and *Lepsius's monograph on his philosophy* (1881).

Lambert, JOHN, one of the chief soldiers in the great Civil War, was born in the parish of Kirkby Mallum, in Yorkshire, September 7, 1619, studied at the Inns of Court, but on the outbreak of the war became a captain under Fairfax, and thereafter showed such conspicuous capacity and courage that he rose rapidly in rank. At Marston Moor he led Fairfax's cavalry on the right wing, was commissary-general of the army in the north after the formation of the 'new model' (1645), major-general of the northern counties (1647), helped Cromwell to crush Hamilton at Preston, captured Pontefract Castle in March 1649, after a three months' siege, and was thus absent from London during the trial of the king. In 1650 he went with Cromwell to Scotland as major-general, led the van at Dunbar, next traversed Fife and defeated the opposing army at Inverkeithing, followed Charles through the western shires to Worcester, and on the day of Cromwell's 'crowning mercy' commanded the troops on the eastern bank of the Severn. He took a prominent part in the installation of Oliver as protector, but actively opposed the proposition to declare him king. He was unable to take the oath of allegiance to the Protector, and became completely estranged from him. After his death he became the head of the cabal of discontented officers which overthrew the feeble administration of Richard Cromwell. Lambert was now looked upon as the leader of the Fifth Monarchy or extreme republican party; suppressed with considerable vigour the royalist insurrection in Cheshire, August 1659; and two months afterwards, dismissing the remnant of the Rump Parliament, virtually governed the country along with his officers under the title of the 'Committee of Safety.' Monk frustrated his designs; he was sent to the Tower, tried in 1662, and banished to Guernsey, where he died in 1683.

Lambessa, or LAMBESE, an Algerian town of 1700 inhabitants, 65 miles SSW. of Constantine, stands amidst the imposing ruins of the ancient *Lambesis*, capital of Numidia.

Lambeth, a metropolitan parliamentary borough in Surrey, forms part of the south-west quarter of London, and since 1885 returns four members. The old borough of Lambeth, which

had a much larger area, returned but two members. Lambeth Bridge dates from 1862. Lambeth Palace has been the official residence of the archbishops of Canterbury since 1197. It contains a splendid series of portraits of the archbishops, and a valuable library of 30,000 volumes, with many fine MSS. The Lollards' Tower, so named in comparatively modern times from the notion that heretics were here imprisoned, was really a water tower. It dates from 1431, but has been restored and modernised. See the Rev. J. Cave-Browne's *Lambeth Palace* (1883). For Lambeth Degrees, see DEGREES. The Lambeth Articles, drawn up in 1595 by Archbishop Whitgift and others, were nine in number, and pronouncedly Calvinistic in doctrine. They were disapproved by Queen Elizabeth, and were never in force. See also DOULTON.

Lamb's Lettuce. See CORN SALAD.

Lamb's-wool, an old English beverage, composed of ale and the pulp of roasted apples, with sugar and spices.

Lamellibranchiata. See BIVALVES.

Lamelliferous, a very numerous family of beetles, for illustration of which see COCKCHAFFER, DUNG-BEETLE, &c.

Lameness is commonly due to some abnormal condition either of the joints or of the muscles and fasciæ of the lower limbs: mere difference in length between the two limbs, even to the extent of an inch or more, is not necessarily incompatible with a natural gait. It is generally one of the earliest symptoms of disease in the joints; and permanent stiffness of any of these, whether the result of disease or of injury, always involves some degree of lameness. The weakness and imperfect development of the muscles which usually follows infantile paralysis is one of the commonest muscular causes. Severe wounds or rupture of any of the important muscles must also be mentioned. Unnaturally shaped or ill-fitting boots, with the corns, bunions, distortion of toes, and other ill effects they produce, are a fertile source of lameness; but conditions thus produced are generally in some degree amenable to treatment. Among the causes most apt to be overlooked are the slighter degrees of flat-foot, of contraction of the calf muscles, or other muscles whose tendons are inserted into the bones of the foot, and of the plantar fasciæ. See also the articles LEGS, ARTIFICIAL LIMBS, CLUB-FOOT, &c.

Lamennais, FELICITÉ ROBERT DE, was born at St Malo, 16th June 1782, the fourth of the six children of a merchant and shipowner, who was ennobled in 1788 by request of the States of Brittany for his patriotic services and for supplying cheapened corn to the poor during a time of scarcity, but who was too modest to use his title or the privileges it bore. His mother was a saintly woman of remarkable ability and of Irish descent, who died when he was but five years old. He grew up slender and small in stature, nervous and weak in health, but lively and restless in temperament, and from a very early age he took to books, and read widely at his will in his uncle's library. He loved music, and became expert in swimming, riding, and fencing, and it is said fought a duel with credit in 1802 or 1803. But the dominant passion of his youth was solitary study, and his earliest companions were doubt and melancholy. It is a fact not without significance that his first communion was deferred till he was twenty-two, at the time when his eldest brother Jean was ordained a priest. The pair retired about the end of 1805 to the solitude of their joint estate of La Chesnaie, two leagues from Dinan, and there, amidst almost savage surroundings, but in an ample library, the real education of Lamennais

began. In 1807 he translated the *Guide Spirituel* of Louis de Blois: Napoleon's police suppressed his *Reflexions sur l'Etat de l'Eglise* (1808). He received the tonsure in March 1809, and his letters of that period reveal a vein of lofty and somewhat mystical devotion and an inward joy of which he was to taste but little in later years. But study, prayer, and meditation could not satisfy all the cravings of his nature, and this exaltation of mind soon gave place to the malady of genius, that vague unrest and distaste for the present which was the fundamental undertone in the constitution of Lamennais. The years from 1806 till 1814 he spent in a narrow range of studies, shut out from the world, the vultures of vague unrest tearing at his heart, while he remained forging the weapons of controversy. He taught mathematics in his brother's seminary, shared his quarrel with the new university, and wrote together with him the ultramontane and anti-Gallican *Tradition de l'Eglise sur l'Institution des Evêques* (1814). In 1815, during the Hundred Days, he took refuge in London, where he was befriended and much influenced by the Abbé Carron. In November he returned to Paris, and with sore misgivings both before and after he was ordained priest at Vannes. At Paris in March 1816 he wrote the first volume of his famous *Essai sur l'Indifférence en matière de Religion* (1818-24), a magnificent, if paradoxical, denunciation of the right of private judgment and the doctrine of toleration—itsself but a virtual unbelief, 'a new kind of persecution against the church.' The whole is a polemic against the individual reason on which certitude cannot rest; its conclusion that the unity of society depends ultimately on the unity of truth, and that all systems but the Catholic destroy one another and lead to scepticism. Three different systems of indifference are in turn examined and refuted: (1) that of those who, repudiating religion for themselves, believe that it is necessary for the people—atheism, and the organised religious polity of the empire; (2) that of those who believe religion to be necessary for men, but that God has not given any special revelation of how He would be worshipped—natural religion, and 18th-century deism; (3) that of those who believe in a divine revelation through a book, but hold that God has left men to interpret it for themselves—Protestantism. In the *Defense de l'Essai* he answered opponents of the most opposite camps, advocates of freedom in thought, Gallican monarchists who refused to admit that the source of all authority was the holy see, and Ultramontanians themselves, who took fright at a bold attempt to find support for the Christian revelation in an analysis of human tradition.

In 1824 Lamennais received a flattering reception at Rome, and it is said that Leo XII. was anxious to give the new Bossuet a cardinal's hat. But soon after this other dreams than those of a pure theocracy enthroned in the Vatican began to fill his mind, and already notions of popular liberty appear in the *Progrès de la Révolution* (1829). The revolution of July (1830) quickened his pulse, and in the famous journal *L'Avenir*, founded in September, with his young friends Lacordaire, Montalembert, and the Abbé Gerbet, ideas strange to Ultramontanians were eagerly advocated. But the old chimæra refused to be rejuvenised, the Jesuits and bishops took fright at the new doctrines of liberty of the press, of instruction, and of discussion, and the journal was suspended by spiritual authority in 1831. Lamennais, Lacordaire, and Montalembert set out for Rome to lay bare their hearts to the Holy Father. The disastrous story is told in *Les Affaires de Rome* (1836), one of the most interesting of all the writings of Lamennais. His Holiness Gregory XVI. gave the ardent tribune

but a quarter of an hour's audience, talked to him of art, pointed out the claw in a lion of Michael Angelo's, and, according to the Abbé Riard, offered him a pinch of snuff. After waiting in vain for an opportunity of conference, they returned doubtful and disheartened at the cowardly chicanery and worldliness of Rome. A severe condemnation reached them at Munich, 30th August 1832, the date of the beginning of the second life of Lamennais. He signed obedience, but the iron had entered his soul. He retired to La Chesnaie, and there watched with sinking heart a more shameful betrayal still of his Master by the Vicegerent of Christ in the final extinction of Polish nationality, crushed to death by Russia with the sympathy of Austria and before the approving eyes of Rome. Here, in one week of restless walking under the oaks, he pointed out the prophetic inspirations of his whole heart in the *Paroles d'un Croquant* (1834), a glowing poem rather than a treatise, expressed in rhythmical prose arranged in short verses like those of the Bible, under forms now parabolic, now direct, at one moment recalling the gloom of the *Inferno*, at another the tenderness of the *Imitation*. The apocalyptic empyrean is a region far above the rules of logic, and it is impossible to set forth precisely the doctrine of this strange book further than to describe it as an illusion of a perfect society, ideal, Paradiseic, governed by love, hindered awhile by the wickedness of despots, but ultimately to be effectuated by perfect liberty. The book made an extraordinary sensation; Sainte-Beuve tells us how he found the composers gathered round while one of their number read the MS. aloud, his voice trembling with emotion. To churchmen it was 'the apocalypse of Satan,' 'the *bonnet rouge* planted upon a cross.' It brought about the complete rupture of the apostle with his old associates; repulsed by the pope, he had made his appeal to the people against Rome, itself become faithless to its mission, and henceforth he belonged to the people alone. His further books, *Le Livre du Peuple*, *Une Voix de Prison*, *Du Passé et de l'Avenir du Peuple*, were but weaker echoes of his masterpiece. For one he got a year's imprisonment in Sainte Pelagie. In the revolution of 1848 he started paper after paper, and poured forth a succession of pamphlets while struggling on bravely against broken friendships, ill-health, and poverty. His piety survived the shipwreck of his faith; he had the gift of attaching friends who still loved the man whatever his opinions, and to these he poured forth his thoughts in impetuous swiftness as he paced up and down, his limbs trembling with emotion. George Sand describes his austere and majestic face, the brow an unbroken wall, furrowed between the eyebrows with those perpendicular wrinkles which, Lavater says, belong exclusively to those of high capacity who think justly and nobly—its rigid austerity ever lightened and humanised by the sudden smile of tenderness. To the last he remained a Breton even to his accent. His ideas and emotions alike ever tended towards excess and to absoluteness of conviction; his temperament was framed for suffering, and his passionate devotion to truth, the foundations of which yet slipped from under him, made his intellectual life a very martyrdom. Lamennais sat in the Constituent Assembly till the *coup d'état* ended his dreams of popular liberty. At his death, which occurred February 27, 1854, he refused to make his peace with the church, and was buried, by his own desire, without religious rites, in an unmarked grave among the poor at Pere-la-Chaise.

In his *Correspondance*, edited by M. Émile Fergues (2 vols. 1858; 3d vol., ed. by his son, M. Eugène Fergues, 1886), we see the ebb and flow of his stormy emotions for twenty years. His brother and sister kept back from

publication many of his papers, but five posthumous volumes appeared under the care of Forgnés (1855-58), of which at least one volume, that entitled *Mélanges philosophiques et littéraires*, was quite worthy of his name. M. Blaize, the nephew of Laennec, edited his *Œuvres complètes* (2 vols. 1866), mainly composed of additional letters. Amid the storms of his later life he found consolation in writing his serene and large-minded *Esquisses d'une Philosophie* (4 vols. 1840-46), perhaps the most really remarkable of all his works.

See Blaize's *Essai Biographique* (1858); Sainte-Beuve, in *Portraits Contemporains*, vol. i., and *Nouveaux Laudes*, vols. i. and xi.; Guizot, in vol. iii. of his *Mémoires*; E. Scherer, in vol. iv. of his *Études sur la Littérature Contemporaine*; Renan, in *Essais de Morale et de Critique* (1859); E. Dowden, in *Studies in Literature, 1789-1877* (1878); and Paul Janet, *La Philosophie de Linnæus* (1890).

Lamentations. BOOK OF, a canonical book of the Old Testament which, in the present arrangement of the Hebrew Bible, occupies the sixth place among the Hagiographa (between Ruth and Ecclesiastes), and bears the superscription *'Echa* ('Ah, how'; see chap. i. 1; ii. 1; iv. 1). In the Talmud and elsewhere it is called the book of *Kenoth* ('elegies' or 'dirges'), a name which reappears in the Septuagint title *Thrēnoi* (Lat. *Lamentationes* or *Lamentata*). The fuller title, *Lamentations of Jeremiah*, is found in the Syriac and in some MSS. of the Septuagint, but is not so old as the shorter form. The book consists of five dirges or laments, the first four of which are alphabetical acrostics (like Ps. cxix.); each of the five consists of twenty-two verses, except the third, which has sixty-six. In general character the first four are very similar, each beginning with a representation of the great calamity that has befallen the city and people, and then rising through the thought of Jehovah's righteousness to the hope of his just vengeance on the enemies of his people. The fifth differs from the others in that it takes the form of a prayer and is throughout pervaded by a sense of Jehovah's wrath, which is spoken of as having been long continued. The tradition, which attributes the authorship of Lamentations to Jeremiah, can be traced to a note prefixed to the Septuagint translation, where, as in the Syriac, they are now attached to the book of that prophet. Perhaps, indeed, this tradition is already implied in 2 Chron. xxxv. 25, in which case the supposed reference to Josiah must be sought in Lam. iv. 20. The internal evidence is rather against the attribution of the Book of Lamentations to the prophet. Nagelsbach, following Ewald, has shown how completely different is its style from that of Jeremiah; some of the indications that were at one time supposed to make for his authorship disappear on closer examination; and the anticipated restoration of Israel is somewhat dissimilar in the two works.

See Ewald's *Dichter des Alten Bundes*, vol. i. (2d ed. 1866), and the commentaries of Nagelsbach (1868; Eng. trans. 1871), Keil (1872; Eng. trans. 1874), and Payne Smith (in *Speaker's Commentary*).

Lametric. JULIEN OFFRAY DE, French philosopher, born at St Malo on Christmas-day 1709, studied first for the church, but subsequently went over to medicine, and was trained by Boerhaave at Leyden. He entered the French army as surgeon in 1742; but the publication in 1745 of a thorough-going materialistic work, *L'Histoire Naturelle de l'Âme, traduite de l'Anglais de Sharp* (a fictitious name), roused such a feeling of odium against him that he was compelled to seek refuge in Leyden (1746). The work was of course Lametric's own. But in Leyden the fear of persecution still dogged his footsteps: he published *L'Homme Machine* (1748), and was glad to escape a threatened arrest by accepting an invitation

from Frederick the Great of Prussia to settle in Berlin. In Germany Lametric continued his materialistic studies in *L'Homme Plante* (1748), *L'Art de Jouir* (1751), *La Volupté*, and other works. A good deal of the enmity excited against him was occasioned by cynical and satirical books which he published against the medical men, including such great authorities as Boerhaave, Linnæus, Astruc, Winslow, &c. Lametric died at Berlin on 11th November 1751. Frederick himself wrote a memoir, which he caused to be prefixed to the philosophical works of Lametric (2 vols. 1774). The best account of Lametric is in Lange's *History of Materialism* (1878-81). See also the study by Quépat (Paris, 1873), and that by Du Bois-Reymond (Berlin, 1875).

Lamia. DEMONOLOGY.

Laminaria. See SEAWEEDS.

Lamination. THE ARRANGEMENT of rocks in thin layers or laminae, the condition of a large proportion of the earth's strata. Shale deposits exhibit this structure very plainly, being frequently easily separable into the thin laminae in which they were originally deposited. Shale is the fine sediment that settles down at the bottom of some tranquil or slightly-moving water. The laminae indicate interruption in the supply of the materials, which may have been occasioned by successive tides, by frequent or periodical floods, or by the carrying medium having access to a supply of different material, passing, e.g., from mud to sand, and back again to mud. The laminae of the brick-clay deposits are separated, in many places, by the finest sprinkling of sand, which is almost invisible in the vertical sections. The layers are occasionally obvious, from their being of different shades of colour, often produced by the bleaching of the layers when they were deposited; but frequently the various laminae of a bed are so united, and the bed so homogeneous, that except when the face is exposed to weathering, the laminated structure is not visible. This condition seems to have resulted from the shortness of the interruptions in the deposit not permitting the solidification of any of the layers until all was deposited, when the whole set cohered together as a single bed.

Lammass-day. THE 1st of August, is one of the cross-quarter-days, or half-quarter days, in England. On this day, which is the feast of St Peter ad Vincula, it was customary in early times to make offerings of the first-fruits of the harvest, and hence the feast took the name of *Iluf-masse* (lit. 'loaf-mass'), afterwards corrupted into Lammass. In Scotland it was an ancient practice with farmers to pay the half-year's rent due at Whitsunday on Lammass-day.

Lämmergeier (*Gypactus barbatus*), a large bird of prey, also called the Bearded Vulture or Bearded Griffin. The full-grown bird is of a shining brownish-black colour on the upper parts, with a white stripe along the shaft of each feather; the head is whitish, with black stripes at the eyes; the neck and under-part of the body are rusty yellow. It is the largest bird of prey in the Old World, measuring almost 4 feet high when sitting, nearly 5 feet in length, and from 9 to 10 feet in expanse of wing. Though by no means brave, it is bold and rapacious, swooping down on hares, lambs, young goats, chamois, &c., and sometimes, it is said, on infants. But as the feet and claws are comparatively weak, only young and light animals are lifted, and it is very difficult to believe the circumstantial tales of their carrying children. The usual food consists of animals newly killed, but carrion and even offal are not despised. Once common in the Alps, it is now very rare, but occurs not infrequently in Sardinia, the Pyrenees, North Africa,

mountains, and the Himalayas, where it often soars high above the loftiest peaks. The lammergeier

Lammergeier (*Gypaëtus barbatus*).

is said by some to be the original of the fabulous 'roc.'

Lammermoors, a broad range of moorish hills in Haddington and Berwick shires, extending east-north-eastward from the vale of Gala Water to the German Ocean at St Abb's Head, and culminating in Lammer Law (1733 feet).

Lamorièrièrè, CHRISTOPHE LEON LOUIS JUCHAULT DE, a French general, was born at Nantes, 6th February 1806, entered the army as an engineer in 1826, and saw active service in Algeria, taking part in nearly all the military events which occurred in that country between 1833 and 1847. It was through his energy chiefly that the war against Abd-el-Kader was brought to a successful end by the capture of that chief in 1847. In June 1848 Lamorièrièrè commanded the attack on the barricades in Paris, and quelled the anarchic tumults of the Socialists. He was war-minister during the government of Cavaignac; but was arrested on the occasion of the *coup d'état* of 2d December 1851, and banished from France. When the Italian war of independence threatened the safety of the pope, Lamorièrièrè proceeded to Rome in 1860, and was appointed by Pius IX. commander of the papal troops. He was, however, defeated at Castellidardo by the Sardinian general, Cialdini, on 18th September, and on the 29th capitulated at Ancona. He died near Amiens on 10th September 1865. See Lives by Keller (2 vols. Paris, 1873; new ed. 1891) and Rastoul (1894).

La Motte Fouqué. See FOUQUÉ.

Lampblack is the soot or amorphous carbon obtained by burning bodies rich in that element, such as resin, petroleum, and tar, or some of the cheap oily products obtained from it. The supply of air is limited or controlled so as to produce a smoky flame, and the smoke passes into a chamber with some arrangement for receiving the abundant deposit of soot. For some of the finer qualities of lampblack this soot or carbon is purified by heating it in closed vessels. A large quantity of lampblack has been made in the United States by the imperfect combustion of natural gas. Lampblack is a useful pigment for artists both in oil and water colour, a coarser kind being employed by house-painters. It is the chief ingredient in Indian Ink

(q.v.), and along with boiled linseed oil forms printing-ink. Of it is formed the pigment for the carbon paper used in the Autotype Process (q.v.). Lampblack is also employed in the preparation of some kinds of leather, and for other purposes.

Lampedusa, a small island of the Mediterranean, 150 miles S. of Sicily, and 80 E. of Tunis. Belonging physically to the African continent, it has since 1863 been administratively reckoned part of the Sicilian commune of Licata. It has 19 miles of coast, and a small harbour. Fruits are grown, and some grain. Pop. 1074.

Lampeter, a market-town of Cardiganshire, 27 miles by rail NNE. of Carmarthen. It is the seat of St David's Theological College (1827), which has the power to grant B.A. and B.D. degrees. Pop. 1443.

Lamprey (*Petromyzon*), a genus of round-mouths (Cyclostomata, q.v.), nearly allied to the Hag (q.v.), and like it differing markedly from true fishes in the absence of jaws, paired fins, and scales, and in the presence of peculiar gill-pouches. An eel-like form, a slimy skin, a gristly skeleton, a primitive brain imperfectly roofed in, a single median nostril, a suctorial mouth with numerous horny teeth on the lips and on the large piston-like tongue, seven pairs of gill-pouches (whence the German name *neun-augig*, 'nine-eyes') opening by as many apertures to the exterior, and connected internally with a tube lying beneath and communicating with the adult gullet and the striking differences between young and mature forms are among the less technical characteristics. They differ from hag in the development of a dorsal fin, in the fact that the nasal passage ends blindly without opening into the pharynx, and in several peculiarities of the respiratory and other systems. Along with *Petromyzon*, there are several genera—e.g. *Mordacia* and *Geotria* from the coasts of Chili and Australia—differing only in detail. Lampreys occur both in the rivers and seas of the north and south temperate regions, and at least some of the marine forms spawn and pass part of their long larval life far up rivers. They seem to represent an ancient race, more primitive than fishes, and, though their gristly skeletons are unknown as fossils, certain structures called 'conodonts' from very early strata are identified by some as lamprey teeth.

The habits of lampreys are in many ways curious. Thus, though they will eat worms, larvae, small crustaceans, and dead animals, they have also learned the audaciously aggressive habit of fixing themselves to fishes, and scraping holes in the skin. The mouth sticks like a vacuum sucker, the toothed tongue works like a piston, and both flesh and blood are thus obtained by a sort of parasitism which reminds one at once of leech and hagfish. When engaged in sucking they are carried about by their victims, and salmon have been captured in the middle course of the Rhine with the marine lamprey attached to them (Günther). As the name *Petromyzon* suggests, they also attach themselves, as if to rest, to stones in the bed of the stream, or it may be even to the bottom of boats. Some species are able to move stones of considerable size to form nests, and their grip is so firm that it is occasionally difficult to detach them from their hold. When the mouth is occupied in its suctorial work, water passes in as well as out by the respiratory apertures. The spawning occurs in spring, usually far up rivers, and according to some the mature forms die after reproduction. From the small eggs young develop which live wallowing in the sand or mud of the streams, and feed on minute animals. They are so different from the parents that in the case of the small lamprey (*P. branchiatus*) they were for long

referred to a distinct genus *Ammocetes*. The head is small, the upper lip semi-circular, the lower lip small and separate, the mouth toothless and not suctorial, the eyes rudimentary and hidden, the future gullet (as distinguished from the above-mentioned respiratory tube) not yet developed, and so on. There is in fact a metamorphosis in the history of the lamprey, as was discovered 200

Lamprey (*Petromyzon marinus*).

years ago by a Strasburg fisherman Baldner, but overlooked till August Muller worked out the curious story in 1856. In the small river lampern—and analogous facts are probably true for the others—the change to the adult form is frequently postponed until the August of the fourth or fifth year, when it completes itself rapidly.

There are three British species—the sea-lamprey (*P. marinus*), over 3 feet in length, mottled greenish brown; the river lampern (*P. fluviatilis*), nearly 2 feet, dark bluish with silvery sides; the sandpiper, pride, stone-grig, or small lampern (*P. branchialis* or *planeri*), hardly one foot in length, like the preceding species in colour. The marine and river lampreys, though despised in Scotland, have been esteemed as good eating since Roman times, being especially palatable in pies and potted preserves. They are caught in baited baskets or traps, and their eel-like tenacity of life makes them useful bait stores.

Lamps are contrivances in which to utilise the illuminating power of fluid light-giving material. The most primitive lamps were probably skulls of animals, or certain kinds of sea-shells. The principle of these natural lamps was long retained in the ancient earthenware and metal lamps of Egypt, Greece, and Rome, and in the stone cups and boxes of northern nations. Such lamps were called *Lycbna* by the Greeks, and *Lucerna* by the Romans. Specimens obtained from the excavations of the ruins of Tarsus, Pompeii, and Herculaneum, and from other sources, show that they were made in considerable variety. A very primitive form of lamp, called a 'crucis,' was in use in Scotland until mineral oils were introduced by James Young about 1850. Animal fats and fish oils were the principal substances used in all parts of the world for burning in lamps till vegetable oils were introduced, viz. colza or rape, and other seed oils and nut oils of various kinds. The vegetable oils, being more limpid in character, admitted of improved and more complex means of burning them. Progress in this direction began in France with Leger, who in 1783 adopted flat ribbon wicks in place of the old round, thick, and smoky wick. He was followed in 1784 by Aimé Argand (q.v.), who introduced round cylindrical burners; and round burners, whether for oil or gas, are still known by his name as Argand burners.

In the use of fatty oils, the ordinary capillary attraction of the wick was insufficient to maintain a uniform flow of oil to the flame, and various con-

trivances were used to keep the oil as nearly as possible at one level. In 1803 M. Carcel introduced an excellent mechanical method of forcing the oil up by means of clockwork. This lamp, however, was too easily disarranged, and too expensive to come into general use. It was not till 1836 that Franchot invented his lamp, known as the 'French Moderator.' The main features of this lamp are a cylinder or oil-container with a tubular piston resting on the surface of the oil. This piston, being acted upon by a spiral spring placed between it and the top of the cylinder, forces the oil up through the piston and so maintains a constant supply of oil to the flame. The spring was wound up by rack and pinion. The unequal tension of such a spring, and the correspondingly unequal flow of oil, was counteracted (or 'moderated'—hence the name of the lamp) by placing a tapering iron rod in the ascending tube. This lamp was simple and effective, and soon supplanted all other mechanical arrangements for controlling the flow of oil to the burner; and it is the lamp still used by the few people who burn colza or rape oil in preference to mineral oils.

Mineral oils are known under various names, such as paraffin, petroleum, kerosene, crystal oils, &c., for the lighter sorts; and for the heavier or specially high list kinds such names as mineral sperm or mineral colza are used. These oils, being much more limpid and volatile than the fatty oils, rise freely in lamps by the ordinary suction of the wicks, and, being rich in carbon, a plentiful supply of oxygen is absolutely necessary to perfect combustion. The main problem, therefore, to be solved in the construction of a good paraffin or petroleum lamp was to secure a current of air powerful enough to consume the carbon contained in the oil, and so prevent its passing off in the form of smoke.

Previous to the introduction of mineral oils, camphine, which is a volatile hydrocarbon spirit distilled from turpentine, was burned in Young's 'Vesta' lamp, introduced in 1834. His lamp was constructed on the round or Argand principle, with a button or deflector over the central air tube, and a constricted chimney. The leading features of this lamp have been followed in many of the later developments of mineral oil lamps with circular wicks. But the common flat wick paraffin lamps now so familiar to every one were first made by Stobwasser in Berlin, and introduced into Great Britain in 1854. Since then the manufacture of paraffin lamps has grown to be an industry of great importance, and is carried on largely in England, Germany, and the United States. The number of patents in all these countries for paraffin or kerosene lamps has been enormous, but most of them refer simply to slight modifications of existing types. We cannot do more here than mention some of the chief improvements effected.

Mineral oil lamps are made with flat wicks and with circular wicks. The circular or Argand form of lamp has been generally adopted in continental countries. The body of the lamp or oil container is made of glassware or metal, mounted on a pedestal. The outward casing of the burner is made of brass perforated for the admission of air. In the centre of the burner the wick-tube or holder is inserted. Over the wick tube in flat wick burners a metal dome is placed to deflect the air into the flame. Across the dome there is a slit or oblong opening for the flame to pass through, and a chimney 8 or 10 inches high, resting on a gallery at the base of the dome, creates the current of air necessary to perfect combustion of the oil.

Flat-wick burners have the advantage of being more easily trimmed and the flame more easily controlled than round burners. They admit also

of a better supply of oxygen to all parts of the flame than has been possible with ordinary round burners, and are in consequence less liable to smoke. The most successful lamp developments in Great Britain have therefore hitherto been in flat-wick burners. In 1865 Messrs Hinks of Birmingham introduced the Duplex lamp, with two parallel wicks and two openings in the dome, producing two flames. This form of lamp rapidly became very popular, and still deservedly continues so. In 1874 Captain Doty patented his Triplex lamp, with three flat wicks arranged in the form of a triangle, open at each corner, so that an abundance of air circulates freely all round each of the three wick-tubes. There are three openings in the dome, and three flames which distribute the light nearly equally in all directions; and this no other flat-wick burner does. This is a powerful burner; it has little tendency to smoke, and is easily managed.

The great difficulty with round-wick burners has been to procure a sufficient supply of oxygen to the inside circumference of the flame, so that they are very liable to smoke after burning for a short time. To obviate this very serious objection a round burner was introduced, with a circular air-channel passing up from the base of the lamp through the reservoir and through the burner, which supplied a cool current of air to the inner side of the circular flame. This lamp of necessity was made of metal, and, having a metal tube passing from the burner down through the oil-container, was thus liable to raise unduly the temperature of the oil, and was considered too unsafe for general use. In 1885, however, Messrs Defries introduced an improved lamp of this type, with a thin metal casing enclosing the portion of the wick inside the oil reservoir, and open only at the bottom, so that no oil or oil vapour can escape from the lamp except by passing up through the wick from the bottom of the reservoir. By this means the Defries lamp becomes a perfectly safe lamp for domestic use. But it is still not free from the drawback which attaches to all circular burners—viz. the difficulty in ordinary domestic use of trimming the wick quite level all round.

A still later advance in lamps for burning mineral oils economically is a lamp patented by Messrs Ross & Atkins, which applies to oil illumination the regenerative inverted Argand principle so successfully employed by Siemens in gas-lighting. The mechanical difficulties of producing an inverted shadowless flame with oil are obviously very much greater than with gas; but these difficulties have been successfully overcome in this lamp, now introduced to the public by the Wanzer Company, under the name of the Down-flame Shadowless Lamp. The essential features are an annular reservoir, with three converging flat wicks, which unite to form a circular flame; a glass cup underneath the flame; and a compound chimney above. The flame curves inwards, and the products of combustion passing up through the centre of the burner heat the fresh air on its passage through the burner to the flame. It is doubtless this feature which gives to this lamp its greater economy in the consumption of oil, considering the intensity of light produced.

Mineral oils are now extensively used for heating and cooking, and the burners employed for these purposes are generally adaptations of the flat wick type. Captain Doty in 1868 patented a lighthouse lamp for burning mineral oils, and this method of lighting has since been adopted by all the important lighthouse services of the world, with much advantage to the mariner, and great economy as compared with the use of rape or colza oil (see LIGHT-HOUSE). These lamps consist of one or more

concentric wicks, and are capable of producing a very powerful light; one by Sir James Douglass, engineer to the corporation of the Trinity House, has eight concentric wicks, and produces a flame whose intensity is equal to 1400 candles.

COMPARATIVE TABLE.

Type of Lamp.	Candle power.	Consumption of oil per hour, in grains.	Consumption of oil per hour per candle power, in grains.
1-in. flat-wick burner.....	134	650	48
Duplex " " ".....	25	1250	50
Triplex " " ".....	39	1750	45
Defries' circular burner, 11-in. diameter.....	49	2290	47
Wanzer down-flame burner, 2½-in. diameter.....	90	3050	34

To burn mineral oils successfully both theory and experience teach the absolute necessity of keeping all parts of the burner perfectly clean, so that the ingress of air to the flame may not be lessened or impeded by deposits of carbonised wick, which accumulate unless removed from time to time when lamps are in use, and which moreover become a source of danger from their liability to ignite. Long experience has also shown that a most fruitful source of annoyance in burning these oils arises from the presence of water or moisture in the oil or in the lamp. The greatest care should therefore be taken to keep the oil and the lamps perfectly free from water, and new wicks should be carefully dried before being inserted in the burner. See also SAFETY-LAMP, LUCIFER.

Lamp-shell (*Terbratulida*), a genus of brachiopods, or a popular name for the whole class. See BRACHIOPODS.

Lampyris. See GLOW-WORM.

Lanark, the county town of Lanarkshire, on a slope near the right bank of the Clyde (q.v.), 33 miles by rail SW. of Edinburgh, and 31 SE. of Glasgow. It has an interesting ruined church, a large Catholic chapel (1859), the county buildings (1836), a good racecourse, memories of Wallace, and some weaving and other industries. A royal burgh since the 12th century, it unites with Falkirk, &c. to return a member to parliament. Pop. (1851) 5008; (1891) 4579.—NEW LANARK, 1½ mile S. by W., is a manufacturing village, founded in 1783 by David Dale, and for twenty-eight years the scene of the social experiments of his son-in-law, Robert Owen. Pop. (1831) 1901; (1891) 672.

Lanarkshire, or CLYDESDALE, a Scottish county, enclosed by Stirling, Dumbarton, Linlithgow, Edinburgh, Peebles, Dumfries, Ayr, and Renfrew shires. Its length is 50 miles, its greatest breadth 32 miles, and its area 889 sq. m. Drained almost entirely by the Clyde (q.v.) and its numerous affluents, Lanarkshire is subdivided into three wards, of which the upper or southern comprises 332,338 acres, the middle 194,211, and the lower 42,319. These offer a striking diversity of aspect—lonely uplands, smiling orchards, busy coalfields and manufacturing district. The principal hills are Green Lowther (2402 feet) and far seen Tinto (2335); whilst the mining village of Leadhills (1300 feet) is the highest in Scotland. The predominant rocks are Silurian, old red sandstone, and carboniferous, and the county possesses great mineral wealth—coal, ironstone, fireclay, shale, and lead, with some silver and even gold. The coal alone in the Lanarkshire coalfield is estimated to exceed 2000 million tons. The soil is as various as the scenery; and barely one-half of the whole area is in cultivation, whilst in 1888 89 woods occupied 20,148 acres, orchards 591, and market gardens 1313. The orchards of Clydesdale were famous as early as the time of Bede, and yielded into the 19th century £8000 per annum; but now the ground is more profitably employed in producing straw-

berries, gooseberries, vegetables, &c. for the Glasgow market. The climate is moist, mild and genial in many of the lower districts, but often cold and boisterous on the uplands. Lanarkshire is not a great grain county; but much of it is excellently adapted for the rearing of stock and for dairy purposes. The sheep are Cheviots and black-faced, the cattle Ayrshires; and the celebrated Clydesdale cart-horses issue from a Flemish cross (about 1720). The mineral, textile, and other industries are very extensive, and are noticed under the towns—Glasgow, Rutherglen, Lanark, Hamilton, Airdrie, Coatbridge, Motherwell, Wishaw, &c. Besides pre-historic and Roman remains, Lanarkshire contains the castles of Bothwell, Douglas, and Craignethan (Scott's 'Tillicoultry'), the priories of Blantyre and Lesmahagow, and the battlefields of Langside, Drumclog, and Bothwell Brig. Among its worthies have been Joanna Baillie, Dr John Brown, Sir Colin Campbell, Thomas Campbell, Lord Dundonald, David Livingstone, and Sir John Moore. Though only the twelfth in size, Lanarkshire is far the most populous and wealthy of all the thirty-three Scottish counties. Valuation (1875) £1,714,183; (1890) £2,226,352. Pop. (1801) 147,692; (1841) 426,972; (1881) 904,412; (1891) 1,105,899—an increase due largely to the transference hither of the portions of Glasgow formerly in Renfrewshire.

See works by Hamilton of Wishaw (1831), Irving and Murray (1861-64), and others cited at GLASGOW, CLYDE, COATBRIDGE, BIGGAR, &c.

Lancashire is a county palatine of England, ranking sixth in point of area, first in population, and first in return of revenue from all sources. It forms the north-western division of England, stretching along the shore of the Irish Sea from the river Duddon and the mountains of Cumberland on the north to the river Mersey on the south. It is bounded on the E. by Yorkshire, on the W. by the Irish Sea, on the N. by Cumberland and Westmorland, and on the S. by Cheshire. The extreme length from N. to S. (including the hundred of Furness) is 75 miles, and the greatest breadth at the south end 43, and at the north end 10 miles. The circumference is 240 miles, and the area 1905 sq. m., or 1,219,221 statute acres. Pop. (1801) 673,486; (1821) 1,052,948; (1841) 1,667,054; (1861) 2,429,440; (1881) 3,454,441; (1891) 3,926,760. The ratable value increased from £10,029,967 in 1868 to £18,623,910 in 1890.

The coast is level, free from rocks, and has numerous estuaries stretching far into the mainland. Its ports are the only ones accessible to large vessels between Milford Haven, in South Wales, and the estuary of the Clyde. This, with the ease with which the coast is approached from the interior, has made the county the principal outlet for the commerce of the country in a westerly direction, one-third of the whole foreign trade of Great Britain being carried on from its ports. The chief rivers are the Mersey, Ribbles, Lune, Wyre, Kent, Leven, and Duddon. The rainfall in Lancashire is sometimes twice as great as on the east coast; the climate is mild. The lofty hills on the east shelter it from the land winds, while the prevailing winds, those from the south and west, are rendered mild from the effect of the Gulf Stream. This humidity of climate is said to contribute to the superiority of the finer kinds of cotton threads manufactured in Lancashire. An outlying portion of the county, called Furness, 25 miles long by about 20 wide, is separated from the main portion by Morecambe Bay, and seems as if it properly ought to belong to the Lake District. Coniston, Esthwaite, and Windermere lakes lie within the borders. The highest point here is 'Coniston Old Man' 'alt man,' or the 'high rock' 2633 feet above the sea. The larger division

is intersected in the north and east by branches of the hill-system which runs southward through the counties of York and Derby, the chief eminences being Pendle Hill (1831 feet), Bleasdale Moor (1709), Bondswood Hill (1689), and Rivington Moor (1545). The soil is peaty in the upland districts, but for the most part a fertile loam in the flats. Oats and potatoes are general crops; wheat grows well in the southern division. Coal is the chief mineral product, the coalfield being estimated at 217 sq. m. in extent. The latest estimate of the quantity raised in one year amounted to 19,120,000 tons. Limestone and iron are common in the north. Lead, copper, sulphur, and fireclay are also found. The whole surface of the county is covered with a network of canals and railways which connect the principal manufacturing and commercial centres (see MANCHESTER, LIVERPOOL, PRESTON, BLACKBURN, &c.). Lancashire is the great centre of the cotton manufacture of the world, having about two-thirds of the entire trade (see COTTON). The other textile manufactures, such as woollens, silk, carpets, are likewise of considerable importance. It is pre-eminent in the manufacture of engineers' tools; and the making of all kinds of iron and steel machinery is extensively carried on. Shipbuilding, sailmaking, the manufacture of boots and shoes, hosiery, and kindred trades are also in a flourishing condition. The county returns, since 1885, twenty-three members to parliament (formerly eight), besides those for the boroughs. The phrase, 'Lancashire Witches,' which is now used as an expression of admiration for the young maidens of the county, arose from the prevalence of the crime of witchcraft in Lancashire in the reign of James I. So many as twenty witches were tried and executed at the Lancaster Assizes of 1612. Twelve of these were the witches of 'Pendle Forest,' and eight belonged to the witches of 'Samblesbury.' A few years previously, Ferdinand, fifth Earl of Derby, was supposed to have been murdered by witchcraft. At the time of the Reformation the Roman Catholic party was extremely strong in Lancashire, and religious houses of great wealth and influence existed in every district, twenty-two being suppressed by order of King Henry VIII.; this included the abbeys of Furness and Whalley (see FURNESS). An unusually large proportion of the land-owners still adhered in the reign of James I. to their old faith, and in 1604 six priests were tried at the Lancaster Assizes and executed. Those connected with the Gunpowder Plot expected to rouse the Catholics of Lancashire, but entirely failed to do so. The whole of the district was continually unsettled and full of discontented recusants, some of them of Roman Catholic and others of Puritan opinions. The people of Lancashire have long been noted for their love of music and natural history, there being amongst them many working-men who are botanists and entomologists of repute; while their politics and opinions have had such influence in the country that the proverb has arisen that 'What Lancashire thinks to-day England says to-morrow.' Amongst eminent names connected with Lancashire are those of Mrs Gaskell, Mrs G. L. Banks, Miss Martineau; of Roscoe, De Quincey, Sir Robert Peel, Horrocks, Dalton, Hodgkinson, Joule, Greg, Bamford (the weaver poet, 1788-1872), William Henry the chemist, Sir W. Fairbairn, Sir J. Whitworth, James Martineau, Gladstone; and names connected with the success of the cotton trade, as John Kay (inventor of the fly-shuttle), Crompton, Arkwright, Hargreaves. The Lancashire dialect, renowned for terseness and vigour, is illustrated in works by J. Collier ('Tim Bobbin'), Ben Brierley, Edwin Waugh. See maps at MANCHESTER and at LAKE DISTRICT.

See Baines, *Lancashire* (1836; new ed. by Croston, 1888); Espinasse, *Lancashire Worthies* (1873-77); Nodal and Milner, *Dialects* (1882); and works by Bunterworth (1841), Grimdon (1866, 1882, 1892), Axon (1883).

Lancaster, the capital of Lancashire, is picturesquely situated on an eminence on the left bank of the Lune, 7 miles from its mouth, 51 $\frac{1}{2}$ N.W. of Manchester and 231 N.W. of London by rail. The ancient castle, which overlooks the town, was built on the site of a Roman castle, and was restored by John of Gaunt. 'Time honoured Lancaster;' it is now used as the county gaol. The church of St Mary (15th century) contains some good oak-carvings and stained glass. The Ripley Hospital is an asylum for orphan children. The houses are built of the freestone quarried in the vicinity. The Lune is here crossed by a bridge of five arches, erected in 1788, and by an aqueduct carrying the Lancaster Canal across the river. Owing to the sanding of the Lune, large vessels have to unload at Glasson, 5 miles distant. The chief manufactures are furniture, cotton, silk, oil-cloth, table covers, machinery, and railway plant. A public park was presented in 1881. Sir R. Owen, the anatomist, and Dr Whewell were born at Lancaster. In 1698 the town was nearly burned to the ground. A very ancient municipal borough, it returned two members to parliament from 1547 to 1867, when it was disfranchised for corrupt practices at elections. Pop. (1881) 20,663; (1891) 31,038. See works by Hall (1843) and Simpson (1852).

Lancaster, (1) capital of Fairfield county, Ohio, on the Hocking River and Canal, 32 miles S.E. of Columbus, with machine-works and railway shops. Pop. (1890) 7555.—(2) Capital of Lancaster county, Pennsylvania, 69 miles by rail W. of Philadelphia. Besides a large court-house and numerous churches, it contains the Franklin and Marshall (German Reformed) College, and a theological seminary of the same body. There are large cotton-mills, and tanneries, breweries, potteries, and a number of other manufactures; and extensive warehouses for tobacco have been built. Founded in 1730, Lancaster was the capital of the state from 1799 to 1812. Pop. (1870) 20,233; (1890) 32,011.

Lancaster, DUCHY OF, was created in the reign of Edward III, the dignity of county palatine being at the same time conferred upon the duke. The heiress marrying John of Gaunt, son of the king, the duchy was settled upon him and his heirs for ever by royal charter in 1362. Henry IV., third Duke of Lancaster, on his accession to the throne, passed a law in which it was provided that the inheritance of the house of Lancaster should be held by him and his family separate from the crown-lands. Edward IV., in 1461 ordained, with the consent of parliament, that the duchy of Lancaster should be annexed to the crown, but 'held separately from all other hereditaments.' This arrangement has continued until the present time, and the affairs of the duchy have thus enjoyed an independent administration, and formed no part of those hereditary revenues in view of which the Civil List was granted. The revenues of the duchy have increased from £29,000 in 1847 to £86,284 net at the end of 1888, the payment to Her Majesty at these two periods being respectively £12,000 and £50,000 sterling. These proceeds are wholly exempted from parliamentary control, except that the annual account for receipt and expenditure is presented to parliament. The chancery of the duchy of Lancaster is still a crown-office, and was at one time a court of appeal for chancery of the county palatine, but is now merely nominal. The administration of justice has since 1873 been assimilated to that of the rest of

England. The office of chancellor is a political appointment; it is the practice to confer it on a statesman of eminence, frequently a member of the cabinet, who is expected to devote his time to such larger questions occupying the attention of government as do not fall within other departments. The emoluments of the office are about £2000 a year. For the House of Lancaster, see HENRY IV., V., VI.; and ENGLAND, Vol. IV, p. 351.

Lancaster, SIR JAMES, an English navigator who commanded the first fleet of the East India Company that visited the East Indies in 1600-3, and on his return home was knighted. He had previously been a soldier and a merchant in Portugal, had visited the East Indies on his own account in 1591-94, and in 1595 had captured Pernambuco in Brazil. He was one of the original board of directors, and afterwards did much to promote the voyages of Waymouth, Hudson, and Balbin in search of the North-west Passage to India. The strait leading westwards from the north of Balbin Bay was in 1616 named Lancaster Sound by Balbin. Lancaster died in May 1618. See Sir Clements R. Markham's *Voyages of Sir James Lancaster* (Hakluyt Soc. 1877).

Lancaster, JOSEPH (1778-1838). See BELL (ANDREW), EDUCATION.

Lancaster Gun, a species of rifled cannon, named after its inventor, which had a bore of oval section. It failed during the Crimean war, and was superseded.

Lancaster Sound, a western outlet of Balbin Bay, in 74° 20' N. lat., connected with Boothia Gulf on the south by means of Prince Regent Inlet. Though this opening into the Arctic Ocean was discovered by Balbin in 1616, it was first navigated by Parry in 1819.

Lance, GEORGE, painter of fruit and still-life, was born at Little Easton, near Dunmow, in Essex, on 24th March 1802. He studied under Haydon, but discovered that his strength lay in painting fruit, game, and similar subjects. Specimens from his brush in this line were exhibited year after year at the Royal Academy and British Institution. His admission that he had 'restored' parts of Velazquez's 'Boar Hunt' caused a stir of controversy in 1853. Lance died at Sunnyside, near Birkenhead, on 18th June 1864.

Lancelet. See AMPHIOXUS.

Lancers, a branch of Cavalry (q.v.) introduced into the British service in 1816.

Lancet-window. See EARLY ENGLISH.

Lancewood, a wood valuable for its great strength and elasticity. It is produced by the small tree *Gualteria cecata* (natural order Anonaceae). Another species, *G. laurifolia*, yields the wood called White Lancewood, which, however, is not much used. Lancewood is of great value to coach-builders, by whom it is used for shafts and carriage-poles, for which it is especially fitted. The part used is the main trunk of the tree, which is very straight, and rarely more than 9 inches in diameter with the bark on. It comes in small quantities from the West Indies, chiefly from Jamaica.

Lancing College, or ST NICHOLAS COLLEGE, a well-known boys' school, conducted on High Church principles, and situated at Lancing, 8 miles W. of Brighton, on the south coast of England. Founded in 1848, it has branches at Shoreham, Hurstpierpoint, and Ardingly, all like Lancing, in Sussex.

Land. See EARTH, GEOLOGY, LITHOLOGY, WATER; also LAND LAWS, AGRICULTURE, SOILS.

Landau. See CARRIAGE.

Landau, a town of the Bavarian Palatinate, 11 miles W. of the Rhine and 17 SW. of Spire. Founded and made an imperial city in the 13th century, it has some interesting old churches, and played a prominent part in history as a fortress. During the Thirty Years' War it was taken eight times; in 1688 it was fortified by Vauban for Louis XIV., but surrendered four times during the war of the Austrian succession. In 1816 Bavaria became mistress of it; and in 1870-71 its fortifications were levelled to the ground. Pop. 11,395.—Landau, another town of Bavaria on the Isar, 72 miles NE. of Munich, has 3165 inhabitants.

Laudaur, a sanitary station in British India, in Dehra Dun district, North-west Provinces, forming part of the town of Mussooree (or Masuri; pop. 3106). It is on the slope of the Himalayas, 7459 feet above the sea.

Land-crab. See CRAB.

Lander, RICHARD, the discoverer of the mouth of the Niger, was born at Turro on 8th February 1804, and in 1825 accompanied Clapperton as his servant to Sokoto. There Clapperton died, and Lander, returning to England, published an account of the expedition. The British government then entrusted to him and his brother John (1807-39) the prosecution of further researches along the lower course of the Niger. In 1830 they proved that the Quorra, or Niger, falls by many mouths into the Bight of Benin. They published a *Journal of an Expedition to Explore the Niger* (3 vols. 1832). In the course of a third expedition in the same quarter, Richard Lander was wounded by the Niger natives, and died in consequence at Fernando Po on 2d or 7th Feb. 1834. The story of this third journey is contained in Laird and Oldfield's *Narrative of an Expedition into the Interior of Africa by the River Niger* (2 vols. 1837).

Landerneau, a small seaport of France, stands at the head of the harbour of Brest, 12 miles by rail NE. of Brest; it has linen manufactures, tanneries, candle-works, and shipbuilding. Pop. 8903.

Landes, a maritime department of southern France, one of the largest and most thinly peopled in the country, is bounded on the W. by the Bay of Biscay. Area, 3598 sq. m.; pop. (1876) 303,508; (1891) 297,842. The chief river is the Adour (navigable). The greater portion of the department consists of the *landes*, tracts of barren sand, interspersed with marshes and forests of pine and oak and cork, forming one of the dreariest regions in Europe. The inhabitants are mostly of Gascon race, small and the reverse of robust in appearance, yet capable of great endurance. They herd sheep (no longer requiring to traverse the marshes on stilts), grow wine, and extract the products of the forests (timber, resin, cork, charcoal, &c.). Fowling and fishing also yield good returns. The Bayonne hams are obtained from pigs bred and fed in the *landes*. Besides wine, the soil is made to yield rye, maize, wheat, &c., especially in the hilly district called Chalosse, to the south of the Adour. By means of draining operations and the planting (since 1787) of forest trees rapid progress has been made in the reclamation of the soil and its cultivation. Although it has a coast-line of 75 miles long, the department does not possess a single harbour. A belt of sand dunes, 2½ miles wide and reaching 300 feet in height, fringes the sea-shore from north to south. About 20,000 tons of iron ore are smelted annually. The mineral springs of Dax were known to the Romans. The railway from Bordeaux to Bayonne passes through the district from north to south. The department is divided into three *arrondissements*, Mont-de-Marsan, St Sever, and Dax. Capital, Mont-de-Marsan. See FRANCE, Vol. IV, p. 774.

Landgrave, a title of superior distinction borne by certain counts (*graf*)—e.g. of Thuringia and Hesse—in the former German empire. They were the constitutional successors of the old rulers (counts, *grafe*) of the original counties (*graue*) of the German empire, and as such claimed the rank of princes (of the first class) of the empire.

Landguard Fort. See HARWICH.

Land Laws. Land being the universal and necessary basis of existence of the human race, it has in all countries been deemed to be subject to rules of use and possession established by the community. Of these rules in the earliest stages of society we have no written record, for they were in force before writing was invented. But we are able to trace their probable origin and first development partly from tradition, partly from customs which survive in later periods, and partly from investigation of the systems in force in rude nations when they first come within the view of competent observers. The formation of rules begins when civilisation or population has advanced so far as to render the regulation of conflicting rights desirable. Prior to that time the only law was that of the strongest: each man or each tribe occupied what he or it could conquer, and so much as it was within the power of either to defend from hostile aggression. Hunting, and afterwards pasturage, were the only uses to which land was then devoted. But as the tribes grew in numbers, and a nomad life became fatiguing, or inadequate to supply the means of existence, incipient agriculture led to the establishment of settlements more or less permanent. It is at this stage that we begin to meet with the recognition of rules for the regulation of culture and possession. The Roman writers, who examined with marked interest the contemporary institutions of their German enemies, show us one of the earliest stages of settled life. The wealth of the tribe lay still in herds of cattle, but a portion of the land around the villages was cultivated. This land was annually allotted to heads of families, and was changed in rotation from one to another, so as to ensure equality. Such arrangements survive in Europe to the present day. In Servia and some of the adjacent principalities the family property is still held in some degree in common, and every member of the household is considered to have a right to reside in the family dwelling, and to share in the produce of the family fields. The Russian *mir*, or village, preserves similar characteristics. It is a community recognised by the state as joint-proprietor of the village lands, and jointly responsible for the taxes. The lands themselves, with their apportionment of taxes, are allotted by the community among its several families. Where the land is poor the division is seldom changed, but where it is rich a fresh arrangement is made at frequent intervals or even every year. This village system prevails also in India, though there the division has become permanent. In Great Britain, as will be seen hereafter, its existence was unquestionable, and traces of it survive even at the present day in the customs and nomenclature of numerous districts.

Such rudimentary systems are, however, from their own nature destined to extinction as population increases. The family grows into the village, but the village finds its bounds restricted more and more by the pressure of neighbours, while every year the number of mouths to be fed within its limited space becomes larger. Thus more labour and more manure must be given to the soil to extract from it increased return, and the individual who has made his allotment more fertile than his neighbour's does not willingly exchange it for one which has been comparatively neglected. If he

has either power or influence, which probably his natural energy will procure for him, he insists on retaining his own plot, and on handing it on to his own family. As all who are in the like position will make a like claim, it easily becomes established as a right, and the more that labour is employed on the separate property the more impregnable does the title tend to become. This stage has always been reached by the time that the nation in which it prevails comes to have a recognised code and written laws. The laws of the Israelites (it matters nothing whether prescribed by Moses, or compiled at a later date from tradition, or from theories of sound policy and justice) recognised that the tribe had a title to a certain district, but that each member of the tribe had an absolute and indefeasible right to his own separate portion of land. This right was guarded by a law, at once of equal partition and of entail, under which alienation was only valid for a term of forty-nine years. In Greece private ownership was fully established. In Rome every family had its permanent share allotted to it. The survival of the idea of community was limited to the common lands, which by conquest became of immense extent. But the object of the agrarian agitation which covers so many pages of Roman history was not to revert to the original community of possession, but only to secure that of the remaining common lands each citizen, however poor, should be deemed entitled to receive a grant for his future possession in exclusive and private property.

From this general sketch of the origin of private property in land we may now proceed to consider its development in modern times, and especially in the United Kingdom.

The system of ownership of land in England under the Saxons was substantially the same as among their Germanic ancestors. There was still ample space for all. The village community remained the unit of social arrangements, and held generally large areas of forest or heath in common, on which every villager had a right to pasture stock. The small area of land under tillage was appropriated to individuals, sometimes in understood permanence, especially where a family held a position of pre-eminence, sometimes under a custom of more or less frequent redivision or appropriation. This village system, with its rights of common, survived far into the period of Norman occupation; and in numerous districts it may still be traced in the divisions and names of fields, and in the local customs. But a vast change of principle was introduced by the Norman Conquest, bringing with it the ideas of feudalism which had grown up on the Continent. Under this theory the whole land of the realm was deemed to be vested primarily in the sovereign. By him it was granted in knight-fee to certain nobles or gentlemen, who in return were bound to perform all duties of a vassal to his lord, and in especial to furnish a contingent of armed men to support him in war. Default in these duties involved forfeiture, but if performed punctually (or so far as the lord could enforce punctuality) the vassal was supreme in the territory granted to him. By degrees he gained the right of subinfeudation—i.e. of making similar grants of portions of his land to others, to be held by them as his vassals. This privilege was abolished in England by the statute *Quia Emptores*, 18 Edw. 1., which recognised the right of a vassal to sell, but required that the purchaser should hold subject to the original lord. At a still later period the owner of land in England acquired the right of devising land by will (32 Henry VIII. chap. 1). But the system of feudal tenures was swept away in England by the statute 12 Charles II. chap. 24, which abolished all services,

already long fallen into disuse, of the nature of military aid to the sovereign. Meantime the character of the land laws had been chiefly affected by the struggle between parliament, representing the wishes of the great nobles, the courts of law, guided by judges sprung mainly from the people, and the Court of Chancery, which in its earlier stages was inspired by the church. The statute *De Donis* established entails. But these were defeated by fictions, called fines and recoveries, sanctioned by the courts of law. Parliament passed acts for bidding alienation of lands in mortmain, chiefly in order to prevent the aggrandisement of the church. But these were defeated by the Court of Chancery giving effect to trusts for religious corporations. Parliament by the Statute of Uses, 27 Henry VIII. chap. 10, annulled such trusts. But again the judges defeated the statute by declaring that it did not apply where a trust was created to hold for another, who again was to hold for a third person. At last a device was hit upon by the ingenuity of lawyers under which the effect of entails has been attained by means of what are called Settlements, under which the operation of natural motives is brought into play to induce each successive owner to restrict himself to a life-interest only. By this system, which applies to a very large proportion of the land of England, estates are preserved in families, from one generation to another, but at the cost of grave evils, arising from the restraint placed on the powers of the actual possessor.

In Scotland the feudal system superseded that of clanship; and the chief of the clan, who was at first only the village headman, acquired in the eye of the law the sole title to the land which supported the community. But subinfeudation was never abolished in Scotland. It formed the basis of the system of conveyancing till past the middle of the 19th century, and it is still in practical use in the creation of 'feus.' Entails also, in all their strictness, were recognised as valid from the year 1696, and only since 1848 have been subjected to restraints resembling those which were from the first imposed upon them in England by the fictions which were sanctioned by the courts of law. Legislation subsequent to 1848 has enabled every owner under an entail to acquire the fee-simple on paying to the next heirs the estimated value of their interests.

Feudalism held sway in France down to the Revolution. The introduction of modern ideas of taxation even aggravated its hardships, for the great nobles secured exemption from these imposts, which thus fell the more heavily on their vassals. Both in France and Germany the vassals were also heavily burdened with the obligation of forced labour, partly due to the state for the maintenance of roads, &c., but chiefly to the immediate lord, who thus obtained the advantage of gratuitous cultivation for his own lands, while the peasantry were left to devote more inconvenient seasons to the work of their small farms. In France this system was swept away by that Revolution to which it had so largely contributed. The *Codé Napoléon* now regulates the law, which, except that on death it directs the compulsory division of land among the whole of the children, practically resembles the law of England. In Germany the feudal system disappeared under the celebrated legislation of Stein and Hardenberg. To purchase their relief from the duty of forced labour and other exactions of the lords the peasantry surrendered a portion of their lands to the lords, and were declared to hold the remainder free from any service. Land banks were at the same time established, which made advances to those who desired to buy up rights of common affecting their lands, or to commute rents for a payment in money.

In northern Europe feudalism took no root, and land has generally been held by small freeholders who were the cultivators. The system passed from Scandinavia to Orkney and Shetland, where the same tenure exists to a considerable extent under the name of *udal* right.

The principles which are involved in the ownership of land receive illustration in modern systems where new or unappropriated lands have to be settled. Generally speaking, first occupation is recognised in such cases as a sufficient title to exclusive and permanent ownership. There is, however, an unwritten law almost universally in force that occupation must be actual, and not merely an assertion of right over more area than the settler can actually work. This understanding crystallises into the rule that the occupation must be only of a limited space or 'claim,' and that actual labour of a specified amount must be expended on it within a definite period. Such rules are instituted wherever bodies of men establish themselves, whether as miners, shepherds, or farmers. When the community has existed for a short time, and is so far permanent as to have organised a government, these or similar rules are enacted as laws, and the authority of the whole community is asserted over such portions of territory as lie within its powers to defend, and which are not yet appropriated to individuals. The state generally sells these in plots to private individuals for a certain fixed price. This system prevails both in British colonies and in the United States. In the latter the remaining public lands are vested in the separate states, several of which have established a 'Homestead Law,' under which each naturalised citizen is entitled to claim a free grant of a certain portion of unoccupied land on condition of actually cultivating it. (For the present division of land in Britain, see AGRICULTURE, Vol. I, p. 102; see also UNITED STATES, &c.)

From the foregoing sketch it may be seen that the fundamental idea of ownership in land, in the leading systems of village communities and of feudalism, is that it is ultimately vested in the state or nation. But it is equally apparent that individual ownership, subject to such services or other equivalent as the state may demand, is universally recognised as the most useful form in which land can be employed. It applies the stimulus of individual profit and enjoyment to the culture and improvement of the soil. Under this influence an enormous amount of capital has in all countries, but in the most marked degree in Great Britain, been invested in the reclamation of the land from its original state of nature, whether as forest, prairie, or swamp. The fee-simple value of the land as it at present exists, in the majority of cases, represents not the original value, but little more, very often considerably less, than the mere expenditure of capital within the last century on erection of farm-houses and farm-buildings, cottages, and fences, on making roads, on draining, levelling, embanking, warping, or such other improvements as the situation demands. These outlays have been made on the understanding that the state would deal with them on the same principles as with investments in factories, railways, dwelling houses, or other species of recognised individual property—i.e. that it would apply to them the general rules of ownership and succession established in the community at large. Such rules permit all property whatever to be taxed and even to be appropriated by the state when the public good requires; but they require that no one class of owners shall be treated differently from others, and that if anything is taken for the public benefit the public shall pay its fair market price to the owner.

A number of schemes have been proposed for what is vaguely called 'nationalisation of the land.' These all start from the principle which has been seen to form in most countries the basis of land tenure, that the land is the property of the nation; and their object is to assert this principle in the direction of recovering possession for the nation from individuals. The first of these proposals in the present day was made by Mr Herbert Spencer, who, in his *Social Statistics*, suggested that land should be held by the state and let for short terms to the highest offerer. Subsequently Mr George (q.v.) proposed that, without divesting the present holders, land should be taxed in their hands to the amount of the full rental value, excluding only so much value as had arisen from improvements effected by the present holders or their ancestors. Dr Alfred Russell Wallace has proposed that the state should acquire the land of the country on payment of compensation to present owners, such compensation in his first suggestion being limited to their life-interest, but in later editions being extended to the value in fee-simple. He also urges adoption of a modified form of the Homestead Law of the United States, by which every citizen should be entitled to claim a sufficient extent of ground for a house and garden out of land in any situation not already devoted to that purpose. For this he would pay rent to the state. The agricultural land of the country in Dr Wallace's scheme is to be let by the state to tenants in perpetuity, subject to the obligation of 'occupying ownership'—that is to say, of being farmed by themselves without intervention of tenants. Other ideas, less distinctly formulated by their authors, contemplate the general division of the land into small portions sufficient only for the maintenance of a single family, which is recommended as 'restoring the people to the land;' while others suggested the ultimate cultivation by the community, under undefined arrangements of a socialist character. Thus it cannot be said that, as yet, any approach to agreement on a distinct system has been arrived at by the advocates of the idea of nationalisation of the land. The fundamental question whether any or what compensation is to be made to existing holders has yet been scarcely debated; the shock to the security of property if one species be confiscated has not been estimated; the difficulty of discriminating between original value and value added by outlay of capital has not been approached; and finally the question whether the nation would gain on the one hand by the transfer from one set of holders to another, or on the other by the substitution of state for individual cultivation, has not in any quarter been entered on.

As a middle scheme between existing private ownership and nationalisation, Mr Mill brought forward the doctrine of the right of the state to what he called the 'unearned increment' of land. His idea was that when land rose considerably in value from the mere fact of its proximity to a town, from a general rise of prices, or from other circumstance not dependent on the skill or capital of the owner, the public should be entitled to appropriate the rise to itself in the shape of a rent or tax. The idea of an 'unearned increment' in the value of agricultural land is, however, scarcely tenable, as it is the fact that any such increment is due (as has been shown above) mainly to the investment of capital by successive owners. The application of the doctrine would, therefore, occur generally in the case of land adjoining towns. But the growth of towns is largely due to private enterprise stimulated by the hope of profit. The confiscation or prohibition of such profit, which would be involved in a law permitting a municipality to take

possession of land or buildings at its original value, would annul the operation of private enterprise. This is an entirely novel factor in modern progress, and one of which the full effects can hardly be forecast.

Under the name of 'Betterment,' the increase of value due to municipal improvements in restricted areas (e.g. a new street, bridge, or the like) has in America been subjected to a graduated tax, and this proposal has also been lately brought forward in Great Britain.

The mischiefs arising from the aggregation of large extents of land in the hands of one owner have also been the subject or motive of legislative proposals. The statute book contains one notable effort to restrain it, in the Thellusson Act (q.v.). Such aggregation is, however, fostered by entails and by the rule of primogeniture, while the subdivision of land is the result of laws of succession which prescribe that land shall be divided equally among children. That this should be done in cases of intestacy, while the parent is still allowed the option of bequeathing the whole to one son, would be the effect of merely abolishing the rule of primogeniture. But the *Code Napoleon* makes equal division among children a compulsory rule. The rule itself is, however, much older in many countries, and in the United Kingdom it has existed from time immemorial in the Channel Islands. One evil which flows from it is the excessive *morcelement*, as it is termed in France, of estates in land. But this result is partly attributable to the system of subdividing every separate portion of the paternal estate, which obviously is not a necessary condition. In practice a restraint on inconvenient minuteness of subdivision is found in the habits of the population. Where these tend towards emigration (which is largely the case in the Channel Islands, but not in France) the inheritor of a very small fraction of land readily sells it to a neighbour, and uses the price to set himself up in trade, or for the purpose of emigration. A graver evil is that the same family consequences follow from compulsory division as were shown by Bacon to attend entails on the eldest son. Children are apt to attend with impatience the father's death, which puts them in assured possession of their patrimony, and filial duty is weakened by the knowledge that disobedience involves no penalty. A middle course has been suggested—that children should have absolute right to only a portion of the paternal estate (as is the case in regard to personal property in Scotland under the law of Legitim, q.v.), but that the parents should have power of bequest over the remainder. To arrest aggregation it has also been proposed that no owner of property, whether in land or personally, should be entitled to bequeath more than a fixed amount to any single individual, though with full power to bequeath the whole of the estate to such persons as he chooses, subject to the above restriction.

Land has also been employed in all countries for the subsidiary purpose of forming a security for debt, as by mortgage in England or heritable security in Scotland. This also tends to aggregation, as it relieves the owner from the necessity of selling a part when in need of ready cash. Estates so burdened are, however, little better than leaseholds. The owner is necessarily short of capital to improve them, while led to keep up the appearance of greater wealth than he actually possesses. The lender of the money is also a strict creditor, seldom inclined to grant indulgence in time, and never to concede abatement in amount even in bad seasons. The evil is very ancient and very widely spread. It was the occasion of many insurrections in Rome, and at

this day is even more prevalent on the Continent than in Britain. Vast tracts of land in eastern Europe are passing from the hands of the peasantry into those of money-lenders, and in India the same class of speculators, availing themselves of the strictness of British law for the recovery of debt, are becoming a scourge of the country. The Jewish law met the mischief by the laws against usury, and by the law of restitution at the jubilee. In 1880 the suggestion was offered (Boyd Kinnear, *Principles of Property in Land*) to attack the evil at its root by declaring that land shall not be a subject of preferential debt, while liable like all property to sale for payment of general debt. If such a rule were established no one would lend on land, and the owner who desired to raise money would be compelled to sell a portion. What he retained would be free from debt, what a purchaser acquired would be equally free, and every possessor would be a real, instead of fictitious owner of a smaller but more beneficial estate.

The cultivation of land may be either by the owner or by a tenant. The former is the natural, and almost always the most advantageous method, in the interests of the community, for it tends to induce the largest outlay on improvements which bring enhanced returns. The first departure from this idea takes the form (unknown in Britain, but common on the Continent, and not infrequent in the United States) of cultivation on shares, or *métairie*. Under this arrangement the landlord furnishes land and generally stock, the tenant gives the labour, and the produce is shared in certain proportions, frequently in moieties. It involves a close superintendence by the landowner or his steward to ensure that the stock is not made away with, and that his fair share is handed to him either in kind or in cash. The next stage of the arrangement forms the system, once universal in Scotland, of 'grain rents,' where the tenant binds himself to pay annually the value of a fixed quantity of different species of grain according to the market prices then prevailing, these being annually ascertained in Scotland by the 'striking of the Fairs' (q.v.). The last stage is the agreement to pay a fixed money rent irrespective of crops or prices. It is preferred by tenants in times of prosperity, as it leaves them the whole benefit of increased crops or rise in prices. The term during which the arrangement continues is in foreign countries very generally seven or fourteen years, in Scotland usually nineteen; while in England it has been most frequently only from year to year, and in Ireland it was often for lives. The last is the worst, because the most uncertain of all. The lease from year to year has gained a sort of expectation of permanency; the lease for definite terms enables the tenant to make positive arrangements, but it has the disadvantage of disposing him to cultivate less liberally as the termination approaches. To meet this the Agricultural Holdings Act entitles him to payment by the landlord for the unexhausted value of certain specified beneficial outlays made during his tenancy.

In Ireland the majority of the tenants prior to 1832 held under lease; but after that date they were gradually converted into yearly tenants. The prevailing rule, however, was that they continued in possession, at such rents as they could pay, from generation to generation. In 1860, and subsequently in 1870, 1881, and 1887, the legislature introduced successive restraints on the landlord's right of eviction. The position of tenants subsequent to the last-named statute is briefly as follows. They all hold in permanence, subject to eviction only in the event of non-payment of rent. Even if evicted on that ground they may recover

possession by paying the arrears within six months after notice. They are entitled also, although existing, to receive payment for any permanent improvements they have made. They may sell or bequeath their right of tenancy at pleasure. The rent is fixed (if the tenant desires) by the Land Commissioners, after examination by valuers; but it is subject to revision every fifteen years—so, however, that it is not to be raised in respect of any improvements made in the interval by the tenant. During three years of low prices (1886-89) the tenant was entitled to obtain a new valuation and reduction, and all judicial rents were further reduced according to an official scale, based on current prices for each year. In 1882 an Arrears Act wiped out all arrears then due by tenants, on payment of only one year's rent. In 1870 the 'Bright clauses' granted advances by the state to the extent of two-thirds of the price to enable tenants to purchase the fee-simple of their holdings from landlords who were disposed to sell. The 'Ashbourne Act' in 1885 extended this boon to a sum sufficient to cover the whole price, and the tenant paying interest on this at 4 per cent. per annum for forty-nine years clears himself of the full amount. The amount to be thus advanced by the state was at first limited to £5,000,000. In 1888 £5,000,000 more were granted; and these sums being absorbed, a bill was in the session of 1890 introduced into parliament extending the sum to about £30,000,000, under some slight modifications. The Land Law Act of 1896 extends and simplifies the fixing of fair rents, simplifies purchase, and extends the powers of the Congested District Board and facilitates advances from the Land Commission.

For the land-tax imposed in Britain on land and houses for purposes of revenue in lieu of the ancient subsidies, tentages, tallages, tenths, and such occasional taxes, see VALUATIONS. The land-taxation and land revenue of India are discussed at p. 115 of this vol.; for the proportion of the land-tax to other sources of revenue in various countries, see CHINA, TURKEY, &c. Land League. In Ireland, founded by Devitt (q.v.) in 1879, to purchase land for the tenants, and suppressed in 1881 as illegal. See IRELAND.

Landlord and Tenant. Primitive custom often recognised two classes of tenants those having fixed rights, who were in some sort owners or part owners, and those who derived their rights from the grant or contract of a superior. The British authorities in India have been compelled to take note of these primitive forms of tenure; in Bengal and elsewhere tenancy laws have been

passed for the protection of cultivating occupiers. In the Roman law tenancy appears in two forms. *Locution* is an agreement of letting and hiring; the rights of the parties are derived from the contract between them. *Emphyteusis* is tenure in perpetuity, or for a long term, at a fixed rent. Feudalism, as Sir H. Maine has shown, combines Roman ideas with primitive custom. The *dominus* of Roman law is a private person; the *dominus* of feudal law is the political superior of whom land is held. By the English common law, which was formed under feudal influences, the *dominium* of all lands was vested in the king as lord paramount; so that even a freeholder, holding to himself and his heirs for ever, is technically described as a tenant in fee-simple. When the freeholder makes a formal lease of his land, the lessee on entering acquires a limited interest which is protected by rules of common and statute law. A mere contract or agreement for a lease, not embodied in a formal conveyance, creates rights as between the parties, but it gives no interest in the land at common law. Equity, however, compels the lessor to fulfil his contract by executing a formal lease. A formal lease must be made by deed, unless it be a lease for three years or less at a rent equal to two-thirds of the improved value. An agreement for a lease must be proved by writing; and the Stamp Act requires that it should be stamped as if it were a lease. A tenant who has no formal lease or written agreement to show is, in strict theory, only a tenant at will; but if his landlord accepts rent from him he is entitled to a reasonable notice to quit. The English courts held long ago that a tenant from year to year was entitled to six months' notice, terminating with a year of the tenancy, and the Agricultural Holdings Act requires twelve months' notice in the case of agricultural tenants.

Under a lease or agreement, possession is transferred to the tenant during the term agreed. There is, on the landlord's part, no implied warranty as to the state of the premises, except in the case of a furnished house. A person who lets a house furnished is taken to warrant that it is in a habitable state. The landlord usually reserves the right to re-enter and put an end to the tenancy in case of non-payment of rent or other breach of covenant; but he is not now permitted to take full advantage of such stipulations in cases where the tenant is prepared to make pecuniary compensation for his default. Rent in arrear may be recovered by action, and also by the landlord's special remedy, Distress (q.v.). If a tenant fraudulently removes his goods in order to avoid a distress, the landlord may, within thirty days, seize and sell such goods wherever found, unless they have passed into the hands of a *bona fide* purchaser for value. The tenant has a right to assign his interest, or to sublet; but this right is, in practice, restricted by providing that the tenant shall not assign or sublet without his landlord's consent. An agricultural tenant had a common-law right to emblements, i.e. he might reap the crop he had sown, even if his term expired before harvest; and now an Act of 1851 enables a tenant to keep possession till the end of the year, though the interest of the person under whom he holds may have expired. Extensive powers of leasing have been given to tenants for life and other limited owners of settled land. In tracing the changes made by statute in the law of landlord and tenant, we observe that feudal and customary ideas have been giving way before the application of commercial principles. So far as England is concerned, the results of the change have been good on the whole. Landlords and farmers have been encouraged by the contract system to invest large sums in buildings, drainage, &c.; and a

large amount of food is thus raised with a comparatively small expenditure of labour. In Ireland the English system has been widely introduced; but the peasant farmers have always clung to primitive ideas and customary rights. They regard themselves as owners of the land, subject to a tribute rent, and they think it unjust that rent should be raised by competition. See LAND LAWS, REPAIRS.

For the English law of landlord and tenant, see the standard work of Woodfall; Irish legislation on this subject is expounded in Roche and Rearden's *Irish Land Code*. See also the Report of the Duke of Richmond's Commission, presented in 1882.

In the law of Scotland a lease assumes the form of a contract, binding on the parties; and by a statute of 1449 leases were made binding on singular successors—i.e. on those who may purchase from the lessor. If the lease be for more than a year it must be in writing, the term and the rent should be specified, and possession must be taken by the tenant. A written obligation to grant a lease is equivalent to a lease; and an agreement for a lease must be stamped as a lease. When the term of a lease has expired it may be continued from year to year by 'tacit relocation.' The remedies given to a landlord in respect of rent have been restricted by an Act of 1880, which abolishes the right of hypothec in respect of any land, exceeding two acres, let for agriculture or pasture. It has long been the practice of Scotch proprietors to grant farming leases for nineteen years. The Agricultural Holdings Act, 1883, is designed to give adequate security for tenants' capital invested in improvements; and the Crofters' Holdings Act, 1886, has conferred on small tenants in Highland counties rights somewhat analogous to the 'three F's,' as understood in Ireland.

See Hunter on Landlord and Tenant, and the Reports of the Richmond Commission (1882) and the Crofters Commission (1884).

In the United States the law of Louisiana is based on the civil law; in all the other states English principles seem to have been adopted. Distress has been abolished in some states, but the landlord's remedy is practically preserved to him by the law of liens and attachments. In case of non-payment of rent the landlord may enter and dispossess the tenant, on giving him the notice required by law (see Stimson's *American Statute Law*). Commercial principles have been more rigorously applied to land in America than they are in England or Ireland; no special protection or favour has been extended to agricultural tenants.

Landor. LETITIA ELIZABETH, was born in Chelsea, August 14, 1802. At an early age she contributed short poems to the *Literary Gazette*. Between the years 1824 and 1838 she published several volumes of poems, and three novels, besides contributing to 'Annuals,' the *New Monthly Magazine*, and the *Literary Gazette*. In 1838 she married Mr Maclean, the governor of Cape Coast Castle, and went out there with her husband at once. Two months after her arrival she died suddenly from having taken an overdose of prussic acid, which she had been in the habit of using as a remedy for spasmodic affections to which she was subject. Her poems and novels, written under the initials 'L. E. L.,' show genius, and were in their day exceedingly popular. See Life and Literary Remains, by Laman Blanchard (1841).

Landor. WALTER SAVAGE, was born at Warwick, 30th January 1775. He was the eldest son by a second marriage of Dr Landor, a medical practitioner in that town. His mother was Elizabeth Savage, of a well-known Warwickshire family. At the age of ten he was sent to Rugby School,

from which he was expelled for insubordination. After two years spent with a private tutor, Landor, now in his eighteenth year, entered Trinity College, Oxford. At the university he gave further proof of his impracticable temper—pursuing his own independent course of study, and taunting his political opinions so ostentatiously as to gain for himself the name of 'mad Jacobin.' For firing a gun into the room of a Tory undergraduate, and absolutely refusing to make any statement to the president, he was rusticated in 1794. He published a volume of *Poems* in 1795. Returning home, he shortly afterwards quarrelled with his father, and left the house 'for ever.' A reconciliation having been effected, Landor retired to South Wales on an allowance of £150 a year, with the liberty to live as he pleased. As the result of a diligent study of Milton and Pindar he published his *Gebir* in 1798. The poem found a few ardent admirers, and was the occasion of his lifelong friendship with Southey; but it failed, as it has done ever since, to find acceptance with the majority of those interested in poetry.

On the death of his father in 1805 Landor settled in Bath, where his style of living went beyond even his now considerable income. In 1808, with a band of volunteers raised at his own expense, he went to Spain to assist in the emancipation of that country from the yoke of Napoleon Bonaparte. The following year he purchased the estate of Llanthony in South Wales, where he mainly lived till 1814. Landor had bought the estate with the intention of doing all in his power for the good of his tenants and the neighbourhood in general. Before long, however, he quarrelled all round with his neighbours and his tenantry alike, and administered his affairs with so little judgment that ruin stared him in the face. In 1811 he had married Miss Thuillier, a step he took in the true Landorian manner, after a casual meeting with the lady at a ball. The union proved an ill-assorted one, and in 1814 he quitted her and crossed to France. Throughout all his domestic troubles Landor, who had in singular degree the faculty of forgetting the actual cares of life, had never ceased to occupy himself with literature. The most notable production of this period is his tragedy of *Count Julian*, which De Quincey has praised in the strongest terms, but which the majority even of Landor's admirers find defective in all the qualities indispensable to a successful drama.

After a short sojourn in Tours Landor, accompanied by his wife, who had rejoined him, proceeded to Italy, where, living in succession at Como, Pisa, and Florence, he remained till 1835, with the exception of a short visit to England. To this period belongs the best known of all his works, the *Imaginary Conversations*, a first instalment of which was published in England in 1831. A second quarrel with his wife in 1835 led to his return to England, where he settled in Bath till 1858. During these years Landor wrote much in prose and verse. As the most solid contributions to his fame should be specially mentioned the *Examination of Shakespeare* (1834), the *Pentameron* (1837), *Pericles and Aspasia*, and his *Hellenics*. The writing of Latin verse had from Landor's youth been one of his serious occupations, and in 1847 he published a collection of his Latin poems under the title of *Poemata et Inscriptiones*. In 1858 an unhappy scandal (see *Dry Sticks Fagottd*, by W. S. Landor), which involved him in an action for libel, again forced him to make his home in Italy. After an unsuccessful attempt to live with his family in Florence, by the advice and assistance of friends, chief among whom was Browning, he took rooms by himself in that city. Here, with health and faculties in wonderful

preservation, visited by men who have since become famous in literature and art. Landor lived till his death on 17th September 1864, assiduously composing to the last both in prose and verse.

By his singularly imposing personal appearance, his imperious will, and his massive intelligence, this 'unsubduable old Roman,' as Carlyle called him, was one of the most original figures among his contemporaries. A brief record of Landor's life perhaps unduly emphasises the least attractive aspect of his character. Irrational in the highest degree in the everyday conduct of life, he yet inspired affection and esteem in men whose opinions cannot be disregarded. Southey and Francis and Julius Hare were his friends of many years' standing, and in the latter part of his life, John Forster (afterwards his biographer), Charles Dickens, and others all testify to the essential nobility of his character. By a narrow circle of admirers Landor is ranked with the great names of English literature. In the sculpturesque severity of his verse they find a perfect reproduction of the finest work of the ancients. His prose they place even higher than his verse, asserting that a judicious selection from the *Imaginary Conversations* would be 'one of the most beautiful books in the language—that is to say, in the world.' For the majority even of cultivated readers, however, Landor holds by no means so supreme a place either as a poet or writer of prose; and the very subordinate place assigned to him in every history of literature clearly marks where he stands in the aggregate opinion of his countrymen. While it is admitted that there are 'shining elevations' in all his work, the general impression seems to be that his form, alike in his prose and verse, is essentially artificial and factitious, and that the subject-matter of both is largely vitiated by the same irrationality which displayed itself so grotesquely at every period of his life.

See Forster, *Life and Works of Landor*; Sidney Colvin, *Landor* ('English Men of Letters' series); Mrs Lynn Linton, *Reminiscences of Landor* (*Fraser's Mag.*, July 1870); Lord Houghton, *Monographs*; S. Wheeler, *Letters and Unpublished Writings of Landor* (1897); Swinburne, *Miscellanies*. Mr Boythorn, in *Black House*, embodies Dickens's impressions of Landor 'with his intellectual greatness bit out.'

Landrail. See CORN-CRAKE.

Landberg, a town in the Prussian province of Brandenburg, on the Warthe, 80 miles by rail NNE. of Berlin. Its industrial establishments include sawmills, machine-works, breweries, distilleries, &c.; there is a large trade in timber. Pop. (1885) 24,896; (1895) 30,483.

Landscape-gardening deals with the disposition of ground, water, buildings, trees and other plants which go to the composition of verdant landscape. Such in a broad sense is the definition of the art; for it may be employed to create a beautiful and harmonious scene where only nature in barren wildness reigned before, or to merely improve and adapt existing natural beauties and resources to the requirements of taste and convenience. Landscape-gardening has been practised from the earliest dawn of civilisation, but little of a reliable kind is known of the style or features of the gardens of the Jews, the Phœnicians, Assyrians, or even those of the ancient Greeks. All that we learn from Greek writers respecting the character of their gardens is that they afforded shade, coolness, repose, freshness, and fragrance. The Greeks cultivated the sister art of architecture so well as somewhat to neglect gardening; hence Lord Bacon's remark in his *Essay on Gardens*, that 'when ages grow to civility and elegance, men come to build stately sooner than to garden finely,' as if gardening were the greater perfection.

The Romans introduced landscape-gardening into Britain; but the art was lost when the country was abandoned by them to the Saxons. As, however, it had meantime been fostered in France, it was probably reintroduced by the Normans. Henry I., according to Henry of Huntingdon (*Hist. lib.* vii.), had a park (*habitationem ferarum*) at Woodstock, and it is conjectured that this park may have surrounded a magnificent Roman villa, the ruins of which—covering about 6 acres in extent—were discovered on the Blenheim estates early in the 19th century. If the conjecture is well founded, Blenheim may be regarded as the most ancient site as well as the grandest example of landscape-gardening in Britain—according to many, it is the grandest in Europe. William Kent (1684-1748) and Lancelot Brown (1715-83), better known as 'Capability Brown,' may be considered as the founders of modern English landscape-gardening. See works by Loudon (1822), Repton (1840), F. R. Elliott (1878), and H. E. Milner (1890).

Landseer, SIR EDWIN HENRY, an English animal-painter, son of the engraver John Landseer, A.E.R.A. (1769-1852), was born in London, 7th March 1802. He was carefully trained by his father to sketch animals from life, and began exhibiting at the Royal Academy when only thirteen; but the first work that brought him prominently before the public was 'Fighting Dogs getting Wind,' exhibited in 1818. Down to about 1823 he was content to reproduce the natural expression and character of animals; after that date his animal pieces are generally made subservient to some sentiment or idea, without, however, losing their correctness and force of draughtsmanship. Dogs and deer were his favourite and best subjects; the scene of several fine pictures is laid in the Highlands of Scotland, which he first visited in 1824. In 1826 he was elected an A.R.A., in 1830 an R.A., and in 1850 was knighted. Among his most celebrated pictures are 'The Cat's Paw,' 'The Illicit Whisky-still,' 'High Life and Low Life,' 'King Charles Spaniels,' 'Jack in Office,' 'Suspense,' 'Bolton Abbey,' 'Highland Shepherd's Chief Mourner,' 'Dignity and Impudence,' 'Peace and War,' 'Laying down the Law,' 'The Challenge,' 'The Sanctuary,' 'Monarch of the Glen,' 'Stag at Bay,' 'The Random Shot,' 'Night and Morning,' 'The Children of the Mist,' 'Deer-stalking,' 'Flood in the Highlands,' 'Man Proposes, but God disposes,' and 'Swannery invaded by Sea-eagles.' The bronze lions at the foot of Nelson's Monument in Trafalgar Square, London, were modelled by him. Landseer was elected president of the Royal Academy in 1866, but declined the honour. The last dozen years of his life were clouded by much mental suffering, and he died October 1, 1873. He is buried in St Paul's. Most of Landseer's best pictures are well known from the excellent engravings of them done by his elder brother THOMAS (1796-1880). Another brother, CHARLES (1799-1879), was a painter of historical scenes. See *Landseer* by F. G. Stephens (1880), and Loftie's *Landseer and Animal Painting* (1891).

Land's End. See CORNWALL.

Landshut, a picturesque town of Upper Bavaria, on the Isar, 44 miles by rail N.E. of Munich. Of its eleven churches, St Martin's (1177) has a steeple 436 feet high. The castle of Trausnitz (*v.* 1232) was partially restored in 1872-74. Landshut has several breweries, manufactories of tobacco, wagons, hats, &c., and an active trade in corn. The Dominican monastery (1271) was the seat of the university, removed hither from Ingolstadt in 1800, and transferred to Munich in 1826. During the Thirty Years' War and the war

of the Austrian succession Landshut was several times captured; and here on 16th April 1809 the Austrians drove back the Bavarians, but were in turn defeated by Napoleon five days later. Pop. (1875) 14,780; (1885) 17,873. See works by Wiesend (1858-78) and Kaleher (1887).

Landsknecht. See FREE-LANCES.

Landskrona, a seaport of Sweden, stands on the Sound, 16 miles NNE. from Copenhagen. It has a good harbour, carries on sugar-refining, ship-building, and the manufacture of tobacco and leather, exports considerable corn and butter, and imports raw sugar, coal, and grain. Pop. (1875) 9084; (1888) 20,354. The town was a fortress down to 1870. Opposite Landskrona in the Sound lies the island of Ryen, on which Tycho Brahe built his observatory of Uranibourg.

Landslips, large portions of land which from some cause have become detached from their original position, and slid down to a lower level. They are especially common in volcanic districts, where the trembling of the earth that frequently accompanies the eruption of a volcano is sufficient to split off large portions of mountains, which slide down to the plains below. Water, however, is the chief agent in producing landslips. It operates in various ways. The most common method is when water insinuates itself into minute cracks, which are widened and deepened by its freezing in winter. When the fissure becomes sufficiently deep, on the melting of the ice a rock-fall or landslip is produced. Sometimes, when the strata are very much inclined, and rest on an impermeable bed like clay, the water which percolates down through the more porous rocks above softens the clay, which becomes slippery, whereupon the superincumbent mass slides over it to a lower level. This took place on a large scale in Dorsetshire between Lyme and Axminster in 1839, an unusually wet season; a mass of chalk and greensand here slid over the slippery surface of a bed of liassic clay down into the sea. Of a like kind were the slip of the Rossberg, in Switzerland, in 1806 (see GOLDIAT), and that which overwhelmed the village of Elm, in Glarus, in September 1881, when about 200 lives were lost. Another notable landslip was that of the Bocca di Brenta in south-west Tyrol in the year following; and at Zug in 1887 a landslip carried twenty-seven houses, with eleven persons, into the lake. Landslips of a different kind have been produced in peat-mosses, which, becoming by heavy rains thoroughly saturated with water, have burst their natural boundaries and discharged themselves on a lower level. The most remarkable case of this kind is that of the Solway Moss, which in 1772, owing to rains, spread itself in a deluge of black mud over 400 acres of cultivated fields. In 1880 a most destructive landslip occurred at Naini Tal, a health-resort on the southern slopes of the Himalayas. The town was partly built on a great sloping terrace of shaly deposit overhanging the lake, and this becoming saturated with the heavy autumn rains, it suddenly slipped forward, burying many houses in its debris. Forty Europeans and from 100 to 200 natives lost their lives. See GOO.

Land-surveying. See SURVEYING.

Landwehr ('Land-defence'), a military force in the German and Austrian empires, forming an army reserve, but not always retained under arms. Its members, although care is taken that they are sufficiently exercised, spend most of their time in civil pursuits during peace, and are called out for military service only in times of war or of commotion. (During the agrarian disturbances in Galicia in 1890 the Landwehr was employed for the first time against the peasant labour movement.)

The Prussian system of land defence was called into existence in 1813, when the Landwehr was organised according to Schamhorst's plan. At first it was designed solely as a land defence, properly so called, and not, what is now the case, as an integral part of the regular army. Every German capable of bearing arms, after serving in the standing army for seven years, now has to enter the Landwehr, and remain in it for other five years. In exceptional cases the Landwehr may be filled up from the *Landsturm*, which is not reckoned part of the army, and is called out only in the event of invasion; in both Germany and Austria it embraces men up to the age of forty-two (in Austria, for retired officers, till sixty). For the period of service in the Austrian Landwehr, see ARMY, Vol. I. p. 436.

Lane, EDWARD WILLIAM, the most eminent of English Arabic scholars, and the well-known translator of the *Arabian Nights*, was the son of the Rev. Theophilus Lane, LL.D., prebendary of Hereford, and his wife, Sophia Gardiner, a niece of Gainsborough the painter, and was born 17th September 1801. After education at the grammar-schools of Bath and Hereford, he began life, like his brother Richard (q.v.), as an engraver; but the need of a warmer climate took him to Egypt, and with that country the whole of his subsequent work was connected. The result of his first (1825-28) and second (1833-35) visits to Egypt was his *Manners and Customs of the Modern Egyptians* (1836; 5th ed. 1871), a work immediately recognised as of unrivalled accuracy and completeness, and still the standard authority on the subject. This was followed by the translation of the *Thousand and One Nights* (1838-40; 2d ed. 1859, and many reprints), which was the first accurate rendering of the tales, and (though necessarily abridged, on account of the objectionable nature of some of the incidents) is still the standard library edition. The numerous and instructive notes on Mohammedan life, literature, and superstition appended to the translation have been separately issued under the title of *Arabian Society in the Middle Ages* (1883). A volume of *Selections from the Koran* appeared in 1843 (2d ed. 1879). Lane's third visit to Egypt (1842-49) was devoted to laborious preparation for the great work of his life, the *Arabic Lexicon*, for which his extraordinary familiarity with the Arabic language and literature and his intimacy with the learned at Cairo peculiarly fitted him. The cost of this vast undertaking was borne by the fourth Duke of Northumberland and afterwards by his widow. Lane toiled without cessation for twenty years, with the zeal of a Sealiger, before he began printing, and then his first five quarto volumes came out (1863-74). The *Lexicon* was instantly accepted throughout Europe as the supreme authority. He died at Worthing, 10th August 1876, before completing it, but the publication of the remaining portions was carried on (1876-90) by his grand-nephew, S. Lane-Poole. In recognition of his unwearied devotion to learning he received a Civil List pension; the French Institute in 1864 elected him a correspondent; and he was made a Doctor of Literature at the telexentenary of the University of Leyden. See S. Lane-Poole, *Life of Edward William Lane* (1877).

Lane, RICHARD JAMES, engraver and lithographic artist, elder brother of the preceding, was born in 1800, and trained as an engraver by Charles Heath so successfully that at the age of twenty-seven he was chosen an A.R.A., partly on the strength of a fine engraving after Lawrence. Lithography, however, was just then coming in, and Lane abandoned engraving in favour of the

new art, in which 'he displayed a dignity and refinement of expression and an instinctive sympathy with his originals which have never been equalled.' His pencil was so delicate that his lithographs have often been mistaken at the first glance for line engravings. As a draughtsman in pencil or chalk he was very successful. In 1829 he executed an excellent profile of the Princess Victoria, then ten years of age, and he afterwards made portraits of most of the members of the royal family, and was appointed lithographer to the Queen and Prince Consort. His best lithographs (which number more than a thousand) include Lawrence's cycle of George IV., his own grand-uncle Gainsborough's sketches, and many works of Leslie, Landseer, and G. Richmond. He was also no mean sculptor, and attracted Chantrey's hearty admiration by such modelling as his life-size figure of his brother Edward. In his last years he directed the etching-class at the South Kensington Art Schools. He died 21st November 1872. See *Mag. of Art*, August 1881.

Lanercost, an Augustinian priory, founded about 1169, lies in the valley of the Irthing, 16 miles NE. of Carlisle. It is partly in ruins; but the nave has been restored and is now used as a parish church. The *Lanercost Chronicle, 1201-1246*, a valuable source for Border history, was really written, not at Lanercost, but at Carlisle. It was edited in 1839 by Joseph Stevenson for the Bannatyne and Maitland Clubs. Naworth Castle, 1 mile S. of the priory, is associated with the 'Belted Will Howard' of Scott's *Lay of the Last Minstrel*; it contains old armour, tapestry, &c. See R. S. Ferguson's *Lanercost* (1870).

Lanfranc, the first archbishop of Canterbury after the Norman Conquest, was born at Pavia about 1005, and educated at Pavia for the law. About 1039, however, he left Italy, and founded a school of law at Avranches, which soon became one of the most popular in France. Three years later he took the monastic vows at the Benedictine monastery of Bee, and in 1046 was chosen its prior. He figured prominently in the Berengarian controversy as to the real presence, ranging himself against Berengarins. About 1053 he came into close contact with William of Normandy. Although he at first condemned this prince's marriage with his cousin, he afterwards (1059) went personally to Rome to procure the papal dispensation for it. As a reward for this service William made him prior of his new foundation, the abbey of St Stephen at Caen (1062), and in 1070 promoted him to the primacy of England by making him Archbishop of Canterbury in place of the deposed Stigand. Lanfranc still continued to be William's trusty adviser, helping him both to fill the English sees with Normans and to make the royal power supreme above that of the church. He died in May 1089, leaving commentaries, sermons, letters, and a work against Berengar (ed. 1618 and 1844). See Hook's *Lives of the Archbishops*.

Lanfrey, PIERRE (1828-77), author, born at Chambrey, wrote on the church and the philosophers (1855), essays on the Revolution, and a history of the popes; but is best known for his famous (hostile) *Histoire de Napoléon I.* (1867-75; 8th ed. 1875; trans. 1872-80). He was successively moderate republican deputy, ambassador to Switzerland, and senator.

Lang, ANDREW, a remarkably versatile writer, was born at Selkirk, March 31, 1844, and was educated at Edinburgh Academy, St Andrews University, and Balliol College, Oxford. He took a classical first class, and was elected Fellow of Merton College in 1868. Ere long he plunged into the sea of literature, and soon became one

of the busiest as well as the brightest writers in the world of London journalism. He treats the most varied subjects with the same light, humorous touch, and he touches nothing which he does not adorn, although on serious themes he sometimes falls short of the seriousness that his reader has a right to expect. He has taken a foremost part in the controversy with Max Muller and his school about the interpretation of mythology and folk-tales, and it may safely be said that to his brilliant polemic have fallen most of the honours of the field. He was made LL.D. of St Andrews in 1885, and in 1888 was elected the first Gifford lecturer at that university. His chief books are *Ballads and Lyrics of Old France* (1872), *Ballades in Blue China* (1880), *Helena of Troy* (1882), *Rhymes a la Mode* (1884), *Grass of Parnassus* (1888), and *Ballads of Books* (1888), volumes of far more than merely graceful verse; *Custom and Myth* (1884), and *Myth, Ritual, and Religion* (2 vols. 1887), a solid contribution to the study of the philosophy and religion of primitive man, written with unusual directness and vigour, and lightened up by a wealth of felicitous illustration. Admirably clever and entertaining volumes, on subjects ranging from pure literature, as well as folklore and primitive religion, down to the by-ways of bibliographers and gossip of the day, are *The Library* (1881), *In the Wrong Paradise* (1886), *Books and Bookworm* (1886), *Letters to Dead Authors* (1886), *Letters on Literature* (1889), *Lost Leaders* (1889), *Old Friends: Essays in Epistolary Parody* (1890). He translated with exquisite skill *Aucassin and Nicolette* (1887), produced the faultless edition of Perault's *Popular Tales* (1888), and selected the fairy-tales forming the *Blue Fairy Book* (1889), the *New Fairy Book*, &c. He himself translated *Theocritus*, *Bion*, and *Moschus* (1880); and shared (with Butcher, Leaf, and Myers) in brilliant translations of the *Odyssey* and the *Iliad*. He was editor of the 'Abbotsford' Scott; wrote a history of *St Andrews* (1893), a novel, *The Monk of Fife* (1895), an edition of Burns's poems (1896), a *Life of Lockhart* (1896), *Pickle the Spy* (1897), and *Prince Charles Edward* (1900). He contributed BURNS and SCOTT to this Encyclopedia.

Lange, FRIEDRICH ALBERT, philosopher, was born at Wald, near Solingen, 28th September 1828, and died at Marburg, 23d November 1875. He wrote a most valuable *History of Materialism* (Eng. trans. by Thomas, 3 vols. 1878-81).

Lange, JOHANN PETER, theologian, born 10th April 1802, at Somborn, near Elberfeld, studied at Bonn, and after holding several pastoral charges became professor of Theology at Zurich in 1841, and in 1854 at Bonn, where he died, 9th July 1884. He wrote many works, of which the best known are a *Life of Jesus Christ* (1839; Eng. trans. by Marcus Dods), treatises on dogmatics (1849-52), Christian ethics (1878), hermeneutics, theological psychology, and his great *Bibelwerk*, a series of commentaries on the gospels (trans. into English), and, with other scholars, on the whole Old and New Testaments (also trans. into English).

Langeland (i.e. 'long land'), a low, fertile Danish island, 33 miles long by 5 broad, situated at the southern entrance to the Great Belt, between Funen and Lolland. Area, 106 sq. m.; pop. (1880) 19,900. Principal products—corn, flax, cattle, timber, fish. Chief town, Rudkjøbing (pop. 3179), on the west coast.

Langensalza, a town of the Prussian province of Saxony, 13 miles by rail N. by W. of Gotha, with a pop. of (1885) 10,924, and woollen and cloth manufactures. Here occurred, on 27th June 1866, an encounter between 19,000 Hanoverians and 8200 Prussians; the latter were at first defeated, but

being reinforced compelled the former to capitulate two days later. Not far from the town is a sulphur spring that attracts 600 visitors annually.

Langholm, a market-town of Dumfriesshire, at the junction of Ewes and Wauchope Waters with the Esk, 23 miles SSW. of Hawick, and 22 (by a branch-line) N. of Carlisle. Near the town hall is a marble statue of Admiral Sir Pulteney Malcolm (1768-1838), and on White Hill an obelisk to his brother, General Sir John Malcolm (1769-1833). Shepherd's plaid and tweeds have been manufactured since 1832. In 1890 Thomas Hope, a New York merchant and native of Langholm, left £80,000 to found a hospital here. Langholm is a burgh of barony (1643), under the Duke of Buccleuch, whose seat, Langholm Lodge, is close by. On the site of the town the Douglasses were defeated in the battle of Arkinholm (1455). Pop. (1831) 2264; (1881) 4209; (1891) 3643.

Langhorne, JOHN (1735-79), for a time rector of Blagdon in Somerset, devoted most of his life to literature, and published a long series of poems, tales, translations, &c. He is best known as having, with his brother William (1721-77), produced what has always ranked as the standard translation of Plutarch.

Langkat, or LANKHAT, a port on the east coast of the NW. part of Sumatra, near the borders of Acheen, is famed for its wells and shipments of petroleum.

Langland, or LANGLEY, WILLIAM, the supposed name of the author of *Piers the Plowman*, of whose life some few facts have been constructed from the internal evidence offered by the poem, mainly by the industry of Professor Skeat. He was born a franklin or freeman's son about 1332, probably at Cleobury Mortimer in Shropshire; went to school, possibly in the monastery at Great Malvern; became a clerk, but, having married early, could not take more than minor orders, and earned a poor living by singing the *placcho*, *dirige*, and 'seven psalms' for men's souls, and by copying legal documents. He lived many years in London, was named 'Long Will' from his stature, and prolonged poverty seems to have made him embittered and somewhat churlish in disposition. The last trace of him is in his poem of *Richard the Reddes* (850 lines), from which we learn that he was at Bristol in 1399.

The full title of his famous poem is *The Vision of William concerning Piers the Plowman, together with Vita de Do-wel, Do-bet, et Do-best secundum Wit et Resonum*. It exists in three different forms or recensions, distinguished by Professor Skeat as the A, B, and C texts. Of these the first was composed about 1362, and contains only 2567 lines. In it the Vision of Piers the Plowman is quite distinct from the Vision of Do-wel, Do-bet, and Do-best, the former consisting of a prologue and 8 passus (1833 lines), and the latter of a prologue and 3 passus (734 lines). The B text, the form of the poem which best represents the genius of the poet, was written after 1377, and contains about 7400 lines, consisting of the two Visions as before, the former arranged in a prologue and 7 passus, the latter in 3 prologues and 10 passus. The first part of the B text, giving the Vision of the Field full of Folk, of Holy Church, and of Lady Meed, next the Vision of the Seven Deadly Sins and of Piers the Plowman, was admirably edited by Professor Skeat as a school-book in the Clarendon Press series (1869). The C text was probably not composed till 1390. It adds about 250 lines to the poem, and is arranged, without prologues, continuously in 23 passus.

This long poem has great defects as a work of art, but the moral earnestness and energy of the author sometimes glow into really noble poetry,

particularly in his invectives against injustice and wrong, the idleness and pride of the clergy, and especially the dissolute habits of the mendicant friars. The theological discussions are not seldom tedious, but are brightened by vivid glimpses of the life of the poorer classes in his day, and some of the allegorical representations, as of the Glutton and Sloth, have something of the reality of life. The conception of the Plowman grows as the poem proceeds, and from a mere honest labourer he passes into a personification of the reforming spirit, and at one moment becomes identified with Christ himself. The writer is no precursor of Lollardism on its speculative side, or specially a Reformer other than in his revolt from the slavish hypocrisy of form apart from the inward power of religion, and his longing for a return to simple scripture truth without sacerdotal domination.

The metre of the poem is alliterative, but irregular. The dialect is mixed, but mainly Midland, with occasional introduction of Southern forms, and the vocabulary is of unusual extent.

The earlier editions of Robert Crowley (1505), Owen Rogers (1561), Dr Whitaker (the C text, 1813), and Thomas Wright (1842) were superseded by Professor Skeat's exhaustive and final edition for the Early English Text Society: Part I. (A text), 1867; Part II. (B text), 1869; Part III. (C text, with *Richard the Reddes*), 1873; Part IV., Notes, 1877; Glossary, &c., 1881. A more convenient edition of this was issued by the Clarendon Press in 1886 (2 vols.), the three parallel texts being printed together. See J. J. Jusserand, *La Poésie Mystique de William Langland* (1893).

Langres, a town in the French department of Haute-Marne, is situated at an elevation of 1530 feet above sea-level (one of the highest towns in France), 184 miles ESE. of Paris by rail. A place of military importance as key of the communication between the Seine and the Rhone, it has been strongly fortified since 1868, and has a cathedral of the 12th and 13th century. Pop. 7157. Langres (anc. *Audenotianum*) in Caesar's time was the capital of the Lingones, a name corrupted into Langres.

Langside, a southern suburb of Glasgow, with a pop. of 6023. Here, after her escape from Loch Loven, Queen Mary's forces were totally defeated by the Regent Moray, 13th May 1568. A monument (1887) commemorates the battle.

Langson, a town in Tongking, situated north-east of Ha-noi, near the frontier of the Chinese province of Kwang si. It was a centre of operations in the Franco-Chinese war of 1884-85.

Langton, STEPHEN, famous in the history of the liberties of England, was born about 1150, but where is uncertain, Lincolnshire, Yorkshire, and Devonshire all claiming him. He received his education in the university of Paris, where he was the fellow student and friend of the future Pope Innocent III.; he rose to the office of chancellor of the university. Innocent after his elevation gave Langton a post in his household, and afterwards made him a cardinal (1206). On occasion of the disputed election to the see of Canterbury in 1205-7 Langton was recommended by the pope to those electors who had come to Rome on the appeal, and, having been elected, was consecrated by Innocent himself at Viterbo, June 27, 1207. His appointment was resisted by King John (q.v.); and for six years Langton was kept out of the see, only being admitted when John made terms with Innocent in 1213. In the conflict of John with his barons Langton was a warm partisan of the latter, and his name is the first of the subscribing witnesses of Magna Charta. And, although the pope excommunicated the barons, Langton refused to publish the excommunication, and was in consequence suspended from his func-

tions by the pope in 1215. But after the accession of Henry III. he was reinstated (1218) in his see, and from that time chiefly occupied himself with church reforms till his death, which took place July 9, 1228. See Dr Hook's *Lives of the Archbishops of Canterbury*, vol. ii. (1861).

Language. See PHONOLOGY; and UNIVERSAL LANGUAGE, VOICE, LETTERS.

Languedoc, a former province of the south of France, bounded on the E. by the river Rhone, on the S. by the Mediterranean and the counties of Foix and Roussillon, and on the W. by Gascony and Guienne. It is now embraced in the departments of Lozère, Gard, Ardèche, Aude, Hérault, Upper Loire, Tarn, and Upper Garonne. The name is derived from *langue d'oc*, the southern French dialect, or Provençal (q.v.), so called because the people used *oc* instead of *oui* for 'yes,' as in the northern provinces. During the period of the Roman empire this part of Gaul was prosperous and wealthy, a home of enlightenment. In 412 the Visigoths founded the kingdom of Toulouse (one of the chief cities of Languedoc, Montpellier being the other), and were only overthrown in 759 by Pepin the Frank. Two centuries later this part of France was immediately subject to the count of Toulouse, one of the great feudatories of the kingdom. The story of the religious wars of the 12th and 13th centuries has been already recounted under ALBIGENSES (q.v.). For the Languedoc Canal, see CANAL.

Lanida. See BUTCHER-BIRD.

Lankâvatâra, one of the chief religious works of the Buddhists, which treats of their religious law, and of some of their most abstruse philosophical problems.

Lankester, EDWIN RAY, zoologist, was the son of Dr Edwin Lankester (1814-74), scientific writer, and was born in London, 15th May 1847. Educated at St Paul's School and at Christ Church, Oxford, he was fellow and tutor of Exeter College, and in 1872 became professor of Zoology and Comparative Anatomy in University College, London. He is F.R.S. and LL.D. Among over a hundred scientific publications by him are memoirs on 'Fossil Fishes of the Old Red Sandstone' in the *Philosophical Transactions*, and works on *Comparative Longevity* (1871), on *Depravation* (1880), and on *Advancement of Science* (1890).

Lammer. See FALCON.

Lannes, JEAN, DUKE OF MONTEBELLO, a French marshal, was born, the son of a livery-stables keeper, on 11th April 1769, at Lectoure (Gers), entered the army in 1792, and by his conspicuous bravery in most of the battles of the Italian campaign fought his way up to be general of brigade by 1796. He rendered Napoleon important service on the 18th Brumaire. On 9th June 1800 he won the battle of Montebello, whence his title, and bore a principal share in the battle of Marengo. He commanded the left wing at Ansterlitz, and the centre at Jena, and distinguished himself at Eylau and Friedland. Being sent to Spain, he defeated General Castaños at Tudela, 22d November 1808, and took Saragossa. In 1809 he again served on the Danube, and commanded the centre at Aspern (22d May), where he had both his legs taken off by a cannon-shot. He was carried to Vienna, and died there, 31st May. He was interred, first in the Pantheon, afterwards in Pere-la-Chaise, in Paris.

Lannion, a town in the French department of Côtes du-Nord, on the Gner (which is navigable for sea-going ships to this point), 69 miles by rail E.N.E. of Brest. Pop. 5893.

Lansdown, a hill (813 feet) to the north of Bath, commanding a prospect of exceptional beauty. Here stands a tower of 130 feet, built by Beckford, and two miles beyond was fought the battle of Lansdown, 5th July 1643, when Waller's entrenchments were stormed by the Cornish royalists. On the spot where the heroic Sir Bevil Grenville fell Lord Lansdowne raised a monument in 1723.

Lansdowne, HENRY PETTY FITZMAURICE, third MARQUIS OF, was the son of the first marquis, better known as the Earl of Shelburne (q.v.), and was born in London, July 2, 1780. He received his education at Westminster School, Edinburgh University, and Trinity College, Cambridge, where he graduated in 1801. Born in the purple of politics, he was returned for the burgh of Calne at the age of twenty-two. He ranked himself among the opponents of Pitt, and took a leading part in that attack on Lord Melville which brought home to him the charge of corruption. When Pitt died Lord Henry Petty—as he was then styled—succeeded him as member for Cambridge University, and also as Chancellor of the Exchequer in the administration of 'All the Talents' formed by Lord Grenville, but held office for about a year only. In 1809, and after having represented the borough of Camelford for a short time, he succeeded by the death of his half brother to the marquise of Lansdowne. A sincere though cautious Liberal, he in 1826 entered the Canning cabinet; and in the short Goderich administration he presided at the Foreign Office. When, in 1830, the Whigs came into power under Lord Grey, Lansdowne became President of the Council, and took an active part in the passing of the Reform Bill of 1832. He held this office, with a short interval, till September 1841. Five years later, under Lord John Russell, he resumed his post, taking with it the leadership of the House of Lords, and held it till 1852. In that year he was requested to form an administration, but consented to serve without office in the coalition cabinet of Lord Aberdeen. When that ministry fell in 1855, Lansdowne was again asked to accept the premiership, but he once more declined, although he consented to help Lord Palmerston as he had helped Lord Aberdeen. He refused a dukedom. After the death of the Duke of Wellington Lansdowne was recognised as the patriarch of the House of Peers, while almost up to his death his advice was asked at his seat of Bowood by the leaders of the Liberal party. He was the attached personal friend of the Queen. Fond of literature and of the company of men of letters, he formed a great library, and one of the best collections of pictures and statuary in the kingdom. He died January 31, 1863.

The political biographies of the period in which Lansdowne lived abound in references to him. A considerable number of his letters on public affairs appear in *Lord Melbourne's Papers*, edited by Lloyd C. Sanders (1889). *The Life of Lord John Russell*, by Spencer Walpole (1889), illustrates in a remarkable manner the quiet but great influence exerted by Lansdowne in the councils of his party.

Lansdowne, HENRY CHARLES KEITH PETTY FITZMAURICE, fifth MARQUIS OF, was born January 14, 1845. Educated at Eton and Balliol College, Oxford, he succeeded to the marquise in 1866, and, attaching himself to the Liberal party, was a Commissioner of Exchequer of Great Britain and of Treasury of Ireland from 1868 to 1872. Between 1872 and 1874 he was Under secretary for War. In 1880 he again took office under Mr Gladstone as Under-secretary for India, but resigned owing to a difference with his chief over the Compensation for Disturbance (Ireland) Bill. In 1883 he was appointed Governor general of the Dominion of

Canada, in 1888 Governor-general of India, in 1895 Secretary for War, and in 1900 Foreign Secretary. See a book by G. W. Forrest on his Indian administration (1894).

Lansing, the capital of Michigan, on both sides of the Grand River, 85 miles WNW. of Detroit, at the meeting-point of four railroads. It contains the state capitol, library, reform school, and agricultural college, a school for the blind, and several manufactories. Lansing was settled and made the state capital in 1817, and incorporated as a city in 1859. Pop. (1870) 5241; (1890) 13,102.

Lansingburg, a town of New York, on the Hudson, 10 miles above Albany. It contains an Augustinian priory, and has extensive manufactures of brushes and oil-cloth. Pop. 10,550.

Lantern, in Architecture, an ornamental structure raised over domes, roofs, &c., to give light and ventilation. The dome of St Paul's Cathedral and many other large domes are crowned with a lantern. Where a lantern is for the purpose of giving light it is called a *lantern-light*. In Gothic architecture a *lantern-tower* is frequently placed over the centre of cross churches—the vault being at a considerable height, and the light admitted by windows in the sides. York and Ely cathedrals, and many churches in England, have such lantern-towers.

Lantern-fly (*Fulgura*), a genus of Hemiptera, type of a family Fulgoridae, allied to Cicadidae, but with legs more adapted for leaping, and without organs for producing sound. There are about a score of species, all tropical, most from South America, the rest in Asia and Africa. The forehead bears a remarkable empty dilatation or 'lantern,' quaint in form, sometimes towards an inch

Lantern-fly (*Fulgura leucocentria*).

in length. The name lantern-fly was originally given to *F. leucocentria*, a species found in Guinea, measuring about 3 inches in length. The inflated projection of the forehead is said by some to be at times very brilliantly luminous; but the evidence is contradictory, and most naturalists refuse to believe in the luminosity of any of the species. It is possible that the luminosity, if genuine, is only occasional and of sexual significance. In the Chinese Lantern-fly (*F. cambelaria*) the prolongation of the forehead is comparatively narrow.

Lanthanum (sym. La, equiv. E39), so named from the Greek *lanthano*, 'to be hid,' is a metal which was discovered by Mosander in 1839 in *Cerite*, a hydrated silicate of Cerium (q.v.). It is of little chemical interest, and is of no practical value. See DIDYMIUM.

Lanzi, LUIGI, Italian antiquary, was born at Monte dell' Olmo, near Macerata, June 14, 1732. He entered the order of the Jesuits, but devoted his time to the study of classical antiquities and of Italian painting. He resided chiefly at Florence, where he died, March 30, 1810, and was buried by the side of Michael Angelo in the church of Santa

Croce. The principal monuments of his learning are the works *Saggio di Lingua Etrusca* (3 vols., 1789), in which he insisted upon the kinship of Etruscan with Latin, Oscan, Umbrian, and Greek; and *Storia Pittorica d'Italia* (1792-1806; Eng. trans. by Thomas Roscoe, 6 vols., 1828). Lanzi also wrote works on Etruscan vases, antique sculptures, &c. His posthumous works were published in 2 vols. at Florence in 1817. See Life in Italian by Cappi (1810).

Laocöon, according to classic legend, a priest of Apollo, afterwards of Poseidon, in Troy, who married against the will of the former god, and who warned his countrymen against admitting the wooden horse into Troy. For one or both of these reasons he was destroyed along

with his two sons by two enormous serpents which came up out of the sea. This legend is not Homeric, but of later origin. It was a favourite theme of the Greek poets, and is introduced in the *Æneid* (ii.) of Virgil. The subject is represented in one of the most famous works of ancient sculpture still in existence, a group discovered in 1506 at Rome, on the side of the Esquiline Hill, and purchased by Pope Julius II. for the Vatican. It was carried by Bonaparte to Paris in 1796, but recovered in 1814.

Laocöon.

The whole treatment of the subject, the anatomical accuracy of the figures, and the representation both of bodily pain and of passion, have always commanded the highest admiration. According to Pliny, it was the work of the Rhodian artists, Agesander, Polydorus, and Athenodorus; various dates have been assigned to it, from 200 B.C. till 200 A.D.; but the best authorities place its date at a little before 100 B.C. For an admirable æsthetic exposition of its merits, see Lessing's *Laocöon* (1766; new ed. with bibliography by Blümner, 1889; Eng. trans. 1836, 1853). There is a recent German Monograph by Kekulé (1883).

Laodamia, in Greek heroic history, the daughter of Acastus and wife of Protesilaus. Her husband was the first of all the Greeks who fell by a Trojan hand, being killed as he leaped on shore from his ship. Laodamia prayed the gods to give him back to her for but three hours. Her prayer was granted; Hermes led him back to the upper world; and, when the fatal moment to return had come, Laodamia died with him. This noble story has been treated by Wordsworth in verse worthy of the theme.

Laodicea, a name given to several cities—eight at least can be distinguished—founded or rebuilt by the Seleucid rulers of Syria; it is adapted from Laodice, a favourite name for the female relatives of these sovereigns. Of the cities so called, the most famous and most interesting was situated 2 miles from the banks of the river Lycus in Phrygia, and on the great commercial road leading from the Ionian cities to the Euphrates. The district in which it stands has frequently suffered from earthquakes, and the city was more than once in part overthrown by them. It finally began to decay at the period of the Ottoman invasions,

and is now a heap of uninteresting ruins, known as Eski-Hissar. Art and science flourished among the ancient Laodiceans; it was the seat of a renowned medical school, produced some famous philosophers, and in its mint was struck a valuable series of coins, which come down to the time of Diocletian. But its greatest importance is due to the fact that it was one of the chief homes of early Christianity, designated one of the seven churches of the Apocalypse, but doomed to unhappy memory as 'lukewarm and neither cold nor hot' (Rev. iii. 16). Probably the fact is traceable to the settlement here of great numbers of Jews at that period. The important ecclesiastical council of Laodicea, held here in 363, adopted resolutions concerning the canon of the Old and New Testaments, and concerning ecclesiastical discipline. A second council, held here in 476, condemned the Eutychians.—Another of these cities Laodicea will be found described under Latakia (q.v.).

Laomedon, king of Troy (q.v.), and father of Priam.

Laon, chief town of the French department of Aisne, is situated on a steep isolated hill (594 feet), 87 miles by rail N.E. of Paris. Occupying a naturally strong position, it has been a fortress since the 5th century; its citadel is surrounded with ruinous walls. From 515 to 1790 it was the seat of a bishop. The cathedral, a Gothic edifice of the 12th century with a handsome facade, and the bishop's palace, now used as a law court, still remain. The inhabitants are noted market-gardeners, producing excellent artichokes and asparagus. In the 10th century the city was the place of residence of the Carolingian kings, and capital of *Francia*. At Laon, on March 9 and 10, 1814, Napoleon I. was repulsed by the allies under Blücher and Bulow; and it surrendered to a German force on 9th September 1870, when the explosion of the powder-magazine by a French soldier cost some 500 lives. Pop. (1872) 10,243; (1891) 13,959.

Laos. See SHANS.

Láo-tsze, a celebrated philosopher of China, generally reputed to have been the founder of Taoism, which at the present day shares the allegiance of the Chinese with Confucianism and Buddhism under the appellation of San Chiáo, 'the three doctrines' or 'teachings.'

According to the most likely account, Láo's birth took place in 604 B.C., fifty four years before that of Confucius. His surname was La (meaning 'Plum'), and his name Erh (meaning 'Ear'), which after his death gave place to Fan, denoting some peculiarity in the form of his ears. He comes before us as a curator of the royal library in the capital city of Loh, not far from the present city of Loh yang in Ho-nan. The designation Láo tsze means the 'old philosopher.' The two Chinese characters may also be translated 'the old son or boy;' and the legendary writers have taken occasion from this to relate that the child was carried in his mother's womb for seventy-eight, some say for eighty-one, years, and that he was born with the white hair of an old man. Confucius and Lao seem to have met several times. One interview at the capital in 517 B.C. is pretty well established. It was not entirely amicable, but left a strong impression on the mind of Confucius. He said at the close of it to his disciples, 'To day I have seen the Old Philosopher (Láo tsze), and can only liken him to the dragon who mounts aloft on the clouds, I cannot tell how, and rises to heaven.' So it was that Li Erh came to be denominated 'Láo tsze.' Nothing certain can be said of the length of Láo's life. Sze-ma Ch'ien, the historian of ancient China, tells us that he cultivated 'the Táo and its characteristics,'

his chief aim being to keep himself unknown; that he resided long at the capital, and then seeing the decay of the dynasty of Chau, went away to the gate which led out of the royal domain towards the regions of the north-west; that there he was recognised by Yin Hsi, the keeper of the gate, the place of which is shown in the present Shan Chau of Ho-nan, and was prevailed upon to write out for him the treatise called the *Táo Teh King*, which has come down to us as the only record of his teaching. Ch'ien adds that after giving this writing to the keeper 'he went away, and it is not known where he died.' Such is the substance of all of importance which the great historian, writing in the 2d century B.C., could tell of Láo-tsze. He says nothing of the pre-existences attributed to him, nor of his subsequent travels in the west, where he became acquainted with the wisdom of India and even Judea. These and other marvels are later and fabulous additions to Ch'ien's brief account, and arose in imitation of the legends of Buddhism and through misconceptions of the meaning of the *Táo Teh King*.

Some doctrine of the Táo had come down from the most ancient times, and a father, or at least a most important teacher, of it is claimed in Hwang Ti, the mythical sovereign of the 27th century B.C. It served especially as a discipline adapted to promote longevity and to preserve life. Láo-tsze entered into this, and the doctrine assumed in his hands a more subtle character. It is not easy, however, to say what he meant by his Táo. 'It was the originator of heaven and earth; it is the mother of all things.' At the same time it is not a personal being. 'It might appear,' he says, 'to have been before God.' 'It gave,' says Chwang-tsze, the ablest of all Lao's followers, 'their mysterious existence to spirits and to God (or to gods).' The character Táo properly means 'path,' 'course,' or 'way;' and it is in this sense that Lao uses it. His 'great way' is but a metaphorical expression for the way in which things came at first into being out of the primal nothingness, and how the phenomena of nature continue to go on, in stillness and quietness, without striving or crying. Of the same kind should be the influence of the Táo in the conduct of individuals and of government. That things may come to the right and successful issue they must be carried on without effort or purpose. The secret of good government is to let men alone. The appeal to arms is hateful. All learning is injurious. The wisdom of men defeats its own ends. 'Táo works by contraries, and the secret of its strength is its weakness. In many of these teachings Láo-tsze may seem to be only a visionary dreamer, but he enunciates many lessons of a very high morality. Its fundamental quality is humility, which he compares again and again to water, soft and weak in itself, yet able to attack and overthrow the strongest and firmest things. With humility he associates gentleness and economy, and calls them his 'three precious possessions.' He even rises to the greatest of all moral principles, the returning of good for evil, and enunciates 'recompensing injury with kindness.' He nowhere speaks clearly of the state of man after death; but Chwang tsze teaches that life and death follow each other in endless succession, or like the sequence of the four seasons. There is nothing about religion or religious worship in the *Táo Teh King*. The origin of Taoism as a religion cannot be placed earlier than our 1st century. It was not till after Buddhism found its way to China that the other system began to have images, temples, monasteries, and nunneries. The pursuits of alchemy, communications with spirits, concoctions of the *elixir vita* and pills of immortality are among the phases which it has assumed at different times; but such things have no connection with the teaching of Láo tsze.

La Paz. (1) A department of Bolivia, bordering on Peru, with an area of 171,200 sq. m., and a pop. (1895) of 595,000, not including some 2500 wild Indians. The La Paz cordillera contains the loftiest peaks of the Bolivian Andes, and much of the surface of the department is a dry plateau; but in the east the great mountains sink to the plain, and the country is richly watered.—The capital, La Paz, lies at the foot of a steep valley 11,952 feet above the sea, 42 miles SE. of Lake Titicaca. It has a handsome but unfinished cathedral, and a college, seminary, and medical school; but the houses are mostly of mud, and owing to the extremely uneven site present a very irregular appearance. The inhabitants, mostly Indians and half-breeds, carry on an active trade in copper, alpaca-wool, cinchona, &c. Pop. (1889) 57,000.—(2) A town of Entre Rios province, in Argentina, on the Paraná, 530 miles by river N. by W. of Buenos Ayres. Pop. 6800.

La Pérouse. JEAN FRANÇOIS DE GALAUP, COMTE DE, a French navigator, was born near Albi, in Languedoc, on 22d August 1741. He distinguished himself in the naval war against England (1778-83), especially by destroying the forts of the Hudson Bay Company. Two years after the conclusion of peace he was chosen to command an expedition of discovery sent out by the French government. He sailed in August 1785 with two ships, visited the north-west coast of America, explored the north-eastern coasts of Asia, where by sailing through La Pérouse Strait between Saghalien and Yezo he discovered that each of these was a separate island. In February 1788 he sailed from Botany Bay; after that all trace of him was lost. In 1826 it was fully ascertained by the English Captain Dillon that both of La Pérouse's ships had been wrecked in a storm on a coral-reef off Vanikoro, an island lying north of the New Hebrides. The account of the early portions of La Pérouse's voyage, prepared from journals sent home by him, was published under the title of *Voyage autour du Monde* (4 vols. Paris, 1797; new ed. in 1 vol. 1888).

Lapis Lazuli (Lat., 'azure stone,' the *lazuli* being for Arabic *lazward*, the name of the stone; *azur* is a corruption of *lazward*), a mineral of beautiful ultramarine or azure colour, consisting chiefly of silica and alumina, with a little sulphuric acid, soda, and lime. The colour varies much in its degree of intensity. Lapis lazuli is often marked by white spots and bands. It is generally found massive, and is translucent at the edges, with uneven, finely granular fracture, but sometimes appears crystallised in rhombic dodecahedrons, its primitive form. It is found associated with crystalline limestone amongst schistose rocks and in granite, in Siberia, China, Tibet, Chili, &c. The finest specimens are brought from Bokhara. It seems to have been the only stone of any intrinsic value known to the Egyptians under the Pharaohs. The ancients used it much for engraving, for vases, &c. (see King's *Natural History of Gems*). It is extensively employed in ornamental and mosaic work, and for sumptuous altars and shrines. It is easily wrought, and takes a good polish. The valuable pigment called Ultramarine (q.v.) is made from it. It is one of the minerals sometimes called *Azure Stone*.

Lapithæ. a mythical race inhabiting the mountains of Thessaly. They were ruled by Pirithous,

a son of Ixion and half-brother of the Centaurs. At the marriage of Pirithous to Hippodamia, the Centaurs, flown with insolence and wine, attempted to carry off the bride and the other women, but were overpowered after a bloody struggle by the Lapithæ.

Laplace. PIERRE SIMON, MARQUIS DE, the greatest mathematician and theoretical astronomer since Sir Isaac Newton, born 28th March 1749, was the son of a poor farmer at Beaumont near Trouville, in Normandy. He studied at Caen, through the assistance of some charitable neighbours, and, after teaching mathematics at a military school in his native town, went to Paris and attracted the notice of D'Alembert by a paper on dynamics. When appointed professor in the Royal Military School he soon acquired a reputation by his mastery of the whole range of mathematical science and its application to certain difficulties in practical astronomy—solving a problem which both Euler and Lagrange had grappled with in vain. Chosen an associate of the Academy of Sciences in 1773 and member in 1785, he meanwhile, by his powerful grasp of the analytic method of dealing with gravitating masses, established the great generalisation that our planetary system is stable—that what had been termed irregularities were not disturbing the general equilibrium, but, on the contrary, necessary to it. This complete solution of the 'mechanical problem of the solar system,' as he termed it, has bestowed upon astronomy the 'Three Laws of Laplace.' Here, as well as in his great treatise to be presently mentioned, the special service of Laplace was that he set forth comprehensively in one homogeneous work the leading results which had severally been attained by Newton, Halley, Clairaut, and Euler, at the same time proving their harmony and interdependence. The singular insight of Laplace as an astronomer was apparent in his explanation of the 'secular inequalities' shown by ancient and modern observations in the motions of the planets Jupiter and Saturn. He was the first to construct a complete theory of the satellites of Jupiter, and his investigation of the tidal theory has been characterised by Airy as 'one of the most splendid works' in the history of mathematics.

The successive governments of France agreed in honouring Laplace. He helped to establish the Polytechnic and Normal Schools in Paris, became one of the first members of the Bureau des Longitudes, and soon after was appointed president. After the 18th Brumaire Bonaparte made Laplace Minister of the Interior, though only to supersede him in six weeks' time. In 1799 Laplace entered the senate, where he made a report on the necessity of returning from the Revolution calendar to the Gregorian; in 1803 he was appointed chancellor of the senate. He was created count under the empire, and in 1815 a peer, in 1817 a marquis, by Louis XVIII. His opponents attributed the latter honour to his having voted for the deposition of Napoleon in 1814, accusing him of servility, which was also alleged in 1827 when he became an 'ultra royalist.' Elected to the Academy in 1816, he was next year appointed president. In his memoir on the 'attraction of spheroids' are first set forth the two celebrated means of applying analysis to physical problems—Laplace's coefficients and the potential function—which are requisite in the theory of attractions and in the more abstruse parts of electrical science.

Besides many original treatises on the application of mathematical methods to lunar and planetary problems, molecular physics, electricity, and magnetism—mostly memoirs to the French academies—Laplace published the four following books. *The Mécanique Céleste*, with supplements (5 vols. Paris, 1799-1825), stands alone amongst works on mathe-

mathematical astronomy as a systematic demonstration of the highest results in natural philosophy. The *Exposition du Systeme du Monde* (1796; 6th ed. 1824) was written for non-mathematicians, and has been admired for the excellent style as well as for its clear and concise statement of all the leading astronomical facts and theories. In a note at the end of the later editions occurs the famous Nebular Hypothesis (see NEBULE), which many have deemed to be of not less importance than many of the results obtained by great mathematic effort. As early as 1784 Laplace issued his *Theorie du Mouvement et de la Figure des Planetes*, and in 1812-14-20 his *Theorie analytique des Probabilites*. The last remains a classic work to algebraists, though extremely difficult, the theory being applied not only to ordinary chances and averages, but to causes of phenomena and vital statistics.

Laplace was gifted with great power of memory and keen scientific sagacity, as well as with singular skill in interpreting nature by means of the higher mathematics. He showed some personal vanity, but was of an amiable disposition, frequently assisting young men of promising parts. His constant good health was partly attributable to his abstemiousness. Laplace died at Paris, 5th March 1827. In 1878 the Academy undertook a 13-vol. edition of his *Œuvres complètes*.

Lapland is neither a political nor a geographical unity; it is simply the collective name for the extensive region in the north of Europe that is inhabited by the Lapps. On the N. it is bounded by the Arctic Ocean, on the NW. by the Atlantic, on the E. by the White Sea; its southern limits coincide, roughly speaking, with 66° N. lat., though Lapps are sometimes found as far south as 63° N. lat. in Norway and Sweden. Norwegian Lapland is of course a mountainous country, its coasts cleft by the narrow, steep-walled fjords. In Swedish Lapland the most characteristic features are ridges with narrow valleys between, the latter generally partly filled with long, narrow lakes. Farther east, in Finnish and Russian Lapland, the surface is more level, the rivers and lakes become more numerous, marshes are frequent, and next the Arctic Ocean barren tundras; and many square miles are covered with forests of fir and spruce. Yet low ranges of hills occur in some districts, as, for instance, the Umebek Mountains, in the peninsula of Kola. Some of the lakes are of large size; Lake Enare or Inara, in Finnish Lapland, has an area of 1147 sq. m.; Lake Inuandja is 65 miles long by 9 wide; and Lake Nnot, 35 miles long by 7 wide. The river Tana, which flows north to the Arctic Sea, is the second longest river of Norway; and several other rivers of considerable size flow into the White Sea and the Gulf of Bothnia, as the Tulom, the Kemi, &c. The summer is short and comparatively hot, owing to the fact that the sun scarcely ever sinks below the horizon during the three months that summer lasts. During this period the mosquitoes are a terrible plague. For seven or eight weeks in winter the sun does not rise above the horizon; comparative darkness prevails all the time, except when the snow-covered landscape is illuminated by the weird conceptions of the aurora borealis. The cold in winter is excessive, the thermometer generally indicating sixty degrees of frost, and sometimes more; but owing to the prevalent stillness of the air the cold is not felt so severely as might be expected. The total Lapp population is about 28,000, thus distributed: 18,000 in Norway, 7000 in Sweden, nearly 800 in Finland, and 2000 in Russia. But there are also numerous settlers belonging to these four nationalities in Lapland, chiefly engaged in agriculture, hunting, trading, and in administrative work, some of them no doubt

the descendants of the criminals transported thither from Denmark three centuries ago.

The Lapps, who call themselves Sabme or Sabme-ladsjak (the Norwegians call them Finns, whilst the Finns they call Kvæns or Qvæns), belong to the Ural-Altaic stock, and are consequently closely related to the Finns (Suomi). As a race they are the shortest people in Europe (4 or 5 feet in height), and the most brachycephalic. In other respects they are spare of body, with dark, bristly hair and scanty beard, and short, often bandy, legs. Although not very muscular they are capable of great exertion and fatigue, and frequently live to a great age (eighty or more). The mouth is large, the lips thick, and the eyes small and piercing, but not obliquely set. The Lapps are usually distinguished as Mountain, Sea, Forest, and River Lapps. The Mountain Lapps, the backbone of the race, are nomads; they move constantly from place to place in order to find sustenance (Arctic moss) for their reindeer herds, their only source of wealth. In summer they go down to the fjords and coasts, but spend the rest of the year in the mountains and on the plains of the interior. The Sea Lapps, mostly impoverished Mountain Lapps, or their descendants, dwell in scattered hamlets along the coast, and live by fishing. The Forest and River Lapps are nomads who have taken to a settled mode of life; they not only keep domesticated reindeer, but hunt and fish. The nomad Lapps live all the year round in tents. The reindeer supplies nearly all their wants, except coffee, tobacco, and sugar. They live on its flesh and milk; they clothe themselves in its skin; and use it as a beast of burden. In winter, harnessed to a boat-shaped sledge (*putk*), it takes them the longest journeys, across frozen lakes and rivers, and over the mountains, and through the forests. It is computed that there are 400,000 reindeer in Lapland, for the most part semi-wild. In his personal habits and in his clothing the Lapp is the reverse of cleanly. He is, however, very good-natured, rather prone to self-indulgence when the opportunity presents itself (which is not often), but at other times sober enough. As a rule, he is 'saving, almost miserly,' selfish and 'cute in all his dealings,' not very trustworthy in the matter of speaking the truth, but on the whole inclined to take life easily. His imagination is easily excited, and he is readily susceptible to religious impressions of a sensational type; a notable 'epidemic' occurred at Koutokemo in Norwegian Lapland in 1848-51. The Lapps all profess Christianity; those of Norway and Sweden belong to the Lutheran Church, those of Russia to the Greek Church. Lapland witches, who are, more correctly speaking, wizards, have been famous from very early times. The principal instrument of divination was a curious oval-shaped drum, covered with a variety of figures and signs. In very early times the Lapps probably came much farther south in both Scandinavia and Russia; the bones of men of a short race, identified with the Lapps, have been discovered in several ancient Scandinavian burial mounds. The Norsemen treated the Lapps as a subject race as early as the 9th century, but had to reconquer them in the 14th; the Russians followed suit in the 11th, and the Swedes in the 16th. From the 13th to the 17th century the Lapps were kept in a state little better than slavery by Swedish adventurers known as Birkaadians. But at the present day both the Scandinavian governments bestow upon them every kindness.

Wind (1875); Lieutenant Temple in *Proc. Roy. Geog. Soc.* (1880); Leem, *An Account of the Laplanders of Finmark* (Pinker's *Voyages*); and David MacRitchie, *The Testimony of Tradition* (1890). For folklore, see also Fris, *Lappisk Mythologi*, &c. (1871); Donner, *Lieder der Lappen* (1876); and Poestion, *Lappplandische Marchen*, &c. (1885). Many Lapp and Finnish parallels are given in Jones and Kropf's *Magyar Folk-tales* (1889).

La Plata, the capital of the Argentinian province of Buenos Ayres, was founded in 1882, after Buenos Ayres city, from which it is about 30 miles S.E., had been made the federal capital. The new city was rapidly built, with wide streets, that are now mostly paved, and over a score of open squares; the central portion is lit with the electric light, the rest with kerosene lamps, and there is a service of tramways. The only buildings of note are the handsome capitol and other offices of the government, an observatory, several chapels, and a fine railway station. There are scores of hotels, inns, and cafes. The city has a college, and, 7 miles away, a hospital and an asylum for the insane. Among the manufactories already established is one of cotton and woollen tissues. A canal connects a harbour which has been constructed at La Plata with a larger outer harbour at Ensenada, on the La Plata River. Pop. (1888) of municipality (including, however, Ensenada and a country district of nearly 60 sq. m.), 50,803.

La Plata, Rto DE, a wide estuary of South America, between Uruguay on the north and the Argentine Republic on the south, through which the waters of the Parana and the Uruguay sweep down to the ocean. It is about 200 miles long, 28 wide at Buenos Ayres, and 140 miles broad at its mouth, between Maldonado and Cape San Antonio. The northern shore is somewhat steep and lofty, but that along the province of Buenos Ayres is low and flat, with wide sandbanks that prevent ships from approaching closely to the shore. The estuary has thus no shelter from the tempestuous storms that come from the south-west; and even the only good harbour, that at Montevideo, is open to the south-east. The affluents of the La Plata drain an area estimated at 1,600,000 sq. m., and the outflow of the estuary is calculated at about 52,000,000 cubic feet per minute—a volume exceeded only by that of the Amazons; the yellow, muddy stream is recognisable 60 miles out at sea. For the navigation of the affluents, see PARAGUAY, PARANA, and URUGUAY. The estuary was discovered in 1515 or 1516 by Diaz de Solis, who was shortly afterwards roasted and eaten by the Indians on its bank. See Sir Horace Rumbold's *Great Silver River* (2d ed. 1890).

La Porte, capital of La Porte county, Indiana, at the junction of several important railways, 50 miles ESE. of Chicago. It manufactures wooden and woollen goods, and ships large quantities of ice. Pop. 7195.

Lappenberg, JOHANN MARTIN, a German historian, was born 30th July 1794, in Hamburg, and pursued historical and political studies in Edinburgh, London, Berlin, and Göttingen. He became the representative of his native city at the Prussian court in 1820, and in 1823 was appointed keeper of the archives to the Hamburg senate, an appointment which he held for forty years. He died at Hamburg on 28th November 1865. The book by which he is best known is the careful and painstaking *Geschichte von England* (2 vols. 1834-37), which was continued by Pauli (3 vols. 1853-58), and translated into English by B. Thorpe (3 vols. 1845-57). Besides this Lappenberg completed Sartorius's *History of the Origin of the German Hansa* (2 vols. 1830), wrote books on the history of Heligoland and the Steelyard in London, and edited

valuable historical documents relating to Hamburg and Bremen, and old chronicles, such as Thietmar of Merseburg, Arnold of Lubbeck, &c. These latter for Pertz's *Monumenta Germanica Historica*. See Memoir by E. H. Meyer (1867).

Lapsed (*Lapsa*), the designation applied, in the early centuries of the Christian church, to those who, overcome by heathen persecution, did not continue faithful to the Christian religion. They were distinguished according as they had sacrificed (*sacrificati*) or burned incense (*thurificati*) to idols, or had purchased a certificate (*libellus*) from the authorities to the effect that they had done so (*libellatici*). Afterwards, during the Diocletian persecution, those were included among the lapsed who had given up copies of the Scriptures (*traditores*). The lapsed were at first punished by excommunication, and their reception into the church again was strenuously resisted; but in the 3d century a milder course was generally adopted with regard to them. The treatment of the lapsed was one of the practical questions most earnestly discussed in the early church. See NOVATIANS, also DONATISTS.

Lapwing (*Vanellus vulgaris*), a common British bird in the plover family Charadriadae. The familiar cry is echoed in the names *Peewit*, Scotch *Pee-weep*, Old English *Wape*, and French *Deshout*, while the regular, slow flapping of the long, rounded wings is referred to in the title lapwing. It

Lapwing (*Vanellus vulgaris*).

usually resides in Britain all the year, and is widely distributed across Europe and Asia. Its haunt are marshy pastures and moorlands; its food worms, slugs, and insects; its nest little more than a depression in the ground; its eggs, four in number, olive green to stone-buff in ground colour, with blackish brown blotches, are laid in April. When disturbed the female runs from the nest, while her mate, with devils flight and anxious cries, strives to divert attention away from the nest. After the young are hatched, the parents both exhibit loving solicitude. The adults are about a foot long, with crested head and very beautiful plumage, which almost baffles brief description. The birds themselves are eaten, and the eggs are highly esteemed. Most of the plover eggs sold in Britain are lapwings' eggs gathered in the Netherlands and North Germany. See PLOVER; and Howard Saunders, *Manual of British Birds*.

Lar, capital of the district of Laristan, in south Persia, situated on a well wooded plain, 60 miles from the Persian Gulf and 170 S.E. of Shiraz; with trade in tobacco, cotton, and grain. Pop. 12,000.

La Ramée. See OUDA.

Laramie, a river which rises in northern Colorado, flows generally N.E. through south-eastern Wyoming, and enters the North Fork of the Platte at Fort Laramie, after a course of about

200 miles. It gives name to a large county of Wyoming; to the Laramie Plains, a treeless plateau of Wyoming, about 7500 feet above sea-level, and some 3000 sq. m. in extent; and to the Laramie Mountains, a Rocky Mountain range which bounds this plateau on the north and east. Laramie City, Wyoming, on this great plain, and on the Union Pacific Railroad, 573 miles W. of Omaha, has a rolling-mill and railway shops. Pop. 6388.

LARAMIE BEDS. The name given by American geologists to certain strata which appear to be intermediate in age between the Cretaceous and Tertiary. The strata are well developed in Utah and Wyoming, and consist chiefly of lacustrine strata; they contain numerous seams of lignite, and hence are often called the lignitic series. While the vertebrate remains of the Laramie are essentially Mesozoic in character, the plants are just as unequivocally Tertiary. It would seem from this that a Tertiary flora was contemporaneous with a Cretaceous fauna.

Larboard. See STEERING.

Larceny. See THEFT.

Larch (*Larix*), a genus of trees of the natural order Coniferae, differing from firs (*Abies*) in having the cones ovate-oblong, about an inch in length, the scales of which are attenuated at the tip, and not falling off from the axis of the cone when fully ripe, and the leaves deciduous and in clusters, except on shoots of the same year, on which they are single and scattered. The Common Larch (*L. europaea* or *Abies Larix*) is a native of the mountains of the south and middle of Europe, and is found also in Asia, where it extends much farther north than in Europe, even to the limits of perpetual snow. The date of the introduction of the larch into Britain is fixed by some authorities at about 1629; but it was for many years treated as a rare and curious plant, and grown in pots in green-houses by the few that possessed it, till about the middle of the 18th century,

Common Larch (*Larix europaea*):
a, twig with shoots; b, twig with male (m)
and female (f) flowers; c, mature cone;
d, needle with section.

when it began to be extensively planted as a forest-tree. It has changed the aspect of whole districts, particularly in Scotland, where it was introduced at Dawick, Peebleshire, in 1725, and at Dunkeld and Blair, Perthshire, in 1738. The perfectly erect and regularly tapering stem of the larch, its small branches, its regular conical form, and its very numerous and very small leaves, make its aspect peculiar, and very different from that of any other tree seen in Britain. It attains a height of 60 to 100 feet, and an age of 200 years. The larch grows rapidly, and is useful even from an early age; the thinnings of a plantation being employed for hop-poles, palings, &c., and the older timber for a great variety of purposes. It is very resinous, does not

readily rot (many notable Italian pictures are painted on panels of larch), is not readily attacked by worms, and is much used in shipbuilding. It is, however, very apt to warp, and is therefore not well suited for planks. Larch bark is used for tanning, although not nearly equal in value to oak-bark. In Siberia, where large tracts of larch-forest are not unfrequently consumed by accidental fires, the scorched stems yield, instead of a resin, a gum similar to gum-arabic, reddish, and completely soluble in water, which is known as *Orenburg Gum*, and is used for cementing and in medicine, and, notwithstanding a somewhat resinous smell, even as an article of food. In warm countries a kind of Manna (q.v.) exudes from the leaves of the larch in the hottest season of the year, having a sweetish taste, with a slight flavour of turpentine. It is gathered principally in France, and is known as *Briançon Manna*, or *Larch Manna*. The larch woods of Britain have of late years suffered greatly from a disease in which the centre of the stem decays; the nature and causes of this disease are very imperfectly understood, but it seems to be sufficiently ascertained that those plantations are peculiarly liable to it which are formed where any kind of fir has previously grown, and those least so which are regularly thinned, so that the trees enjoy abundance of fresh air. The larch does not dislike moisture, but stagnation of water is very injurious to it, and thorough drainage is therefore necessary. There are varieties of the common larch remarkable for crowded branches, for pendulous branches, and for other peculiarities, which are sometimes planted as ornamental trees. The Common American Larch (*L. americana*)—the Tamarack or Hackmatack—distinguished by very small cones, is common in the northern parts of North America, and on the Alleghany Mountains, often covering extensive tracts. It is a noble tree, much resembling the common larch, and its timber is highly valued. Other American species are the Western Larch (*L. occidentalis*)—also called Tamarack—and the smaller, alpine, *L. Lyallii*. The Himalayan Larch (*L. Griffithsii*) abounds in the Himalayas, but is generally a small tree, 20 to 40 feet high. Its cones are larger than those of the common larch. The Golden Larch (*L. Komperi*), a native of Japan, is described by Fortune, who introduced it in 1832, as a beautiful tree growing to the height of about 120 to 130 feet, with corresponding girth of bole. It has not proved hardy in any except the mildest parts of Britain. See C. Y. Michie, *The Larch* (Edin. 1882).

Lard, the fat of the hog. Until after the first quarter of the 19th century lard was only used for culinary purposes and as the base of various ointments in medical use. The enormous extent, however, to which pork was raised in America rendered it necessary to find some other applications for so valuable a material, and large quantities were pressed at a low temperature, by which the stearine and oleine were separated. The former was used for candle-making; and the latter soon became an important article of commerce as a lubricant, under the name 'lard oil,' which was found to be a valuable lubricant for machinery. See OIL, STEARINE.

Lardner, DIOXYSIUS, a successful populariser of physical science, was born in Dublin, 3d April 1793, and, after four years as clerk to his father, a solicitor, entered Trinity College. He first attracted attention by a *Treatise on Algebraic Geometry* (1823), and a work on *Differential and Integral Calculus* (1825). But he is best known as the originator and editor of *Lardner's Cyclopaedia*, a series of 132 volumes on scientific subjects, published between 1830 and 1844. Lardner himself wrote the volumes treating of

mechanics, hydrostatics, geometry, arithmetic, heat, and electricity. This was followed up by the historical series entitled the *Cabinet Library* (12 vols. 1830-32) and *Museum of Science and Art* (12 vols. 1854-56). He also wrote several useful handbooks of various branches of natural philosophy. In 1828 Lardner had been appointed professor of Natural Philosophy and Astronomy in University College, London; but in 1840 he lost his chair through running away with the wife of an army officer, who claimed £8000 damages from him. However, Lardner went to the United States, and there made five times that sum by lecturing. He lived in Paris from 1845 to 1859, and died at Naples on 29th April 1859.

Lardner, NATHANIEL, an English divine, was born at Hawkshurst, in Kent, in 1684, and studied in London, afterwards at Utrecht and Leyden. He belonged to a body of English Presbyterians who had become Unitarians. He died at Hawkshurst on 24th July 1768. His *Credibility of the Gospel History* (2 vols. in 1727 and 12 vols. in 1733-55) and his *Jewish and Heathen Testimonies* (4 vols. 1764-67) have secured for him a place among the modern apologists for Christianity. See the Life by Kippis prefixed to his works (10 vols. 1788).

Larcan, EDMUND, French Canadian author, was born at St. Gregoire, Province of Quebec, 12th March 1848, and was educated at the college of Ste. Marie de Mannoir, at Victoria College, and at McGill University. He was called to the bar in 1870, became professor of Law in McGill University in 1876, and in 1886 was elected in the Liberal interest to the provincial legislature. His works, written in French, include histories of Canadian law (1872) and literature (1874), and *Melanges historiques et littéraires* (1877).

Lares, Penates, Manes. The Lares were tutelary deities belonging originally to the Etruscan religion, and worshipped especially as the protectors of a particular locality. In Roman usage they were usually regarded as the tutelary deities of a house (*familiares* or *domestici*), and their images stood on the hearth in a little shrine (*achæ*), or in a small chapel (*lararium*). We find also *Lares compitales* (of cross-roads), *Lares vicinarii* (of streets), *Lares rurales* (of the country), &c. See ANCESTOR WORSHIP.

The Penates were the old Latin guardian deities of the household, and of the state regarded as a union of households. Their seat was originally in Lavinium, and the name is generally joined with *Di*. By a natural enough case of metonymy both the words Penates and Lares came to be used as equivalent to a home or a hearth.

The Manes were the deified souls of the departed, the gods of the Lower World considered as benevolent spirits, in contrast to *laræ* and *lemures*, malevolent spirits; but the name frequently applied merely to the departed spirit, ghost, or shade of a dead person.

These divinities were by no means exactly differentiated from each other, and obviously all owed their existence to the fundamental ideas underlying the worship of ancestors, with its altar, the domestic hearth—the most persistent and perhaps the oldest of all the religions of man.

Largo, a village of Fife, on Largo Bay, and at the base of Largo Law (965 feet), 13 miles N.E. of Kirkeady. It has a bronze statue by T. Stuart Burnett (1885) of Alexander Selkirk, who was born here. Pop. of parish, 2324.

Largo, an Italian word, used in music, to denote very slow time, and especially in compositions where the sentiment is quite solemn. *Larghetto* is the diminutive of *Largo*, the time being slightly quicker.

Largs, a watering-place of Ayrshire, on the Firth of Clyde, 14 miles S. of Greenock, and 11 N. of Ardrossan by a railway opened in 1885. Here on 12th October 1263, in a war between Scotland and the Norse colonies of Man and the Isles, Alexander III. defeated Haaco of Norway, who with 160 ships and 20,000 men had descended on the coast of Ayrshire. Pop. (1851) 2824; (1891) 3187. See *Wemyss Bay and Largs* (Paisley, 1879).

Laricio. See PINE.

Larida. See GULL.

Larissa (called by the Turks *Yenisher*), famous in ancient times as the chief town of Thessaly, is now a place of 13,169 inhabitants, one-third Greeks and one-third Turks. Larissa was ceded by Turkey to Greece in 1881. It stands on the *Salambría* (anc. *Peneus*), in the fertile plain of Thessaly, and has manufactures of silk, cotton, and tobacco. It was the centre of the Turkish operations in the war of Greek Liberation, and was occupied by the Turks in the war of 1897.

Laristan, the south-west part of the Persian province of Kerman (q.v.). Area, 22,954 sq. m.; pop. about 90,000.

Lark (*Alauda arvensis*), a familiar songster, otherwise well known as the symbol of poets and the victim of epicures. It is included among Passerine birds, type of the family Alaudidae,

Lark (*Alauda arvensis*).

which comprises over 100 species, widely distributed in Europe, Asia, and Africa, with straggling in Australia and North America. The plumage is usually sandy brown, the colour of the ground; the lower legs bear scales, behind and before; the hind-claw is very long and straight; the bill is strong and conical. The skylark measures about 7 inches in length; the males and females are alike in plumage; the food consists of insects, worms, and seeds. It nests in April, making a structure of dry grass in a hollow in the ground, usually among growing grass or cereals. The eggs (three to five) are dull gray, mottled with olive-brown; two broods are usually reared in the season. Great crowds of larks come to Britain from the Continent in autumn, and later on there is a general movement southwards. It has been introduced into Australia and New Zealand, and to some extent in the United States.

'The lark is a creature of light and air and motion, whose nest is in the stubble and whose trust is in the clouds.' Its song 'at heaven's gate,' idealised by Shelley, Wordsworth, Hogg, and other poets, 'is not especially melodious, but blithesome, sibilant, and unceasing.' 'Its type,' Burroughs well says, 'is the grass, where the bird makes its home, abounding, multitudinous, the notes nearly all alike and in the same key, but rapid, swarming, prodigal, showering down as thick and fast as drops of rain in a summer shower.' The bird very

rarely sings on the ground, but when soaring or descending.

There is no doubt that larks when very numerous, as they often are, may do considerable damage to autumn-sown wheat or young green crops. This fact is sometimes urged to excuse the custom of catching them for the cage or table. They are caught in horse-hair nooses, or netted, or shot after being attracted and mesmerised by 'twirling' some bright glistening object. It is estimated that, during last century, in Leipzig alone over five million larks were received annually; in 1854 there were brought to the London markets over 400,000; and the official returns state that in 1867-68 more than a million and a quarter were taken into Dieppe.

In Europe there are several other common species of lark—e.g. the Wood-lark (*L. arborea*) and the Crested Lark (*L. cristata*), the former of which is locally distributed in England and Wales, and the latter a rare visitor. Among the other genera may be noted the Shore or Horned Larks (*Otocorys*), with a hornlet over each eye; these are 'the only larks which occur regularly in the western hemisphere.' One species (*O. alpestris*) has occasionally been found as a straggler in Britain, just as the species of *Alauda* occasionally wander beyond their usual range.

Larkhall, a small town of Lanarkshire, 3 miles S.E. of Hamilton, with coal-pits and mills. Pop. 8349.

Larkhana, the capital of a district called the Eden of Sind, stands 150 miles N. of Hyderabad by rail. It manufactures silk and cotton cloth, and has a great cotton market. Pop. 13,188.

Larkspur (*Delphinium*), a showy and popular genus of garden-flowers of the natural order Ranunculaceæ, natives of the temperate and cold regions of the northern hemisphere, and comprising both annual and perennial species. The well-known Rocket Larkspur (*D. Ajacis*), a native of Switzerland, and the Branching Larkspur (*D. consolida*), a native of most parts of Europe, doubtfully so of Britain, are familiar examples of the annual species; and Barlow's Larkspur (*D. Barlowii*) and the Great-flowered Larkspur (*D. grandiflorum*) are not unfrequent examples of the perennial species; but many more showy varieties have been produced by cultivation and selection which have displaced the older-fashioned species. *D. glauciale* is one of the most distinctively alpine plants in the world. *D. Staphisagria*, corrupted to *Stavesacre*, yields an alkaloid extract from its seeds, named *Delphinine*, which is highly poisonous even in very small doses, acting chiefly on the nervous system.

Larnaka (ancient *Citium*), the chief port of Cyprus, 27½ miles S. of Nicosia. A small fort built by the Turks in 1625 is now used as the district gaol, and the English have built a convenient courthouse, custom-house, and other public offices on the sea front, as well as two iron piers accessible at all times by small boats. Sea-going vessels are obliged to lie ½ mile from the shore owing to the shallow water. The Greek church of St Lazarus, an ancient Byzantine building, is in good preservation, and there is an English burial-ground attached to it with monumental inscriptions as old as 1685. Even if *Citium* be not the *Citium* of the Old Testament, it is certain that the king of *Citium* paid tribute to the Assyrian Sargon in 707 B.C. as appears from a cuneiform inscription on a bas-relief dug up at Larnaka in 1846, and now in the museum at Berlin. Carobs, or locust-beans, cotton, and grain are exported; and goods of western manufacture of all kinds are imported, chiefly from Germany. A most interesting fair called *katakismos*, 'the deluge,' and held every

year fifty days after the Greek Easter, is traditionally supposed to be the anniversary of the birth of Aphrodite, and is attended by Orthodox Christian Cypriots from all parts of the island in immense numbers (cf. *Herodotus*, i. 199). Pop. 7833.

Larne, a market and seaport town of County Antrim, at the entrance of Lough Larne, 25 miles N.E. of Belfast by rail. There is daily communication with Stranraer by mail-steamer. Pop. 4522.

La Rochefoucauld, FRANÇOIS, DUC DE, was born at Paris on the 15th September 1613. He belonged to an old family, and his father was made a duke by Louis XIII. in 1622. During his youth he was known as the Prince de Marsillac. His education was somewhat neglected. He joined the army when a boy, and was present in his seventeenth year at the siege of Casal. His life, says Sainte-Beuve, might be divided into four periods, to each of which might be assigned the name of a woman—viz. Mme de Chevreuse, Mme de Longueville, Mme de Sablé, and Mme de la Fayette. As a young man he showed an ultra-romantic temperament. Under the influence of Mme de Chevreuse he devoted himself to the cause of the queen in opposition to Richelieu, and became entangled in a series of love-adventures and political intrigues, the result being that on the flight of Mme de Chevreuse he was forced to live in exile at Vertueil from 1639 to 1642. About 1645 he formed a liaison with the beautiful Mme de Longueville. He then joined the Frondeurs and was severely wounded at the siege of Paris. He was very unlucky in his political schemings. His father died in 1650, and in 1652 he was again badly wounded, whereupon he retired to the country to restore his health, which had been shattered by twenty years of battle and adventure. On Mazarin's death in 1661 he repaired to the court of Louis XIV., and about the same time began his liaison with Mme de Sablé. A surreptitious edition of the *Mémoires*, which he had written while living in retirement, was published by the Elzevirs in 1662, and as the book gave wide offence he disavowed its authorship, without, however, finding many to accept his denial. His *Reflexions, ou Sentences et Maximes Morales* appeared in 1665. No book, said Voltaire, did more to form the taste of the nation. The first edition contained 316 *maxims*, which were afterwards expanded to about 700. His last years were brightened by his friendship with Mme de la Fayette, which lasted until he died at Paris on March 17, 1680. In his early life he had married Andree de Vivonne, by whom he had five sons and three daughters.

The *Maxims* vary in length from two or three lines to about half a page. For brevity, clearness, and finish of style they could hardly be excelled. Their writer did not seek to play the part of the mere epigrammatist, though he has now and then sacrificed his thought for the sake of striking and pointed expression. A vein of melancholy runs through the book. It is the work of a man of singularly keen and subtle intellect, who was deeply versed in life, and had formed independent judgments on most of its relations. He was a remorseless analyst of man's character. 'Everything is reducible to the motive of self-interest'—such is usually said to be the key-note of all his philosophy. That is not, however, exactly correct, though it is true of the book in the main. La Rochefoucauld tracks out self-love in its most elusive forms and under its cunningest disguises. He lays it bare with the most piercing insight and pitiless trenchancy. But he occasionally overstates his case against humanity, through forgetfulness of the fact that self-love is not the only motive by which men are impelled. Read in certain moods, the *Maxims*

seem a crushing exposure of man's baseness and folly; read in others, they seem little better than a morbid libel on human nature. But of their writer's depth and keenness as a thinker there can be no more question than there can of his wonderful mastery of terse and incisive phrase.

See French Life by Bourdieu (1895), and the article on 'La Roche-toucauld' included in Sainte-Beuve's *Portraits de Femmes*. The best edition of his works is that by Gilbert and Gourdaud (3 vols, 1868-84), in the series of *Grands Ecrivains de la France*.

Larochejaquelein. DU VERGER DE, an old noble family of France. The name Du Verger is derived from a place in Poitou. Guy du Verger married, in 1505, the heiress of the seigneur of Larochejaquelein. Several of his descendants distinguished themselves by their devoted loyalty to the old royal house against the fury of the French Revolution.—HENRI, Comte de Larochejaquelein, born in 1772, was an officer in the guard of Louis XVI., and after the 10th of August 1792 left Paris to put himself at the head of the insurgent royalists in La Vendée. He signalled himself by many heroic deeds, and for a time successfully repelled the republican forces, but was severely defeated by Westermann, 21st December 1793, and escaped with difficulty. He raised a new body of troops, however, in Upper Poitou, but was killed in a battle at Nonafle, 4th March 1794. His heroic words to his soldiers are memorable beyond most: 'Si je recule, tuez-moi; si j'avance, suivez-moi; si je meurs, vengez-moi!'—His brother, LOUIS DU VERGER, Marquis de Larochejaquelein, born in 1777, emigrated at the commencement of the Revolution; returned to France in 1801, but resisted all Napoleon's efforts to win him, and in 1813 placed himself at the head of the royalists in La Vendée. Louis XVIII. appointed him in 1814 to the command of the army of La Vendée, and during the Hundred Days he maintained the royalist cause there, supported by the British. He fell in battle at Pont-des-Mathis, 4th June 1815. His wife, MARIE-LOUISE VICTOIRE, Marquise de Larochejaquelein (1772-1857), published *Mémoires* of the war, of which she was an eye-witness (Bordeaux, 1815), which are of real value to the historian. See her Life by Nettement (3d ed. Paris, 1876).

La Rochelle. See ROCHELLE.

Larrey. DOMINIQUE JEAN, BARON, a celebrated French surgeon, was born at Beaudéan, near Bagnères-de-Bigorre, in the Pyrenees, in July 1766, studied medicine in Toulouse, and after graduating served as surgeon in the navy. But in 1793 he transferred his skill to the army, and introduced the 'flying ambulance' service. After teaching for a short time at Toulon and Val de Grâce, he joined Napoleon in Italy in 1797; and from that time onwards invariably accompanied the successful Corsican in his campaigns. In 1805 he was placed at the head of the medico-surgical department of the French army, and a few years later was created a baron of the empire. Larrey continued to fill important offices till 1836, when he retired from that of surgeon-general of the Hôpital des Invalides. He died at Lyons, 25th July 1842. From his pen came valuable treatises on army surgery and the treatment of wounds; they were translated into most European languages. See the German memoir by Werner (1885).

Larva. the young form of an animal after leaving the egg, but before acquiring adult characteristics. Tadpoles of Frogs (q.v.), caterpillars of Insects (q.v.), nauplii and zoeæ of Crustaceans (q.v.), the quaint young of Echinodermis (q.v.), &c. are good illustrations. There may be no larval stage, when the embryo grows continuously

into the adult form; on the other hand, the larval life may be longer than that of the adult. Many larval characters are recapitulations of ancestral forms; others are special modifications adaptive to larval life. See the Rev. J. Seymour's *Larva Collecting and Breeding* (1890).

Larynx (Gr. *larynx*) is the organ of voice, and plays an important part in the respiratory process, as all air passing either to or from the lungs must pass through it. It is a complex piece of mechanism, resembling a box composed of pieces of cartilage which are capable of executing movements, and enclosing the vocal-cords by which phonation is produced. The larynx is situated between the *trachea*, or windpipe, and the base of the tongue, at the upper and front part of the neck, where it forms a considerable projection (especially in men); it opens superiorly into the *pharynx*, or throat, and inferiorly into the windpipe. The principal cartilages of which the skeleton of the larynx is composed are five in number—viz. the thyroid and cricoid cartilages, the epiglottis, and the two arytenoid cartilages.

The *thyroid* (Gr., 'shield-like') consists of two square plates of cartilage united in front at an acute angle, which forms the projection commonly known as the *prominens Adami*, or Adam's apple. Each of these plates is prolonged at the upper and lower posterior corners. The thyroid cartilage forms almost the whole of the anterior and lateral walls of the larynx. The *cricoid* (Gr., 'ring-like') cartilage is a ring the lower margin of which is parallel to the first ring of the trachea, and to the last-named it is united by fibrous membrane. Its upper border is connected in front with the lower border of the thyroid cartilage by a thick yellow-fibrous tissue. It presents two articular surfaces on either side—viz. a lower, which articulates with the inferior cornu of the thyroid cartilage, and an upper, which is oval in form, and supports an arytenoid cartilage. The *arytenoid* (Gr., 'ladle-like') cartilages are pyramidal bodies resting on the oval articular surfaces at the upper and posterior part of the cricoid cartilage.

Fig. 1.

Cartilages of larynx and epiglottis, and upper rings of trachea, seen from behind: a, arytenoid cartilages; b, superior cornu of thyroid cartilage; c, its inferior cornu; d, posterior surface of cricoid; e, epiglottis, with its perforations; f, upper margin of thyroid; h, its left inferior tubercle; g, trachea.

When *in situ* they present a concave posterior surface. From their connection with the vocal cords, and from their great mobility as compared with the two larger cartilages, the arytenoids play a very important part in the mechanism of the larynx. The *epiglottis* is a very flexible cartilaginous valve (fig. 1, e), situated at the base of the tongue, and covering the opening of the larynx. Its direction is vertical, except during deglutition, when it becomes horizontal. It is attached inferi-

only by a kind of pedicle to the angle of the thyroid cartilage. Upon removing the investing mucous membrane the cartilage is found to be perforated by numerous foramina. Each perforation admits some fasciculi, of yellow, elastic, ligamentous tissue, which expands on its anterior aspect, and secures the return of the epiglottis to its vertical position, independently of any muscular action. Such is the skeleton of the larynx, hanging as it does from the hyoid bone, with which it is connected by the thyro-hyoid ligament and certain muscles.

The various cartilages which have been described are connected with one another by ligaments, the chief of which are those known as the true and false vocal cords. In their quiescent state the former do not lie parallel to each other, but converge from behind forwards. The length of the vocal cords is greater in the adult male than in the adult female, in the ratio of three to two. In infancy they are very short, and increase regularly from that period to the age of puberty. The mucous membrane of the larynx is part of the extensive respiratory tract, and is remarkable for its extreme sensibility. The length of the chink or aperture of the glottis, which is directed horizontally from before backwards, varies, like the

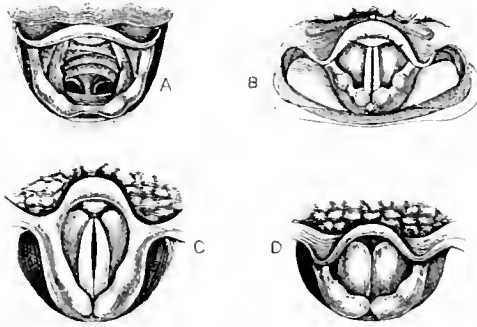

Fig. 2.

A, Larynx and trachea during deep inspiration; B, on phonation; C, during expiration; D, approximation of the ventricular bands or false cords as it occurs in straining.

vocal cords, until the period of puberty, when its length, in the male, undergoes a sudden development, while in the female it remains stationary. In the adult male it is about eleven lines in length.

The larynx is provided with two sets of muscles: the *extrinsic*, by which the whole organ is elevated or depressed, and the *intrinsic*, which regulate the movements of the various segments of the organ in relation to one another. By the action of these latter muscles, aided, in some cases, by the extrinsic muscles, the tension of the vocal cords may be increased or diminished, and the size of the opening of the glottis regulated at will (see VOICE). The nerves of the larynx are derived from the superior and inferior laryngeal branches of the pneumogastric or vagus nerve.

That the larynx is the organ of voice is easily proved. Thus, alteration in the mucous membrane covering the vocal cords causes hoarseness or other change of voice; ulceration of the vocal cords destroys or injures the voice; opening the trachea below the vocal cords, or section of the inferior laryngeal nerves, destroys the voice; and sounds like those of the voice may be produced by experiments on the dead larynx.

DISEASES OF THE LARYNX.—*Laryngitis*, or inflammation of the larynx, may be either an acute or a chronic affection. Acute laryngitis, in its more

severe form, which is fortunately rare, commences with a chill, which is followed by fever, with a full strong pulse, a hot skin, and a flushed face. There is also soreness of the throat, hoarseness of the voice, great difficulty in swallowing, and a feeling of extreme constriction of the larynx. There is a painful stridulous cough, but only a little mucus is ejected. Great difficulty in breathing occurs in severe cases, the act of inspiration being prolonged, and wheezing results, in consequence of the swollen membrane of the glottis impeding the entrance of air. On examining the larynx, the epiglottis is observed to be of a bright red colour, erect, and may be so much swollen as not to be able to descend, and may close the glottis during deglutition; the other parts of the larynx are seen to be more or less swollen according to the severity of the case. The patient may exhibit symptoms of great anxiety and distress; his lips may become blue, his face of a livid paleness, his pulse irregular and very feeble, and at length he may sink into a drowsy state, often preceded by delirium, and quickly followed by death. The disease is very rapid, ending, when fatal, in three or four days, and occasionally in less than one day. Although we have here described what may occur in exceptionally severe cases, acute laryngitis rarely passes beyond hoarseness, a feeling of constriction, slight feverishness associated with cough and marked hoarseness.

Laryngitis is most commonly due to exposure to cold; but the inflammation rarely reaches a dangerous height in these cases. The dangerous forms are usually the result of injury (e.g. swallowing boiling or corrosive substances); or they may be a secondary result of ulceration, or due to infection, such as erysipelas. In simple cases confinement to a warm room, with soothing steam inhalations, will, if the voice be rested, usually effect a cure. In severe cases sucking ice, leeching, scarification of the swollen parts, and even tracheotomy may be necessary. In persons who use the voice much the affection is apt to become chronic, or indeed to be chronic from the beginning without the super-vention of an acute attack. Laryngotomy is discussed at TRACHEOTOMY.

Ulceration may occur in phthisis, syphilis, lupus, and after typhoid fever. Cancer of the larynx may lead to ulceration, but the primary disease constitutes a tumour. Innocent growths are also met with, the more common varieties being papillomata (warts) and fibromata. Paralysis of the laryngeal muscles may involve those muscles only which close the glottis, in which case the affection is often due to hysteria and easily cured. Paralysis of the muscles which open the glottis or affecting all the muscles is usually due to some grave disease of the nervous system, chest, or throat, and is often incurable. The treatment must depend upon the condition discovered by laryngoscopic examination in each case.

THE LARYNGOSCOPE.—Although successful attempts had been previously made by Garcia to explore the recesses of the larynx by means of a reflecting mirror, it was not until two German physiologists, Turek and Czernak, took up the subject, in 1857 and 1858, that the great importance of laryngoscopy was first generally recognised. The laryngoscope is a small mirror placed on a stalk attached to its margin, at an angle of from 120° to 150°, the stalk being about six inches in length. The mouthpiece of a large reflector, with a central opening through which the observer looks, is held between the molar teeth; or, what is better, the reflector may be attached to a spectacle frame or forehead band by a stiffly working ball-and-socket joint. The rays of the sun or of a good lamp are concentrated by means of this

reflector on the laryngeal mirror, which is placed against the soft palate and uvula. The laryngeal mirror, previously warmed, and introduced with the right hand, which rests by two fingers on the jaw, is maintained at such an inclination that it throws the light downwards and illuminates the parts to be examined, while at the same time it reflects the images of these parts into the eye of the observer through the central opening of the reflector. By this means we can look through the larynx into the trachea or windpipe, and can see the actual position of small tumours, ulcers, &c., whose existence would otherwise have been at most only suspected; and the precision and accuracy of diagnosis to which we can thus attain enable us to employ rational means of local treatment to an extent that was quite impossible before the introduction of laryngoscopy. It is also possible to illuminate the larynx by throwing a powerful and concentrated light upon the front of the throat, and introducing a mirror into the dark mouth (*Durchleuchtung* of German physicians).

La Salette. See SALETTE.

La Salle, a city of Illinois, at the head of steam-navigation on the Illinois River (here crossed by bridges), 99 miles by rail WSW. of Chicago, with which it is also connected by the Illinois Canal. Bituminous coal is mined here, and the city has a large zinc-rolling mill and smelting-furnaces, besides manufactures of glass and iron wares. Pop. 7847.

La Salle, ABBÉ DE. See SCHOOLS, CHRISTIAN.

La Salle, ROBERT CAVELIER, SIEUR DE, one of the greatest French explorers in North America, was born at Rouen in 1633. Settling in Canada at the age of twenty-three, he began his travels with an attempt to reach China by descending the Ohio River, which he supposed to empty into the Pacific. As soon as he found that the great southern streams drained into the Gulf of Mexico he formed the project of descending the Mississippi to the sea. After many and severe hardships this long voyage was concluded, and the arms of France set up at the mouth of the great river, on 9th April 1682. Two years later an expedition was fitted out to establish a permanent French settlement on the Gulf, which should secure France's claims to the Mississippi valley. But La Salle's bad fortune pursued him; he mistook Matagorda Bay for a mouth of the Mississippi, landed there, and then spent two years in unsuccessful journeys to discover the great river, while his colonists and soldiers gradually dwindled away. His harshness of manner, more than his want of success, embittered his followers, and he was assassinated by some of them in March 1687. See works by Francis Parkman (q.v.).

Lascar, in the East Indies, signifies properly a camp follower, but is generally applied to native sailors on board of British ships, as, for instance, the large steamers of the Peninsular and Oriental Company. The Lascars make good seamen, being both temperate and docile. They are mostly Mohammedans, and speak, besides their native dialects, a *lingua franca* based on Hindustani, with English, Arabic, and other words.

Lascaris, CONSTANTINE, a Greek scholar, who, after the capture of Constantinople by the Turks, fled to Italy, where he was instrumental in reviving the study of Greek. He was a descendant of the royal family of Nicea. Francesco Sforza, Duke of Milan, made him tutor to his daughter Hippolyta. But more important scenes of Lascaris' labours were Rome (where he settled in the train of Bessarion), Naples, and Messina; at this last city he taught rhetoric and Greek letters until his death in 1493. His Greek grammar, entitled *Erotemata*, and dated 1476, was the earliest Greek

book printed in Italy. His library, which is very valuable, is now in the Escorial.—JOHN or JANUS LASCARIS, a member of the same family, surnamed RHYNDAENUS, born about 1445, who also found an asylum in Italy after the fall of Constantinople, was employed by Lorenzo de Medici in the collection of ancient, especially Greek, classical authors. On the death of Lorenzo, Lascaris went to Paris, where he taught Greek with the countenance of Charles VIII. and Louis XII.; but he eventually settled in Rome, and was appointed by Leo X. superintendent of his Greek press and of a seminary for young Greeks. He was, moreover, employed as ambassador at the court of Francis I., and afterwards at Venice, and died in Rome in 1535. From Rome he edited several *editiones principes* of the Greek classics. His own works were chiefly grammatical, with a volume of letters and epigrams. See Villemain's *Lascaris, ou les Grecs du 15^{me} Siècle* (Paris, 1825).

Las Casas, BAROLOMÉ DE, Bishop of Chiapa, in Mexico, surnamed the *Apostle of the Indians*, was born in Seville in 1474. He studied at Salamanca, sailed with his father in the third voyage of Columbus, and again in 1502 accompanied Nicolas de Ovando, the new governor, to Hispaniola. Eight years later he was ordained to the priesthood. In 1511 he was summoned to accompany Diego Velasquez to Cuba, and he assisted in the pacification of the island, and its division into *repartimientos* or allotments of natives, and was rewarded in the usual way by an *encomienda* or commandery of Indians, held together with his friend Pedro de Renteria. But ere long a burning love for the unhappy natives and indignation at their sufferings filled his heart; and he gave up his own slaves, and went to Spain, where he prevailed on Cardinal Ximenes to send a commission of inquiry to the West Indies. Its proceedings by no means satisfying his zeal, he revisited Spain to procure the adoption of stronger measures for the protection of the natives. Finally, to prevent the entire extirpation of the native race by the toils to which they were subjected, he proposed that the colonists should be permitted to import negro slaves for the more severe labours of the mines and sugar-plantations; and the proposal was adopted. Las Casas has on this account been represented as the author of the slave-trade, although it has been proved to have existed before this proposal was made, and it should be remembered that afterwards he bitterly repented the advice that he had given. He also attempted to carry out Castilian peasants as colonists to the West Indies, but failed in his scheme, and spent eight years (1522-30) of mortification in austere seclusion and devoted study within the walls of a Dominican convent in Hispaniola. In 1530 he again visited Spain, and, after missionary travels in Mexico, Nicaragua, Peru, and Guatemala, returned to devote four years to advocate the cause that lay closest to his heart. During this period he wrote his *Veynte Razones* and his *Brevissimo Relacion de la Destruccion de los Indios*, which was soon translated into the other languages of Europe. The rich bishopric of Cuzco was offered to him, but he preferred the poor one of Chiapa, and reached its chief city, Ciudad Real, in 1544. He was received with the most active hostility by the colonists, and was soon mortified to the heart by Charles V.'s time-serving revocation of the New Laws, which his own devoted energy had extorted. He maintained his ground that the granting of *encomiendas* to private persons was flagrant injustice, but bowed his head to the storm, returned to Spain, and resigned his see (1547). Three years later he argued before a Junta at Valladolid with splendid force and eloquence against Sepulveda, who defended the right of carrying on war against

the Indians. In 1555 he appealed in terms of marvellous boldness to Philip II, not to sell the claims of the crown to the reversion of the *encomiendas*, and was successful in thus averting a measure which would have brought final and hopeless slavery upon the Indians. His last work was to get the *audiencia* or court of justice restored to the oppressed natives of Guatemala. He ended his life in a convent in Madrid, July 1566, at the age of ninety-two. His most important work, the unfinished *Historia de las Indias*, was printed in 1875-76. See the admirable Life by Helps (1868).

Las Cases, EMMANUEL DIEUDONNE, COMTE DE, the historiographer and companion of Napoleon in St Helena, was born in 1766, near Revel in Languedoc. He was a lieutenant in the navy before the Revolution, but then fled from France, and supported himself in England by private teaching. After Napoleon became consul, Las Cases established himself as a bookseller in Paris. A work that he wrote, *Atlas historique* (1803-4), attracted the attention of the emperor, who made him a baron, and employed him in the administration. After Waterloo he obtained leave to share the exile of Napoleon in St Helena, and there the ex-emperor dictated to him a part of his Memoirs. In 1816 Las Cases was sent back to Europe, and after Napoleon's death published *Memoirs de St-Helene* (8 vols. 1821-23), of which O'Meara's *Napoleon in Exile* is a kind of continuation. Both works attack Sir Hudson Lowe, Napoleon's keeper, charging him with undue harshness towards his prisoner. Las Cases died at Passy, 15th May 1842.

Laseo, JOHANNES A., or JAN LASKI, Polish reformer, was a man of high family and was born at Lask, in the modern government of Piotrkow, about 1499. He was educated at Cracow by his uncle, chancellor and primate of Poland, and chose to enter the church. He studied further in Rome and Bologna, was ordained in 1521, and two years later at Basel came in contact with Erasmus and Farel; the former by his will left his library to A Laseo. From this journey the young Pole returned in 1526, his mind greatly exercised with the question of church reform. At length he was caught in the current of the Reformation, and, quitting his native land in 1538, he settled at Louvain in the Netherlands. But a year or two later he moved to Emden in East Friesland. The countess of that little province appointed him superintendent of church affairs, and he used his influence to establish a presbyterian form of church government. The *Emden Catechism*, defining the religious doctrines of the East Friesland Church, was in great part his work. But in 1550 he accepted an invitation by Crammer to visit England; he had already passed the winter of 1548-9 there and became head of an influential congregation of Protestant refugees in Austin Friars, London. Mary's accession in 1553 drove him back to Emden and scattered his flock. After staying a while in Frankfort-on-Main, he finally returned to Poland in 1556. There the Reformation was making rapid headway, and was assisted in no inconsiderable degree by the labours of A Laseo as superintendent of the churches in Little Poland. He died at Peczow, on 8th January 1560. See Dalton's *John a Laseo* (Eng. trans. from the German, 1886), which only brings the narrative down to A Laseo's second arrival in England; G. Pascal, *Jean de Laseo* (1894).

Lashkar. See GWALTOR (city).

Las Palmas, chief town of the Canary Islands (q.v.), on the north-east coast of Gran Canaria, is the seat of a bishop, and has sea-bathing and ship-building yards. Pop. 17,554.

Lassa. See LBASSA.

Lassalle, FERDINAND, who may justly be regarded as the historic originator of the social-democratic movement in Germany, was born at Breslau, April 11, 1825. Like Karl Marx, the founder of international socialism, he was of Jewish extraction. Lassalle's father was a prosperous merchant, who intended that his son also should follow a business career. But as young Ferdinand preferred a student life, he went to the universities of Breslau and Berlin, where he devoted his time chiefly to philology and philosophy. In philosophy he was a disciple of Hegel; and it was his first literary ambition to write a work on Heraclitus from the Hegelian point of view. During a stay in Paris he made the acquaintance of Heine, who, like so many of Lassalle's friends, formed the highest opinion of his talent and energy.

On his return to Berlin in 1846 he met the Countess Hatzfeldt, a lady at variance with her husband, a wealthy German noble of high rank. Taking up her case, Lassalle prosecuted it before thirty-six tribunals, and after eight years of litigation forced the husband to a compromise on terms most favourable to the countess.

As a decided adherent of the democratic republic Lassalle took a part in the revolution of 1848, and for disobedience to the authorities at Düsseldorf, where he then resided, spent six months in prison. He lived in the Rhine country till 1858, when he returned to Berlin; and at the same date brought out the work on Heraclitus, which had been laid aside during the Hatzfeldt suit. It at once gave him a high place in the learned circles of Germany. In conducting the Hatzfeldt case Lassalle had gained a very considerable legal knowledge, and this he now utilised in writing a work on the philosophy of law, entitled *System of Acquired Rights* (1861). It was an attempt to apply the historical method to legal ideas and institutions, but we may well question whether he has not often read into history theories of very doubtful validity.

For many years after 1848 no opportunity for fruitful action had occurred to men of democratic opinions. The opening of the Bismarck era in 1862 was therefore a welcome event for Lassalle, the aim of the latter being to resuscitate the democracy in face of the half-hearted Liberalism of his time. His first effort was to show the futility of the Liberal policy in opposing army reform. A lecture delivered in the spring of 1862 'On the connection of the present period of history with the idea of the working-class' strongly brought out the contrast between Lassalle's position and the Liberalism of his day. In his *Open Letter* to a committee of German workmen at Leipzig (1863) he still more clearly expressed his dissent from the current Liberalism, and in luminous and comprehensive language expounded the leading points of his social democratic programme. His success in advocating his views now encouraged him at Leipzig to found the Universal German Workingmen's Association. Its programme was a simple one—by all legal means to agitate for universal suffrage. In the autumn of 1863 Lassalle continued his agitation on the Rhine, and in the winter of 1863-64 he attempted to gain Berlin over to his cause, but without success. The chief literary product of the winter was his *Bastiat-Schulze, or Capital and Labour*, in which he attacked Schulze-Delitzsch, the prominent representative of German Liberalism. In May 1864 Lassalle held the last 'glorious review of his army' on the Rhine.

In the summer of 1864 Lassalle met on the Rigi Helene von Donniges, a lady whom he had previously known, and by whom he had been fascinated. They resolved to marry, but encountered the strongest opposition from the

lady's parents. Under pressure from them the lady at last renounced Lassalle in favour of the Wallachian Count Racowitza. Mad with rage and mortification, Lassalle went to both her father and lover a challenge, which was accepted by the latter. At the Carouge, a suburb of Geneva, Lassalle fell mortally wounded, and died two days afterwards, August 31, 1864. His unworthy end in such a miserable affair can hardly be regarded as an accident; it was the outcome of the weaker elements in a remarkable character.

Lassalle has left no systematic exposition of his views. In the *Bastiat-Schulze*, which is the nearest approach to such an exposition, we find philosophic statement too frequently interrupted by unprofitable controversy and unjustifiable abuse of his opponent. We can only glean from his works the most important points of his teaching. Lassalle held that the historical development of Europe is to culminate in a democracy of labour, in which political interests shall be subservient to social—the social democracy. The democracy of workers, who are destined to be the makers and representatives of the new order, are to be guided by science and the highest ideals of culture and morality. But they cannot by their isolated efforts fulfil this high mission; they need organisation. This organisation they will find in the state, which is, and should be, simply the great association of workers, inasmuch as they constitute the overwhelming majority of every community. The Liberal or bourgeois regime has degraded the state to the function of policeman or mere protector of property. It will be the aim of the new epoch to raise the state to its high and ancient position, as the promoter of freedom, culture, morality, and progress; its mission is the development of the human race in the way of freedom.

The working-class, however, need adequate material means to enable them to rise to the high vocation reserved for them. At present they are crushed by the *iron law of wages*, the law which holds the central and decisive position in the system of Lassalle, and which therefore requires a more lengthened statement. In his exposition of the law Lassalle founds on Ricardo and the classical economists generally. It was the doctrine of those economists that the workman's wage represents what is necessary for his subsistence (in accordance with the standard of living usual among his class) and for the continued supply of labour in his family. It is not a fixed quantity; it rises or falls according as the supply of labour decreases or increases in proportion to the demand for it. A rise in wages leads to greater comfort, more marriages, &c., and these tend to increase the supply of labour, and thereby again to lower wages. A fall in wages leads to want, sickness, abstinence from marriage, &c., and these tend to diminish the supply of labour, and thereby to raise wages. There is continual oscillation, but it never rises permanently above or falls permanently below the point necessary for subsistence and the continuance of the working class. Thus, so long as the present economic order, of which the iron law of wages is an implicate, continues, its inevitable operation leaves no hope of real improvement for the working-class; in other words, it follows from the iron law that the existing order must be fundamentally changed.

For the iron law of wages is merely an implicate in the regime of capital, the exposition of which is the main theme of the *Bastiat-Schulze*. With Lassalle capital is a historical category, the rise of which we can trace, the disappearance of which under altered circumstances we can foresee. The historical conditions necessary for the rise of capital were the opening of the world market through

geographical discovery, colonisation and conquest, the development of machinery, and of the division of labour, and above all the appropriation of the instruments of labour by a class, who, employing another class of labourers free but destitute of capital, pay them a subsistence wage and pocket the surplus. Thus the general exposition of capital leads us back again to the iron law of wages.

It is the gist of Lassalle's polemic against Schulze-Delitzsch that the working class cannot by their unassisted efforts escape from the iron law of wages. The state, whose function it is to promote and facilitate the great progressive movements of humanity, must furnish them with the necessary capital. As the easiest and mildest means of transition Lassalle brought forward his scheme of productive associations with state-credit, by which the workmen would be their own capitalists, would secure the full product of labour, and would thus gain for themselves the entire benefit of an ever-increasing production. His scheme would moreover provide the organic germ of an incessant development, for the associations would themselves combine into credit and insurance unions, until the industries of the whole country should form a well-ordered unity, superseding the present anarchic condition of things by a systematic, rational and equitable organisation of labour. As the associations would be self-governing, there would be most adequate guarantee for freedom; the state would simply see that its credit was not abused. In effect the socialism of Lassalle is a collectivism, resembling that of Rodbertus and Marx, but in many obvious points also differing from theirs. Since Lassalle's time, the political economy of Germany has been revolutionised, and the social democrats are an increasing power in the Reichstag and the country.

Bernstein edited for the social democratic party in 3 vols. an edition of Lassalle's socialistic writings (1891-94). See the articles MARX, SOCIALISM; monographs on Lassalle by Bernstein (Eng. trans. 1893), Brandt (1895), Aberg (1883); Brandes, *Ferdinand Lassalle* (2d German ed. 1888); Mehring, *Geschichte der Deutschen Sozialdemokratie*; Laveleye, *Le Socialisme contemporain* (Eng. trans. *Socialism of Today*); J. Eac, *Contemporary Socialism*; W. H. Dawson, *German Socialism and Ferdinand Lassalle*; the Countess Racowitza's *Memoirs* (1879); and George Meredith's *Tragic Comedians*.

Lassell, WILLIAM, astronomer, born at Bolton, in Lancashire, on 18th June 1799, belongs to that class of observers who have created their own instrumental means. He built himself a private observatory at Stanfield, near Liverpool, about 1820, and observed there down to 1861. There, too, he constructed and mounted equatorially reflecting telescopes of 9 inches aperture and 2 feet aperture successively. The speculum of the latter was polished by means of a machine of Lassell's own invention. With this same telescope he discovered the satellite of Neptune (1847); the eighth satellite of Saturn (1848), simultaneously with Prof. Bond of Harvard; and two new satellites of Uranus (1851). In 1861 he went out to Malta, and there set up a reflecting telescope of 4 feet aperture and 37 feet focal length, mounted equatorially; with this he made observations until 1865, chiefly of nebulae and the satellites he had discovered. After his return to England he transferred his observatory to near Maidenhead. There he died on 5th October 1880. See *Memoirs of Astron. Soc.*, vol. XXXVI., for his work in Malta, and *Trans. Roy. Soc.* (1874) for a description of his polishing-machine.

Lassen, CHRISTIAN, orientalist, was born on 22d October 1800, at Bergen, in Norway, and studied at Christiania, Heidelberg, and Bonn. He assisted Schlegel in the publication of the *Ramayana* and

Hitopadesa, and translated into Latin Jayadeva's *Gitagovinda*. He also associated himself with Eugene Burnouf in the *Essai sur le Pali* (Paris, 1826). In 1830 he became extra-ordinary and in 1840 ordinary professor of Ancient Indian Languages and Literature at Bonn, and taught there until disabled by blindness in 1864. He edited many Sanskrit works, deeply investigated the relations of the oriental languages and antiquities, and published several very important books. Amongst them are works on Persian Cuneiforms (1836 and 1845); on the Greek Kings in Bactria (1838); *Institutionis Linguae Praeceptiva* (1837); his great work on *Judische Alterthumskunde*, a critical history of Indian civilisation (1844-61; new ed. 1867-74), &c. He has contributed much to our knowledge of the cuneiform inscriptions, of the inscriptions of ancient Italy, and of the ancient and modern Iranian dialects. He was one of the co-founders of the *Zeitschrift für die Kunde des Morgenlandes*. Lassen died at Bonn, 9th May 1876.

Lasso (Spanish *lazo*), a thin, well-plaited rope of raw hide, used in Spanish America for catching wild cattle. One end is fastened to the saddle gear of the man who uses it, the other ends in a small brass ring, by means of which a running noose, usually 8 feet wide, is formed. The rider holds a coil of the lasso in the left hand; with the right he dexterously whirls the open noose round his head, and hurls it (to no great distance, but with a wonderfully sure aim) so as to fall over a given object—round the horns of a wild ox, or the like. In Mexico the lasso is *la veta* ('the rope'); thence the term *larial* for a kind of lasso in the United States. The lasso has been used in warfare with deadly effect. See BOLAS.

Latakia (Turk. *Ladikiyeh*), a decayed seaport of Syria, with a sanded-up harbour, stands on a rocky cape 75 miles N. of Tripoli. It possesses remains of Roman buildings, having been a flourishing port during the early empire; it was still a wealthy city at the time of the Crusades. The present town occupies the site of the ancient *Ladicea ad Mare*, which was founded by Seleucus Nicator, and named after his mother. Pop. estimated at 10,000, who export the Latakia tobacco, grown on the hills in the interior, and some grain, silk, sponges, oils, &c.

Lateau, LOUISE. See STIGMATISATION.

Lateen-sail, a large triangular sail, common in the Mediterranean. See SAIL.

Latent Heat. See HEAT, and EVAPORATION.

Latent Life, a phrase often used to describe the physiological condition of organisms in which the functions are for a time suspended, without losing the power of future activity. The condition is one of the grades between full life and total death, and was contrasted by Claude Bernard with the 'constant life' of most organisms, and with the 'oscillant life' of those which hibernates. It is illustrated by dry seeds and quiescent spores, by encysted ova and Protists, and by those animals and plants (e.g. paste-cells and lichens) which survive desiccation. See DESICCATION, LIFE.

Lateran, CHURCH OF ST JOHN, the first in dignity of the Roman churches, and styled in Roman usage 'the Mother and Head of all the churches of the city and the world'; as cathedral church of Rome it surpasses St Peter's in dignity. It is called Lateran from its occupying the site of the splendid palace of Plantius Lateranus, which, having escheated (66 A.D.) in consequence of Lateranus being implicated in the conspiracy of the Pisos, became imperial property, and was

given to St Sylvester by the Emperor Constantine. It was originally dedicated to the Saviour; but Lucius II., who rebuilt it in the middle of the 12th century, dedicated it to St John the Baptist; in 1586 it was completely demolished by Sixtus V., and rebuilt from plans by Fontana. It has been the scene of five councils, regarded as oecumenical by the Roman Church (see COUNCIL). The Lateran Palace was the habitual residence of the popes till the 14th century. It is now under the control of the Italian government. Pius IX. converted a portion of it into a museum of classical sculpture and early Christian antiquities. In the piazza of the church stands the celebrated relie called the 'Scala Santa,' or 'Holy Staircase,' which is reputed to be the stairs of Pilate's house at Jerusalem, made holy by the feet of our Lord as he passed to judgment.

Laterite, a mineral substance, the product of the disintegration and partial decomposition of various igneous and schistose rocks. It often attains a very considerable thickness, especially in tropical regions, where the heat is extreme and the rainfall at certain seasons is copious. In such regions the chemical decomposition of rocks is more or less rapidly effected, and the resulting products may be swept by the rains over wide areas. The earth so formed is generally red in colour, as in Ceylon, where in the dry season it is blown about as a fine dust, and imparts its hue to every neglected article and to the dresses of the inhabitants. The redness of the streets and roads attracts the notice of every stranger at Galle and Colombo. In the Deccan laterite derived from the decomposition of the basalts of the great plateaus reaches a thickness in many places of upwards of 150 feet. The red colour is due to the presence of iron oxide; but when this is absent or in small quantity the laterite may be whitish or yellowish.

Latex, in Botany, the sap of plants after it has been elaborated in the leaves. See SAP.

Latham, ROBERT GORDON, ethnologist and philologist, was born 24th March 1812, at the vicarage of Billingborough, in Lincolnshire. From Eton he passed in 1829 to King's College, Cambridge, of which in due course he was elected fellow. In 1842 he took the degree of M.D.; but nine years before a tour in Denmark and Norway had led him to direct his attention particularly to Scandinavian philology. From 1842 to 1849 he held appointments in connection with London hospitals; already in 1839 he had been elected professor of the English Language and Literature in University College, London; and in 1852 he became director of the ethnological department of the Crystal Palace. His first work was *Norway and the Norwegians* (1840), followed by translations from Tegner's *Fritiof's Saga*. His well-known work, *English Language*, published in 1841, went through numerous editions. The *Natural History of the Varieties of Man* (1850) was justly accepted as a valuable contribution to ethnology. Among his other works may be mentioned his edition of Tacitus's *Germania*, with philological and historical notes (1850); *Ethnology of the British Colonies* (1851); *Ethnology of the British Islands* (1852); *Man and his Migrations* (1851); *Descriptive Ethnology* (1859); *The Ethnology of Europe* (1852); *Native Races of the Russian Empire* (1854); a new edition of Johnson's *Dictionary* (1870); *Outlines of General or Developmental Philology* (1878). The fact should be specially emphasised that in 1862 Latham entered the field against Lassen, Bopp, Pott, Grimm, and Max Müller, declining to accept the central Asian theory of the 'good Aryan,' and affirming the view, since advanced by Penka, Schrader, Isaac Taylor, and Sayce, that the Aryan

race originated in Europe. He suffered for years from aphasia, and died at Putney 9th March 1888. Since 1863 he had been in receipt of a government pension of £100. See the long obituary by T. Watts in the *Athenæum* for 17th March 1888.

Lathe. See TURNING.

Lathom House, the seat of the Earl of Lathom, in Lancashire, 45 miles ENE. of Ormskirk. It is a Grecian mansion, built about 1750. Its predecessor was splendidly defended by Charlotte de la Tremouille, Countess of Derby, against Fairfax in 1644.

Laths. Laths are small strips of wood of various lengths, rarely more than 4 feet; they are made either by splitting lathwood, which is the Norway spruce fir (*Pinus abies*), or else they are sawn from Canada deal. The sawn laths are a modern introduction, due to the development of steam sawmills in Canada, which thus use up the small portions of the lumber. Laths are used for nailing to the uprights of partition-walls and to the rafters of ceilings; they are placed slightly apart to receive the plaster, which, by being pressed into the intervals, is retained, and when dry is held securely on the wall. Slaters' laths are longer strips of wood, nailed on to the framework of the roof, for the purpose of sustaining the slates, which are fastened to the laths by nails.

Lathyrus. See SWEET-PEA.

Latifundia. See AGRARIAN LAWS.

Latimer, HUGH, Protestant martyr, was born at Threaston, near Leicester, about the year 1485. 'My father,' he tells us, 'was a yeoman, and had no lands of his own; only he had a farm of three or four pound by year at the uttermost, and hereupon he tilled as much as kept half a dozen men. He had walk for a hundred sheep; and my mother milked thirty kine. He kept me to school . . . and was as diligent to teach me to shoot as to learn me any other thing.' An only son, Hugh was sent at fourteen to Cambridge, in 1510 (while still an undergraduate) was elected a fellow of Clare, and, having taken orders some nine years before, was in 1523 appointed a university preacher. In 1524 for his B.D. thesis he delivered a philippic against Melancthon, for he was, in his own words, 'as obstinate a papist as any in England.' Next year, however, through much talk with Bilney (q.v.), he 'began to smell the Word of God, forsaking the school doctors and such fooleries,' and soon becoming noted as a zealous preacher of the reformed doctrines. The consequence of this new-born zeal was that many of the adherents of the old faith were strongly excited against him, and he was embroiled in controversies. The question of the divorce brought Latimer more into notice. He was one of the Cambridge divines appointed to examine as to the lawfulness of Henry's marriage, and he declared on the King's side. This secured him the royal favour, and he was made chaplain to Anne Boleyn and rector of West-Kington in Wiltshire. In 1535 he was consecrated Bishop of Worcester; and at the opening of Convocation on 9th June 1536 he preached two powerful sermons urging the work of reformation. After a while that work rather retrograded than advanced, and Latimer found himself with his bold opinions in little favour at court. He retired to his diocese, and laboured there in a continual round of teaching, preaching, exhorting, writing, correcting, and reforming, either as ability would serve or the time would bear. This was his true vocation; he was an eminently practical reformer. Twice during Henry's reign he was sent to the Tower, in 1539 and 1546, on the former occasion resigning his bishopric. At Edward VI.'s accession he contemptuously declined to resume his

episcopal functions, but devoted himself to preaching and practical works of benevolence. The pulpit was his great power, and by his stirring, homely sermons he did much to rouse a spirit of religious earnestness throughout the land. At length by Edward's death (1553) he was stayed in his course of activity. In April 1551 he was examined at Oxford, and committed to Bocardo, the common gaol there, where he lay for more than a twelvemonth, feeble, sickly, worn out with his hardships. In September 1555, with Ridley and Crammer, he was brought before a commission, and after an ignominious trial was found guilty of heresy and handed over to the secular power. On 16th October he was burned with Ridley opposite Balliol College, exclaiming to his companion, 'Be of good comfort, Master Ridley, and play the man; we shall this day light such a candle by God's grace in England as I trust shall never be put out.'

Latimer's character presents a combination of many noble and disinterested qualities. He was brave, honest, devoted, and energetic, homely and popular, yet free from all violence; a martyr and hero, yet a plain, simple-minded, unpretending man. Humour and earnestness, manly sense and direct evangelical fervour, distinguish his sermons and his life, and make them alike interesting and admirable.

His sermons, letters, &c. were edited, with a memoir, by the Rev. G. Elwes Corrie (2 vols. 1844-45). See also Tulloch's *Leaders of the Reformation* (1859); and the Lives by Gilpin (1755), the Rev. R. Demaus (1869), and R. M. and A. J. Carlyle (1900).

Latin Empire, the name given to that portion of the Byzantine empire which was seized in 1204 by the Crusaders, who made Constantinople their capital. It was overthrown by the Greeks in 1261. See BYZANTINE EMPIRE.

Latin Language and Literature. Latin is one of the members of the Aryan or Indo-European family of languages. In ancient Italy several languages were in use; of which the Etruscan, spoken in Etruria (q.v.), and the Iapygian, spoken in the south-east of the peninsula, were non-Aryan, and very distinct from one another and from all the other Italic tongues. The latter fall into two main groups: the *Umbro-Sabellian*, including Umbrian, Oscan or Samnite, and Sabine; and the *Latin*, spoken in Latium, and probably at one time in Campania and Lucania, afterwards partly Hellenised. This Italic group seems to have had closer affinities with the Celtic tongues than with Greek (see GREECE, Vol. V, p. 381). For the relation of the Italian tribes to one another, see ROME. Latin was the language of Rome. The growth of Rome led to the dominance of the Latin over the others; and under Greek influence Latin became a great literary tongue.

Latin has played a great part in the history of language, entering largely, as it did, after Rome's conquests into the dialects of Spain and Gaul, countries thoroughly permeated by Roman life and civilisation. The Romance languages are built up on Latin, are indeed Latin in a new dress. Italian may be described as modern Latin; French and Spanish, the latter especially, are based mainly on Latin; and English, of course, has borrowed largely from Latin. (See ROMANCE LANGUAGES, the relevant sections on the Italian, French, Spanish, and other Romance tongues, and ENGLISH LANGUAGE.)

Latin reflects admirably the leading characteristics of the Roman people. It is the language of a practical, hard-headed people, who felt themselves called to rule, to give laws, and to establish order. Virgil's famous verse, 'In regere imperio populos, Romane, memento' (*Æneid*, vi. 852), happily expressed the genius of Rome. Latin, it has been said, is the voice of Empire and of Law;

it suits history, politics, jurisprudence, the business of the law-court, but it is not pliant or flexible enough to lend itself to the subtleties of philosophical speculation or to the refinements of the highest poetry. Horace, with all his skill, evidently found, in the composition of his odes, that Latin did not run very easily into a lyric mould.

Of literature, properly so called, there was nothing at Rome till the 3d century B.C. It then took the form of annals; we can hardly dignify it with the name of 'history.' These annals were, in part at least, based on old family chronicles, which the conservative spirit of the Romans jealously guarded. Family life in the great houses of Rome was intensely strong; a funeral was always a very solemn and impressive ceremony, and was never complete without an oration commemorating the merits of the deceased man. These orations, or at any rate the heads of them, were committed to writing and treasured in the family archives, and in them the annalists of the 3d century B.C. found their materials. The early history of Rome would, in fact, be made up of the memorials of a few noble families. The systematic treatment of it was undertaken towards the close of the 3d century by Fabius Pictor and Cincius Alimentus, who, however, wrote in Greek, feeling no doubt that as yet Latin was hardly equal to the demands of literary composition. The famous Marcus Porcius Cato, the Censor, as he was styled, who had fought in the great war with Hannibal, and who lived on into the middle of the 2d century B.C., seems to have been the father of Latin prose. His history of his own time, and his *Origines*, in which he discussed the origin of Rome and of some other cities of Italy, were the first important works written in the Latin language. Only a few meagre fragments have come down to us.

Contemporary with these men were two poets, Naevius and Ennius—metrical annalists we may call them—who gave the Romans histories in verse of the first and second Punic wars. Naevius wrote in the old native Italian metre—Saturnian, as it was termed; Ennius (half a Greek by birth) introduced the Greek hexameter. With these two poets, both men of considerable genius, Latin literature made a decided advance. A few poor fragments of their works are still extant, sufficient to show that they accepted the current legends and traditions about the origin of Rome.

Side by side with these essays in epic poetry there grew up a dramatic literature, to which Ennius and Naevius also contributed. This arose in the 3d century B.C. out of rude old Italian stage representations connected with popular festivals, and from a growing acquaintance with Greek culture, which by this time was widely diffused throughout Italy. The rough Latin humour, not much better than a sort of horseplay, could not evolve anything that deserved to be called the drama till it had come into contact with Greek art. The first play is said to have been exhibited on a Roman stage under the superintendence of Livius Andronicus, a Greek from Tarentum, whom we may regard as the father of Roman dramatic poetry. From that time the theatre became a recognised institution among the Romans. The plays of Andronicus were adaptations, almost translations, from the Greek; for the most part they seem to have been clumsy, inartistic performances. Still, they were popular and very widely circulated, and gave the Romans a decided taste for theatrical entertainments. Ennius and Naevius improved on them; nor did they confine themselves to a servile imitation of the Greeks, but aspired to build up a truly national drama, taking their subjects from old Roman legends or even from the history of their time. Tragedy as well as comedy, though never

equally popular, now took its place at Rome. Through Ennius more especially the rather questionable moral influence of the clever and subtle Euripides, with its cosmopolitan and denationalising tendencies, filtered down into the Roman mind, with the result of somewhat weakening the fibre of Roman character. Of Roman tragedy, however, we know but little; sensational horrors seem to have been peculiarly attractive, fostering perhaps the vile taste which subsequently found its gratification in the gladiatorial combats. Of comedy the chief and to us the best known representative is Plautus, deservedly a most popular poet with the Roman people, as his twenty extant plays testify, full as they are of original humour, of bright, witty dialogue, and funny, laughable incidents. Plautus, it seems, was exhibiting his plays in the latter part of the 3d and the early years of the 2d century B.C. Terence followed at no distant interval; six of his comedies which have come down to us show that a rather more refined and cultivated taste was coming into fashion. There is something of a modern tone and flavour about Terence. He is a pleasing, graceful writer, without, however, much originality; he in fact did little more than reproduce Greek comedies, especially those of Menander.

There was another branch of literature alongside of the drama, distinctively Roman, so that Quintilian (x. 1, 93) says of it 'it is all our own.' This was satire—'satura,' as the Romans called it—by which they seem to have meant both a sort of rude dramatic medley or miscellany, and a string of reflection, in a poetical form, on mankind and the world in general. Indeed all poetry that could not be classed as epic or dramatic came under the head of satire. There was nothing necessarily satirical in our sense about it. Ennius was a writer of 'satires' in the old meaning of the phrase; but it was Lucilius, in the latter half of the 2d century B.C., who introduced what we understand by 'satires,' and prepared the way for Horace and Juvenal. It was from the poets of the old Greek comedy, from Aristophanes, Eupolis, and Cratinus, that he borrowed the idea of political satire, in which, it seems, he allowed himself the utmost freedom. The public men of the day were the subjects of his attacks, and he lashed them, it is said, with merciless severity. His versification was rough, but he was undoubtedly a man of real wit and genius. We have unfortunately only a few scraps of his poetry.

Prose literature was but poorly represented in the 2d century B.C. by a few inferior historians, or rather annalists, of whom Cicero and Tacitus express a very mean opinion. They seem to have been utterly uncritical chroniclers, ridiculously pretentious, and always straining after rhetorical effect. In the early part of the 1st century was a historian of some merit, Sisenna, who described the social war and the civil wars of Marius and Sulla. Cicero speaks of him with considerable praise (*Brutus*, 64), and Sallust (*Jugurtha*, 95) says that in his treatment of the period of Sulla he was a careful and painstaking writer.

In the 1st century B.C. Roman literature made a great advance. A man of prodigious learning and industry, Marcus Terentius Varro, poured forth a multitude of works on every variety of subject, discussing agriculture in a treatise which has come down to us, and philology, grammar, and antiquities in elaborate dissertations which are unhappily lost. Varro, too, was a prolific writer of 'satires,' which in his case seem to have taken the form of moral and philosophical essays, more or less resembling the papers in the *Rambler* and *Spectator*, or Cicero's short dialogues on 'friendship' and 'old age.' Varro's heart was with the old life of Rome, and he liked to

ridicule the new lights and Greek philosophy, then becoming fashionable. Indeed he was a witty and lively satirist, as we may see from our extant fragments, and he must certainly have been one of the very first of Roman men of letters, a profound student and a clever essayist.

Cicero was ten years junior to Varro. It was the aim of his life to create a perfect prose style, and in this he has generally been regarded as successful. As head of the Roman bar he was accepted as an arbiter of finished composition and of correct taste. His speeches were published after careful revision as political pamphlets. In his numerous philosophical works he dexterously adapted Latin to Greek thought and speculation, achieving with considerable success a difficult work which had hitherto been but very imperfectly accomplished. The general verdict on him is, and as far as we can see will always be, that he was a consummate artist in style, if not a deep or fruitful thinker.

In poetry, in the first half of the 1st century, there was a new departure, a school which formed itself on the model of the Greek fashionable poets. At the head of this movement stands Catullus, the first to naturalise Greek lyric metres at Rome, a man of genuine poetic feeling and with true pathos. There is a more hearty ring about his poetry than in the more elaborate odes of Horace. Catullus had a touch of genius as well as scholarship and culture. His poems—the coarse ones too, it must be feared—accurately reflect the tone of gay Roman fashionable society. A widely different poet was the earnest and philosophical Lucretius, who in his *De Rerum Natura* puts the doctrines of Epicureanism, acceptable no doubt to many of his contemporaries, into the dress of hexameter verse, in which he considerably improved on Ennius. There is a stateliness if not much grace about the hexameters of Lucretius. The subject-matter of his work is decidedly unpoetic, but the genius of a poet makes itself felt in several passages. In the midst of a dreary wilderness are many beautiful spots and resting-places.

The later part of the 1st century was the great age of Roman poetry, the age of Virgil, Horace, and Ovid, familiar names throughout the whole civilised world. The fact that we happily possess their works entire is a proof of the high estimation in which they were held. Much of what is best in modern poetry is distinctly traceable to their inspiration. It has been the fashion to speak of this period as the Augustan age.

Virgil (70 B.C.), said to have been a great admirer of Lucretius, to whom he was evidently indebted, has the special merit of having brought Latin hexameter verse to exquisite perfection. There are no hexameters in the whole range of Latin poetry to compare with those of Virgil. His peculiar charm lies in a nice subtlety and refinement of expression, which makes the work of a translator almost hopeless. Every scholar recognises the great difficulty of Virgil. His *Pastorals* (*Bucolics*) and his four *Georgics*, poems on the various phases of agricultural life, and written, it would seem, to stimulate a healthy taste for rural pleasures, were direct imitations of Greek originals. Along with minute descriptions of farming operations, which he forces into verse with extraordinary ingenuity, are beautiful and highly poetic episodes—as, for instance, when he sings the praises of the farmer's life by way of conclusion to his second *Georgic*, or tells the tale of Orpheus and Eurydice in the fourth and last of these poems. In his *Æneid* he imitates Homer; here he writes with the definite purpose of stirring Roman patriotism, tracing back Rome's origin to Troy and to the gods, while he seeks to please Augustus by suggesting a comparison between him and the Trojan hero Æneas.

Virgil stood high in the emperor's favour, and rose from the rank of rather a small country squire to a foremost place in the great fashionable world of Rome.

Horace (65-8 B.C.) was a man of very humble origin, the son of a father who had been a slave, but he received a liberal education, which his natural genius enabled him to turn to good account. His *Odes* are to a great extent imitations of Greek lyric poetry, his metres are borrowed from the Greek; still there is much that is truly original in them, much that is distinctly Roman, and there is an indescribable charm about the exquisite finish of the language. Their peculiar grace and beauty, which to all Latin scholars are most delightful, seem to evaporate even in the most skilful translations. In his satires and epistles, the most popular of his writings, because so full of homely common sense and a pleasant, genial humour, there is a charming lightness of touch, an easy natural style and manner which perhaps have never been equalled. His laugh has no bitterness; of satire in one sense there is next to nothing in these amusing essays. 'The terseness of his language,' it has been well said, 'is that of a proverb, neat because homely.' Like Virgil, whose friend he was, Horace enjoyed the favour of Augustus.

Ovid (43 B.C.-18 A.D.) is the most voluminous of the Roman poets, and his facility in poetic composition seems to have been absolutely boundless. His verse is a marvel of cleverness and ingenuity. His great poem, the *Metamorphoses*, is a collection of mythological stories, turning on the change of men and women into animals, trees, plants, or flowers. His *Fasts* or *Roman Calendar*, a sort of poetical almanac, abounding in well-told stories of old Rome and her heroes, is on the whole pleasant reading. His love poetry, on which he specially prided himself and no doubt took great delight, are very bright and playful, in style and expression almost perfect, but they have not much depth of sentiment, and here and there they are so sensuous as to be positively offensive. One can well understand how it was said of him that he corrupted the morals of the youth. He has been fairly well described as the poet of fashionable society. From some cause unknown to us he was forced to end his days in a sort of Siberian exile on the shores of the Black Sea.

Two poets, writers of elegiac verse, contemporaries of Ovid, deserve a passing mention—Propertius and Tibullus: the first learned, pedantic, and obscure, yet often rising with true poetic fervour into a manly dignity and nobleness of thought; the latter sweet and tender, with a decided tinge of melancholy, the melancholy of a Roman who resigned himself to what he regarded as the fallen fortunes of his country, and who deliberately kept aloof from the imperial court. Tibullus was the friend of Horace and Ovid.

Prose-literature in the 1st century B.C. was represented by Cæsar, Sallust, and Livy. The great Cæsar wrote the history of his campaigns in a style admirably suited to the subject-matter, and recognised by all scholars as a specimen of the best and purest Latinity. Sallust (86-34 B.C.), whom we know through his narratives of the Catiline conspiracy and the war with Jugurtha, modelled himself on Thucydides, and like him aimed at a philosophical treatment of history. As yet Rome had had mere annalists; in Sallust she found a man who really deserved to be called a 'historian.' Of his *Histories*, a work which is said to have treated of the period immediately following Sulla's death, we have but fragments.

Livy (59 B.C.-19 A.D.) was simply a man of letters, taking no part in politics. His great work, the history of Rome from the beginning down to

9 B.C., the year of the last campaign of Drusus in Germany, and of his death, written during the reign of Augustus, with whom he was on friendly terms, though himself a republican, was comprised in 142 books, of which we possess 35, the last of these bringing us down to 167 B.C., the year of the annexation of Macedonia as a province to Rome. Livy's treatment of his subject evidently became fuller and more detailed as he approached his own time. Hence the loss of his later books is irreparable. As it is, we have not adequate material for a thorough history of Rome in the 1st century B.C. Livy's style is all that can be desired, bright and lively, as picturesque as that of our own Macaulay, but he is not a learned or critical writer; he wrote for the public generally, not for scholars or antiquaries; his aim in fact was to popularise the history of Rome and to magnify her empire, not to sift the legends which had gathered round her origin and early growth.

The last years of Augustus, and indeed most of the 1st century A.D., were, as regards literature, almost a barren desert: no poetry of any account, no forensic oratory, which under the empire had little scope, and no history. With Domitian, the last of the Caesars (81-96 A.D.), came a revival of letters, the silver age of Latinity, as it has been called, marked by the names of Juvenal, Tacitus, Pliny the Younger, and Quintilian. Under Nero indeed there had been a few minor lights in literature: the satirist Persius, spirited and dramatic, but obscure and affected, reminding one here and there of Browning; Lucan, author of a poem once read in schools and universities, describing under the title *Pharsalia* the civil war of Caesar and Pompey; and Seneca, whose numerous essays on morals and philosophy, embodying as they do what was best in Stoicism, have much of a modern, even of a Christian, tone. To these we may add the witty epigrammatist Martial and the learned and laborious Pliny the Elder (23-79 A.D.), in whose *Natural History* we have a comprehensive work on geography, botany, zoology, medicine, with attempted explanations of every kind of natural phenomena. A compilation rather than an original work, it is very useful as giving us an insight into the physical philosophy of the ancient world.

Juvenal's satires—satires in our sense of the word, bitter and savage—were published in the early part of the 2d century A.D., under Trajan and Hadrian. The man's honest indignation against the vulgar rich and the cringing tribe of parasites and fortune hunters, with which Rome swarmed, has our hearty sympathy, and it is expressed in pure, vigorous Latin. Johnson has imitated two of his satires in his *London* and his *Faculty of Human Wishes*.

The most conspicuous literary figure of the age was the great historian Tacitus, who was not, like Livy, a man of letters and nothing more, but who was practically acquainted with public life, and had distinguished himself at the Roman bar. An undertone of satire runs through his writings, which at many points remind us of Carlyle. He sums up a character with a few trenchant epithets, and throws out reflections which have passed into proverbs. There is perhaps no ancient author who has supplied more material for the modern essayist and historian. His concise and nervous style at once arrests the reader, and again and again demands from him a very considerable mental tension. His life of his father-in-law, Agricola, governor of Britain under Domitian, a masterpiece of biography, was written in 98 A.D.; so too was his *Germany*, a description of the native population of that country, with a sketch of its geography—a subject which must have been interesting to Romans who knew how little impression their arms had made

on those wild regions. In his *Annals* and *Histories*, much of which has been unfortunately lost, he describes the period from the accession of Tiberius to that of Nerva (14-98 A.D.). All that remains to us is his history of the reigns of Tiberius, Claudius, Nero in part, Galba, Otho, Vitellius, and of the rise of Vespasian. His *Histories*, as he termed the memoirs of his own time, were evidently written with great fullness of detail, and the loss of the later books is much to be deplored. In these we should have had a minute and trustworthy narrative of the three last Caesars, and of the better time which began with the brief reign of Nerva. Suetonius, a writer of the same period, the author of biographies of the twelve Caesars, which have come down to us, supplies but very poorly our deficiency.

With Tacitus we may couple his intimate friend, Pliny the Younger, as he is known in contradistinction to his uncle, whom we have already mentioned. The name is generally familiar as that of the man who as the governor of a Roman province in Asia Minor came into collision with the early Christians, and gave his opinion of them in a letter to the Emperor Trajan. Pliny's letters, dealing as they do with every variety of topic—politics, literature, art, society, with glimpses into his home-life and descriptions of his villas—and written, too, in a pleasing style of good Latinity, rank among the best literary specimens of the period. They are of special interest as illustrating aspects of Roman life which would otherwise be unknown to us.

A work also of great merit has happily come down to us from the pen of an eminent professor of rhetoric, Quintilian, who is said to have numbered Pliny among his pupils. It is a treatise on rhetoric and kindred subjects, written in the reign of Domitian, discussing with deep learning and sound critical taste the whole subject of education, and concluding with a short sketch of Greek and Roman literature in its special connection with oratorical training. Scholars have always admired its diction.

Latin literature is from this time almost a blank, represented only by a few feeble writers whose names are not worth noting in a brief summary. The age of what we call classical Latin was finally over. Petty rhetoricians and epitomisers alone survived. Coming down to the close of the 4th century A.D., the period of the Emperor Theodosius (the first of that name), we light on a writer who has been described as 'the last subject of Rome who composed a profane history in the Latin language,' Ammianus Marcellinus, the historian of the period from 96 to 378 A.D. Rather more than the half of his work is extant; in this we have a full account of the reigns of Julian, Jovian, Valentinian I. and II., and Valens—in all twenty-five years of the history of which he had a personal knowledge. He is a good, useful writer, but hardly a man of letters. The last of the classic poets, Claudianus, flourished about the same time.

In the last years of the 5th and the first half of the 6th century A.D. lived the learned Boethius, whose work on the consolation to be derived from philosophy (*De Consolatione*) was translated by King Alfred. There is something of a mystery about Boethius: whether he was a Christian or half-heathen philosopher is uncertain; he seems to have hovered on the borderland between the rising and the decadent belief.

Latin was now the language of the Christian church of the West, and the Vulgate the current version of the Scriptures; in Latin, more or less cultured, were written the works of the Latin Fathers, of the theologians and thinkers of the middle ages; sonorous Latin hymnology with rhyming metres grew up; and Latin remains still the language of the services in the Catholic Church. Learning and literature almost died out for

centuries, the period we call the dark ages. Latin in its fusion in the Celtic and Teutonic dialects was quite losing its distinctive character, although it is true that Rome imposed not only her yoke but her language on Spain and Gaul; still, as regards language, her victory was won with heavy loss. The grammar and syntax indeed were to a great extent retained; but, with the introduction of the definite and indefinite articles, of the auxiliary verb, the addition of a number of words from the barbarians, and the utter disregard of quantity in pronunciation, Latin underwent a complete change, and was at last transmuted into its derivatives, the Romance languages. In its corrupted form, however, it was for a long period a living language, but it ceased to be so in the 10th century. With the revival of letters in the 15th and 16th centuries Latin recovered itself; Ciceronianism became the fashion, Erasmus being one of its most eminent representatives. Latin for the time established itself as the recognised medium of communication in the learned world; and almost all books of any importance, theological and scientific treatises, were written in that language. The controversial works of the English and Swiss reformers were written in Latin; so were the works of Bacon, and Newton's *Principia*—to quote but a few examples. In the universities professors lectured in Latin; candidates for degrees disputed in Latin theses; the grace before and after meals was in Latin—a usage still surviving at Oxford and Cambridge and in the Inns of Court. Notes to editions of the classics, both critical and explanatory, were always in Latin; and Dr Arnold thought it necessary to apologise in the preface to his *Theoglyphes* in 1830 for deviating from the universal practice. It was indeed a true instinct which assigned the Latin language a principal place in our schools and universities. Not only is it the key to a most important literature, but it throws infinite light on the history of language in general, as well as on the particular languages of modern Europe. Hence it is an admirable instrument of mental discipline.

See the articles in this work on the several Latin authors referred to; those on ALPHABET, ARYAN RACE, DRAMA, CHURCH HISTORY, FATHERS OF THE CHURCH, GRAFFITI, HYMNS, INSCRIPTIONS, PHILOLOGY, RENAISSANCE, ROME, ROMANCE LANGUAGES; the grammars of Roby, Kennedy, Madvig, Kühner, Stolz and Schmalz; the German works on the history of the language and literature by Bahr (new ed. 1873), Bernhardt (1872), Munk (new ed. 1881), Touffet, trans. 1873; German 5th ed. 1800); Simcox's *History of Latin Literature from Ennius to Boethius* (1883); Cruttwell's *History of Roman Literature* (1879); Brown's *History of Roman Classical Literature* (new ed. 1884); Sellar's *Roman Poets of the Republic* (new ed. 1881) and of the *Augustan Age* (new ed. 1884); Wilkins's *Prætor*; Tyrrel's *Latin Poetry* (1895); and Mackail's *Latin Literature*. Mayor's *Bibliographic Clue to Latin Literature* (1875) is based on Hubner. See also W. M. Lindsay, *The Latin Language, a Historical Account of its Sounds, Syntax, and Phrasing*.

Latin Union. See BELL-FALLISM.

Latitude and Longitude. in Geography, denote the angular distances of a place on the earth from the equator and first meridian respectively. The latitude of a place is the angle subtended at the centre of the earth by the arc of the meridian from the equator to the place in question. The longitude of a place is the angle at the earth's axis between the plane of the first meridian and that of the meridian of the place. Latitude is reckoned from the equator to the poles, the equator having 0 lat., and the poles 90° N. and 90° S. respectively. Longitude is reckoned along the equator or along a parallel of latitude from the first meridian; but as nature has not in this case supplied us with a fixed starting-point, it is necessary to fix upon one in an arbitrary

manner. Cardinal Richelieu in the 17th century proposed to use the meridian of Ferro, one of the Canary Isles, for this purpose, as this meridian lay to the west of all the Old World and to the east of America. The Arab geographers had also reckoned longitude from the 'Fortunate Isles.' For convenience the meridian of Ferro was subsequently reckoned as exactly 20° W. of Paris, and thus lost its independent character. The meridian of Greenwich came into widest use, being universal as the zero of longitude in sea-charts and in the land maps made in the United Kingdom and the United States. Large scale maps of the United States are usually marked with longitudes west from Greenwich and also the number of degrees from Washington. One set of engraved meridians serves for this purpose, as Washington lies 77° W. of Greenwich. By the decision of a conference of delegates from almost all the civilised countries in the world, held at Washington in 1884, the meridian of Greenwich was accepted as the universal prime meridian, from which longitudes were measured to + 180° (or 180° E.) and - 180° (180° W.); the French delegate dissented, and in France maps are still drawn to the prime meridian of Paris, although reference marks to Greenwich longitude are now usually added. On German maps the meridian of Berlin was sometimes employed, in Italian maps that of Rome, and in Russian maps that of Pulkova Observatory (St. Petersburg) is still commonly used together with that of Ferro.

The determination of both latitude and longitude depends upon astronomical observation. The principle on which the more usual methods of finding the latitude depend will be understood from the following considerations: To an observer at the earth's equator the celestial poles are in the horizon, and the meridian point of the equator is in the zenith. If now he travel northwards over one degree of the meridian the north celestial pole will appear one degree above the horizon, while the meridian point of the equator will decline one degree southwards; and so on, until, when he reached the terrestrial pole, the pole of the heavens would be in the zenith, and the equator in the horizon. The same thing is true with regard to the southern hemisphere. It thus appears that to determine the latitude of a place we have only to find the altitude of the pole, or the zenith distance of the meridian point of the equator (the complement of its altitude). The method most usual with navigators and travellers is, by means of a sextant, to observe the meridian altitude of a star whose declination or distance from the equator is known; or of the sun, whose declination at the time may be found from the *Nautical Almanac*; the sum or difference (according to the direction of the declination) of the altitude and declination gives the meridian altitude of the equator, which is the co-latitude, i.e. when subtracted from 90° leaves the latitude.

The determination of the longitude is less easy, and long presented insuperable practical difficulties. All methods depend on measuring the difference between local time and the time of the first meridian, which, reduced to degrees (at the rate of 360° per day, or 15° for every hour, or 1° for 4 minutes), gives the longitude. Eclipses of the sun, moon, or Jupiter's satellites, occultations of fixed stars by the moon, the time occupied in the moon's transit over the meridian, &c. are occurrences the exact period of which are calculated in advance in Greenwich time. When one of these phenomena is observed the true Greenwich time can at once be obtained from the *Nautical Almanac*, and the local time from direct observation is the only other datum required. The longitude of stations on land connected by telegraph with an observatory

is most readily and accurately determined by an exchange of time signals; the exact position of every observatory is always ascertained to a high degree of accuracy by repeated observations of celestial phenomena. The two methods in use among travellers and on board ship are remarkable for their combination of simplicity with accuracy. The first and most common consists merely in determining at what hour on the chronometer (which is set to Greenwich time) the sun crosses the meridian. If, when the sun is on the meridian, at the place of observation, the chronometer points to 3 hours 52 minutes, the difference of longitude is 58', and the longitude will be W., as the sun has arrived over the place *later* than at Greenwich; similarly, if the sun be over the meridian of a place at 9 hours 40 minutes A.M., the longitude is 35° E. (by the chronometer). The accuracy of this method depends evidently upon the correctness of time-keepers (see HOROLOGY). The other method—that of 'lunar distances'—is much used at sea in order to check the results of chronometer measurements, and may be thus explained: The angular distance of the moon from certain fixed stars is calculated with great accuracy (about three years in advance) for every three hours of Greenwich time, and published in the *Nautical Almanac*. The moon's distance from some one star having been observed, and corrected for refraction and parallax, and the local time having also been noted, the difference between this local time and *that time in the table which corresponds to the same distance* gives the longitude. When applied to a heavenly body, the terms latitude and longitude have the same relations to the ecliptic and its poles, and to the point on the ecliptic called the Equinox (q.v.), that terrestrial latitude and longitude have to the equator and a first meridian. The positions of a heavenly body relatively to the equator are called its Declination (q.v.) and Right Ascension (q.v.). See also DEGREE.

Latitudinarians, a name applied by contemporaries to a school of theologians within the English Church in the latter half of the 17th century. It grew out of the earlier movement in favour of a more liberal constitution for the church, represented by the names of Falkland, Hales, Jeremy Taylor, and Chillingworth. This earlier movement was mainly ecclesiastical, aiming at a wider extension of the Anglican Church system; the later was mainly philosophical, and had still more directly in view the interests of rational religion. The school was represented by a succession of well-known Cambridge divines, of whom the chief were Whichcote, Smith, Cudworth, and More. Starting from the same ground as Hales and Chillingworth, in the disregard for authority and tradition in matters of faith, and the assertion of the supremacy of reason as the test of truth, their liberalism takes a higher flight, and brings us to the discussion of larger questions and principles of a more fundamental and far-reaching character. The Cambridge divines, nurtured on Plato and the later Platonists, sought to wed philosophy to religion, and to confirm the union on an indestructible basis of reason. This was the first attempt to link together philosophy and Christianity ever made by any Protestant school; and, indeed, the first true attempt since the days of the great Alexandrine teachers to construct a philosophy of religion at once free and conservative, in which the rights of faith and the claims of the speculative intellect should each have free scope and blend together for mutual elevation and strength.

See the articles on CHILLINGWORTH, FALKLAND, HALES, SMITH, &c.; and Principal Talbot's *Rational Theology as Englished in the Seventeenth Century* (2 vols. 1872).

Latium. See ROME.

Latona, or LETO. See APOLLO.

Latour d'Auvergne. THEOPHILE MALO CORRET DE, dubbed by Napoleon 'First Grenadier of the Armies of the Republic,' was born, 23d November 1743, at Calvaix in Finistère, of an illegitimate branch of the family of the Dukes of Latour d'Auvergne. He enlisted as a musketeer in 1767, and distinguished himself at the siege of Fort Mahon in 1782. But he steadily refused advancement in military rank, and was killed, a simple captain, on 28th June 1800 at Oberhausen, near Neuburg in Bavaria. His remains were carried to Paris and interred in the Panthéon on 4th August 1889. French biographies are full of instances of his daring valour, his Spartan simplicity of life, and his chivalrous affection for his friends. When he died the whole French army mourned for him three days; his sabre was placed in the church of the Invalides at Paris; and every morning, till the close of the empire, at the muster-roll of his regiment his name continued to be called, and the senior sergeant answered to the call: '*Mort au champ d'honneur*' (Dead on the field of honour). Latour d'Auvergne was also a respectable student of languages, and wrote *Recherches sur la Langue, l'Origine, et les Antiquités des Bretons* (1792). See Lives by Buhot de Kersers (1874) and Simond (1895).

La Trappe. See TRAPPISTS.

Latreille. PIERRE ANDRÉ, French naturalist, was born, 29th November 1762, at Brives, in the department of Corrèze. Though he completed his education for the church, he gave himself chiefly to entomological studies. In 1798 he was commissioned to arrange the entomological collections in the Museum of Natural History at Paris, and in 1830 was appointed to the chair of Natural History (along with De Blainville) in the same institution. He died at Paris on 6th February 1833. In 1796 he published his great work, *Précis des Caractères Génériques des Insectes*—an important step towards a truly natural system of entomology. The more important of his other works are the *Salicmoules* (1800), *Singes* (1801), *Crustacés et Insectes* (14 vols. 1802-5), *Reptiles* (1802), *Généra Crustacéorum et Insectorum* (4 vols. 1806-9), *Considérations sur l'Ordre Naturel des Animaux* (1810), *Familles Naturelles du Règne Animal* (1825), and *Cours d'Entomologie* (2 vols. 1831-33).

Latten (Fr. *laton*, 'brass'), a term specially applied to sheet-brass, but also used for sheet-tin and tinned iron-plate.

Latter-day Saints. See MORMONS.

Lattice Leaf, also called LACI LEAF, WATER-YAM, or OUYBRANDRANO (*Oucicandra fenestralis*), an aquatic plant belonging to the natural order Juncaginæ. It is best known as the lattice-leaf plant, from the singular resemblance of the leaves to open lattice-work. The plant is a native of Madagascar, and was introduced into England about 1850 by the Rev. W. Ellis. It grows on the margins of running streams in shallow water. The leaves grow in radiating clusters, and float immediately under the surface of the water; in outline they are oblong, rounded at base and point, from 9 to 12 inches long. Their peculiar structure is due to the absence of the cellular tissue which fills up the spaces between the nerves or veins of ordinary leaves, the veins, which in this instance are almost geometrically parallel longitudinally and transversely, being alone coated with cellular matter and parenchyma. The flower-stems rise to the surface of the water and there divide into two spikes of flowers, which are accompanied by conspicuous white bracts. The plant is not only curious but useful as an article of food to the

natives, who eat the yam-like roots. The native name of the plant is *Ouvirandra*, which means literally water-yam. There are several other species of *Ouvirandra*, but none so remarkable and interesting as the lattice-leaf plant, which is frequently to be seen growing in hothouses. See AQUATIC PLANTS for illustration.

Latude, HENRI MAZERS DE, prisoner in the Bastille, was born at Montagnac, in Languedoc, 23d March 1725. A young artillery officer, he sought to secure Madame de Pompadour's favour by revealing to her a plot to poison her. The plot was discovered to be of his own contriving, and he was sent to the Bastille in 1749. In spite of ingenious efforts to escape, he remained in prison till 1777, when he was released on condition of living in his native village. But having come to Paris again, he was imprisoned till 1784. At the Revolution he was treated as a victim of despotism; but he died forgotten, 1st January 1805. See the monograph by Thierry (1792; new ed. 1889).

Lauban, an ancient town of Prussian Silesia, on the Queiss, 15 miles by rail E. of Görlitz, carries on linen and cotton weaving, printing, bleaching, &c. Pop. (1895) 12,634. It was destroyed by the Hussites (1427 and 1431), and by the Swedes (1640).

Laud, WILLIAM, Archbishop of Canterbury, was born at Reading, a well-to-do clothier's son, on 7th October 1573. From Reading free-school, where he 'had the happiness to be educated under a very severe schoolmaster,' he passed at sixteen to St John's College, Oxford, of which four years later he was admitted a fellow. Ordained in 1601, he made himself obnoxious to the university authorities by his open antipathy to the dominant Puritanism; but his solid learning, his amazing industry, his administrative capacity, his sincere and unselfish churchmanship, soon won him both friends and patrons. One of these was Charles Blount, Earl of Devonshire, whom in 1605 Laud married to the divorced Lady Rich (an offence that ever weighed heavy on his conscience); another was Buckingham, to whom he became confessor in 1622, having a month previously disputed before him and the countess his mother with Fisher the Jesuit. Meanwhile he rose steadily from preferment to preferment—incumbent of five livings (1607-10), D.D. (1608), president of his old college and king's chaplain (1611), Prebendary of Lincoln (1614), Archdeacon of Huntingdon (1615), Dean of Gloucester (1616), Prebendary of Westminster and Bishop of St Davids (1621), Bishop of Bath and Wells, Dean of the Chapel Royal, and a privy-councillor (1626), Bishop of London (1628), Chancellor of Oxford (1630), and finally Archbishop of Canterbury (1633). That very week he received two orders of a cardinal's hat; but 'my answer,' he writes in his Diary, 'was that somewhat dwelt within me, which would not suffer that, till Rome were other than it is.'

Already, after Buckingham's assassination, he had virtually become the first minister of the crown, one with Strafford and Charles I. in the triumvirate whose aim was absolutism in church and state, and which thus stood opposed to Puritanism alike and democracy. Laud's task, a grateful one, was to raise the English Church to its rightful position of a branch, if a younger branch, of the Church Catholic, to root out Calvinism in England and Presbyterianism in Scotland. In the former country he drew up a list of 'Orthodox' and 'Puritan' ministers, whom, the wheat and the tares, he proceeded to separate by scolding, suspending, depriving. Freedom of worship was withdrawn from Wallon and French refugees; Englishmen abroad were forbidden to attend Calvinistic services; and

at home 'gospel preaching, justification by faith, and Sabbatarianism were to be superseded by an elaborate ritual, by the doctrine of the real presence, celibacy, and confession, and by the Book of Sports (q.v.)—changes rigorously enforced by the court of High Commission and the Star Chamber. Nor was a policy without result which checked the development of Puritanism within the Anglican communion; which raised up a school of such Laudian clergy as Cosin, Nicholas Ferrar, George Herbert, Juxon, Manwaring, Montague, and Wren; which has borne later fruit in the Nonjurors, the Tractarians, and the Ritualists; and which to-day has a standing memorial in every Anglican church throughout the world—the altar-wise position of the Holy Table. In Scotland it was otherwise. There the tentative effort made by James I. and Laud in 1617 to give back life to dead Episcopacy had merely failed. Laud's second attempt (1635-37), involving the thorough Anglicising of the Scottish Church, gave birth to the riot in St Giles', Edinburgh, that riot to the Covenant (q.v.), the Covenant to the 'Bishops' war,' and this in turn to the meeting of the Long Parliament, which on 18th December 1640 impeached the archbishop of treason, and ten weeks later sent him to the Tower. He would not escape (Grotius urged him to do so); and at last, after a tedious and complicated trial before a handful of peers, of whom never more than fourteen were present, and of whom the Speaker alone sat through the whole proceedings, after a defence that extorted praise even from Prynne, on 17th December 1644 he was voted 'guilty of endeavouring to subvert the laws, to overthrow the Protestant religion, and to act as an enemy to parliament.' The judges unanimously declared that this was not treason; but under an unconstitutional ordinance of attainder, and the gallows reluctantly commuted for the axe, he was beheaded on Tower Hill, 10th January 1645. He was buried first in the church of All-Hallows, Barking, and in 1663 translated to the chapel of St John's at Oxford.

To Heylin Laud is 'the holy martyr;' to Laud's accusers 'the great incendiary;' to Macaulay just 'a ridiculous old bigot.' To us he seems rather a typical college don, fussy, restless, high-handed, concerned about trifles, cold and unsympathetic, as little in mind as in person. Withal, he was childishly superstitious, his Diary teeming with omens and silly dreams, as 'Dreamed of the marriage of I know not whom,' and 'Dreamed of the burial of I know not whom, and waked sad.' Superstition, of course, was a failing of that age; so, too, was the chief sin of which Laud stands accused—intolerance. For if Laud cut off Puritans' ears, the Puritans cut off Laud's head. His great misfortune, indeed, was that he rose, like the parasite ivy, to eminence. Had he lived and died a college president, his waspishness would have long since lost its sting, and his memory survived only as that of the founder of the chair of Arabic, and a munificent benefactor of the Bodleian Library.

Of Laud's works, collected in the Anglo-Catholic Library (7 vols. Oxford, 1847-60), by far the most interesting is his Diary, which was published by Wharton in 1694. Peter Heylin, Laud's chaplain, first wrote his biography, *Cyprianus Anglicanus* (1668); and there are modern lives by Le Bas (1836), Mozley (1845; republished in *Essays*, 1878), Hook (*Lives of Archbishops*, 1875), A. C. Benson (1887), C. H. Simpson (1894), and R. H.utton (1895). See also the articles, with work there cited, on CHARLES I., STRAFFORD, CHILLINGWORTH, HALES, JEREMY TAYLOR, and PRYNNE.

Laudanum, or more correctly TINCTURE OF OPIUM, is the most generally used of all the preparations of opium. It is obtained by macerating the sliced or powdered drug in dilute spirit, and filtering.

It is of a deep brownish-red colour, and possesses the peculiar odour and smell of opium. One of the greatest objections to it is that it is liable to great variations of strength. When the tincture of opium is ordered a definite strength is always obtained, but under the name of *laudanum* various compounds are sold, and the former term should therefore alone be used. Laudanum is a powerful anodyne and soporific, but is more liable to cause headache than the solution of one of the salts of morphia. Its general action and its uses will be described in the article OPIUM. The dose for an adult varies from ten minims to a drachm. To children (as is the case with all opiates) it must be given with extreme caution. *Oscumium*, or about two drops, has been known to prove fatal to an infant. See POISON.

Lauder, a quaint little royal burgh of Berwickshire, on Leader Water, 25 miles S.E. of Edinburgh. Near it is Thirlestane Castle, the seat of the Earl of Lauderdale. Till 1885 it united with Haddington, &c. to return one member to parliament. Pop. 719. See JAMES III.; and for the town's immemorial tenure of Lauder Common, *Common's Village Communities* (1890).

Lauder, ROBERT SCOTT, subject and portrait painter, was born at Silvemills, near Edinburgh, in 1803, studied at the Trustees' Academy and in London, and in 1830 was elected a member of the recently founded Royal Scottish Academy. He lived in Italy and at Munich in 1833-38, and then chiefly in London till 1849, when he returned to Edinburgh. He died there, 21st April 1869. Among his best works are two portraits, 'Christ teaching Humility,' and 'Sentinels,' all in the National Gallery of Scotland; scenes from 'The Bride of Lammermoor,' 'The Trial of Eddie Deans,' and 'Meg Merrilies.' His brother, JAMES ECKFORD LAUDER, R.S.A. (1811-69), was also a subject-painter. His works include 'Hagar,' in the National Gallery of Scotland; 'The Unjust Steward,' and 'The Wise and Foolish Virgins.'

Lauder, SIR THOMAS DICK, Bart., was born in 1784, the eldest son of Sir Andrew Lauder of Fountainhall, Haddingtonshire. He served for a time in the 26th (Cameronian) regiment, succeeded to the baronetcy in 1820, and lived at the Grange, near Edinburgh, from 1831 until his death on 29th May 1848. For the last nine years of his life he was secretary to the Board of Manufactures and of Fisheries. Of Lauder's two romances, *The Wolfe of Badenoch* and *Lochavallon*, the former is still a popular book. His best works are not these, however, but his *Northshire Folds* (1830) and, especially, *Scottish Rivers*, which was appearing in *Tait's Magazine* when his death cut the series of papers short. His *Legendary Tales of the Highlands* (3 vols. 1841) may also be mentioned. In politics a Liberal, and of unwearied public spirit, Lauder was in private a lovable and accomplished gentleman. Lord Cockburn, who describes him as 'the greatest favourite with the mob that the Whigs have,' says: 'Lauder could make his way in the world as a player, or a ballad-singer, or a street fiddler, or a geologist, or a civil engineer, or a surveyor, and easily and eminently as an artist or a layer out of ground.' See Dr John Brown's preface to the reprint of *Scottish Rivers* (1874).

Lauderdale, JOHN MATTLAND, DUKE OF, who earned the detestation of his countrymen, was born at Leithington (now Lennoxlove), near Haddington, 24th May 1616, son of the first Earl of Lauderdale. In his youth he simulated ardent zeal for the Covenanting cause, and was actually one of the Scottish commissioners at the Westminster Assembly of Divines. He succeeded as second earl in 1645, was taken prisoner at Worcester in

1651, and confined nine years in the Tower. Before the Restoration he had gained the king's ear, and he now became Secretary of State in Scotland. He found the nobles impoverished and corrupt beyond all precedent, and for the first seven years he was engaged in an incessant struggle to maintain his place with rivals like Middleton as unscrupulous as himself, as well as with more open and honourable opposition from Clarendon and others in England. He made himself indispensable to Charles, who liked his clever and caustic wit, and felt no repugnance at his sensuality, his ribaldry and his drunken buffooneries; his slobbering mouth and heavy face brutalised by vice, as we see it still in Lely's portrait. His main object was to bring about the absolute power of the crown in church and state, and for this end he laboured with the most unceasing persistence, using patriotism, honour, and religion alike as mere pawns in his unscrupulous game. He was ever bold, full of resource, and quick to recognise the use to be made of such creatures as the brutal Rothies and the 'Andas' Sharp. His harsh measures gould the poor peasants of the west country into the rebellion of 1666, but the greater guilt of the Highland invasion during the winter of 1677 and the spring of 1678 lies on the shoulders of the bishops no less than of the ruthless Lauderdale. He formed a militia of 20,000 men ready to do the bidding of the king anywhere, and drilled the Episcopal Church into complete subservience. He was a member of the king's privy-council, had a seat in the famous Cabal ministry, and was created a duke in 1672. Fresh intrigues against him of the Scottish nobles, in concert with Shaftesbury in London, reached their height in 1674, but were foiled by his own ability in counter-plots and the king's personal regard for him. On the 7th May 1678 a vote was carried in the House of Commons for an address to the king praying for Lauderdale's removal from the royal presence for ever; but two days later, through lavish use of court intimidation and the Speaker's corrupt management of the forms of the House for procuring adjournments, the address when prepared was thrown out by a single vote. Another short struggle with Hamilton in the Convention of Estates left him again triumphant, and for two years more he held his power, until unable from infirmity to hold it longer, Lauderdale in his later life married the ambitious Lady Dysart, and it was alleged had cleared the way by hastening the death of his countess. He had but one daughter, and his dukedom died with him, while the earldom and family titles passed to his brother. He died, worn out by debaucheries and the anxieties of constant intrigue, at Tunbridge Wells, 20th August 1682, and eight months later was laid in the Abbey Church at Haddington, but not to rest, according to persistent popular tradition.

See two admirable articles together embracing his whole public career, by Osmond Ayr, in the *Quarterly Review* (vol. clvii. 1884) and the *English Historical Review* (vol. i. 1886), based on the 36 volumes of Lauderdale MSS. in the British Museum, each containing from 100 to 150 documents. A selection from these was edited by Mr Ayr for the Camden Society (3 vols. 1884-85).

Laudon. See LONDON.

Lauds. See BREVARY.

Lauenburg, of SAXE-LAUBENBURG, a German duchy, formerly united to the crown of Denmark, and lying on the right bank of the Elbe between Holstein and Mecklenburg. In the 12th century this district was conquered by the dukes of Saxony. In 1260 John I., son of Albert I. of Saxony, founded the ducal House of Saxe-Lauenburg. After the extinction of this line, it was inherited by the Duke of Brunswick-Celle in 1702,

and passed into the possession of the Hanoverian kings of Great Britain, was seized along with Hanover by the French in 1803, and afterwards, with some changes of boundary, was made over to Prussia, and by Prussia transferred to Denmark (1816), but with reservation of all rights and privileges. By the treaty of Gastein (1865) it came again into the possession of Prussia. It has an area of 457 sq. m., and (in 1885) 49,861 inhabitants, and is a well-cultivated and fertile country. In 1876 Lauenburg was finally incorporated with the province of Sleswick-Holstein, of which it is now a district. Prince Bismarck was offered, and accepted the title of Duke of Lauenburg on his retirement from office in 1890.—The town of Lauenburg, once capital of the duchy, stands on the Elbe, 25 miles SE. of Hamburg. It has a pop. of 4748. It contains the old ducal palace, dating from 1482.—LAVENBURG, in Pomerania, 38 miles NW. of Danzig, has flax and woollen spinning, iron-founding, and machine-making. Pop. 7214. It was originally a town of the Teutonic Knights (from 1322), then of Poland (1454-1657), and finally of Brandenburg.

Laughing Gas. See NITROGEN, and ANÆSTHESIA.

Laughing Jackass, or GREAT KINGFISHER (*Dacelo gigas*), a bird belonging to the Alcedinidae (see KINGFISHER), but in some respects an aberrant form. It has the general build of a kingfisher, but is not a fisher. It feeds upon insects, reptiles, and even small mammals. The peculiar hoot which it utters has, of course, given to it its name. It lays its pearl-white eggs in a hole in a gum-tree. There is another closely allied species (*D. leucii*), of identical habits: both birds inhabit Australia.

Launce. See EEL.

Launceston, till 1838 the county town of Cornwall, on the Kenesey, a tributary of the Tamar, 36 miles NW. of Plymouth and 50 W. of Exeter by branch-lines opened in 1865 and 1886. It has a handsome granite church (1511); the circular Norman keep of a castle which figured much in the Great Rebellion, and in which Fox the Quaker was imprisoned (1656); an old gateway; and a new town-hall (1887). A municipal borough since about 1227, Launceston returned two members till 1832, one till 1885. Pop. (1851) 3397; (1891) 4345. See A. F. Robbins, *Launceston, Past and Present* (Launceston, 1885).

Launceston, the second city of Tasmania, is to the north of the island what Hobart, the capital, is to the south—the chief port of entry and mart of trade. It stands in a valley enclosed by hills at the junction of the Esk with the Tamar, which, after a course of 40 miles, enters Bass Strait (q.v.) at Port Dalrymple. It is accessible to ships of considerable burden, and carries on a thriving commerce with the principal Australian ports, having steam communication twice a week with Melbourne, and with Sydney fortnightly. There is a railway (133 miles) to Hobart. The town is supplied with water from St Patrick's River, 15 miles E. The principal buildings are the government house, new post-office, convent, theatre, town-hall, and mechanics' institute with a library of 13,000 volumes. Launceston was incorporated in 1858, and raised to a city in 1889. Pop. (1881) 12,753; (1891) 17,208.

Launch, the largest boat belonging to a ship. For steam-launch, see BOAT; for the process of launching ships, see SHIPBUILDING.

Laura. See MONACHISM.

Lauraceæ, a natural order of exogenous plants, consisting of trees or shrubs which have leaves without stipules, and flowers in panicles or umbels. The perianth is 4-6-cleft; the stamens are

opposite to its segments, and twice as many. The fruit is a one-seeded berry or drupe; the fruit-stalk often enlarging and becoming fleshy. This order contains about 450 known species, mostly tropical. The Laurel (q.v.) is the only European species. An aromatic and fragrant character pervades the order, and amongst its products are cinnamon, cassia, and other aromatic barks, also a number of aromatic fruits somewhat resembling nutmeg (see NUTMEG). The timber of some species, as greenheart, is valuable; some are esteemed for their medicinal barks, as greenheart (bebeern) and sassafras; some for their secretions, of which camphor is the most important. *Oraculaphoe oqafira*, a South American tree, yields a camphoraceous volatile oil in great quantity if mere incisions are made in its bark. The fruit of some species is agreeable, as the Avocado Pear (q.v.). A very few remarkable species, forming the genus *Casyltha*, have been united with this order by many botanists, although others separate them as a distinct order. They are climbing parasites, like dodders, found in the woods of the hottest parts of the globe.

Laureate, POET, an official attached to the household of the English sovereigns. His early history is involved in some obscurity. In the *Domestic Book* we find one Berdie described as 'Joelaton Regis,' and a certain Roger or Raheus, king's minstrel, is said to have founded the monastery of St Bartholomew in Smithfield under Henry I. We read of Richard I. carrying William the Foreigner to Palestine to sing his exploits, and of Edward I. taking the Carmelite friar, Robert Baston, with him to Scotland in 1304. The latter apparently went also for the same purpose with Edward II. to Bannockburn, but was captured by the Scottish soldiers and forced to celebrate their prowess instead, as the price of his freedom. The badness of his verses (rhymed hexameters) was humorously ascribed by the next century Scottish writers to the unwillingness of his conscience. We read of one John Kaye attached to Edward IV. as versifier (*versificator*), and before this period we meet the term 'laureate' applied on the one hand to one who had earned the laurel wreath at one of the universities for rhetoric and versification in Latin, and on the other to any poet of surpassing merit. Skelton was one of the former, and proudly styled himself 'Poeta Skelton Laureatus' in the headings of his Latin poems; the term 'laureate poet' applied by Chaucer to Petrarch bears the latter sense. The first poet-laureate in the modern sense was Spenser, who was granted a pension of £50 by Queen Elizabeth in 1591; but the first who received the office by formal letters-patent was Ben Jonson. His salary was 100 marks, raised by Charles I. to the same number of pounds sterling, with the addition of a tierce of Canary. James II. was mean enough to discontinue the allowance of wine, but it was afterwards resumed, until commuted for £27 a year in the laureateship of Pye. It was long the duty of the poet-laureate to write an ode on the king's birthday—'his quit rent ode, his peppercorn of praise,' in Cowper's phrase; but this task fell into abeyance towards the end of the reign of George III. The list of poets-laureate preserves the memory of a few names else almost forgotten; but it contains Spenser, Ben Jonson, Dryden, Southey, Wordsworth, and Tennyson. The complete list, with the years of office, is as follows: Edmund Spenser (1591-99), Samuel Daniel (1599-1619), Ben Jonson (1619-37), followed by an interregnum until 1660; William Davenant, knight (1660-68), John Dryden (1670-89), Thomas Shadwell (1689-92), Nahum Tait (1692-1715), Nicholas Rowe (1715-18), Laurence Easden, clerk (1718-30), Colley Cibber (1730-57), William Whitehead (1757-85), Thomas Warton, clerk (1785-90), Henry James Pye (1790-

1813), Robert Southey (1813-43), William Wordsworth (1843-50), Alfred Tennyson (1850-92), Alfred Austin (appointed in 1896). See W. Hamilton, *The Poets Laureate of England* (1878); Kenyon West, *The Laureates of England* (1896).

Laurel (*Laurus*), a genus of Lauraceæ, restricted, containing only a single species, the Noble Laurel or Sweet Bay (*L. nobilis*), a native of Asia Minor, but now diffused over all the countries around the Mediterranean Sea. It is often a mere bush of 15 feet or less, but sometimes becomes a tree of 30 or even 60 feet high. It has rather large, lanceolate, leathery, shining leaves, reticulated with veins, and axillary clusters of yellowish-white flowers of no beauty. The fruit is oval, bluish black, and about half an inch long. Both the leaves and the fruit are bitter, astringent, and aromatic, and were formerly much used in medicine as a stomachic and stimulant. The leaves are still used in cookery for flavouring. They contain a volatile oil (*oil of sweet bay*), and a bitter, gummy extractive. See the article BAY, and the illustration there.

By the ancient Greeks the laurel was called *daphne*; it was sacred to Apollo. Berry-bearing twigs of it were wound round the forehead of victorious heroes and poets; and in later times the degree of Doctor was conferred with this ceremony—whence the term *laureation*; and, according to some, the term *Bachelor* (q.v.). And to this day a laurel-crown is the emblem of the honour to which poets, artists, and warriors aspire.

The Noble Laurel is common in shrubberies in Britain, but not nearly so common as the species of Cherry-laurel, which share with it the name Laurel, as do not a few other shrubs botanically very different, but somewhat similar in their evergreen foliage.

LAUREL-CHERRY, or CHERRY-LAUREL, is a name given to those species of *Prunus* (sub-genus *Cerasus*)

Common Cherry-Laurel
(*Prunus laurocerasus*).

(see CHERRY) which have evergreen leaves. They have small flowers in long racemes, and small fruit—the fruit of a nauseous taste—and most parts of the plant, but particularly the buds, leaves, and kernels, remarkably abounding in hydrocyanic (prussic) acid, and therefore very poisonous. The Common Cherry-Laurel (often spoken of simply as the Laurel or Common Laurel, or even more erroneously as the Bay Laurel), *Prunus (Cerasus) laurocerasus*, is a shrub, sometimes of the very largest size, with large ovate-lanceolate, convex, smooth, remotely serrated, shining, light-green leaves, and erect racemes of flowers. It was discovered towards the middle of the 16th century by Belon, at Trebizond, and thirty years later introduced by Chéris through the imperial ambassador at Constantinople, and planted at Vienna, whence he soon widely distributed it. Gerard thus mentions it as a choice garden shrub in

England before the end of the century. It is now naturalised throughout the south of Europe, and is one of the most common ornamental shrubs in Britain, where it suffers only from such severe frosts as are of rare occurrence. It is propagated by seeds, layers, and cuttings. Its leaves resemble bitter almonds in smell and taste, and have in great abundance the same essential oil (see ALMONDS, OIL OF), and hydrocyanic acid. From these leaves, by maceration in water for twenty-four hours, and subsequent distillation, is obtained the *Laurel-water*, or *Cherry-laurel water*, formerly employed in medicine as a substitute for hydrocyanic acid. The leaves are sometimes employed also for flavouring puddings, sauces, &c., and are safer for such purposes than oil of bitter almonds, but ought to be used with caution, fatal accidents being on record. A bottle of cherry-laurel leaves bruised and moistened is often carried by entomologists to kill their captured prey. Neither the essential oil nor the hydrocyanic acid seems normally present during the life of the leaf; both are believed to be produced by the decomposition of amygdalin, or by a ferment, but neither of these has been successfully isolated. Several varieties are in cultivation—notably, e.g., var. *latifolia*, large leaved; *colchica*, dwarf, with narrow, shapely serrate leaves; and *caucasica*, which is said to be the handsomest, hardiest, and most vigorous of all. Another species, also very common as an ornamental shrub in Britain, but not quite so hardy, is the Portugal Laurel (*Prunus or Cerasus lusitânica*), a large shrub—sometimes a tree—with smaller dark-green leaves and lateral racemes. It does not grow so well under the shade of trees as the common cherry-laurel. From the dissimilarity of form, size, and tint of their leaves, these species contrast well in the shrubbery. The variety *myrtifolia* is small and compact. The North American cherry-laurels are *Prunus caroliniana* of the southern states, and *P. ilicifolia* of California, both small and handsome evergreens.

Laurentian System, the name given to the lower division of the Archaean System (q.v.) in Canada. For the Laurentian Range of mountains (also named from the St Lawrence), see CANADA.

Lauriston, ALEXANDRE JACQUES BERNARD LAW, MARQUIS DE, marshal and peer of France, was a grand nephew of John Law, the financier, and was born at Pondicherry, 1st February 1768. He was Napoleon's comrade at the Artillery School, received rapid preferment in the army, and held diplomatic appointments at Copenhagen and London. After Austerlitz (1805) he took possession of Venice. He held high commands at Wagram (1809) and in the retreat from Moscow (1812). He fought at Bautzen (1813) and Katzbach, and was taken prisoner at Leipzig. Already emboldened, he was made a peer by Louis XVIII, as not having joined Napoleon during the Hundred Days, and became marquis in 1817 and marshal in 1821. He died 10th June 1828.

Laurium, a mountain (1171 feet) of Attica, NW. of Cape Colonna, and connected by a railway with Athens. It was famous in ancient times for its silver-mines, but these were already exhausted in Strabo's day. Since 1874, however, the great heaps of slag have been profitably worked, and fresh deposits of argentiferous lead and of zinc ore have also been found, so that the most important mining in the kingdom is carried on here. In 1887 nearly 60,000 tons of ores of every kind were exported, besides 2779 tons of pig lead. The mining town that has sprung up has a pop. of over 5000. See *National Review* for July 1888.

Laurustinus (*Viburnum Tinus*, see VIBURNUM), a beautiful evergreen shrub, a native of

south of Europe and North Africa, and belonging to the natural order Caprifoliaceæ. Its beauty is enhanced by its habit of flowering in winter. The flowers are white, in corymbs, and are succeeded by small black berries with a blue bloom, which inflame the mouth, if eaten, like those of Mezeron (q.v.), and are said to be violently purgative, yet are the favourite food of certain birds. *Laurus* suffers from severe winters in Britain, and will not endure the winters of northern Europe and the colder regions of America.

Laurvik, a seaport of Norway, at the head of a small fjord on the western side of Christiania Fjord, 98 miles by rail SSW. of Christiania. It has several sawmills, and exports timber and other products to the value of £155,000 annually; annual imports, £170,510. Pop. (1886) 11,196.

Lausanne, capital of the Swiss canton of Vaud, is picturesquely situated on the southern slope of the Jura Mountains, close to the northern shore of the Lake of Geneva, on which the village of Ouchy (where Byron wrote *The Prisoner of Chillon*) forms its harbour. Two principal parts of the city are separated by a valley, across which a fine bridge (617 feet long and 82 feet high) was thrown in 1844. Lausanne is famous for its educational institutions; amongst these institutions are the new cantonal university, opened in May 1891, and an industrial, music, and other schools. The cathedral, a beautiful Gothic building, begun in the 10th century and completed in the 13th, is the greatest ornament of the city; this church was the scene of the disputation between Calvin, Farel, and Viret in 1536, which led to the introduction of the Reformation in the city. Here are the cantonal museum of natural history and antiquities, and the Arland Museum (1846) of Art, &c. Since 1875 Lausanne has been the seat of the Federal Tribunal, which decides all questions pending between the several cantons, and between the cantons and the federal government. Lausanne is much frequented by visitors from all parts of the world. Here Gibbon resided for many years, and the house in which he wrote the greater part of the *Decline and Fall* is still shown. John Kemble, the actor, died and was buried here. The town has little industry, but considerable trade. Pop. (1888) 31,049, of whom 86 per cent. are Reformed, and 78 per cent. speak French. Benjamin Constant was a native of Lausanne.

Lausitz. See LUSATIA.

Lauterbrunnen, the name of an Alpine valley in the Swiss canton of Bern, through which flows the Weisse Lüt-schine, one of the principal feeders of the Aar. The valley is surrounded by perpendicular walls of sandstone from 1000 to 1600 feet in height, down which pour about a score of waterfalls. Of these the finest is the *Staubbach* ('dust-stream'), 866 feet in height.

Lautverschiebung. See GRIMM'S LAW.

Lautzen. See BIRON.

Lava, any rock ejected from a volcanic orifice in a state of fusion. Lavas differ much in liquidity at the time of eruption—the basic lavas being more fluid generally than those that contain a high percentage of silica. The surface of a lava stream, which speedily cools and hardens, is generally more or less porous and vesicular, from the escape of the confined gases; but, as rock is always a bad conductor of heat, the interior often remains long in a liquid condition, permitting the continued flow of the stream sometimes to a very great distance from the orifice from which it has been discharged, notwithstanding its indurated covering. The end of the stream is a slowly-moving mass of loose porous blocks, rolling and tumbling over

each other with a loud rattling noise, being pushed forward in fits and starts by the viscid lava, when it bursts the hardened crust and rushes on. The structure of the interior of a solid lava-stream shows a compact and homogeneous rock, assuming a more or less crystalline structure as the cooling has been the work of a longer or shorter period of time. Caverns are sometimes formed in lava-streams by the escape of the molten mass below, leaving the cooled crust standing like the roof of a tunnel.

Laval, capital of the department of Mayenne, and one of the most picturesque towns of France, is situated on the river Mayenne, 46 miles by rail E. of Rennes. Its chief buildings, both dating from the 12th century, are the cruciform cathedral and the old ducal castle of the Trémoilles (a prison now), in whose courtyard young Philip de la Trémoille, Prince de Talmont, was guillotined by the Republicans in 1794. Since the 13th century, when Flemish weavers settled here, the town has been the centre of a district noted for its linen-manufactures—linen, ticking, sacking, &c. In the vicinity the Vendéens defeated the Republicans in 1793. Pop. (1872) 24,255; (1891) 38,405.

La Valetta. See VALETTA.

Lavalette, FATHER. See JESUITS, p. 314.

La Vallière, LOUISE FRANÇOISE DE LAUREME LERLANC DE, a celebrated mistress of Louis XIV. of France, was born at Tours, in 1644, of an ancient and noble family. At an early age she lost her father, and was brought to court by her mother, who had married a second time. She was not a great beauty, and was slightly lame; but the winning charm of her manners, and the sweetness of her face, quickly took captive the affections of the king. She really loved Louis, and bore him four children, of whom two died in infancy; but, although she and they received wealth and titles of honour, she never lost her sensitiveness to the dishonour of their birth. When Madame de Montespan became the royal favourite she retired into a Carmelite nunnery in Paris, where she took the veil in 1674. She died 6th June 1710, after having spent more than thirty years in penances and religious austerities. Her *Reflexions sur la Miséricorde de Dieu par une dame pénitente* (1680) was re-edited in 1854. A collection of her letters was published in 1767.

There are Lives of the Duchesse La Vallière, by Quatremère de Roissy (1823), Capéguie (1859), Hous-saye (1860), and Duches (4th ed. 1890). See also Lair (1881), and Pauthé (1891).

Lavater, JOHANN KASPAR, writer on physiognomy, was born on 15th November 1741, at Zürich, studied there under Bodmer and Breitinger, and in 1769 received Protestant orders. He early gained a high reputation by a volume of poems, entitled *Schweizerlieder* (1767). His next publication was *Aussichten in die Ewigkeit* (4 vols. 1768-78), of which several editions were soon called for. The tone of this and similar works is one of high religious enthusiasm, mingled with asceticism and a considerable heaven of mysticism. From 1769 he officiated in the orphanage church in his native city, and from 1778 in the church of St Peter. He brought his keen powers of observation and his skill in judging character to bear upon physiognomy, which he attempted to elevate into a science, in his most celebrated work, *Physiognomische Fragmente zur Beförderung der Menschenkenntniss und Menschenliebe* (4 vols. 1775-78). This work, which Holcroft first translated into English (3 vols. 1793), is written in an extravagant and inflated style. It gave rise to much discussion, was bitterly attacked, as by Nicolai, although Goethe greeted it with praise, and occasioned not a little display of wit and humour from Lichtenberg and others.

Lavater was the chosen spiritual adviser of many persons in Switzerland and Germany, with whom he maintained an unwearied correspondence. On his tours in Germany he was received with extraordinary marks of popular esteem and honour. Whilst tending the wounded on the street at the capture of Zurich by Massena, 26th September 1799, he received a wound, of the effects of which he ultimately died on 2d January 1801. His *Verwünschte Schriften* appeared in 2 vols. (1771-81) and his *Sämmtliche Kleine prussische Schriften* in 3 vols. (1784-85). See Lives by Gessner (1802), Heisch (English, 1842), and Müncker (1883), and monographs by Steck (1884) and Von der Hellen (1888).

Lavaur, a town in the French department of Tarn, on the Agout, 25 miles ENE. of Toulouse. A bishop's see from 1317 to 1891, it was the strongest fortress of the Albigenes, but in 1211 was taken by Simon de Montfort. Pop. 4651.

Laveleye, EMILE LOUIS VICTOR DE, political economist, was born at Bruges on 5th April 1822, studied at Paris and Ghent, and was appointed to the chair of Political Economy at Liege in 1864. His works include *De la Propriété et de ses Formes Primitives* (1874; Eng. trans. 1878); *Lettres d'Italie* (1880-84); *Le Socialisme Contemporain* (1881; 3d ed. 1886; Eng. trans. 1885); *Éléments d'Économie Politique* (1882); *La Péninsule des Balkans* (1886; curtailed trans. 1887); and works on 'moral economy' in the Netherlands, and on current topics of the day, such as education, luxury, the gold question, and democracy. He contributed to the *Revue des Deux Mondes* and some of the English reviews. He was made a baron just before his death, 2d January 1892. See Life by Count Goblet d'Alviella (1892).

La Vendée. See VENDEE.

Lavender (*Lavandula*), a genus of labiate plants, having the stamens and style within the tube of the corolla, the upper lip of the corolla bilobed, the lower trifid. The Common or Narrow-leaved Lavender (*L. vera* or *L. angustifolia*), grows wild on stony mountains and hills in the south of Europe, and in more northern regions is very generally cultivated in gardens. It has a delightful aromatic fragrance, and an aromatic bitter taste, and contains a great quantity of a volatile oil, *oil of lavender*. The whole plant possesses stimulant properties, and is used in medicine, but particularly the spikes of the flowers, as a tonic, stomatic, nervous stimulant, &c. Lavender flowers are often put into wardrobes to keep away moths, and are much used in perfumery. *Oil of Lavender* is procured by distillation of lavender flowers with water, and is rather lighter than water, pale yellow, very fluid, and very fragrant; it requires 70 lb. of flowers to yield 1 lb. of oil. *Spirit of Lavender* is made by distilling lavender flowers with rectified spirit; *Lavender Water*, one of the most popular of all perfumes, by dissolving oil of lavender with smaller quantities of other volatile oils in rectified spirit. Lavender is extensively cultivated for its flowers at and near Mitcham in Surrey, and at Hitchin (q.v.) in Hertfordshire. Broad-leaved Lavender (*L. latifolia* or *L. spica*) is also a native of the south of Europe, but is more tender than common lavender. It is also less fragrant, and the oil which it yields is called *Oil of Spike*, and sometimes *Foreign Oil of Lavender*. This oil is used by painters on porcelain, and in the preparation of varnishes.

Laver, a name given to a number of kinds of seaweed, which are used as food, especially *Porphyra vulgaris* and *P. laciniata*, of the sub-group Florideae, or red seaweeds (Algae). These plants grow on rocks and stones in the sea, and are not

unfrequent on the British shores. They consist of a very thin, flat, purple frond, which is not gelatinous. The frond of *P. vulgaris* is wavy and undivided, that of *P. laciniata* (sometimes called Sloke) is deeply cleft, and has the segments lobed and cut at the edges. Laver is sometimes stewed and brought to table; also pickled and eaten with pepper, vinegar, and oil, or with lemon-juice. It is regarded as useful in serofulous affections and glandular tumours, a property which it probably owes to the iodine which it contains. Porphyra is the 'red laver' of commerce. The name of Green Laver is given to *Ulva latissima*, of the sub-group Chlorophyceae, or green algae. It is a common seaweed of the British shores, the frond of which is green, membranous, broad, flat, wavy, and sometimes inflated. It is bitterish, but is often used in the same way as the true laver, and possesses similar properties.

La Villemarqué, THÉODORE CLAUDE HENRI HERSART, VICOMTE DE, Celtic antiquary and scholar, was born of an ancient Breton family at Quimperle, 6th July 1815, and became in due time a member of the Institute, and a corresponding member of the Berlin Academy. His first important work was *Barzaz Breiz* (2 vols. 1839; Eng. trans. by Tom Taylor, 1865), a collection of popular Breton songs and melodies, with a French translation and notes. Unfortunately the scientific value of this work was seriously impaired by the embellishments added to the ballads by the editor, and the composite product of artificially made history and affected archaisms can be accepted neither as sound literature nor as safe philology. The author was inspired by glowing patriotism and a too facile imagination, but his conscience failed to teach him the respect that is due to the grave dignity of history. But Brittany is not the Scottish Highlands of Macpherson's day, and Breton scholars are too learned for such impositions. An admirable exposure of the defects of M. de la Villemarqué's work is Luzel's paper, *Les Chants du Barzaz-Breiz* (1872). He died 9th December 1895.

Later works are *Contes populaires des Anciens Bretons* (2 vols. 1842), *Poésies des Anciens Bretons* (1850), *Notices des Principaux Manuscrits des Anciens Bretons* (1856), *Le Grand Mystère de Jésus* (1865), *La Légende Celtique en Irlande, en Cambrie et en Bretagne* (1859), *Méredinn ou l'Enchantement Merlin* (1861), *Les Romains de la Table ronde* (3d ed. 1860), and *Poésies Bretons du Moyen-âge* (1879). He also edited *Le Guide des Dictionnaires Français-Breton* (Saint-Brieuc, 1857).

Lavoisier, ANTOINE LAURENT, the founder of the antiphlogistic or modern chemistry, was born in Paris, on 26th August 1743, and devoted himself to scientific studies, particularly to chemistry. In order to obtain means for more fully prosecuting his investigations he accepted, in 1769, the office of farmer-general. In 1768 he was made an academicien. As director of the government powder-mills, he discovered in 1776 a way of greatly improving the quality of gunpowder; and in 1791 he was appointed a commissioner of the treasury. He rendered great service in the application of chemistry to agriculture. A statement of his principal discoveries, and of the great part he played in the establishment of modern chemistry, will be found under CHEMISTRY; his discovery of oxygen was wholly independent of Priestley (see *Nature*, xxvii., also WATER). Lavoisier's services to science could not save him from the popular rage against farmers of the taxes during the Reign of Terror, and he died by the guillotine, 8th May 1794. His principal work is the *Traité Élémentaire de Chimie* (1789). His *Complete Works* were published in 4 vols. in 1861-68. See his Life by Grimaux (Paris, 1888); *Edinburgh Review*, July 1890; Berthelot, *La Révolution Chimique: Lavoisier* (1890).

Law is a term which must be variously defined, according to its application. The laws of nature, as expounded by men of science, are general propositions as to the order in which physical events have occurred, and will probably recur; the moral law, or the law of God, is a body of truth thrown into the form of rules for the guidance of human conduct. But when we speak of law we usually mean to indicate the law which is set and enforced by civilised states. Law, in this sense, derives its sanction, or binding force, from the penalties by which men are constrained to obey it or punished for breaking it. The earliest source of law is custom: the customary rules of a primitive community formed the basis of the Civil Law at Rome, as they form the basis of the Common Law (q.v.) in England. Customary law is rigid and formal; in a progressive society it is relaxed and improved by the use of legal fictions, by the influence of Equity (q.v.), and by legislation. At Rome, for example, the growing commerce of the city compelled the praetor to go beyond the civil law (which was a law for Romans only), and to devise a new law of nations, based on principles of equity, such as all civilised men could understand. When the Romans began to study Greek they identified this law of nations with the law of nature, as expounded by the Stoics. The civil law, amended and rationalised by successive praetors and emperors, has furnished most of the nations of modern Europe with the greater part of their legal rules and ideas; even England, while refusing to borrow directly from the *Corpus Juris Civilis*, has derived no small part of her law from that source. Scots law has largely drawn its principles and nomenclature from Roman law.

It is usual to distinguish public law (constitutional and criminal) from private law (which applies to personal status, family relations, property, and contract). Canon Law (q.v.) is not received, as an entire system, by any modern state; but its rules are followed in defining the powers and functions of ecclesiastical persons. The Law of Nations, or International Law (q.v.), is also divided into public and private.

See such works as Maine's *Ancient Law*, Colquhoun's *Civil Law*, Austin's *Jurisprudence*, and Pollock and Maitland's *History of English Law* (1895); also the articles CODE, CONGRESS, CRIMINAL LAW, JURI-SPRODENCE, JURY, JUSTINIAN, LAND LAWS, PARLIAMENT, &c.

Law, JOHN, originator of the *Mississippi Scheme*, and famous for his credit operations during the minority of Louis XV., was born at Edinburgh, 21st April 1671. His father was a goldsmith and banker, and proprietor of the estate of Lauriston, near Edinburgh. Law early showed a most remarkable talent for arithmetic, algebra, and kindred sciences. At twenty he removed to London, where he found admission into good society, but was soon compelled to flee, in consequence of a duel in which he killed his adversary. He went to Amsterdam, and spent his time in studying the credit operations of the bank. About the year 1700 he returned to Edinburgh, a zealous advocate of a paper currency; but his proposals to the Scottish parliament on this subject met with an unfavourable reception. He now visited different parts of the Continent, where he won and lost vast sums in gambling and speculation, but sought in vain to win the favour of governments for his financial schemes. At last he settled in Paris, and, in company with his brother William, set up in 1716 a private bank. This was soon so successful and prosperous that the Duke of Orleans, the regent, adopted in 1718 Law's plan of a national bank, and issued prodigious quantities of bank notes, which enjoyed perfect credit, whilst the ordinary national bonds remained, as they had

long been, at a price far below their nominal value. In 1719 Law originated his *Mississippi Scheme* (q.v.), and the following year was made a Councillor of State and Comptroller-general of Finances. When the bubbles burst he became an object of popular hatred, and found it best to quit France. After wandering here and there he finally settled in Venice, where he spent his last years poor and forgotten, yet to the very end occupied with plans for restoring himself to power and prosperity. He died 21st March 1729. See Wood's *Life of Law* (Edin. 1824), and Thiers, *Law et son Systeme des Finances*, of which there is an American translation (New York, 1859). An edition of his works was published at Paris, 1843.

Law, WILLIAM, one of the ablest controversialists of the 18th century, was born a grocer's son at Kingscliff, in Northamptonshire, in 1686, entered Emmanuel College, Cambridge, in 1705, and became a fellow in 1711. At the accession of George I. he found himself unable to subscribe the oath of allegiance, and consequently forfeited his fellowship. About 1727 he became tutor to the father of Edward Gibbon at Putney, and here, or at Cambridge with his pupil, he spent ten years 'the much honoured friend and spiritual director of the whole family.' Gibbon, in his autobiography, speaks of the unworldly thinker with unusual warmth as 'a worthy and pious man who believed all that he professed, and practised all that he enjoined.' The elder Gibbon died in 1737, and three years later Law retired to his native village, and there was soon joined by his disciples, Miss Bester Gibbon, sister of his pupil, and Mrs Hutcheson, a wealthy widow. The two ladies had a united income of about £3000 a year, and most of this they spent in those works of charity to which they devoted themselves in their seclusion, which lasted over twenty years. Law rose at five, and spent many hours of every day in silent meditation and in exercises of devotion. About the year 1733 he had begun to study the writings of Jacob Boehme, and most of his later books are more or less expositions of his mysticism. Law died in his retreat, April 9, 1761. William Law, however unworldly in his theology, was a strong thinker and a consummate dialectician. He won his first triumph against Bishop Hoadly, in the famous Bangorian controversy, with his *Three Letters* (1717). His *Remarks on Manderill's Fable of the Bees* (1723; republished by F. D. Maurice, 1844) is a masterpiece of incisive logic, caustic wit, and terse and vigorous English. Only less admirable is the *Case of Reason* (1732), in answer to Tindal's able book, *Christianity as old as the Creation*. But the most famous of his works remains the *Serious Call to a Devout and Holy Life* (1729), to which Dr Johnson ascribed his first religious convictions, and which profoundly influenced the Wesleys, and earned the praises of Gibbon. Of Law's mystical works may be named *The Way to Divine Knowledge*, and *The Spirit of Love* (1752).

There are two collected editions of his works, each in 9 vols.—that of 1762 and that of Morvion (1893 *et seq.*). See U. Walton's *Notes and Materials for a Complete Biography* (1848), Canon Ovierton's *William Law, Nonjuror and Mystic* (1881), and Dr Whyte's *Character and Characteristics of William Law* (1892). See also Lecky's *History of England in the 18th Century*; and Leslie Stephen's *English Thought in the 18th Century*.

Law Agent. See SOLICITOR, AGENT.

Lawhnrrows, LETTERS OF, in Scots law, a writ commanding a person to give security against offering violence against another. See PEACE.

Law Courts. See COURTS OF LAW.

Lawfeldt, or LAVELD, close to Maestricht in Belgium, was the scene of the defeat of the

combined Austrian, Dutch, and English forces under the Duke of Cumberland by the French, commanded by Marshal Saxe, on 2d July 1747.

Law-merchant, a name often used in law to denote the customs which have grown up among merchants in reference to mercantile documents and business, such as bills of exchange, bills of lading, &c. These customs become incorporated with, and form part of, the common law, and are binding as such.

Lawn, a fine kind of Linen (q.v.), from which bishops' sleeves are made. For grass-lawns, see GARDENING.

Lawn Tennis. See TENNIS.

Lawrence, (1) capital of Douglas county, Kansas, on the Kansas River, 34 miles SSW. of Leavenworth by rail. It is the seat of the state university (1864), and has manufactures of flour, castings, furniture, &c. Pork-packing is extensively carried on. Lawrence was founded in 1854 by Free-soil settlers, shared in the violent struggle against slavery (see KANSAS), and was partly burned by Quantrell's guerillas in 1863. Pop. (1885) 10,625.—(2) One of the capitals of Essex county, Massachusetts, and an important manufacturing city, on both sides of the Merrimack River, 26 miles N. of Boston, with which it is connected by two railways. The river, which here falls 28 feet in half a mile, is crossed by two railway and two other bridges, and by a dam of granite, 900 feet long and 40 high; and canals on either bank conduct the water to the mills. The mills, some of which are amongst the largest in the world, manufacture cotton and woollen goods, cloth, and paper; and engines, boilers, machinery, clothing, hats, &c. are also produced here. Pop. (1870) 28,921; (1880) 39,151; (1885) 38,845.

Lawrence, St. See ST LAWRENCE.

Lawrence, St. the Deacon, a martyr of the early church, the subject of an elaborate hymn by Prudentius. According to the legendary account, he was born at Huesea in Spain, and became a deacon of Rome in the pontificate of Sixtus I. (3d century). In the persecution of Valerian, being summoned before the praetor as a Christian, and being called on to deliver up the treasures of the church, he produced the poor and the sick, who were his special charge; and on his persisting in his refusal to sacrifice, he was condemned to be broiled on a gridiron. The martyrdom is unquestionably historical, its probable date 258. His day is the 10th August. The Escorial (q.v.) is dedicated to him.

Lawrence, GEORGE ALFRED, novelist, was born in 1827, and from Rugby passed to Balliol College, Oxford, where he graduated with a second in classics in 1850. He was called two years later to the bar, was also a militia officer, and died in Edinburgh, 23d September 1876. Of his nine or ten novels the best is *Guy Livingstone* (1857).

Lawrence, LORD. John Laird-Mair Lawrence was one of twelve children of Lieut. col. Alexander Lawrence, an Irish Protestant, who served in the Mysore campaign and at the storming of Seringapatam. Born at Richmond, York-shire, 4th March 1811, he obtained in 1827 a presentation to Haileybury College, where he carried off the chief prizes. His first years in the Indian civil service were spent in Delhi and the neighbourhood. On the annexation of the Punjab Lawrence was appointed commissioner, and afterwards lieutenant-governor. His administration of this once anarchic province made him deservedly popular with Europeans and natives alike. He used every effort to curb the oppression of the people by their chiefs, devised a rational system of land tenure, and devoted his whole time and energy to the work of restoring peace and

prosperity. It was through the influence which he then acquired over the native population that he was able to render such effective service during the Indian Mutiny. Indeed, it is no exaggeration to say that he then proved himself to be the mainstay of the British dominion in India. The once restless Sikhs had become so attached to his firm and beneficent rule that Lawrence was enabled to disarm the mutineers in the Punjab, to raise an army of 59,000 men, and to capture the city of Delhi from the rebels after an eventful siege of three months. So timely was this succour, and so great had been his foresight, that he was thereafter styled 'the saviour of India.' On his return to England he received the thanks of parliament, with the grant of a pension of £1000 a year. He was made a baronet in 1858, and a privy-councillor in 1859. In 1861 Lawrence was nominated one of the knights of the 'Star of India.' In 1863 he succeeded Lord Elgin as Governor-general of India; he was made a member of the Indian council, and the Court of Directors of the East India Company granted him a life pension of £2000 a year. His five years' administration of the Indian empire was marked by the same wisdom, foresight, and prudence as distinguished his career in the Punjab. His financial policy was based upon sound principles; he took a strong personal interest in the many social problems which Indian statesmen have to confront; and his foreign policy was generally approved of. He did not believe in British interference in Asia beyond the frontier of India, and was especially opposed to intriguing in Afghanistan. In 1869 he was raised to the House of Peers as Baron Lawrence. Lord Lawrence was chairman of the London School-board from 1870 till 1873. He devoted the last days of his life in parliament (1878) to an exposure of the policy which led up to the disastrous Afghan war, and which he had vainly striven to counteract in his retirement. He died 27th June 1879. See his *Life* by Bosworth Smith (1883). Sir Richard Temple (1889), and Sir C. Aitchison (1892).

His elder brother, SIR HENRY MONTGOMERY LAWRENCE, was born at Matua, Ceylon, 28th June 1806. In 1823 he joined the Bengal Artillery near Calcutta, where Havelock was stationed at the same time. He took part in the first Burmese war in 1828, in the first Afghan war in 1838, and in the Sikh wars of 1845 and 1848; and in 1848 he was made K.C.B. In 1856, while in charge of the Rajputana province, Lawrence published two articles pointing out the danger of reducing the strength of the British army of occupation in India, and the latent causes of mutiny, which might burst forth at any time. These warnings were more than justified by subsequent events. In March 1857 he was appointed to the charge of affairs in Lucknow, and did all that he could to restore contentment there. But the mutiny broke out in May, and Lawrence saw that it would inevitably spread throughout India. He made extensive preparations at Lucknow, and it was owing to his wonderful foresight that it was made possible for a mere handful of European soldiers to defend the Residency for about four months against an army of the rebels which was in possession of the town. Sir Henry Lawrence himself was injured by the explosion of a shell on 2d July 1857, and died two days afterwards from the effects of the wound. His death was a great blow to the little garrison, but they held out bravely till the end of September, when relief came from Cawnpore. In addition to his reputation as a statesman and soldier, Sir Henry Lawrence is known as a philanthropist, and was the founder of the Lawrence Military Asylums in the Punjab, Rajputana, and Madras. He devoted the most of his income to these and other deserving institutions. A marble statue has been erected to

his memory in St Paul's Cathedral. See his *Life* by Sir Herbert Edwards and Herman Merivale (1873), and that by M-Leod Innes (1898).

Lawrence, Sir THOMAS, portrait-painter and President of the Royal Academy, was born at Bristol, an innkeeper's son, on 4th May 1769, and at the early age of ten years began to draw portraits in crayons at Oxford, afterwards at Bath. At the age of eighteen he entered as a student of the Royal Academy, having a little while previously taken to painting in oil. In 1791 he was elected associate, and in 1798 full member. After Reynolds' death he was appointed limner to the king in 1792, and was knighted in 1815; and on Benjamin West's death in 1820 he succeeded him as President of the Royal Academy. He died in London, 7th January 1830. Lawrence was the favourite portrait painter of his time, had an immense practice, and obtained higher prices perhaps than were paid to any previous portrait-painter. His talent was overrated during his lifetime; his work, in spite of the elegance and taste that often distinguish it, scarcely rises above the conventional level. See *Life and Correspondence of Sir T. Lawrence*, by Williams (1831); and Lord R. Gower's *Romance and Lawrence* ('Great Artists' series, 1882) and *Sir Thomas Lawrence* (1900).

Lawrence, Sir WILLIAM, Bart., F.R.S., a distinguished surgeon (1783-1867), became in 1815 one of the professors of Anatomy to the Royal College of Surgeons, and in 1829 a lecturer on Surgery to St Bartholomew's. He wrote important works on *The Treatment of Hernia* (1807), *An Introduction to Comparative Anatomy and Physiology* (1819), and *A Treatise on the Venereal Diseases of the Eye* (1831).

Lawrenceburg, a city of Indiana, on the Ohio, 22 miles below Cincinnati. Pop. 4284.

Lawson, Cecil (1851-82), landscape-painter, exhibited at the Academy in 1870, but remained obscure, many of his pictures being rejected by the Academy, till 1878, when his 'Minister's Garden' and a 'Pastoral' at the Grosvenor made him famous. The short remainder of his life was a brilliant success. See his *Life* by Gosse (1883).

Lawsonia. See **HELINA**.

Law-terms. See **TERMS**.

Lawyer, in the United Kingdom, is not a technical term of law, but a popular name given to those who are either practitioners of the law or intimately connected with its administration. In Great Britain and Ireland lawyers are subdivided into two main classes (see **ATTORNEYS, SOLICITOR, BARRISTERS, ADVOCATES**). In the United States an attorney acts as counsel, and *vice versa*, there being no similar subdivision of the profession, and the expediency of the subdivision has often been canvassed in the United Kingdom of late years.

Layamon, the son of Leovenath, called in the later text of his poem *Lawman* the son of Leuca, was, as he himself tells us, a priest at Emsley (now Arley), on the banks of the Severn, near Bewdley, and appears to have flourished about the close of the 12th century. Nothing more is known concerning him. He produced an amplified imitation of Wace's *Brut d'Angleterre*, the value of which is not so much literary as linguistic, although it is the earliest existing poem of considerable length in the English tongue. It was confessedly a compilation from Bede, St Alban, and Austin, and more particularly Wace. Wace's *Brut* contains 15,300, and Layamon's 32,250 lines, the additions consisting of dramatic speeches put into the mouths of the figures and of an extension of the Arthurian romance with names of persons and places supplied. The author seems to have been a simple, pious, and patriotic priest—in his own words 'it came to him

in mind and in his chief thought that he would tell the noble deeds of the English.' The versification is very arbitrary and rude, exhibiting sometimes the alliteration of Anglo-Saxon, and sometimes the rhyme of French poetry. The language shows us the Anglo-Saxon changing or changed into Early English, and a study of its peculiarities of grammar and phraseology enables us to trace the process by which the Saxon of Alfred and the Chronicle became transformed into the English of Chaucer and Wyclif. Sir Frederick Madden pointed out that in the earlier of the two MSS. (13th century) of Layamon's *Brut*, there were less than fifty words derived from the Normans; while in the second (written about 1250) twenty of these are dropped and only about forty more added. There are thus but ninety words of French origin in the two texts, together more than 56,800 lines.

The work was edited, with a literal translation, notes, and a grammatical glossary, for the Society of Antiquaries of London by Sir Fred. Madden (3 vols. Lond. 1847). See vol. iii. chap. 6 (1888) of Morley's *English Writers*.

Layard, Sir AUSTEN HENRY, G.C.B., English traveller and diplomatist, was born in Paris, March 5, 1817, and passed his boyhood in Italy. At sixteen he was sent to London to study law. In 1839 he set out on an overland journey to Ceylon. Travelling along the banks of the Tigris in 1840, he was struck with the ruins at Nimrud, pointed out by tradition as the site of Nineveh (q.v.), and felt an irresistible desire to examine the remains. In 1842 Botta, consul at Mosul, conducted some extensive excavations at Khorsabad; and Layard, returning to the region, again directed his attention to Nimrud. It was 1845 before he could obtain the requisite means and facilities for his search, and he then, with the help of some Arabs, began secretly to dig in the mound supposed to contain the ruins. His excavations were resumed in 1846 and 1847, and his energy and perseverance were rewarded by the discovery of the ground remains of four distinct palatial edifices. The most remarkable discoveries were made in the North-west Palace, supposed to have been built by Sardanapalus. The walls had been lined with large slabs of gypsum or alabaster, covered with bas-reliefs and cuneiform inscriptions. Many of these were sent to England by Layard, together with gigantic winged human-headed bulls and lions, and eagle-headed deities. They were placed in the British Museum, of which they have since remained the chief attraction (see **ASSYRIA**). Layard at first conducted his search at his own expense; he was in 1845 liberally assisted by Lord Stratford de Redcliffe, then British ambassador in Constantinople; and eventually, as the value of these specimens of the Assyrian art began to be known, the House of Commons voted a sum of £3000, which was applied by the trustees of the British Museum in continuing the excavations under Layard's superintendence. On his return to England he published a narrative of his explorations under the title of *Nimrod and its Remains* (1849), and another work entitled *Monuments of Nimrod* (1853). He was presented with the freedom of the city of London, received the honour of D.C.L. from the university of Oxford, and was Lord Rector of Aberdeen University in 1855-56. In 1852 he became M.P. for Aylesbury, and in 1860 for Southwark; in 1861-66 he was Under-secretary of State for Foreign Affairs, and thereafter Chief Commissioner of Works. In 1869 he went as British ambassador to Spain; and in 1877-80 he was ambassador to Constantinople. His markedly philo-Turkish sympathies during and after the war with Russia provoked comment at home. In 1878 he received the Order of the Bath. In 1887 he published his *Early Adventures in Persia, Babylonia, and Susiana*. He died 5th July 1894.

Laying, or **LAYERING**, a mode of propagating trees, shrubs, and perennial herbaceous plants which is very frequently employed by gardeners and nurserymen. It consists in bending and fastening a branch, so that a portion of it is imbedded in earth, there to throw out roots, the extremity being made to grow erect in order to form a new plant. The separation from the parent plant is not effected till the layer is sufficiently provided with roots. Any injury which prevents the free return of the sap greatly promotes the formation of roots, and a notch is therefore usually made in the under side of the branch, at the place where the formation of roots is desired; it is also often a little split up from the notch; and sometimes a ring of bark is cut off, or a wire is twisted round it. The time which must elapse before the layer should be separated from the parent plant is very various; a few weeks being sufficient for some, and two years requisite for others. Many plants which cannot readily be propagated by cuttings are more easily and successfully propagated by layers.

Lay-reader, in the Anglican Church, is a layman who receives authority to read the lessons or a part of the service. The incumbent can permit any one to read the lessons, but for authority to read the morning or evening prayer a license from the bishop of the diocese is required. The absolution, of course, cannot be read by a lay-reader, nor any part of the communion service, but he may receive permission, especially in connection with missions, to preach, or to read the sermons of others. Readers (*lectores*, *amgüshai*) have existed as an order in the church from at least the 3d century; in the Greek Church they constitute the first, in the Latin Church the second of the minor orders that lead to the priesthood. (The office was anciently a favourite one with well-born youths; Julian, afterwards the Apostate, was in his younger years a reader in the church of Nicomedia.) Their duty at first was only to read (and perhaps to interpret) the lessons; afterwards they were often employed also as bishops' secretaries, and had some other functions assigned to them. The appointment of readers in the Anglican Church received the sanction of the bishops in 1866; but they were not to be ordained.

Lazarus, MORITZ (born 1824), Hebrew philosophical writer, is since 1873 professor at Berlin.

Lazareff, PORT, a fine natural harbour, 40 to 60 feet deep, and 8 sq. m. in extent, in Broughton Bay on the east side of Cora. It is 390 miles from Vladivostok to the north and 180 from Port Hamilton to the south, and is free from ice in winter.

Lazaretto. See LEPROSY, and QUARANTINE.

Lazarists. See VINCENT DE PAUL.

Lazistan, a coast strip at the south east corner of the Black Sea, partly Turkish, partly Russian, inhabited by the rough Lazs. See GEORGIA.

Lazulite, or **AZURITE**, a mineral long confounded with lapis lazuli (q.v.), but, although somewhat similar in colour, very different in composition; consisting chiefly of phosphoric acid and alumina, with magnesia and protoxide of iron. It occurs imbedded in quartz, or in fissures in clay-slate, in Styria, North Carolina, Brazil, &c.

Lazzaroni (Ital. *lazzaro*, 'leper;') probably from their being outcasts or separate from other citizens), until lately a special class of the inhabitants of Naples. They had no fixed habitations, regular occupation, or secure means of subsistence, but occasionally obtained employment as messengers, porters, boatmen, itinerant vendors of food, &c. They performed an important part in all the revolutions and movements in Naples, and

were wont annually to elect a chief (*Capo Lazzaro*), who was formally recognised by the government.

Le, or **LEH**, the walled capital of Ladakh (q.v.), stands 3 miles from the bank of the Indus, 11,538 feet above the sea. Pop. estimated at about 4000. Le is one of the chief markets of the trade between Tibet and Chinese Turkestan on the one hand and the Punjab on the other.

Lea, a tributary of the Thames, rises near Houghton Regis in Bedfordshire, flows south-east through Hertfordshire, then south between Middlesex and Essex, and joins the Thames near Blackwall, after a course of 46 miles.

Lead is one of the metals which have been known from early times. It is mentioned in Job, xix. 24, and articles made of it by the ancient Romans—some of them inscribed and dated—such as water-pipes, water-tanks, weights, rings, and small ornamental cylinders, are still preserved. As examples found in the grounds of some of the old abbeys and cathedrals show, the Roman method of making pipes from sheet-lead, which differs from the modern way, continued in use till late in the middle ages. Small lead weights of curious forms have been found among Viking remains dating as early as the 10th century. Of lead compounds, litharge and red lead were known to the ancients.

Lead (symbol Pb, atomic weight 207) is a soft metal of a bluish-white colour, tending to gray, and having also a bright metallic lustre when newly cut or melted. Its surface soon tarnishes, however, when exposed to the air, by taking on a thin film of what is supposed to be suboxide. But the oxidation increases so slowly that lead suffers less than most ordinary metals either by exposure to atmospheric agencies or by being placed in damp soils. Lead can be scratched with the nail, and easily cut with a knife, and it makes a streak upon paper. Its specific gravity varies from 11.352 in the ingot to 11.365 when rolled into sheets, and its melting point is 633° F. (334° C.). It is highly malleable and in a less degree ductile, but its tenacity is small—a wire $\frac{1}{16}$ th of an inch being unable to carry a load of 20 lb. Lead is not a good conductor of heat or electricity. When gently heated it can be forced by pressure through perforations, so that pipes and solid rods for rifle-bullets, &c. are in this way manufactured. It is well to bear in mind that pipes, gutters, and cisterns made of lead are injured by hot water. The two former are often twisted and rendered useless by the constant flow of hot liquids through them. Neither sulphuric nor hydrochloric acid in the dilute state has any action upon lead.

The Action of Lead upon Water is of great importance, because the metal is so much employed for pipes and cisterns, and because lead salts dissolved even in minute quantities in drinking-water act as cumulative poisons, and are therefore injurious when taken for some length of time into the system. Lead is rapidly acted upon by pure water to which air has access, such as rain; and it is also dissolved to an appreciable extent by the water of rivers or lakes which is practically free from lime. In these cases the water after passing through lead pipes has an alkaline reaction. The combined action of air (i.e. of its free oxygen) and water oxidises the lead. After a time this hydrated oxide which dissolves is converted by atmospheric carbonic acid into an insoluble basic carbonate of lead. The oxide is again formed and the corrosive action continues or may continue. Bicarbonate or sulphate of lime, which are common salts in potable waters, prevent water acting on lead. So do some other salts; but ammonium nitrate, on the other hand, assists the solution of the lead. Sir Robert Christison found that a very small amount of peat-

extract in solution prevents the action of an otherwise pure water upon lead. But in the case of even a soft and almost pure water, like that supplied to Glasgow from Loch Katrine, the action is so slow that short-service pipes of lead when constantly used are harmless.

Native lead is of rare occurrence, but it has been found very sparingly in a few places. The metal is obtained chiefly from galena or sulphide of lead, which forms veins in different geological formations. There are several oxides of lead, two of which, plumbic oxide and red oxide, are of importance in the arts.

Plumbic Oxide (monoxide of lead, massicot, litharge), PbO . Massicot, from which red lead is manufactured, is obtained in the form of a yellow powder by heating lead to dull redness. Litharge is produced when lead is oxidised, as in the cupellation furnace, at a high temperature in a current of air. The melted litharge flows from the cupel into iron pots, and after cooling breaks up into crystalline scales of a colour varying from a pale to a reddish yellow. This is called flake litharge, and when ground it is termed bull or levigated litharge. Both massicot and litharge enter into the composition of cements (q.v.). Litharge is used in the fabrication of oil-varnishes to increase their power of drying, in the preparation of lead-plaster, and for glazing earthenware. *Red Oxide of Lead* (red lead or minium), Pb_2O_3 , is occasionally found native. Its manufacture is referred to below. There is another kind of red lead, called orange lead, containing more oxygen than minium. *Plumbic Peroxide* (binoxide of lead, puceoxide), PbO_2 , is obtained by treating the red oxide with dilute nitric acid. This oxide, which is of a brown colour, is used mixed with sulphur along with other ingredients for tipping some kinds of matches, the mixture of puceoxide with sulphur being spontaneously inflammable when rubbed.

The most important lead salts are the following: *Plumbic Carbonate* (carbonate of lead, white lead), $PbCO_3$; the cerussite of mineralogists, and now largely mined in the United States as an ore of lead. White lead is manufactured on a large scale by the process described below. *Plumbic Chloride* (chloride of lead), $PbCl_2$. The minerals matlockite and mendipite are both oxychlorides of lead. By a process introduced by H. L. Pattinson, a basic chloride of lead is made for use as a white pigment, which is, however, not so serviceable as ordinary white lead. *Lead Acetate* (sugar of lead), $Pb(C_2H_3O_2)_2 \cdot 3H_2O$, is prepared by dissolving massicot in dilute acetic acid. It can be obtained in transparent crystals or in scales by evaporating the solution. It is soluble in 1½ part of cold water, and in eight parts of alcohol. Like litharge, it is used in the manufacture of oil-varnishes, and it is an important substance in medicine. For the chromate of lead, which is employed as a yellow pigment, see under CHROMIUM.

The following are some of the tests for lead compounds in solution: An addition of hydrochloric acid produces, unless in very dilute solutions, a white precipitate of lead chloride unaltered on adding ammonia. Sulphuretted hydrogen produces a black precipitate, and this precipitate when heated with strong nitric acid is converted into insoluble white sulphate of lead. Chromate of potash produces a yellow precipitate, which has the same appearance as the precipitate this chromate gives with baryta, but the chromate of lead is soluble in caustic potash, while chromate of baryta is insoluble. Lead compounds, when mixed with a little carbonate of soda, are easily reduced to the metallic state if heated on charcoal in the inner blowpipe flame.

Uses and Smelting.—Until recent years only a

small quantity of lead was obtained from any other ore than Galena (q.v.). This is a sulphide of lead (lead, 86·6; sulphur, 13·4), and is found extensively, more or less pure or associated with other ores, in Great Britain, Germany, Spain, and other European countries. About one-third of the British supply is obtained from the Crossfell district, where the counties of Cumberland, Durham, and Northumberland meet. A few other English counties, Wales, the Isle of Man, and Scotland, also yield lead. The total quantity of ore now annually raised in Great Britain is about 50,000 tons, yielding nearly 40,000 tons of lead—less than was formerly usual.

The United States is now a large producer of lead, the Colorado smelting-works alone, which first rose into importance in 1878, yielding as much as 70,000 tons in the year 1887. The works and mines of this state are chiefly at Leadville, where much of the ore obtained is cerussite or native carbonate of lead. The earlier discovered Nevada lead-veins produced 31,000 tons of lead in 1877, but only 3400 tons in 1887. Utah, Idaho, Montana, New Mexico, Missouri, and Kansas also produce lead. The total lead produce of the United States in 1896 was 187,000 short tons (of 2000 lb.).

Some of the rarer lead minerals, not already mentioned, are anglesite or sulphate of lead, lanarkite, which is a basic sulphate, pyromorphite or phosphato-chloride of lead, and bournonite, consisting of the sulphides of lead, copper, and antimony. All galena is more or less argentiferous.

Galena when taken from the mine is broken up into small pieces or reduced to powder, and the impurities, in so far as these can be removed mechanically, separated by machines noticed under METALLURGY. If the dressed galena is nearly pure, as it often is, the smelting operation is simple. A charge of ore amounting to at least 20 cwt. is first partially roasted or calcined for about two hours on the bed of a reverberatory furnace, such as is shown in fig. 1, which results in one portion

Fig. 1.—Section of a Reverberatory Lead furnace:

a, hearth on which ore is spread; *b*, the fire-place or grate; *c*, the fire-bridge; *d*, chimney; *e*, *f*, working doors; *f*, opening for supplying ore; *g*, tap-holes.

being converted into oxide and another into sulphate of lead, while some of the sulphur goes to form sulphurous acid, which escapes as gas. There remain on the hearth of the furnace oxide, sulphate, and some unaltered sulphide of lead. These, when the heat is raised and the furnace doors closed to practically stop the supply of air, react upon each other, forming sulphurous acid and metallic lead. Towards the end of the process some lime is thrown in to aid in the manipulation of the slag and uncombined ore; and when a further portion of metal is extracted from these the melted lead is run off into a vessel, and the slag removed from the furnace. The changes which take place in the later

or melting stage of the process are shown by the following equations:

In the northern lead districts of Great Britain the calcined ore is removed from the reverberatory furnace and smelted with the aid of a blast of air on a separate ore-hearth called the 'Scotch furnace.'

Owing to lead being to some extent volatile at a red heat, a considerable quantity of the metal would, if not prevented, pass from the smelting-furnaces into the atmosphere as smoke or fume, and cause a loss of, sometimes, 10 per cent. of what the ore should yield. Moreover, lead smoke destroys vegetation for some distance around the furnaces, and herbage on which the fume condenses is apt to poison animals feeding upon it. At Holywell in Flintshire, Alston Moor in Cumberland, and at other lead-works this smoke is conveyed through a system of flues whose combined length amounts in some cases to several miles. Sometimes it is one very long flue. The fume condenses on the sides of these flues, openings being left to collect it. Condensing chambers are also used, in one form of which the lead fume is precipitated by being forced through water. These condensers are constructed to save the expense of long flues, but sometimes both are employed. The lead is of course extracted from the collected fume. In the Harz Mountains, and in some other lead-mining and smelting districts lead is extracted from complex ores—that is to say, from argentiferous galena associated with comparatively small quantities of the sulphides of copper, iron, zinc, and antimony, together with a gangue of quartz (silica), alumina, calc-spar, heavy-spar, and brown-spar. For such ores what is called the *precipitation by iron* or the *iron-reduction process* is, in some cases at least, more suitable than the air-reduction process described above. A certain proportion of iron is added to the charge of ore in a blast-furnace, with charcoal or coke for fuel, because the sulphide of lead is completely reduced when heated with metallic iron, since this metal

As an example of a water-jacketed blast-furnace for lead-smelting we give in fig. 2 a vertical section of the cupola-shaped one called the Pilz furnace now in use at Freiberg, and which has also been adopted in the United States. It has eight tuyères, and varies in size from 4 feet in internal diameter, and 14 feet high from the hearth plates, up to 20 feet in height, with a proportional width across. In the United States, however, the Rchette or rectangular form of blast-furnace seems to be preferred, because its capacity can be increased by lengthening it on plan without also increasing the height, as must be done if a circular furnace is made larger in diameter. The pressure of the blast in these furnaces is from $\frac{1}{2}$ to 1 lb. per square inch. The ore smelted at Leadville, Colorado, is, as already stated, largely cerussite or carbonate of lead, and this is easily reduced in a blast-furnace by coke or charcoal.

Desilverising, &c.—Lead usually contains antimony, tin, zinc, and other metals as impurities. These are separated by fusing the metal in shallow pans, when the foreign metals form oxides, and as such are skimmed off. Lead reduced from galena always contains a little silver, of which 8 or 10 oz. to the ton of lead is a very common proportion, although it often exists in much larger quantity, and as little as 2 oz. to the ton can now

Fig. 3.—Desilverising Pot:
a, pot; b, fireplace; c, main flue.

has a greater affinity for sulphur than lead. The reduction of these complex ores is, however, rather a combination of processes than a single one. Besides lead and silver, copper and sometimes other metals are obtained as accessory products.

be profitably extracted. The desilverising process patented by H. L. Pattinson of Newcastle-on-Tyne in 1853 is still much used. A series of cast-iron pots about 6 feet in diameter (see fig. 3) is used in the process. The argentiferous lead from the smelting furnace is melted in one of these and allowed to cool slowly, and at the same time it is briskly stirred. A portion of the lead is thus made to separate in small crystals, which, as pure lead solidifies at a higher temperature than when it is alloyed with silver, leaves the fluid portion richer in silver. Suppose that the lead to begin with contains 10 oz. of silver to the ton; then if two-thirds of the charge of this pot, which is usually the centre one of several, is transferred as crystals to another pot it will contain only about 5 oz. of silver to the ton. The one-third remaining in the liquid state will contain 20 oz. of silver to the ton. With both portions this process is repeated several times, the one becoming poorer, and the other richer in silver after each crystallisation. When the lead is enriched to the extent of from 250 to 300 oz. of silver to the ton the concentration is usually stopped, although it is sometimes carried a good deal further. The silver is then obtained from this rich lead by melting it on a flat bone ash cupel, placed in a reverberatory furnace, and exposing it to a current of air which reduces the lead to the oxide, or *litharge* of commerce, leaving the silver on the cupel. Fully 320,000 oz. of silver are in this way annually separated from British lead, the latter at the same time being improved in quality.

The Rozan process for desilverising lead is the same in principle as Pattinson's, except that steam is used instead of manual labour, the result being that there is a considerable saving in the cost.

Another method of desilverising lead, known as Parkes' process, was patented in 1850. By this method the silver is separated by adding to the melted lead from 1 to 2 per cent. of zinc, which has a greater affinity for silver than lead. The zinc carrying the silver with it forms, on cooling, crusts on the surface. From these crusts the zinc is afterwards distilled, leaving silver mixed with some lead as a residue. A modification of Parkes' method was patented in France by Conduric in 1866. He uses superheated steam for the separation of the zinc from the crust or scum, and for getting rid of any foreign metals remaining in the desilverised lead. It is said that a very pure commercial lead is obtained by Conduric's process.

Rolled out into sheets, lead is largely used for roofing houses and for water-cisterns; and water-pipes are now made from it without soldering, as already stated. It is also of great service in the construction of large chambers for the manufacture of sulphuric acid. Its value for the manufacture of shot is well known. Alloyed with antimony, &c., it is largely consumed for type-metal, and with tin for solder. Much lead is also required for the manufacture of pewter, Britannia metal, &c. See ALLOY.

White Lead or Carbonate of Lead is a substance very extensively used as a white pigment, as a cement, and for pottery glazes. White lead is still largely made by the old Dutch process. Metallic lead is cast into the form of stars, gratings, or thin perforated slabs in such a way as to facilitate its conversion into the carbonate. These pieces of lead placed in earthenware vessels, like flower-pots, containing a little weak acetic acid, are built up in tiers in the form of a stack, and surrounded with spent tan or horse-dung. The heat given out from the dung volatilises the acid, which along with the air changes the surface of the lead into the basic acetate, and this is, in turn, converted into the carbonate by the carbonic acid given off from the hotbed. Metallic lead requires from four to eight weeks for conversion into white lead, during which a repetition of these reactions goes on. In 1890 a company was formed in London to work R. Macdyvor's process, which consists in acting upon oxide of lead (litharge) by a solution of acetate of ammonia, and then precipitating carbonate of lead from the solution by injecting carbonic acid. By this process white lead is very quickly made. The acetate of ammonia is recovered and used again.

Minium, Red Lead, or Red Oxide of Lead, is much consumed in the manufacture of flint glass, as a cement, and as a pigment. For glass-making it requires to be made of very pure lead, as a slight trace of copper would impart a colour to the glass. Minium is prepared by heating *massicot* or monoxide of lead to a temperature of 600° F. in iron trays, in an oven, carefully avoiding fusion. More oxygen is thus gradually absorbed; and a bright-red compound is formed which is the red lead of commerce. Orange lead, made from white lead instead of from *massicot*, is a very pure kind of red lead.

Yellow Lead.—This name is sometimes given by manufacturers to a mixture of the oxides of lead and antimony, which is to some extent used to give a yellow colour to earthenware and as a pigment. The so-called *Black Lead* (q.v.), of which pencils, &c. are made, contains no lead.

LEAD-POISONING, or PLUMBI-SM. —Minute doses of lead introduced into the system for some time bring on peculiar and distinctive symptoms. In the 18th century, before its cause was ascertained, the

disease was well known in Poitou (hence called '*colica pictorum*'), in Devonshire, and in the West Indies. It was proved by Sir George Baker in 1767 that it was due in each case to the presence of lead in the prevalent alcoholic drink of these regions—wine, cider, rum respectively, owing to its introduction during the process of manufacture. It is occasionally met with in consequence of the action of water, generally very soft water, on the lead pipes through which it passes to the consumers. But it most often attacks persons brought much into contact with lead compounds, such as makers of white lead, workers in the glaze of potteries, painters, and plumbers. The intestinal canal and the nervous system are affected; gout also occurs. See W. D. Prendergast's monograph on lead-poisoning (1898).

(1) Lead or painter's colic is much the most common form of the disease. It consists in more or less severe attacks of pain in the abdomen (see COLIC), not differing much except in their persistency and frequent recurrence from pains otherwise produced, attended by obstinate constipation and frequently by vomiting. They may be so slight for some time that they do not interfere with the sufferer's continuing his work. Lead-colic is rarely fatal; but may be so if the cause of the affection is not recognised.

(2) The commonest affection of the nervous system is paralysis of some of the voluntary muscles; usually those first and most affected are the extensor and supinator muscles of the forearm, and the muscles of the ball of the thumb; and from the characteristic deformity thus arising the condition is termed *wrist-drop*. Other muscles may be first or alone affected; but in almost all cases the muscles of the upper limbs are those where the disease manifests itself. It is not certain whether the nerve-trunks or the centres in the spinal cord are the primary seat of morbid change. Atrophy of the brain-substance, or of the optic nerves, epileptic attacks, and coma occasionally occur as results of lead-poisoning. All the nervous disorders are generally preceded by lead-colic.

(3) The association of gout with lead-poisoning is frequent; and the former is certainly sometimes produced by the latter. But it is probable that gouty subjects are specially sensitive to the action of lead. Cirrhosis of the kidneys (see KIDNEYS, DISEASES OF) occurs in some cases; but whether it is ever a primary effect of lead-poisoning, and not due to induced gout, is not quite certain.

Besides the more obvious effects of the poison above described, there are others of great importance, as they aid in the discovery of the cause of the disease. The most distinctive is the formation of a dark line along the edges of the gums close to the teeth, due to precipitation of lead in the form of sulphide in the tissues. The general health usually suffers, the complexion is sallow and the skin dry and harsh.

Prevention. The most important point to be attended to is that those exposed to the cause of the disease should pay scrupulous attention to cleanliness; should never eat in their workrooms, or without washing their hands; and where dust containing lead is present should wear respirators during their work. Lemonade or some other drink slightly acidulated with sulphuric acid should be used as a beverage, for it forms the insoluble and inert sulphate of lead with any other lead compound which has obtained access to the stomach. Where the water supply is at fault lead pipes must be discarded, or means must be taken to render the water hard before it is admitted to the pipes.

Treatment. When lead is present in the system and causing any of the symptoms above described, its removal can be effected by the administration of

iodide of potassium (see IODINE). Sulphuretted baths, formerly recommended, are of doubtful efficacy. Lead-colic requires the free administration of castor-oil or other purgatives; and lead-paralysis is often benefited by stimulation of the affected muscles by electricity.

Lead, on shipboard. See SOUNDING.

Leadhills, a village of Lanarkshire, the highest in Scotland, being about 1300 feet above sea-level, on Glengonner Water, 45 miles SSW. of Edinburgh. Allan Ramsay was a native. Lead has been mined here for at least six hundred years, the annual output ranging between 700 and 1800 tons of lead. Pop. 998. See Irving's *Lanarkshire* (1864).

Leading Question is a technical expression in law to denote a question so put to a witness as to suggest the answer that is desired or expected. Thus, if a witness is asked: 'Was he dressed in a black coat?' it is supposed the witness will answer, 'Yes;' whereas the proper way of putting the question is: 'How was he dressed?' or, 'What kind of coat?' &c.

Leadville, a mining-town of Colorado, capital of Lake county, stands in a valley 10,200 feet above the sea, 70 miles (151 by rail) SW. of Denver. Its mines produce gold, silver, and lead (see page 544). The town, which was incorporated in 1878, contains numerous smelting-furnaces and stamp-mills. Pop. (1880) 14,820; (1890) 10,384.

Leaf. Leaves are lateral organs developed from the stem or Axis (q.v.) of the plant below its growing point. They never bear flowers, and after reaching their full development they retain their form and size unchanged until death, after which they are removed from the stem either by gradual decay (most monocotyledons) or by breaking off at a distinct articulation (most dicotyledons). They normally consist of two main parts, a stalk or *petiole*, and a blade or *lamina*, the latter being usually flattened and expanded. They may also possess lateral appendages or *stipules* at the base of the petiole. Physiologically considered, they are of the highest importance, as can best be understood after examination of their minute anatomy. The petiole resembles a stem in structure; the blade, however, is distinguished by the great development of cellular tissue, through which the fibro-vascular bundles pursue a course usually similar to that which they possess in the stem, thus exhibiting the parallel and reticulated venation so characteristic of Monocotyledons (q.v.) and Dicotyledons (q.v.) respectively. Taking

Fig. 1.—Transverse Microscopic Section of a Leaf:

common examples of such leaves, it is easy to make out all the principal tissues (see BARK): (1) thus, by tearing the leaf obliquely, we can remove shreds of dry, colourless, transparent *epi-*

dermis, which exposes the subjacent (2) cellular ground tissue or parenchyma, which is dark green on the upper, and paler because of looser texture on the lower side, while (3) the fibro-vascular bundles can readily be prepared as a skeleton by scraping, or better by maceration. A thin transverse section placed under the microscope shows, proceeding from above downwards, (1) the upper epidermis, a continuous layer of empty cells, with walls often considerably thickened, especially on the upper surface, to form the so-called cuticle; (2) the parenchyma, which contains the fibro-vascular bundles, and which is readily distinguishable into two chief layers. Above is the so-called 'palisade parenchyma,' in which the cells are elongated vertically and placed close together like the posts of a palisade, and below this lies the loose parenchyma of the middle and lower surface of the leaf, in which the cells are polyhedral and loosely arranged, leaving irregular air-passages. Finally we have the lower epidermis, in which numerous openings, the *Stomata* (q.v.), place the spaces in the parenchyma in continuity with the external atmosphere.

The essential function of leaves resides in their chlorophyll-containing parenchyma, in which, in presence of light, carbonic acid (CO_2) is decomposed with evolution of oxygen into the atmosphere and formation of starch (see CHLOROPHYLL, VEGETABLE PHYSIOLOGY). This process has, of course, nothing to do with the function of *Respiration* (q.v.)—oxidation of protoplasm with formation of carbonic acid which is going on constantly during life in all the tissues of plants as well as of animals; it is a compensatory process whereby the green plant is enabled to repair its respiratory losses of matter and energy, and provide for its continued growth by the fixing of new matter from the atmosphere and new energy from the sun. The newly-formed starch is first distinguishable in the form of granules, which are visible in the substance of the chlorophyll grains, is then digested into a soluble body, probably glucose, and carried off by the descending Sap (q.v.), to be either directly assimilated to form new protoplasm, or to be reconverted into starch and stored for future use.

The functions of the blade of the leaf are shared to some extent by the petiole, by the green cellular envelope of the stem and branches (which thus not infrequently come to replace the leaves altogether, good respective instances being furnished by cactuses and acacias), and often by the calyx and ovaries; in short, every part of the plant exposed to light tends to utilise it by producing chlorophyll, excepting only those parts of the flower where, in current phrase, more conspicuous colouring matters are required for the attraction of insects.

The forms of leaves are greatly varied, often obviously in adaptation to the habit of the plant, large and free-growing plants which obtain unobstructed light most frequently bearing simple or slightly lobed leaves, while the smaller vegetation generally produces leaves either long, simple, and narrow (e.g. grasses), or highly compound, with small leaflets (e.g. ferns), so as to seize as many as possible of the broken sunbeams which have not been intercepted by the loftier plants, while casting as little shadow as possible upon each other. Again, the leaves of aquatic plants, if floating, are simple and largely expanded, so as to maintain their position and obtain the maximum of light (e.g. water-lily and pond-weed), but if submerged are usually dissected into filiform segments (water-pinrose), so as to allow the water to flow unobstructed, and thus constantly renew the supplies of carbonic acid. Again, where in one and the same plant the leaves on the lower and upper

portion of the axis are in different circumstances, their form is also varied, and we have the *heterophyllous* condition, which can be seen in many land-plants, but perhaps most conveniently in the water-butternut (*Ranunculus aquatilis*), which possesses both floating leaves which are simple, and submerged leaves which are highly dissected. So, too, plants which grow in dry and sandy situations, and obtain scanty supplies of water, either owing to drought or to too pervious soil, very frequently store their water in their leaves, which thus become succulent, and preserve it from the evaporative action of the sun by the aid of a thickened epidermis containing unusually few stomata.

Again, leaves may acquire entirely new functions, and have their form altered in correspondence with these. Where the plant is a climber the whole or part of the leaf may be modified into a tendril; where it is insectivorous it may be converted into a fly-trap (see INSECTIVOROUS PLANTS); or, as in the very highly specialised *Nepenthes*, we may have the base of the leaf of ordinary form and function, the middle twining as a tendril, and the tip hollowed and enlarged into a complicated pitcher.

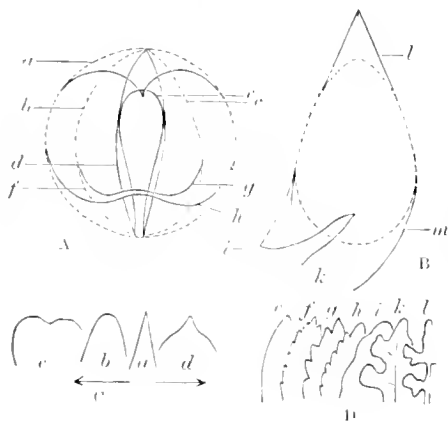

Fig. 2.

A, B, forms of leaves—1, circular; 2, elliptical; 3, oval; 4, linear; 5, spatulate; 6, ovate; 7, hastate; 8, sagittate; 9, pointed ovate; 10, ovate-lanceolate. C, Leaf-tips—*a*, acute; *b*, obtuse; *c*, retuse; *d*, acuminate. D, Leaf-margins—*e*, entire; *f*, serrate; *g*, dentate; *h*, crenate; *i*, undulate; *k*, lobulate; *l*, divided.

Where protection is required, new modifications present themselves; if herbivorous mammals threaten the existence of the plant, the leaves or leaf-tips may become converted bodily into thorns, or covered with epidermic prickles. Bitter or acrid secretions, too, may develop, or stinging hairs be produced; while, if ants are to be guarded against, a hairy or glandular epidermis is the surest protection. Such at least are the interpretations commonly current (see DARWINIAN THEORY).

Such physiological considerations being grasped, comparatively little stress need be laid (save for purposes of specific description) upon the elaborate nomenclature of leaf forms with which botanical text-books are apt to be overburdened.

The parenchyma of the blade may be either in one continuous piece, when the leaf is said to be *simple*, or cut up into separate leaflets, when it is termed *compound*. Simple leaves may be conveniently reduced to three main forms, the *circular*, the *elliptical*, or the *oval*, according to the respective length and position of the longitudinal and the transverse diameter; the *linear* leaf being thus regarded as an elongated variety of the ellipti-

cal, and so on. Innumerable variations in detail arise, however, according to the shape assumed by the apex, the margin, or the base of the leaf. The apex may be *obtuse* or *acute*, *retuse* or *acuminate*;

Fig. 3.

a, petiolate leaf derived from A by backward prolongation of the lobes; *b*, amplexicaul leaf; *b'*, perfoliate; *b''*, connate; all derived from B; *c*, petiolate leaf, its branching represented diagrammatically in *d*.

the margin may be *serrate* or *wavy*, or *puckered* into lobes so deep as to furnish transitions to the compound leaf; the base may be *hastate* or *reniform*, and so on. If the leaf base be prolonged beyond the insertion of the petiole and its lobes unite, we obtain the *petiolate* condition familiar in the common Indian Cress (*Tropaeolum*). If the petiole be absent, the leaf becomes *sessile* upon the axis; if its lobes are produced downwards, as in the reniform leaf, they clasp the axis, and the leaf is termed *amplexicaul*; if the lobes coalesce on the other side of the axis, it becomes *perfoliate*; and if they unite with those of a similar leaf arising on the opposite side, the pair are said to be *connate*.

In compound leaves the leaflets may arise one from another on each side of a median lobe, as in the *pedate* leaf of Hellebore, or may radiate in *palmate* fashion from a common point—the end of the petiole, as in horse-chestnut; or, as is most frequent, they may be placed at intervals along the midrib, like the ribs of a feather, when we have the *pinnate* arrangement, of which the ash furnishes a familiar example. The simplest case of pinnate structure is where the lateral lobes or *pinnae* are only two, as in the *ternate* leaf of clover; complex cases also are frequent, termed *bipinnate*, *tripinnate*, or *decompound*, according as secondary, tertiary, or even quaternary series of leaflets are developed.

How little morphological importance can be attached to these countless variations of form is well illustrated by the study of the development of the apparently similar 'pinnate' leaves of palms, dicotyledons, and ferns. In the palm the pinnate character is seen to be due to a mere tearing of a primarily simple leaf, by the midrib continuing to elongate after the parenchyma is developed; in dicotyledons the lobes develop separately, but sometimes from above downwards, and sometimes from below upwards; while in ferns the leaf is produced by a series of regular bifurcations of the growing point alternately to right and left, the first pinna being thus equivalent to all the rest of the leaf, and the apparent midrib a false axis, resulting from numerous separate dichotomies.

The *comparative morphology of leaves* is of the greatest interest. The essential conception, which floated before the eyes of Wolf and of Linnaeus, was renewed by Goethe, and systematised by De Candolle, is that of a fundamental correspondence or *serial homology* among all the outgrowths from the sides of the axis—from the lowest and earliest, the seed leaves or cotyledons, upwards through the leaves proper to the bracts, and even thence through the parts arranged upon the floral axis—the *sepals*, composing the *calyx*, and the

petals, forming the inner floral envelope or *corolla*, being still modifications of the leaf type, which we finally find most highly metamorphosed in the stamens and pistils (see FLOWER).

The transition from leaf to bract can be seen in any flowering plant, that from bracts to calyx may be conveniently studied in the mallow, that from sepals to petals in the cactus, that from petals to stamens in almost any garden rose (which indeed appears to have suggested the whole theory), and that from leaves to carpels in many monstrous flowers, especially the double cherry. Our consideration of the pinnate type of leaf-formation having shown that such apparent resemblances in adult anatomy are not necessarily real, it becomes necessary to test our theory by actual observation of the development of flowers. Embryology here furnishes an absolute confirmation—leaves and sepals, petals, stamens, and carpels, are all seen to develop as precisely similar processes of cellular tissue from

Fig. 4.

a, development of compound from simple leaf; b, imparipinnate leaf; c, trifidate leaf; d, palmate leaf; e, development of pinnate leaves; f, of palm by tearing; g, of dicotyledons by development either (1) basifolial, or (2) basipetal.

the sides of the axis; and when the forms of leaves are fairly borne in mind, the apparent anomalies of flower structure become clear. Thus, the outer calyx (*epicalyx*) of a strawberry is readily seen to be composed of the united stipules of the sepaline leaves, the numerous stamens in five bunches of the St John's wort become resolved into a whorl of compound staminal leaves, and so on. While petals are obviously modified leaves, there is ground both developmental and analogical for regarding them, in some if not all cases, as barren stamens specialised to the attraction of insects; their relation to the leaf type becoming more remote (see STAMEN; and Grant Allen in *Nature*, July 1882).

The arrangement of leaves upon the axis (termed *phyllotaxis*) is always definite, and possesses a high degree of interest, although perhaps rather mathematical than morphological. An ascending spiral line may in all cases be traced round the axis through successive leaf bases, and these are found to occur at fixed distances, including a certain fraction of the circumference, most commonly $\frac{1}{2}$, $\frac{1}{3}$, $\frac{2}{5}$, or $\frac{1}{5}$, although higher fractions of the same 'convergent series'—viz. $\frac{2}{7}$, $\frac{3}{8}$, &c.—or fractions of different series, and even transitions from one system to another, also not unfrequently occur, especially in such complex arrangements as the scales of fir cones. When leaves are opposite there are two

primary generating spirals; when whorled there are three or more. The mode in which leaves are folded in the bud, termed *profoliation* or *vernation* is of interest, since it is definite for each species. See Van Tieghem's, Sachs's, Vines's, and other text-books; also Lubbock's *Flowers, Fruits, and Leaves* ('Nature' series).

Leaf-insect, or WALKING-LEAF (*Phyllium*), a very remarkable genus of orthopteron insects, of the family Phasmoda (q.v.), natives of the East

Leaf-insect (*Phyllium sicifolium*).

Indian region. The abdomen is flattened out, and covered in the wingless females by a pair of wing-covers which together look exactly like a leaf. The colour is green, and the suggestion of midrib and netted veins is marvellously mimetic. The legs are also flattened, green, and leaf-like. The male has functional wings, but is also remarkably mimetic. As the insects live among leaves, and are sluggish, their detailed resemblance to the surroundings cannot but be usefully protective. The name of the commonest species (*P. sicifolium*) refers to the fact that when the insects die the green colour changes into that of a withered leaf. See MIMICRY.

League (Lat. *leua*, 'a Gallic mile,' a word of Celtic origin), a measure of length of great antiquity. The Romans estimated it as equivalent to 1500 Roman paces, or 1376 modern English miles. The league was introduced into England by the Normans, probably before the battle of Hastings, and had been by then lengthened to two English miles of that time, or 2½ modern English miles. At the present day the league is a nautical measure, and signifies the 20th part of a degree—i.e. 3 geographical miles, or 3.456 statute miles. The French and other nations use the same nautical league, but the former nation had (until the introduction of the metrical system) two land-measures of the same name, the legal posting-league = 2.42 English miles, and the league of 25 to the degree = 2.76 statute English miles. For the German league or *Mile*, see MILE.

League, a term employed to designate a political alliance or coalition. The most famous leagues were the Ætolian and Achaian Leagues, the Lombard League, the Hanseatic League (q.v.), the leagues of Cumbray ('Holy League'), Schmalkald, Nuremberg ('Catholic League'), and Würzburg in the Thirty Years' War (q.v.); also the Solemn League and Covenant, the Anti-corn-law League, the Land League. But the name has a peculiar importance in the history of France, as applied to the opposition organised by the Duke of Guise (q.v.) to the granting of the free exercise of their religion and political rights to the Huguenots. This league, known as the Holy League (*Sainte Ligue*), was formed at Peronne, in 1576, to maintain the predominance of the Roman Catholic religion; but the object of the Guises was rather to exclude the Protestant princes of the

blood from the succession to the throne. For an account of the civil war that ensued, see HENRY III., HENRY IV., and GRISE; and for its full history, see Mignet's *Histoire de la Ligue* (5 vols. 1829).

Leake, WILLIAM MARTIN, topographer of Greece, was born in London on 14th January 1777, and, having in 1794 obtained a commission in the artillery, was sent out five years later to instruct the Turks. He was employed on various other missions in the Levantine countries, till in 1823 he retired a lieutenant colonel from the army; in 1838 he married the widow of Marsden, the orientalist; and he died at Brighton on 6th January 1860. With critical acuteness and soundness of judgment he combined great learning and an admirable power of clear statement. His principal works are *Researches in Greece* (1814); *The Topography of Athens* (1821); *Journal of a Tour in Asia Minor* (1824); *Travels in the Morea* (1830); *Travels in Northern Greece* (1835); *Greece at the End of Twenty-three Years' Protection* (1851); and *Nannismaticu Hellenica* (1854). See *Memoir* by the Rev. J. H. Marsden (1864).

Leamington, a fashionable watering-place of Warwickshire, is beautifully situated on the Leam, a tributary of the Avon, 2 miles N.E. of Warwick. It is wholly of modern growth, having become important only since the rediscovery of its mineral waters in 1784. They are saline, sulphureous, and chalybeate; and the watering-season lasts from October till May. The town, too, stands in the centre of a good hunting country. Among its buildings are the Pump-room (1868), the Warneford Hospital (1832), assembly-rooms (1813), music-hall (1821), the tennis court (1847), the college (1814), the new municipal offices, and the fine old parish church. The manufacture of cooking-ranges is an important industry. Visited by the Duchess of Kent and the Princess Victoria in 1830, Leamington eight years later received the name of 'Royal Leamington Spa.' It was incorporated in 1875, and since 1885 has united with Warwick to return one member to parliament. Pop. (1811) 543; (1851) 15,692; (1891) 26,930. See F. W. Smith's *Leamington Waters* (1884).

Leander. See HERO.

Leap-year. See CALENDAR.

Lear, EDWARD, author of the inimitable *Book of Nonsense*, was born at Holloway, London, 12th May 1812. From his boyhood he had a passion for painting, and from the age of fifteen he had to make his own living. Later he was sent by the Earl of Derby to Italy and Greece, where he painted many landscapes in Albania, Athos, the Morea, and the islands of the Egean. He exhibited at the Royal Academy from 1850 until 1873. His later years were spent in Italy, and at San Remo he died, January 30, 1888. Lear made himself better known by his illustrated books of travels than by his paintings. Of these the most important were his *Sketches of Rome and its Environs* (1842); *Illustrated Excursions in Italy* (1846); *Journal in Greece and Albania* (1851), which called forth the praises of Tennyson in a well-known poem—'I read and felt that I was there'; *Journal of a Landscape Painter in Calabria* (1852); *In Corsica* (1869). The *Book of Nonsense* (1846; 25th ed. 1888) went at once to the heart of all English children. The extraordinary facility and felicity of the rhymes, and the high level of humour, wit, and good sense, maintained throughout, have kept for it its place in popular favour. *More Nonsense Rhymes* followed in 1870; *Nonsense Songs, Stories, and Botany* in 1879; *Laughable Lyrics* in 1876.

Lease, the contract establishing the relation between landlord and tenant. The granting of

leases, commonly for a term of nineteen years, has become common in Scotland since 1312, and to this system is largely to be ascribed the rapid improvement in agriculture in Scotland during the past century. Every lease has its own peculiarities as drainage, to houses, cropping, &c. See BUILDING LEASE, LANDLORD and TENANT, LAND LAWS; and, as to the compensation for unexhausted improvements, AGRICULTURAL HOLDINGS ACT.

LEASEHOLD is a dependent tenure derived either from a freehold or a copyhold, and held by lease. Schemes for the enfranchisement of leaseholds (allowing persons having long leases of small portions of land a right to purchase the fee simple) concern mainly Building Leases (q.v.). See also GROUND-RENT.

Leasing-making, in Scotch law, means seditionous words, which constituted an offence punishable with death by statutes of 1584 and 1585. The punishment was afterwards mitigated to fine and imprisonment, or both, at the discretion of the court.

Leather consists of the skins of animals chemically modified by tanning and otherwise, so as to arrest that proneness to decomposition which characterises unprepared skins, and to give to the substance greatly increased strength, toughness, and pliancy, with insolubility and inalterability in water. Some method of preparing skins so as to make them wearable must have been known from the very earliest times, and there yet exist remains of tanned leather made in Egypt not less than 900 years B.C. In modern times the methods and principles of leather-making have come to be well understood; but the processes employed in the manufacture have not been seriously modified; the attempts made to hasten the essentially slow processes having met with but limited success. There are three methods by which leather is prepared—first, and by far the most important, with tan barks and other vegetable substances containing tannin; second, by tawing with alum, bichromate of potash, and other mineral salts; and third, by shamoying or impregnating the raw skin with oil.

The skins of all animals used for leather-making consist chiefly of a fibrous gelatigenous substance called collagen, which on being boiled forms the ordinary gelatin of commerce, with an interfibrous compound called corium, insoluble in water, but which in common with collagen unites with tannin to form the insoluble and unalterable compound tanno-gelatin, the chemical basis of tanned leather. The compounds are similarly acted on by bichromate of potash and other mineral salts in tawing, whereby insoluble combinations are formed.

The skins of all animals may be made into leather; but in practice the raw materials of the manufacturer consist of the skins of certain animals which are reared and slaughtered primarily for other purposes, and of which the supply is sufficiently large to form the basis of a great industry. Large skins, it may be remarked, such as those of oxen and horses, are in trade termed hides; those of calves, sheep, goats, and other smaller creatures are called skins. Of all leather-making hides the most important are those of oxen, which are primarily distinguished as ox, cow, and bull hides, and calf skins. To the tanner they come in several forms and from many quarters. The first source of supply is the local slaughter-house, from which the newly-flayed skins called market hides are obtained. From abroad ox-hides come either as wet or dry salted hides, or as simply dried hides, the great sources of supply being Australia, the Cape of Good Hope, the River Plate and South America generally, and China and Japan. From the East Indies there come vast quantities of small hides termed kips, both salted and tanned. Buffalo hides are

imported in large quantities from Singapore, Batavia, Bombay, Kurrahee, and Calcutta. Horse-hides are brought in considerable quantities from South America, and the knacker's yards at home supply fresh hides, which, however, are generally in bad condition. Sheep-skins, from the vast quantities yearly available in nearly all parts of the world, are a most important source of leather. Besides native supplies the British market chiefly obtains them from Australia and New Zealand, the Cape, and Buenos Ayres. Goat skins and kid skins come from the Cape, the East Indies, Asia Minor, and Switzerland; but many of the East Indian and Asiatic skins are when imported already tanned, and require only dressing. A now important source of leather is from seal-skins, the supply of which is derived from the Greenland and Newfoundland fisheries. Other skins which have only a local or a limited market are the walrus, rhinoceros, and elephant, from which leather of great thickness, suitable for polishing-wheels and other mechanical purposes is obtained; and hog or pig skin is an important source of leather for saddle-making and other purposes. The skins of various species of deer and antelope, porpoise and kangaroo, are also sources of leather; and from the Cape there are occasionally sent to the London market skins of the gnu and zebra. As sources of leather for fancy articles there may be mentioned the alligator (a leather now extensively imitated), and certain snakes' and sharks' skins.

Tanning.—The operations of tanning and the duration of the process vary very widely according to the nature of the tanning materials employed, the nature and thickness of the hides and skins under treatment, and the class of leather being produced. The sources of Tannin (q.v.; and see BARK) are exceedingly numerous, but oak-bark is the most important, and that which produces the most valuable and substantial of all leathers. Oak tannage is, however, a very tedious process, and the common practice is now to hasten the completion of the operation by mixed tannage, in which more rapidly acting agents play a part. In America hemlock-bark from *Abies canadensis* is the most important tanning material; and the mimosa or wattle barks of Australia are very largely used in the colonies as well as in Britain. Standard extracts containing a fixed percentage of tannin have also come into favour for rapid tannage. But, with all the devices which have been suggested, tanning is essentially a slow operation, and it cannot be forced through without injury to the resulting leather, any more than can the operations of roasting beef or toasting bread be hastened unduly. The many processes which have been suggested, involving chiefly the use of strong tan liquors, or ooze as it is technically called, and the transfusion of these liquors through the hides, have resulted generally in the production of hard and intractable leather, or of a superficial tanning only. Such imperfectly made leather gets an appearance of uniformity and finish by being impregnated with grape-sugar, or with sulphate of magnesia, chloride of barium and other salts, which add weight, but which otherwise are the most rank and deleterious adulterants.

In the treatment of ox hides for the production of, say, sole-leather, the first object of the tanner is to clean and soften the hide. This is done by washing with water, and if necessary working the hide under stocks till the whole is uniformly soft and pliant. The unhairing and removal of the scarf skin is the next operation, for which in English tanneries the hides are steeped in pits containing lime-water, while in America the plan adopted consists of sweating the hides, or artificially heating them till incipient

putrefactive fermentation is set up. The hides are afterwards stretched over a tanner's beam, and the hair and scarf skin are removed by shaving with a fleshing-knife. At the same time the flesh side is gone over, and any fragments of fibre or fat adhering to it are pared away. All traces of lime in the hides must be got rid of, and that sometimes is effected in the first tan-pit, containing acid liquors weak in tannin, and sometimes by 'bating' in 'pure'—which is a warm decoction of pigeons' or other fowls' dung. The *modus operandi* of actual tanning varies endlessly, but in general it may be said to consist in suspending or depositing in layers the hides in a successive series of pits containing tan liquor or ooze which is weak at first, but which as the tanning proceeds is made increasingly rich in tannin. In the early stages of the tanning the hides are frequently handled or turned over in the tan-pits, as often as two or three times daily at first; but as the tanning progresses this handling becomes less and less frequent, till in the final pits, in which strong liquor is used, and where, moreover, the hides are interstratified with raw bark, they may rest for six weeks without being disturbed. When finally taken from the tan-pit the hides are carefully drained in a heap covered over from the light, after which they are suspended in the loft for drying, in which condition they form rough leather, hard, uneven, and refractory. To finish the hides they are damped and softened in water, scoured to remove the bloom from their surface, then liberally oiled and the whole surface worked over by pressure with a three-sided steel implement called a striking-pin. This operation removes all creases and smooths out and solidifies the leather—an operation carried further and finished after renewed oiling, by rolling the hide on a smooth floor under a heavy hand-roller. For both these operations very efficient machinery is now generally substituted for the old method of hand labour. The different portions of an ox-hide, and of all hides in some degree, possess distinct qualities which render them available for special applications; hence in the trade they receive distinctive names, and frequently are separately dealt in. An entire hide is termed a *crop* (see fig.); one-half the crop cut longitudinally forms a *side*; the pieces around the margins are designated as on the diagram, and collectively form the *offal*; the neck and shoulders are sometimes de-

Ox-hide or Crop.

tached from the *butt*, which forms the hide minus the *offal*, and half a butt cut lengthways makes a *bend*.

Dressed Leather.—Under this head there is embraced a great range of leathers which after tanning undergo a varied series of finishing operations at the hands of the currier and leather-dresser, to fit them for the diverse uses to which dressed leather is applied. The currier has to do with the paring down of the flesh side of the leather, to smooth its surface, and to equalise its thickness;

and he also, when desirable, splits hides by means of a machine into two or more useful layers or splits. His further and principal operations have for their objects the rendering of the leather soft, flexible, and waterproof, and giving it the finished surface, grained or smooth, waxed or blackened, glazed or enamelled, dyed, &c. For stuffing the leather, which is the most essential operation of the currier, it is first softened in water, then the surface is gone over with a scraping tool or slicker, and while still wet it is liberally covered with a dubbing composed of mixed tallow and cod-oil. As the moisture evaporates from the leather the grease penetrates and thoroughly permeates the whole texture. For the numerous operations of currying and finishing leather elaborate machinery is now employed, which has almost entirely superseded hand work.

Morocco leather is a term which now applies rather to the finish of a certain class of goods than to the source of the skin of which it is formed. It is a richly grained and dyed leather, originally and properly made from goat-skins tanned in sumach; but now sumach-tanned split calf-skins and sheep-skins are the source of much so-called morocco. Sheep-skins roughly tanned and undressed are termed basils; dressed and dyed as for morocco, but finished smooth, they form roans; and split sheep-skins (the flesh sides of which go to be shamoied to form wash-leather) tanned and dressed are known as skivers. Russia leather is now any smooth finished thin leather, impregnated with the empyrenumatic oil of birch-bark, which gives the substance its peculiar odour and insect-resisting qualities. Originally it was made in Russia of dressed calf-skins.

Tawing consists in dressing skins with certain mineral salts, and is useful principally for glove leathers and the so-called kid-leather employed for the uppers of ladies' boots. It is also by tawing that curriers' skins are prepared, and hides and skins in the hair generally preserved. The process of tawing a lamb-skin may be taken as a typical example of the process, which, however, is much varied, as experience suggests. The skins are generally limed on the flesh side with cream of lime to detach the wool, which is removed as in ordinary hide-tanning. After thorough cleansing, the pelts are steeped for two or three weeks in a pit filled with water and lime, being taken out from time to time, and drained on sloping benches. When removed finally from the lime-pit, the skins are worked with the knife, to render them still more supple, and they are then put into the branning mixture. This consists of bran and water, in the proportion of two pounds of bran to a gallon of water. From this mixture, in about two days, they are transferred to another bath, consisting of water, alum, and salt. After the proper amount of working in this mixture, they undergo what is called the pasting, if intended to form white leather. The paste is a mixture of wheaten-bran and sometimes flour and the yolks of eggs. They are usually worked in a rotating cylinder with this paste and water, and are found in time to have absorbed the paste, leaving little more than the water. If the skins are not intended to be white, other materials are often used, and much pigeons' and dogs' dung is employed. Lastly, the skins are dried and examined, and, if necessary, the pasting is repeated; if not, they are dipped into pure water and worked or staked by pulling them backwards and forwards on what is called a stretching or softening iron, and smoothed with a hot smoothing-iron. Numerous other tawing processes are in use and have been suggested, one of the most promising of which was the chrome tanning of Dr. Heinzerling, introduced about 1876. In

this the active agent is bichromate of potash; after treatment with which the leather is stuffed with paraffin; but the expectations of the promoters of this method of treating leather have not been fulfilled, the demand for chrome-tanned leather appearing to have quite fallen away.

Shamoying consists simply in impregnating and saturating skins with oil. The name is derived from the fact that the process was originally applied for the preparation of the skins of the Alpine chamois, and as it was also used for other deer-skins the name buck-leather or buck-skin was also given to the preparation. Shamoyleather now consists principally of the flesh splits of sheep-skins. The oil is worked by means of stocks slowly into the interstices of the skin and there becomes oxidised, forming a kind of combination with the gelatinous constituents, and yielding a peculiarly soft and spongy texture. A good deal of the buff-leather of commerce is prepared by a process which partakes of the features of both tawing and shamoying.

Owing to the fact that tanners derive a large proportion of their hides and skins from local sources, and dispose of most of their leather in the home-markets, it is not possible to gauge the extent of the trade by published returns. That the international movements of the trade are on a great scale is, however, made plain by the following figures. Into the United Kingdom in 1889 the imports were: dry hides, 575,158 cwt.; salted hides, 647,250 cwt.; leather, 104,916,924 lb., of a value of £6,667,265; boots and shoes, 100,487 dozen pairs. The exports were: dry hides, 365,701 cwt.; salted hides, 52,768 cwt.; foreign leather unwrought, 19,214,996 lb.; British leather, 143,140 cwt.; and wrought leather, value £413,600; boots and shoes, 11,127 dozen pairs; saddlery and harness, value £574,401. The imports into the United States in 1887 were: hides and skins (other than furs) \$24,219,101; leather and leather manufactures, \$10,933,570. Exports: hides and skins, \$765,655; leather, \$10,436,138. See separate articles on PARCHMENT, VELLUM, FURS; works by Collins (1876), Hunter (1885), and Watts (1885); and C. T. Davis's *Manufacture of Leather* (Phila. and Lond. 1885).

Leather-cloth, sometimes called American leather-cloth, or more briefly American cloth, is a textile fabric coated on one face with certain mixtures of a flexible nature when dry so as to resemble leather. Unbleached calico is the most common ground or backing employed, and this is coated with boiled oil, dark pigments, driers, and sometimes other ingredients, made up to such a consistency that the mixture can be uniformly spread on the cloth by rollers. Another method of making leather-cloth is by coating calico with 'linoleum cement' (see FLOORCLOTH). A third and extensively used coating consists of gelatine rendered insoluble by some chemical agent, to which glycerine is sometimes added. But the different mixtures which are or have been employed in making leather-cloth are numerous, and many of them have been patented. A good quality of leather-cloth when employed for covering chairs and sofas has considerable durability. As a cover to writing-tables it is even more durable than morocco leather, and it is not one-fifth of its price. A thicker kind of leather-cloth than that manufactured for upholstery purposes is made of coated linen and used for covering coaches, and there are other applications of this substance. It is more durable when glazed with a varnish than when finished in imitation of morocco leather.

Leatherwood (*Dicella pulsteis*), a deciduous shrub of 3-6 feet high, with the habit of a miniature

tree, a native of North America. It belongs to the natural order Thymeleaceae. The bark and wood are exceedingly tough, and in Canada the bark is used for ropes, baskets, &c. The leaves are lanceolate-oblong; the flowers are yellow, and appear before the leaves.

Leathes, STANLEY, was born at Ellesborough, Bucks, where his father was rector, March 21, 1830. He was educated at Jesus College, Cambridge; graduated B.A. in 1852; took orders four years later; and, after serving several curacies, became in 1863 professor of Hebrew in King's College, London, and in 1869 minister of St Philip's, Regent Street. He was Boyle lecturer (1868-70), Hulsean lecturer at Cambridge in 1873, Rampton lecturer at Oxford in 1874, and Warburtonian lecturer at Lincoln's Inn (1876-80). Further preferments were a prebend in St Paul's (1876) and the rectory of Cliffe at Hoo, near Gravesend (1880). Leathes was made D.D. by Edinburgh in 1878, and sat on the Old Testament Revision Committee. His books include *The Witness of the Old Testament to Christ* (Boyle Lectures), *The Gospel its own Witness* (Hulsean), *Religion of the Christ* (Rampton), *Studies in Genesis* (1880), *The Foundations of Morality* (1882), *Christ and the Bible* (1885), and several volumes of sermons. He died in May 1900.
